MDCCCXLI.

P R E F A C E.

THE utility of geographical works is so generally admitted, that it seems unnecessary to endeavour, by any lengthened statements, to conciliate the favourable opinion of the reader by dwelling on their merits. There are few so incurious as not to wish to learn something of the state of foreign countries, especially of those with which their own nation is connected, or which have been celebrated in history. The desire to gratify this laudable curiosity has, in all ages, prompted individuals to visit foreign countries; and has made the works of voyagers and travellers be eagerly sought after. But the situation of most people precludes the possibility of their leaving their native country; while few of those who do travel can survey more than a small part of the earth's surface. Neither is it possible adequately to supply this want of personal knowledge by resorting to the relations of travellers. These are frequently contradictory and inconclusive; the statements in them are usually, also, limited in their application, and are not always to be depended on; and, though it were otherwise, the command of many hundred volumes, and the free disposal of one's time, would be necessary to enable an individual to acquire, by their means, even a superficial acquaintance with the different regions of the earth. Hence the utility of geographical works, compiled with due care and knowledge: they embody the information scattered in the accounts of travellers, in topographical works, and in official returns and other public and private documents; sift and distribute it under its proper heads; and lay it before the reader in a condensed form, disencumbered from superfluous or irrelevant matter.

Systematical works, or those in which the various details with respect to the physical, moral, and political state of a country or district are arranged in their natural order, in a consecutive narrative, are probably the best adapted for the use of the student and scientific reader. But Dictionaries are decidedly more convenient, and better fitted for public use. When arranged in alphabetical order they are easy of consultation; and, if properly compiled, the articles in them are not connected or mixed up with others, but are separately complete, supplying the inquirer with independent, and, at the same time, precise and well authenticated information. Such works seem, from the extreme diversity and interest of the subjects treated of, peculiarly fitted to "excite curiosity by their variety, to encourage diligence by their facility, and to reward application by their usefulness." We need not, therefore, wonder that they have generally, even when their execution has been very indifferent, enjoyed a large share of popularity.

But how interesting and important soever the matter, it is still true that the value of a Geographical Dictionary must depend principally on its authenticity and trustworthiness. And we believe it will be pretty generally admitted, that by far the greater number of those publications that have hitherto appeared in this country have not been of a kind to inspire confidence. Most of them, perhaps we might say all, have been very carelessly compiled, and evince little discernment or sound criticism; and what is worse, their authors have seldom referred to the sources whence their statements have been derived; so that the reader has nothing better to trust to than the authority of, perhaps, an anonymous compiler, at the same time that he is deprived of the means of readily verifying his facts, or of referring to the original authorities for further information. These works are mostly also either on too contracted or too extensive a plan; so that while, in the one case, the reader is frequently not supplied with important information, in the other, the book is at once too bulky, costly, and inconvenient. Another defect by which most Geographical Dictionaries published in Great Britain have been characterised, is the disproportioned size of the parts, or the preponderance given to minor articles and uninteresting topics, while those having reference to great countries, or important places or subjects, have often been reduced in a more than corresponding degree. It is difficult, indeed, to hinder the descriptions of towns in geographical works from extending beyond their due proportion; but still they may be confined within reasonable limits, and without displaying the glaring anomaly of an account of a capital city, for example, occupying a greater space than that of the country in which it is situated.

The researches connected with his Commercial Dictionary, having led the author of this work to refer to a good many Geographical Dictionaries, he became strongly impressed with a sense of their defects; and it occurred to him that he might perhaps be able to produce one that should be more generally accurate and useful. At first, we were inclined to think that we might probably be able to construct our work on the basis of the Edinburgh Gazetteer, the property of Messrs. Longman and Co.: but on a closer examination of the latter, we found its plan and execution so very defective, that we considered it expedient to lay it wholly aside, and to endeavour to produce an entirely new work. The improved state of geographical knowledge, and the increasing relations of this country with others, required, indeed, that a Geographical Dictionary, aspiring to the character of a book of reference, should be principally drawn up from original sources, and with as much care and discrimination as possible.

It is necessary, however, to observe, that we have not attempted to supply the reader with a complete Geographical, Statistical, and Historical Dictionary. We have proceeded on a principle of selection;

and, instead of noticing unimportant places and objects, have endeavoured to notice those only that might reasonably be expected to interest the reader. A work of this class on any other plan would necessarily extend to many volumes, and would embrace multitudinous details of no general importance. In illustration of what has now been stated, we may mention that the *Grand Dictionnaire Géographique, Historique, et Critique*, by Bruzen de la Martinière, which aims at considerable completeness, occupies no fewer than 6 huge folio volumes* ; and, gigantic as this may seem, it is far surpassed by the German edition of the same work, which extends to 13 similar volumes ! Though on a compressed and far more judicious plan, the *Dictionnaire Géographique Universel*, Paris, 1823-1833, occupies 10 thick octavo volumes. It is needless to say that works of this size are quite unsuitable to the great majority of readers ; and it has been our object, by excluding articles and statements of little interest, to keep our work within reasonable limits, and to allow, at the same time, sufficient space for treating the more important articles at adequate length. It is also necessary to bear in mind, that this being a work intended for the especial use of Englishmen, we have dwelt at greatest length on the articles and details, we presumed most likely to interest them. Hence we have appropriated a much larger space to the description of our Eastern possessions, and of our colonies in different parts of the world, than they may appear, on other grounds, properly entitled to. On the same principle, we have lengthened the accounts of those countries and places with which our countrymen have the greatest intercourse, or which have acquired celebrity by the historical associations connected with them, and have proportionally shortened the others.

Still it may, perhaps, be supposed, that, however condensed, nothing like a really useful Geographical Dictionary can be compressed within the compass of two octavo volumes. And such, no doubt, would be the case were these volumes of the ordinary dimensions. But so far from this being the case, the quantity of letter-press contained in them is fully equal to three and a half times the quantity contained in the last edition of *Pinkerton's Geography*, in two large volumes quarto ! The type, though remarkably clear and distinct, might, perhaps, have been justly objected to as too small, had the work been of a consecutive description ; but, as it principally consists of rather short articles, the size of the type is of less consequence ; and any inconvenience resulting from its smallness is more than counter-vailed by the advantage of having a great deal brought into a volume.

Without neglecting the *physical* geography of the different countries and places, we have directed our principal attention to what has been called their *political* geography,—that is, their industry, institutions, and the condition of their inhabitants. Neither have we

* The first edition of this work was in 10 vols. folio.

attempted to confine ourselves within what might, perhaps, be called the limits of a strictly geographical and statistical work. Wherever the occasion seemed to justify it, we have not scrupled to commend and censure, as well as to describe; and have endeavoured to appreciate the influence of institutions and habits on national welfare. The historical notices are necessarily brief, and, unless in the more important articles, are mostly restricted to an enumeration of leading events.

Our object being to supply a work of easy reference to the public at large, we have, in general, given our notices of countries and places under the names by which they are commonly known in England. This plan does not involve any want of scientific precision; though if it did, the defect would be much more than compensated by its being better adapted for public use. There are not very many readers who would think of looking for Leghorn under *Livorno*, or for Munich under *München*; and among the many thousands who might wish to acquire some information respecting the present state of the Dead Sea, there are not, perhaps, as many dozens who would seek for it under the head *Bahr-el-Lout*, the Arabic name for that famous sea.

It did not enter into our plan systematically to notice countries or places as they existed in antiquity. But, wherever it was supposed that such notices would be likely to interest the general reader, we have not hesitated to introduce them. Our object, in fact, was not so much to compile a dictionary on strictly scientific principles, and that should be perfectly homogeneous in its parts, as to produce one that might be relied on, that should omit few articles of importance, and that ordinary readers should find generally instructive and interesting.

None can be more fully satisfied than we are of the extreme difficulty of accomplishing even this much. In a work embracing so great a variety of statements, many of them relating to matters in regard to which it is frequently all but impossible to acquire correct information, perfect accuracy need not be looked for. But we can honestly say that we have spared no pains to make our work worthy of the reader's confidence; and would fain hope that its errors are not such as sensibly to detract from its utility.

The Maps which accompany the work have been carefully compiled from the latest and best authorities, and are entitled to rank with the first of that class of publications. Those of Asia, of the Inland Navigation, Railways, &c. of Great Britain and Ireland, and of the British Possessions in North America, will be found to be particularly valuable.

To prevent misapprehension, it may be as well to add, that the distances between one place and another are always, unless where the contrary is stated, *direct*. They have mostly been measured on the best maps, or deduced from other good authorities.

A
DICTIONARY
GEOGRAPHICAL, STATISTICAL,
 AND
HISTORICAL.

A A.

A A, the name of some small rivers in France, Switzerland, the Netherlands, Hanover, Saxony, &c. The wide diffusion of the name seems to prove, as has been judiciously remarked, that it has some general signification applicable to all the rivers to which it belongs. Probably it may be derived from the Celtic *Ack* or *Ac*, water. There are, indeed, two small German rivers, one of which falls into the lake of Constance, and the other into the Rher, that are called Aach.

AALBORG, an old town of Denmark, cap. diocese and bailiwick, and the principal town in Jutland, situated about 17 m. from the sea, on the S. side of the channel of the Lynford, or great internal gulf, entering from the Cattegat, near a where it begins to expand into an extensive lake. Lat. $57^{\circ} 2' 32''$ N., long. $9^{\circ} 56' 41''$ E. Pop. 7,050. It is intersected by two small rivers, and surrounded by ditches; it is the seat of a bishopric, has a gymnasium or college, an episcopal library with 11,000 vols., a school of navigation, and an hospital and two workhouses. Exclusive of distilleries and breweries, it has manufactures of soap, fish-oil, fire-arms, refined sugar, leather, silk, &c., with a considerable amount of shipping and trade; principally exports corn, flour, fish, butter, spirits, &c. Formerly it was accessible to large vessels; but owing to the gradual filling up of the channel of the Lynford, it is now accessible only to the smaller class of merchantmen, or those not drawing more than 9 or 10 feet water.—(*Cathau, Tableau des Etats Danois*, tom. i. p. 88.) Aalborg means Keltown; a name derived from the immense number of reeds that are found in the waters in its vicinity.

AALËN, a town of Württemberg, circ. Jost, cap. bailiwick, formerly a free imperial city, on the Kocher, 42 m. E. Stuttgart. Pop. 2,400. It is surrounded by walls flanked with high towers; has manufactures of wool and cotton, and breweries. There are extensive forests in the environs, and iron mines.

AALSMEER, a village of Holland, E. side of the sea of Haarlem, 10 miles S.W. Amsterdam. Pop. 1,800.

AALËTEN, a village of the Netherlands, Guelderland, $\frac{7}{8}$ miles S.W. Groenlo. Pop. 3,830.

AAR, a river of Switzerland, the most considerable in that country after the Rhone and Rhine. Its principal sources are in the glaciers of the Schreckhorn and Grimsel mountains in Berne, near the source of the Rhone. Having united its different arms near Meyringen, it flows thence through the lakes of Brienz and Thun. Escaping from the latter, it takes a northerly direction till it reaches Berne; it then turns W. till having received its tributary, the Saane; it flows N.E. by Arberg, Solothure, Aarau, &c., till it unites with the Rhine, opposite to Waldshut. Its most important tributaries are, on the right, the Emme, Reuss, and Limmat; and on the left, the Saane, already noticed, and the Thiele. Its course is about 170 m. It becomes navigable on emerging from lake Thun. In the upper part of its course it dashes along with great fury, and is precipitated over several waterfalls. This also is the name of two small rivers in Waldeck.—(*Cox's Switzerland*, Letters 29, 30, &c.)

AARAU, or **ARAU**, a town of Switzerland, cap. cant. Aargau, on the Aar, 1,140 feet above the level of the sea, 23 m. S. E. Basle, lat. $47^{\circ} 29' 35''$ N., long. $6^{\circ} 2' 55''$ E. Pop. 3,100. It is well built, has a gymnasium, a school of art, a seminary or normal school for the instruction of teachers, a public or cantonal library, a society of national instruction, &c., with manufactures of silk and cotton, a cannon foundry, and bleach-works. The

AARONSBURGH.

peace, which terminated the civil war of 1712, was concluded here.

AARGAU, or **ARGOVIA**, one of the Swiss cantons, separated by the Rhine from Baden, having the canton of Zurich on the E., that of Lucern on the S., and Soleure and Basle on the W. Area 502 sq. m. Pop. (1836) 182,755, having increased from 144,093 in 1803. The mountains in this canton do not attain to any very great height, and it possesses a very considerable extent of fertile land. It is traversed by the Aar, whence it derives its name, and by its important tributaries the Reuss and Limmat. The country is well cultivated, and the produce of wheat and other grain exceeds the consumption; there are numerous vineyards, but the wine is inferior; with abundance of garden and orchard fruit. The rearing of cattle and sheep is not found to be productive, but they are advantageously fattened in the meadows, which are both extensive and excellent. Manufactures have made great progress. The principal is that of cotton, next to it is silk, and then follow linen, straw-plaiting, &c. Cottons are not woven by power-looms, but mostly in the cottages of the peasants, or small labouring farmers, as has been the case with linen in Ireland. But though this sort of double employment has hitherto afforded a considerable degree of security against the injurious influence of the vicissitudes incident to agriculture and manufactures, the presumption is that the rapid progress of mechanical improvements in other countries will force its abandonment, and that the Swiss will have to employ machinery in the weaving as well as in the spinning of cotton, or be compelled to abandon the former department. This canton is especially distinguished by the attention it has paid to education. Every district of 120 children must have at least one primary and one superior school. In every circle (*Bezirk*), the population being from 15,000 to 20,000, there are from 5 to 6 secondary schools. There is also in the capital a gymnasium, a school of arts, and a normal school for the instruction of teachers. The expense of the schools is defrayed partly by the communes and partly by the state funds. In the gymnasium and school of arts the state provides for the payment of 14 professors and their assistants. About 3-5ths of the population are Catholics and 2-5ths Protestants. The public revenue amounts to about 45,000 l. a-year; but as nearly the half is derived from state property, interest, &c., it is immediately seen that taxation is very light. The cantonal contingent to the diet is fixed at 2,410 men, and 52,212 Swiss fr. For an account of the government, see art. SWITZERLAND. Principal towns Aarau, Laufenberg, Baden, Zoffingen, &c.—(*Review on the Commerce of Switzerland*, p. 80.)

AARHUS, a sea-port town of Denmark, cap. diocese and bailiwick of the same name, on the E. coast of Jutland, lat. $56^{\circ} 9' 35''$ N., long. $10^{\circ} 14'$ E. Pop. 6,765. It is pretty well built, has a large cathedral founded in 1201, a lyceum, a museum of antiquities, and a valuable diocesan library. Its commerce and industry have increased considerably of late years. The exports consist principally of agricultural produce; with spirits and beer, the produce of its distilleries and breweries; and cloth and gloves. Considerable sums have recently been expended on the improvement of its port, which has been rendered one of the best in Jutland. Packets sail regularly between it and Calundberg, on the west coast of Zealand.

AARONSBURG, a small town of the United States. Centre Co., Pennsylvania.

AASZY, see *Chronicles* of Greek geographers, which see.
AATYL, a town or village of Syria, in the Hauran or Great Plain, extending S. from Damascus and E. from the mountains beyond Jordan, lat. 32° 15' N., long. 36° 35' E.; the inhabitants consist of Druses (see *Zababes and Syria*), of the number probably of 200 or 300. Though now insignificant, the remains of ancient grandeur in its vicinity prove that Atyl was once a place of importance. These remains occupy a circuit of a mile, and in many instances are inhabited by the present population. W. of the town a perfect arch of very fine workmanship, with broken pillars and friezes, marks the site of a small but elegant temple. On the S. another temple, almost entire, with a portico of four columns and an entrance beautifully and elaborately carved, has been converted into a private residence.

Atyl is 54 m. (direct distance) S. S. E. Damascus, and 44 m. E. Lake of Tabarja, the Genesareth of the Bible. — (*Robinson's Travels in Palestine and Syria*, vol. ii. pp. 155, 156.)

ABADEH, a town of Persia, prov. Fars. 115 m. N. Shiraz. Pop. 5,000. It is surrounded by walls in a state of decay; and is defended by a large square fort. now containing the whole population. It has suffered severely from the frequent contests for the Persian throne during the 18th century; but it is still environed by gardens, and sends fruit to Shiraz.

ABAKAN, a river of Siberia, an affluent of the Jenissei, which it joins, 16 miles S. Abakansk.

ABAKANSK, a town of Siberia, gov. Jenisseisk, on the Abakan near the Jenissei. The climate is mild; but it is notwithstanding a poor miserable place, and would be wholly unworthy notice were it not that on mount Isar, and other places in its environs, are found some of the most remarkable of those singular remains of former civilisation that are met with in many places of Southern Siberia. They consist principally of tumuli or mounds, which frequently contain ear-rings, bracelets, and other ornaments and utensils of gold, silver, and copper, with iron stirrups, &c. Near Abakansk are statues of men from 7 to 9 feet high, and covered with hieroglyphics, of which unfortunately no explanation has yet been given. — (*Mallet Brun*, *Bull.* ed. 1837, p. 806; *Gmelin*, *Voyage en Sibirie*, cap. 63, 61, &c.)

ABANCAY, cap. prov. of same name in Peru, 60 miles N. W. Cuzco.

ABANO or **ALBANO**, a village of Austrian Italy, prov. Padua, 10 m. S. W. Padua. Pop. 3,000. This village derives its entire celebrity from its hot springs and *minde*. It is situated near the Euganean hills, in a place marked with some low eminences, whence issue copious springs of water capable at their source of boiling an egg quite hard. The waters are partly employed to prepare and soften mud, partly to supply the baths, and partly go to waste, or turn a mill which revolves amid volumes of smoke. They are supposed to be efficacious in cases of palsy, rheumatism, and a variety of complaints. The mud is applied to the affected part, somewhat after the manner of taking a turface cast; and the baths are regarded principally as an auxiliary to the "dirty" application. The season is in the heat of summer; and, according to Mr. Rose, the accommodations for company are very deficient.

These baths were well known to, and much used by, the Romans. They were called *Patavinæ Aquæ*, the principal source being distinguished by the name of *Aponus Jons*, whence their modern name has evidently been derived.

— *Aponus terra ubi fuisse exiit.*

Lucan, vii. l. 191.

There is a very full account of these baths in *Rose's Letters on Northern Italy*, i. pp. 59–70.; see also *Cramer's Ancient Italy*, i. p. 123.

ABAZIA, a country in the region of Caucasus, in the Russian gov. of that name, which see.

ABB, a town of Arabia, in the Djeheil, or mountain land of Yemen, lat. 13° 55' N., long. 44° 15' E., 95 m. S. Sanaa, 73 m. N. E. Mocha, and 104 m. N. W. Aden. Number of houses said to be about 800, which at an average of 6 individuals to each gives a pop. of nearly 5,000. It is built on the summit of a mountain; is surrounded by a strong and well-built wall; and overlooks a well-watered (for Arabia) and extremely fertile country. Houses (as usual in the mountain towns of Yemen) of stone; streets well paved, which, in this country, is very uncommon. An aqueduct conveys water from a mountain at a little distance on the N. to a large reservoir in front of the principal mosque. — (*Niebuhr*, *Des. de l'Arab. pers.* ii. p. 208.)

ABBEVILLE, a thriving, industrious town, in the N. W. of France, dep. Somme, cap. arrond. on the navigable river of that name, 25 m. N. W. Amiens, lat. 50° 4' N., long. 1° 59' 53" E. Pop. 13,842. It is neat and well built; is regularly fortified on the system of Vauban; and has, exclusive of the old Gothic church of St. Vulfian, several public buildings worthy of notice

and a public library. A fine cloth manufactory was established here in 1669, by a Dutchman of the name of Van Robals, under the auspices of Colbert; and Abbeville has since continued to be distinguished as one of the most industrious towns in France. Besides black cloths of the best quality, with serges, barracans, &c., there are produced calicoes and stockings, sackings, neckerchiefs, curdage, jewellery, &c. It has also establishments for the spinning of wool, print works and bleaching works, tanneries, soap works, a glass work, a paper manufactory, &c. The tide rises in the Somme about 7 feet, and vessels of from 100 to 150 tons come up to town. Being situated in the centre of a fruitful country, and communicating by canals and roads with all the surrounding districts, Abbeville has a considerable commerce. — (*Hugo*, *France Pittoresque*, Dep. Somme.)

ABBATEGRASSO, a town of Venetian Lombardy, prov. Pavia, on the canal of Bereguardo, 14 m. W. S. W. Milan. Pop. 4,600. It is fortified; and its position has made it be always regarded of considerable importance in a military point of view.

ABB'S HEAD (ST.), a promontory on the E. coast of Scotland, being the most southerly point of the Frith of Forth, lat. 55° 51' 50" N., long. 2° 8' 20" W.

ABELA, **ABIL**, or **ABILA**, a town of Syria, in the Hauran, on the *Sherat-el-Moudhour* (anc. *Thiermar*), one of the largest affluents of the *Jordan*, lat. 34° 47' N., long. 36° E. It is now in a ruinous and dilapidated state, having probably not more than from 100 to 150 inhabitants; but formerly it was a place of considerable importance, being the capital of and giving its name to one of the six departments (*Ahilec*) into which the Romans divided the country E. of Jordan. Some broken pillars and overthrown columns evince its ancient grandeur; but none of its old buildings remain entire, and it is preserved from desertion only by its vicinity to the water, which renders it a desirable residence for the Arab families by whom it is still occupied. — (*Robinson*, *Travels in Palestine and Syria*, ii. 122, 214.)

ABENGAJA, a town of Spain, prov. La Mancha, 20 m. S. W. Ciudad Real.

ABER, a sea-port and village of Wales, Caernarvon, where there is a ferry to the island of Anglesea, 18 m. Conway. Pop. 532.

ABERBROTTHOCK, or **ABRBROTATL**, a sea-port and manufacturing town of Scotland, co. Angus or Forfar, at the mouth of the Brothock water, lat. 56° 34' N., long. 2° 35' W. Pop. of borough and parish in 1831, 13,795. Number of 102 houses in borough 1811. Parl. constituency in 1837, 415. Abroth unites with Biechin, Bervie, and Montrose, in returning a m. to H. of C. It has a parish church and two chapels of ease, with churches for Episcopians, Seceders, Methodists, and Independents. The other public buildings are the town-house, the trades-hall, the public schools, and the signal tower, which communicates with the Bell-Rock light-house, distant about 12 miles. The harbour is secure, though small, and of difficult entrance. The town, which is rapidly increasing, owes all its prosperity to the flax manufacture; nearly half the population being employed in the spinning, dressing, weaving, and bleaching of coarse linen goods. Some of the mills are driven by the little rivulet that intersects the town; but steam mills are numerous, both in the town and the vicinity. There are the ruins of an abbey, founded in honour of Thomas à Becket, in 1178, by William the Lion, king of Scotland, who, on his death in 1214 was interred within its precincts. It was destroyed in 1560.

ABERCONWAY, or **CONWAY**. See **CONWAY**.

ABERDEEN, a maritime co. Scotland, bounded N. and E. by the German Ocean, S. by the cos. of Perth, Forfar, and Kincardine, and W. by Banff, Elgin, and Inverness. Extreme length 86 m. from N. to S., and 42 from E. to W. Area 1,260,800 acres. In the south-western division, called the district of Mor, are some of the highest mountains of Scotland. Ben Machdu rises to the height of 4,327 feet above the level of the sea, being only 43 feet lower than Ben Nevis; and several of the other mountains are but little inferior in altitude. About a fifth part of the surface consists of high mountainous tracts; and these, with hills, extensive moors, moorlands, and waste lands, occupy nearly two thirds of the entire country. The arable land lies principally in the eastern parts. Principal rivers Dee and Don; and besides these are the Deveron, Bogle, Ythan, Urie, Ugie, &c. Limestone abounds in various places, there are quarries of excellent slate; and millstones are found of good quality. Vast quantities of granite are shipped at Aberdeen, particularly for London, where it is used in paving the streets. The mountains of Graemmar contain numbers of coloured crystals, or caligernia; and some real topazes have been met with. The winters are of the great extent of sea coast, are mild; but the summers are usually short and cold. Agriculture is prosecuted with much more spirit and success than might have been supposed. Oats is the principal crop, about 160,000 acres being supposed to be sown with that grain; barley is also

raised; and some, though only a little, wheat. The culture of turnips and potatoes is extensively carried on. Several thousand acres of land in the vicinity of Aberdeen have been trenched. The practice is not, however, confined to that district, and large additions are being constantly made to the arable land. Farm houses and offices are now, with few exceptions, comfortable and commodious. A greater number of cattle are bred in this than in any other Scotch county; the native breed is preferred. They have increased much in size during the last thirty years; and are said, indeed, to have doubled ~~the weight~~ since the introduction of turnips! They are commonly black, but there are many red or brindled. Sheep comparatively few, and of a mixed breed. There are some large estates, but property is, notwithstanding, a good deal subdivided. Great diversity in the size of farms. It is usual for mechanics to occupy an acre or two. The woods, which are very extensive, afford shelter to the red deer. Average rent of land 4s. an acre. The woollen, cotton, and linen manufactures are carried on to a considerable extent, principally at Aberdeen. There are considerable fisheries on the coast and in the rivers, particularly in the Dee. Principal towns Aberdeen, Peterhead, and Fraserburgh. Parishes 88. Pop. in 1831, 177,687; inhab. houses in do. 25,502. Returns one member to the H. of Commons. Parl. constituency in 1837, 3,046. Valued rental 235,665*l*. Scotch. Annual value of real property in 1815, 325,218*l*. sterling.

ABERDEEN, the capital of the above co., an ancient, distinguished, and flourishing royal borough, situated mostly on rising ground on the N. bank of the Dee, near its mouth; lat. (of Marischal College Observatory) 57° 8' 58" N., long. 2° 41' W. Pop. in 1821, 44,796; in 1831, 58,019. It acquired trade and importance at a very early period, and made a conspicuous appearance in many of the stormy scenes of Scottish history. The earliest preserved charter is one granted by king William the Lion, about 1179; and the journals of the magistrates and town council have been preserved very nearly entire since 1398. King Robert Bruce bestowed much property upon it: in the civil wars, during the reign of Charles I., it made a conspicuous figure, and suffered greatly. It remained in a nearly stationary state for about two centuries previously to 1750, when it began to increase. It has since been signally improved, especially during the present century, by the extension of its manufactures and trade, and the formation of many new streets, which have superseded many of its old narrow and winding thoroughfares. From the S. Aberdeen is approached by two bridges across the Dee; one of 7 arches of stone, first erected 1520-6, and rebuilt 1719-23; the other a suspension bridge of iron, opened in 1830. The roads from these bridges conduct to Union Street, which with Union Place, and Castle Street, in the same straight line, form a grand entrance of about a mile in length, the houses all of white granite, finely dressed: in one part this street crosses a deep and partly wooded ravine by a bridge of granite of one arch of 130 feet span, opened in 1804. Among the public buildings may be mentioned the assembly rooms, the town-house, court-house and new jail; the E. and W. churches of St. Nicholas; the N. church and others of late erection; St. Andrew's church of the Scottish Episcopalians; the barracks, placed on the castle hill, which in former times was the site of a fort; Gordon's hospital, the bridewell, theatre, infirmary, medical hall, and the new edifice of Marischal college. Besides the latter seminary, there are many public and private academies and schools, among which is the grammar school, established before 1418, the masters of which are appointed by comparative trial. The establishment of a regular post to Edinburgh dates from 1667; a printing press was set up in 1621, and the first almanacks published in Scotland commenced here in 1677. The number of charitable establishments and endowments is great;

upwards of 70 being under the management of the magistrates, of which the nett annual revenue, in 1838, was 3084*l*. 12s. 4d. Gordon's hospital supports and educates 140 boys, and has an annual revenue of about 3000*l*.; and there are besides an infirmary; a lunatic asylum erected a few years ago at an expense of upwards of 10,000*l*.; an institution for deaf and dumb persons; a large hospital for girls about to be opened, and one for the education and support of the blind. An assessment for the poor, after having been long postponed, commenced a few years since in the six parishes of the city and the adjoining one of Old Machar.

Aberdeen occupies a distinguished place in the manufactures and commerce as well as in the literature of Scotland. The town and adjoining country were, during the last century, distinguished for the manufacture of knit woollen stockings, which were exported to the Continent, but the late war, and the introduction of machinery, superseded this branch of industry. There are very large establishments for the spinning of cotton, flax, and wool, in most of which steam power is employed; great quantities of the wool of the country are made into carpets; the cotton manufacture, introduced in 1778, employs nearly 3,000 hands; that of flax about 4,000; in 1838, there were imported 1,220½ tons of cotton, 3,460 of flax, and 1,657½ of wool. Extensive iron works have been established where steam engines, anchors, chain-cables, and spinning machinery are produced. Ship-building is carried on to a considerable extent, and there are ropework and sail cloth manufactories: in the vicinity are paper mills, with tanneries, soap and candle works, distilleries of spirits, and brewhouses which export much porter. The natural productions exported are salmon, which is sent to London in ice, granite, of which the export in 1838 was 19,880 tons, eggs, butter, pork, corn, and live cattle, of which the number exported in 1838 by steam was 7001. The value of the exports coastwise and to foreign parts may be estimated at from a million and a half to two millions sterling; it is increasing steadily and rapidly. On the 1st of January, 1836, there belonged to the port 339 vessels, of the burden of 41,743 tons, navigated by 3,095 men. There is a constant communication by steam ships with London, Leith, Peterhead, Inverness, and the Orkneys. The amount of customs duties in 1835 was 45,134*l*. of postage in 1836, 9,230*l*. There is a canal to Inverury, 18½ m. in length, which conveys chiefly agricultural produce, manure, and coal. The harbour of Aberdeen has great natural capabilities, the Dee forming a considerable estuary; it has been in a train of improvement for the last 60 years. There being a bar at the mouth of the river, which sometimes shifts, great exertions have been made to remedy this defect, by the erection of a pier of about 1,500 feet in length, projecting into the ocean on the N. side of the river, by a breakwater on the opposite shore, and various subsidiary works. Still however the harbour is a tide one, only entered when there is sufficient water on the bar, which has 12 feet at neap, and 16 or 17 at spring tides. The bay affords safe anchorage with off-shore winds, but not with those from the E. A light-house has been erected on Girdle Ness, the S. point of the bay. In the interior of the harbour the quays have been greatly extended, the channel of the Dee confined by a massive embankment, and there is in progress the conversion of part of the tide estuary into a wet dock, of large dimensions. The revenue of the harbour, which

is managed by a board of trustees, was for the year 1837-8, 15,976*l.* 9*s.* 4*d.*; the ordinary expenditure 8,713*l.* 5*s.*; the expenditure on works in progress 9,226*l.* 5*s.* 10*d.* From 1810 to 1838 inclusive, there have been expended on the harbour 456,016*l.* 16*s.* 10*d.*, of which sum the interest of money borrowed amounted to 156,466*l.* 16*s.* 6*d.* From the great expenditure on new streets, and the harbour, the affairs of the burgh became involved in 1817, and a disfranchisement ensued, but no permanent loss was sustained, and for many years it has been in good credit. In 1838 the revenue was 17,507*l.* 10*s.* 6*d.*; the expenditure 16,611*l.* 5*s.* 8*d.*, of which about 7,500*l.* was for the interest of borrowed money. In 1832, the number of houses was 2,588, of which 1,289 were of the value of 10*l.* and upwards; since that year, Aberdeen returns one in. to the H. of C. being no longer associated with Arbroath, Brechin, Bervie, and Montrose. In 1837 the constituency was 2,539, having increased from 2,166 in 1834.

ABERDEEN (OLD), an ancient city, situated about a mile N. of Aberdeen, with which it is nearly connected by a village called Spital. In former times it was the seat of a bishoprick, the see of Mortlach having been removed to it in 1154. In 1498 it received a charter from James IV., under which are elected a provost and 18 other members; in 1715, it became disfranchised, and again in 1723. It is a small place consisting merely of a single street, has no trade, and very little property, its importance depending entirely upon its university. Population in 1831, 1483. The revenue in 1832 was about 43*l.* 5*s.*, the expenditure 14*l.* 6*s.* 6*d.*, and there was no debt, but a surplus. Seven trades are incorporated. The chief edifices are the college, cathedral, and bridges across the Don, near which the place is situated. The buildings of King's College have an antique appearance, and are of different periods; from recent additions and alterations they are in good repair, about 6,000*l.* having been expended upon them. The library and chapel are attached to a lofty square tower, surmounted by an imperial crown of open stone work. The cathedral of St. Machar, or Macarius, after whom the parish is named, is an ancient Gothic edifice, chiefly of granite, commenced in the 14th century; the choir, transept, and great central tower have been demolished or fallen down upwards of a century ago; the nave remains, and is used as the parish church; at the west end are two finely proportioned stone spires; the roof of the interior also presents a curious relic. Near its mouth the Don forms a small haven, which does not admit any vessels but of a few tons' burden; a little above is the ancient bridge, erected by King Robert Bruce, of one Gothic arch, 70 feet in span, crossing a rocky and woody ravine in which the river flows; between it and the sea is a new bridge of 5 arches, opened in 1830, the expense of which was defrayed from the funds of the old and less convenient structure.

The Universities of Aberdeen are two in number, in each of which one college has been founded. The most ancient is that of Old Aberdeen, founded by Bishop William Elphinston in 1494, under a papal bull of Pope Alexander VI.; its buildings have been noticed above. It early received the name of King's College, instead of that of the Virgin Mary, to whom it was originally dedicated. The other and later seminary was established in 1593, and is called Marischal College, from its founder George Keith, Earl Marischal. King's College has a principal, sub-principal, and 9 professorships. A sum of about 1770*l.* arising from charitable foundations, is annually distributed

in different proportions among 134 students, who are called bursars. Marischal College has a principal, 10 professors, and 2 lecturers on humanity and Scots law; in it are also taught medical classes, by 5 lecturers, appointed by both colleges. About 1,200*l.* is appropriated to bursaries, distributed in various amounts among 107 students. The attendance of students at each college is about equal; those of divinity hear prelections in both, the distance between them being a few yards more than a mile. In session 1837-8, the aggregate number of students in arts, divinity, law, and medicine, was about 700. Both universities have chancellors and rectors and exercise their powers independently of each other; various efforts have been made to unite them into one establishment, but as yet without success. Although their bursaries are numerous, their other revenues are very small. Formerly the university of Aberdeen was entitled to copies of all works entered at Stationers' Hall; but in 1836 they relinquished the privilege for an annual payment of 242*l.* 14*s.* At present their libraries are exceedingly defective; in Marischal College there is a small museum, an observatory, and an extensive apparatus for teaching natural philosophy. The education given in these seminaries has been highly useful in disseminating knowledge over the N. of Scotland, and raising its intellectual state; particularly in improving the character of the parochial schoolmasters, who having been all at college, are superior to many of their brethren in the southern parts of the country. The cheapness of the education, and the number of bursaries, most of which are given by comparative trial, are inducements to attend; the fees paid by a student who is not a bursar do not amount to more than about 6*l.* yearly, on the average of 4 years' study in the curriculum of arts; and respectable board may be obtained for about 25*l.* or 30*l.* during the session which commences in the last Monday of October, and ends at the beginning of April, without vacations. Many eminent men have been professors in these universities; among whom may be mentioned Dr. Reid, the author of the Inquiry into the Human Mind; Dr. Gerard; Principal Campbell, author of the Philosophy of Rhetoric, and the new Translation of the Gospels; Dr. Beattie, the bard of the Minstrel; and Dr. Hamilton, author of the celebrated Essay on the National Debt. The new buildings now raising for Marischal College, in order to replace very ineffective and ruinous ones, are on an extensive and elegant plan; government, through the agency of Mr. Bannerman, M. P. for the city, granted 15,000*l.* towards their erection, and 7,500*l.* have been raised by subscription among the alumni and friends of the establishment. It is expected that their completion will lead the way to such additions to the university, and such improvements in teaching science and philosophy as will materially conduce to the benefit of this part of the Empire. (We are indebted for these valuable articles to a gentleman of distinction in Aberdeen.)

ABERDUR, a parish and village of Scotland, in Fifeshire, on the N. shore of the Frith of Forth, 10 m. N.W. Edinburgh. Pop. 1751.

ABERFOYLE, in Scotland, a parish, and a celebrated pass or narrow valley leading into the Highlands, in the district of Monteth, in the S.W. part of Perthshire. The village or clachan of Aberfoyle in this pass is the scene of some of the most interesting adventures in the novel of *Rob Roy*. Pop. of parish 660.

ABERGAVENNY, a town of England, co. Monmouth, at the confluence of the Gavenny with the Usk, 14 m. S. W. Monmouth, 120 m. W. by N. London. Pop. of parish 4,230. It is built in a straggling manner; has a fine bridge of 15 arches over the Usk, and some branches of the woollen manufacture. There are very extensive

iron works in the vicinity. On an eminence, near the S. end of the town, are the ruins of its ancient castle.

ABERGELEY, a sea-port and m. town of Wales, co. Denbigh, hund. Idwalas, considerably resorted to of late years for bathing.

ABERNETHY, a parish of Scotland, partly in Fife and partly in Perthshire. It was once the seat of an archiepiscopal see, removed to St. Andrew's in the ninth century. All that now remains of its ancient structures is a round tower 75 feet high, and 16 in diameter. The modern village of Abernethy is small, and the houses mean. Pop. of parish, 1776.

ABERYSTWYTH, a sea-port town of Wales, co. Cardigan, at the mouth of the Ystwith, over which is a neat bridge, 178 m. W. N. W. London. Pop. 4,128. It stands on an eminence overlooking the bay; and the streets, though well paved and Macadamised, are steep and uneven. It is a place of considerable trade, exporting lead, calamine, oak bark, fannels, &c., mostly to Liverpool; but owing to the shallowness of the water, it is accessible only to small vessels. As there is no market town within 18 m. it has the supply of a considerable adjacent territory. Latterly it has been extensively resorted to in summer for sea-bathing. Public rooms were opened for the accommodation of visitors in 1830, and a new theatre in 1839. It seems to have been once strongly fortified. Its castle, of which some vestiges still exist, was rebuilt by Edward I. in 1277. A considerable extent of fen land to the N. of the town has recently been recovered from the sea.—(*Municipal Boundary Reports, &c.*)

ABERYSTWYTH, a parochial chapelry, hund. Aber-gavenny, co. Monmouth, celebrated for its collieries and iron works, which have greatly increased during the last 20 years.

ABIAD (BAHR EL). See NILE.

ABINGDON, an ancient town of England, co. Berks, at the confluence of the Ock with the Isis, and at the junction of the Berkshire canal with the latter, 554 m. W. N. W. London. Pop. 5,259. It has several well-paved streets terminating in a spacious market-place, having a market-house in the centre. It has two churches, with places of worship for Dissenters, a well-endowed grammar school, and sundry almshouses and charitable endowments. It has a considerable corn market: some trade is carried on in malting, hemp-dressing, &c. During the late war a good deal of business was done in the manufacture of canvass, sackings, and such like coarse articles, but since the peace this employment has materially diminished. It returns one m. to the H. of Commons. No of houses in 1831, 1,114, of which 451 were estimated at 100 a year and upwards. Constituency in 1836, 22. This was formerly a scat and lot borough; every inhabitant assessed to the poor rates exercising the elective franchise.—(*Boundary Reports, l. p. 27.*)

ALO, the ancient capital of Finland, near the extremity of the promontory formed by the gulfs of Bothnia and Finland, on the river Aurajoki, by which it is intersected, lat. 60° 20' 58" N., long. 22° 17' 15" E. It was the seat of a university, and has a considerable trade. But in 1827 it suffered severely from a fire, which destroyed the university and about 700 private houses. The university has been since removed to Helsingfors, now the capital of the province. Previously to the fire the town contained about 13,000 inhabitants. It has a gymnasium, a bank, and some unimportant manufactures. A treaty was concluded here in 1743 between Russia and Sweden.

ABOMEY, cap. of the kingdom of Dahomey, in Africa, nearly 100 m. N. from the sea, lat. 7° 30' N. long. 2° 17' E. Pop. said to be 24,000.

ABOUKIR, a village of Egypt, with a citadel, on a promontory, about 10 m. N. E. of Alexandria, being supposed by some to occupy the site of the ancient Canopus, lat. 31° 19' 44" N. long. 30° 27' 10" E.

ABOUKIR BAY, the north coast of Egypt, formed on the west side by the point of land on which Aboukir is situated, and on the east by that which lies at the mouth of the Rosetta branch of the Nile. Here, on the 1st of August, 1798, was fought the famous battle of the Nile, when the French fleet that had conveyed Napoleon to Egypt was totally defeated by the British fleet under Lord Nelson; and here also, on the 7th of March, 1801, the English army, under Sir Ralph Abercromby, effected its disembarkation.

ABOUSAMBUL. See ISPAHABUL.

ABRANTES, a fortified town of Portugal, prov. Estremadura, lat. 39° 26' N., long. 8° 18' W., at the S. extremity of a ridge that trends S. W. from the great range dividing the valleys of the Douro and Tagus. Pop. 4,514. Its position admits it admirably for a military station; and Sir A. Wellesley availed himself of its local advantages by residing there the progress of the French in 1809. (See Napier, ii. 317. &c.) It is about 4 m. from the right bank of the Tagus and 72 m. above Lisbon. The hill-side on which the town is built, as well as the hills about, bear vines, olive, peach, and other fruit trees, while the plain eastward produces pumpkins, water-melons, and other vegetables: all these products are

carried down the river in barges to the capital, with which this town has very considerable traffic. The trade, now occupying above 100 barges, would be much increased if the navigation were improved. A few small craft go 24 m. higher, as far as Villabella; but the stream is rapid, and the bed much impeded with sand and rocks. The church of San Vincente is the largest and finest in Portugal.—(*Milano, Napier.*)

ABRUZZO, an extensive territory of Italy, forming the N. E. portion of the Neapolitan dominions, between 41° 50' and 42° 55' N. lat.; bounded E. (a distance of about 80m.) by the Adriatic, N. and W. by the Papal dominions, and S. by other provinces of Naples. It is divided into the provs. of Abruzzo Ultra I., Abruzzo Citra, and Abruzzo Ultra II., so called from their position with respect to Naples. The first two, lying along the Adriatic, are divided by the Pescara, and occupy the whole country to the E. of Monte Carnio and Monte Prata. Abruzzo Ultra II. is an interior prov., and comprises the whole country included between the others and the Papal states. Their extent, population, and revenue, ordinary and extraordinary, in 1831, were as follows:—

	Area.	Population.			Revenue.	
	Sq. m.	Males.	Fe- males.	Total.	Duc.	Grani
Abruzzo Ultra I.	976	91,576	96,010	190,916	107,971	60
Abruzzo Citra	1,088	133,071	132,100	265,474	207,779	37
Abruzzo Ultra II.	1,908	110,472	158,669	279,511	217,555	32
Total.	3,972	308,822	567,109	735,931	533,506	19

The country presents every variety of soil and surface; but the greater part is mountainous, rugged, and occupied by extensive forests. It is traversed throughout its whole extent by the Apennines, and has some of their highest summits. Monte Corno, surnamed *Il Gran Sasso*, or the Great Rock, rises to the height of 9,527 feet above the level of the sea, Monte Majella to about 8,500, and Monte Vellino to 8,397. It is watered by many rivers, most of which fall into the Adriatic, and in Abruzzo Ultra II. is the celebrated Lago Celano, the *Lacus Fucinus* of the ancients (see CELANO, LAKE OF). The climate differs with the elevation of the soil; but though very cold on the mountains, and comparatively hot in the low grounds, it is, speaking generally, temperate and healthy. Along the Adriatic, and in the valleys and plains, the soil is very productive; and large quantities of corn, oil, wine, silk, liquorice, almonds, &c., are produced. Saffron used to be very extensively cultivated in the valley of Aquila, but the quantity raised is now very much restricted. The inhabitants of the mountainous districts are principally engaged in the rearing of sheep and cattle. The upper regions and recesses of the mountains, which cover by far the larger portion of Abruzzo Ultra II., are depastured in the summer season by vast flocks of sheep, brought from the Capitanata and other level provinces more to the S. Their migrations are regulated by law, and are similar to those that take place in Spain and in the S. E. depts. of France. The migratory sheep are supposed to amount, at present, to between 500,000 and 600,000, having been formerly much more considerable. The inhabitants are stout, well-made, healthy, and industrious. The occupiers and labourers, who form the vast majority of the population, are mostly poor, living in miserable dirty huts, feeding principally on Indian corn, and drinking a poor wine. Many thousands of the peasants emigrate every autumn to seek for employment in the Roman and Tuscan Maremma. Manufactures have made but little progress; but s. collens, silks, earthenware, &c., are produced. An extensive contraband trade is carried on with the Papal dominions; and the coasting and foreign trade would be much more extensive than it is, were it not that the entire coast is without a single good port. Principal towns Chieti, Aquila, Teramo, Sulmona, Avezzano, &c. (See the 2nd vol of the *Descrizione Topografica, Fisica, &c. del Regno delle Due Sicilie*, Napoli, 1835, which is entirely occupied by an account of the Abruzzi: see also Mr. Keppel Craven's *Excursions in the Abruzzi*, 2 vols. Lond. 1838; and Sir R. C. Hoare's *Classical Tour*, &c. 1819.)

ABU-ARISCH. A petty state in the S. W. of Arabia, on the borders of the Red Sea, between 18° 50' and 17° 40' N. lat. and 41° 30' and 43° E. long., consisting of the narrow strip of low land which lies between the coast and the mountain district of Haschid-u-Bekl. On the N. it is separated from Fi-Hedjaz by a small district inhabited by wandering tribes of peculiar manners; and on the S. it borders upon the state of Lochia. Its extreme length is about 130 m., and its greatest width from 70 to 80 m. It forms part of the Tchama or low lands of Yemen, being almost wholly a sandy plain (see ARABIA), extremely hot and dry, destitute of permanent

* These are Italian sq. m. 60 to the degree, and are equivalent to 5,270 Eng. sq. m. 69.15 to the degree.

water courses, and preserved from utter sterility only by the abundant rains in the neighbouring mountains, which periodically inundate its otherwise waterless soil. Its principal products are dhourah or barley, which forms the principal food of the inhabitants, and a peculiar and highly esteemed breed of asses.

ABU-ARISH, a town of Arabia, cap. of the above state, and the residence of the sheriff, lat. $16^{\circ}40'$ N., long. $42^{\circ}20'$ E. It occupies the centre of the principality, being midway between the Red Sea and the mountains, and between its N. and S. boundaries. It is walled; and though its population be not certainly known, it may be safely estimated at from 4,000 to 5,000. In 1809 its strength and resources deterred the Wahabees from attempting its capture, after the battle in which they defeated the sheriff. Some rocky hills in the neighbourhood yield salt, which is exported.

It seems probable that Abu-Arish, which at present is 24 m. from the sea, was formerly much nearer to it, if, indeed, it were not once what Gheran now is, the port of this part of Arabia. This is rendered probable as well from the appearance of the surrounding country as from the well-known fact mentioned by Niebuhr, that the coast here is constantly and rapidly gaining on the water. — (*Niebuhr, Des. d'Ar.* par. fi. p. 232; *Fog. en Ar.* li. 59.)

ABURY. (See ABAURY.)

ABUTIGE, a considerable town of upper Egypt, on the site of the ancient Abotis, lat. $27^{\circ}2'$ N., long. $31^{\circ}23'$ E. It is the seat of a Coptic bishop, and is celebrated for its opium.

ABYDOS, an ancient city, founded by the Thracians, and subsequently occupied by a colony of Milesians, on the Asiatic side of the Hellespont, where it is narrowest, bearing nearly S. from Sestos on the European side of the strait. It had a commodious harbour, and was strongly fortified. It was here that Xerxes constructed the bridge of boats by which he conveyed his vast host across the Hellespont; and it is distinguished in ancient history for the desperate resistance made by its inhabitants to Philip of Macedon, who, however, partly by force and partly by treachery, succeeded in taking it. But Abydos, and also Sestos, are mainly indebted for their imperishable celebrity to the story of the loves of Hero and Leander, and the melancholy fate of the latter. *Abydos magni quondam amoris commercio insignis est.* (*Amm. Marcellinus*, lib. i. s. 19.) It was destroyed by the Turks; and the fact that the materials were carried 3 m. S. to assist in building the *Sultanie Kalesi*, or old castle of Asia, the strongest fort on the Dardanelles, and its contiguous town, accounts for few ruins being found at Abydos. The modern fort of Nagara occupies its site. — (*Mannert, Géographie, Tournefort, Voyage du Levant*, &c.)

ABYSSINIA, an extensive country of Eastern Africa, of which the boundaries are not well defined, but which may be regarded as occupying the space included between 9° and $16^{\circ}40'$ N. lat. and 30° E. long. and the Red Sea; having E. the latter, N. Senaar and Nubia, and on the W. and S. Senaar, Kordofan, and other barbarous and nearly unknown countries. It is supposed to include in all above 300,000 Eng. sq. m.

Name. — Abyssinia was included in the Ethiopia (from which, *a men born by the sun, or of a dark colour*) of the ancients. The name Abyssina, or more properly Habessina, from the Arabic *Habesch*, signifying a mixture or confusion, has been given to the country by the Arabic and Portuguese geographers, and indicates the supposed Arabic origin of the people, and their subsequent intermixture with the Africans. The Abyssinians do not use this name; and either assume that of the provinces in which they live, or call themselves *Ijopians*, and their country *Mancheta Ijopia*, or kingdom of Ethiopia, a name given it by the Greeks during their ascendancy at Axum.

Face of the Country. — Abyssinia presents great inequalities of surface. It consists principally of a series of plateaus, intersected and separated by mountain ridges. Rifter classes the plateaus under three great divisions. Setting out from the coast of the Red Sea, and traversing the low arid ground by which it is bordered, and ascending the heights or mountains of Taranta, we arrive at the first plateau, or country of the Baharnegash, lying between the Taranta on the E. and the River Mareb on the W. Passing through the Baharnegash and making another ascent, we arrive at the great plateau of Tigré, between the Mareb on the E. and the Tacaze on the W.; but including to the south the mountain regions of Enderata, Woljerat, Lasta, &c. The last-mentioned country contains the sources of the Tacaze, one of the principal affluents of the Nile. The towns of Adowah and the ancient Axum (see the names), are situated in the middle of the plateau of Tigré. Antalou lies more to the south, in the province of Enderata. The mountains of Samen, on the W. side of the plateau of Tigré, are the highest in Abyssinia, and form, with those of Lamalmon and Lasta, a great but not continuous chain, running N. E. and S. W., and separating the high lands of Tigré, from the still more elevated plateau or alpine country of the Habesch or Amhara, in-

ABYSSINIA.

cluding the provinces or countries of Dembea, Gojam, Damot, &c. This region, the highest in Abyssinia, and the nucleus and centre, as it were, of the old empire, contains the sources of the Bahr-el-Azrek, or eastern arm of the Nile, and the great lake of Tzana or Dembea. It has a mean elevation of about 8,000 feet, and is fenced and intersected by mountain ridges, of which those of Gojam, from their containing the sources of the E. Nile, are the most celebrated. Gondar, the capital of Amhara, and formerly the residence of the Negus or emperor of Abyssinia, lies a little to the N. of the lake. From this plateau the country shelves down on the W. to the barbarous and unknown regions already alluded to.

The provinces of Efat and Schoa, which now form, with their dependent territories, the most powerful of the Abyssinian states, lie to the S. E. and S. of Amhara. The first is very elevated, part of its waters flowing westward to the Nile, and part eastward to the Hawash. Its chief town is Ankober. The province of Schoa, lying along the southern side of the Nile, is comparatively low, and is renowned for its magnificent pastures and fruitful valleys. It has several towns and some celebrated monasteries. Salt is inclined to think that the Ethiopian language and literature, and the ancient manners of the Abyssinians, are preserved in a purer state in these provinces than in any of the others; but they are very imperfectly known.

Exclusive of the above, there is a vast and but little known country in the S. E. part of Abyssinia, between Efat and Lasta, and the Red Sea and the sea of Bab-el-mandeb. It is almost entirely occupied by tribes of Galla, some of them the most brutified of any to be found in Abyssinia. The country of Nana, at the sources of the Maleg, S. W. from the prov. of Damot, is one of the most elevated of the African plateaus. Its inhabitants are said to be nearly as white as the Spaniards and Neapolitans.

On the S. E. of Tigré, between it and the low country or province of the Dankal, lying along the Red Sea, and between the fourteenth and fifteenth degrees of latitude, is an extensive salt plain, having, in most parts, the appearance of ice covered with partially thawed snow. The salt is perfectly pure and hard for about two feet deep; but that lying beneath is coarser and softer till purified by exposure to the air. It is cut into pieces with a hatchet; and not only serves to season and preserve food, but even circulates as money. The salt is carried off by caravans, or companies, consisting of from 300 to 600 beasts of burden, and its digging is not unaccompanied by danger from the attacks of the savage Galla.

Mountains. — Those of Abyssinia have not been accurately measured. They were represented by the early Portuguese travellers and the Jesuits as being of such vast height that, compared with them, the Alps and Pyrenees were mere hillocks! But these exaggerated representations have been since reduced to their proper value. Bruce states, that during his residence he saw no snow in any part of the country, and he even affirms that it is there totally unknown. This, however, was a rash and unwarrantable assertion. It is doubtful, indeed, whether snow be not always to be found on the highest summits and crevices of the mountains of Samen; at all events, Mr. Pearce was overtaken by a snow storm when passing them in the middle of October, and Mr. Salt saw snow on them from a great distance on the 8th of May. It is clear, therefore, that if the highest summits of the Samen do not attain, they approach closely to the line of perpetual congelation, so that their elevation may be fairly estimated at from 12,000 to 13,000 feet. The mountains of Gojam are of very inferior altitude, and are cultivated to the summits. Generally the Abyssinian mountains have a peculiarly abrupt and precipitous appearance. Sometimes they form what are called *amoras* or hill forts, consisting of steep, rocky, and inaccessible sides, having on the summit a level surface covered with trees and verdure. The most celebrated of these hill forts is that of Ambu Geshm, formerly used as a place of confinement for the princes of Abyssinia.

Rivers. — Of these the Bahr-el-Azrek, Blue River, or eastern branch of the Nile, is by far the most famous. It rises from two mountains near Geesh in Gojam, being, according to Bruce, in lat. $10^{\circ}59'25''$ N., long. $36^{\circ}55'30''$ E., and at an elevation of 10,000 feet above the level of the sea. Its course is thence N. to the lake Dembea, a large sheet of water, which receives many other streams; but the Nile is said to preserve its waters with but little intermixture with those of the lake, across which its current is always visible. Escaping from this lake it sweeps in a southerly direction round the E. frontier of the provinces of Gojam and Damot, till, between the ninth and tenth degree lat., it takes a N. W. direction, which it preserves till, at Halfala, near the sixteenth degree lat., it unites with its other and more important branch, the Bahr-el-Abiad, or White River, flowing from the S. W. (see NILE). The next most important stream is the Tacaze, whose source has been already noticed. It drains the mountains of Samen and Tigré; and pursuing a pretty direct N. N. W. course through Senaar,

falls into the Nile near the eighteenth degree lat. The Mareb, which rises in the heights of Taranta, runs nearly parallel to the Tacazeze. In the dry season it loses itself in the sand; but Bruce says that in the rainy season it continues its course till it unites with the Tacazeze. The Hamazo and Hawash run E. in the direction of the Red Sea; but the latter is swallowed up in the sands before meeting it. Exclusive of the great lake of Dembea or Tsana, already referred to, the lake of Ashangee, on the E. side of the Samen, is also of very considerable size.

Minerology.—This is very imperfectly known. Granite and schistus or slate seem to have been extensively observed; and it is probable that these primitive rocks occupy a large portion of the principal chains. In Tigré, the strata are chiefly vertical; but in the mountains of Samen they incline more to a horizontal position. They seem remarkably destitute of metals; the gold which passes through Abyssinia is brought from the barbarous countries on the S. and W.

Climate.—This necessarily differs with the elevation of the country, the direction of the mountains, &c. In the deep valleys and low grounds (*kollas*) the heats are frequently excessive; and this, combined with excess of moisture, renders them unhealthy. But the climate of the plateaus is extremely fine, particularly that of Amhara, which is said to enjoy a perpetual spring, *ver æternum*. The Portuguese found it quite as temperate as that of their own country. According to Ludolph, the natives often attain, in that happy climate, to the age of 100 years and upwards! The climate of Tigré is not quite so mild; but there, also, the great extent of pasturage and of verdant plains shows that the country is not visited by the extreme of heat. The plateau of the Baharnegash is the hottest. In March, Mr. Salt found its air hot and dry, and the beds of the rivers without water. The year is sometimes divided into four, but more properly into three, seasons. Winter (*kramt*) is the season of rain, which always falls in great quantities, and often with much violence, rendering rivers and even brooks quite impassable. Harvest (*izdan*) follows winter; the rest of the year consisting of summer (*haqai*) or the season of heat and drought.

Race.—*Paganism.*—The inhabitants of Abyssinia comprise a variety of tribes. They all, however, closely resemble each other in their physical character and manners; and, in respect of bodily conformation, are entirely distinct both from the Negroes and the Arabians. They belong to what has been called the Ethiopic variety of the human race; and their most prominent characteristics will be found described in the article *Africa*, to which the reader is referred. Of the different tribes, the principal are the Tigrai, or inhabitants of Tigré; the Amharans, or inhabitants of Amhara; the Agows, inhabiting the province of Damot; the Liats, occupying the southern banks of the Nile; the Gougas and Iancous, still further S.; and the Falashas, occupying the mountains of Samen, &c., who profess Judaism, and pretend, though it is believed on no very good grounds, to deduce their origin from Palestine. These tribes are easily distinguished by their language; but it is not clear whether their idioms be really distinct languages, or, which is most probable, only dialectic varieties of a much smaller number of mother-tongues. — (*Prichard on Man*, vol. ii. p. 136. 3d ed.)

The Galla, or savage tribes by which large portions of Abyssinia have been overrun, are said to have made their first appearance on the southern frontier in 1537. No doubt they belonged originally to the central parts of the African continent. They have a brown complexion, with long black hair; and their tribes are all independent of, and often at war with, each other. Most of them have adopted the Mohammedan faith, and have partially conformed to the manners of the Abyssinians. They are still, however, distinguished by their greater ferocity. In proof of this, it is sufficient to mention that the young men are denied certain privileges, and are, in fact, contemned by the women, as well as their seniors of the same sex, till they have given proof of their manhood by killing an enemy.

No means exist by which to form any probable estimate of the number of people in Abyssinia. Mr. Salt could obtain no accurate information on the subject. If the country were tranquil, it could hardly fail, owing to the fruitfulness of the soil and the general healthiness of the climate, to be exceedingly populous; but the anarchy and civil war in which it is constantly involved more than neutralise these advantages, and keep the population far below its natural level. Its total amount is estimated, in the *Welmar Almanack*, at 4,500,000; and this, perhaps, is as good a guess as can be made.

Language.—The Gheez, or Ethiopic, a language akin to the Arabic and Hebrew, was the language of Axum, and of the subjects of the Axumite sovereign, at the era of their conversion to Christianity in the 4th century. It is now extant only as a dead language, consecrated to literature and religious uses. The Amharic, or modern Abyssinian, is not a dialect of the Gheez, though it has

adopted from it a great number of words, but a totally distinct language. It is probably an ancient African language, and the original idiom of the inhabitants of the south-eastern provinces of Abyssinia. As regards literature and learning, the Abyssinians are at the lowest ebb. Their clergy are ignorant, and have no taste for learning. Mr. Gobat thinks that in the country where Amharic is spoken about 1-5th part of the male population can read a little, and in Tigré about 1-12th part.

Productions.—The country is very fertile, and has a vast variety of products; among which are wheat, barley, millet, and other grain. On the high grounds wheat is raised in considerable quantities; but in the low grounds the heat is too strong for it. Barley (*dhourra*) is raised in large quantities; but the principal dependence of the country is on the *teff* (*Poa Abyssinica*), which grows on every soil, except the very lowest, and affords the bread in general use. The plant is herbaceous. From a number of weak leaves rises a stalk about 28 inches in length, and not much thicker than that of a carnation. Out of the top spring a number of branches, which contain the seed or fruit inclosed in a species of capsula. The grains are not larger than the head of the smallest pin, yet so numerous as to constitute on the whole a bulky crop. But the lowest grounds (*kolla*) are unfit even for the production of *teff*; and on these is raised a species of corn called *locuaso*, which yields a black bread, the food of the lowest classes. There are at least two harvests in the year; and in the same place may at once be seen in progress the operations of ploughing and reaping, with corn at every different stage of advancement. Among the other vegetable products are cotton, of which clothes are usually made; *sema*, myrrh, &c. The stalk of the *enete*, a species of palm, the banana of Abyssinia, is said, when stripped of its green covering, to be the very best of all vegetable food. It is found in great abundance. Various species of figs, some of them of a very large size, as the *Ficus sycomorus*, are also very plentiful. Citrons, oranges, and sugar-canes are met with in the low grounds, but not on the elevated plateaus. Dates and vines are met with, but neither are supposed to be indigenous; both are believed to have been imported and cultivated by the Portuguese. At present the vine is grown only in the district of Enfras, on the E. side of lake Dembea, where it produces magnificent grapes. The Abyssinians do not use wine except for the communion table. Tellez says expressly, that in his time the vine was unknown in Abyssinia. The *papyrus*, so celebrated for its furnishing the principal species of paper used by the ancients, is abundant in the lakes and rivers; and Bruce contends that it was thence transplanted to Egypt.

The domestic animals of Abyssinia do not differ materially from those of Europe. The horses, which are the principal wealth of the inhabitants of the plateaus, are strong and active. They are used in war and the chase, mules and asses being used principally as beasts of draught and burden. Oxen are very abundant. The most remarkable species is a native of the low grounds, and has horns of an enormous magnitude. Mr. Salt having seen one 4 feet long, and 21 inches round at the base. It is called the Galla ox, from its having been brought to Tigré by the Galla. Of the wild animals, the most numerous and characteristic is the hyæna, called here the *ubabab*, exceedingly fierce and unamenable. In most parts of the country they are found in vast numbers, place travellers in continual danger, and even enter houses. They are not naturally gregarious, yet sometimes assemble in vast troops, attracted by some common object, particularly the scent of dead bodies, which, according to the barbarous custom of the country, are often left unburied. Bruce contradicts the common report of their digging into sepulchres. They are protected by the superstitious belief of the people, who regard them as a species of enchanted men. The elephant and rhinoceros are numerous in the low grounds, and in places full of moisture. They are hunted by the Shan-galla, who use their teeth as an article of commerce, and feed upon their flesh. It is a mistake to suppose that any of them have ever been tamed in this country, or, indeed, in any part of Africa. There is a species of rhinoceros with two horns, found only in a few districts. Its horns have no connection with the bone; its skin, which has no folds, is used for shields; the horns for handles for swords, and also as a lining to drinking vessels. The antelope species, which is very numerous, is seldom found in the cultivated districts, but chiefly appears on broken ground near the rivers. The buffalo, domesticated in Egypt and elsewhere, is here one of the most ferocious of animals; he lodges himself in deep and sultry valleys, under the shade of the tallest trees, and near the largest and clearest rivers. The hippopotamus, called *gomari* by the natives, is abundant in the lake of Dembea; but Ludolf affirms that this lake contains no crocodiles. They are both, however, found in the deep pools of the Nile, Tacazeze, and other rivers. The crocodiles in the latter are of an enormous size, of

a greenish colour, and are more dreaded by the natives than the hippopotamus. The torpido is found in the rivers and lakes. The lion is found only occasionally. There are several species of leopard. The zebra is frequent in the southern provinces, where its mane adorns the collars of the war horses. A small animal, the jerboa, about the size of a rat, burrows in the fields, both here and in Barbary.

The feathered creation in Abyssinia bears more than its usual proportion to the other species. The vast profusion of insects, grains, and plants, even the waste and destruction attending continual wars, afford them an abundant supply of food. The nlsier, or golden eagle, perhaps the largest bird of the old continent, and a beautiful species called the black eagle, are particularly noticed by Bruce. To these Salt adds a new species called goodie-goodie, the size of the common falcon. Storks, partridges, snipes, pigeons, and swallows, occur in great number and variety. Bruce never saw a woodcock, sparrow, magpie, or bat; and ostriches are not found in Abyssinia Proper.

Among insects the most numerous and useful are bees. Honey constitutes every where an important article of food. Several provinces used to pay a large proportion of their tribute in this article. The honey assumes different appearances, sometimes black, sometimes blood-red, according to the plant on which the insect feeds. Of a very different character is the locust, which commits here ravages quite as terrible as in the other countries of Northern Africa. It sometimes depopulates whole provinces. In the Subilin language of a prophet, "A fire devoured *before them* and *behind them* a flame consumed *the land* is *before them* as the Garden of Eden, and *behind them* a desolate wilderness; yea, and nothing escapeth them."

Government—Political Divisions.—The former government of Abyssinia, or that which existed in it when it became known to the Portuguese and the Jesuits, was an absolute and despotic monarchy, in which the emperors, restrained by no written laws, popular assemblies, or privileged classes, had full power to dispose at pleasure of the lives and property of their subjects. But this ancient government may now be said to be totally extinct. The force of the central government was gradually weakened, partly by the rebellion of the governors of the different provinces, and partly by the irruption of the Gallas and other savage hordes, who have subjugated some of its finest countries. Salt has ingeniously compared the state of Abyssinia in a political point of view to that of England during the heptarchy; and since he visited it anarchy seems to have made a still more rapid progress. The whole country is now split into an endless variety of states, the limits of which are perpetually changing, and between which the most deadly animosities and interminable contests constantly prevail. The kingdoms of Amhara, Tigre, including the country between the Red Sea and the Taccaze, with the provinces of Enkerta, Wollera, &c., and Schoa, including Eritrea, are supposed to be at this moment (1837) the most powerful of these states. But we have no exact information as to their boundaries, organization, or condition. They have this in common, that they are all despotisms, and anarchy and bloodshed prevail in them all to a greater or less extent. Schoa, which is now entirely separated from the rest of the country, is said by Mr. Gobat to be less devastated by civil war than either of the others, and to be, in consequence, the least depopulated and most flourishing part of Abyssinia.

Manners and Customs.—This perpetual state of civil war and confusion, and not any peculiar cruelty of disposition, seems to be the main cause of that barbarism and brutality by which the manners of the Abyssinians are characterised. All the feelings by which man is restrained from shedding the blood of his fellows seem entirely blunted. Human life is scarcely more respected than that of brutes. Bruce seldom went out at Gondar without seeing dead bodies lying in the streets, left to be devoured by dogs and hyænas, without being even allowed the rites of sepulture. To show the indifference usually felt on such occasions, he mentions that one day, passing along the streets, he saw an officer of rank about to execute three men who had offended the sovereign. This person, calling to Bruce, begged him to stop till he had despatched this business, as he wished to have a short conversation with him. But the circumstance which seems to place the Abyssinians below even the most savage tribes, is the extreme coarseness of their festive indulgences. Their *brinde* (raw beef) feast has excited the astonishment of all travellers. Alvarez, who visited the country as ambassador from Portugal in 1520, and remained there for 6 years, describes it as a thing "of which he dare not in a manner speak." Being invited to a feast, he was much surprised, instead of the usual dishes, to see brought in "pieces of raw flesh, with warm blood." The landlord, on seeing his guests show no favour to this savoury dish, ordered other food better suited to their tastes; but immediately began eagerly to

devour the flesh, "as if it had been marchpane or comfits." The lady of the house did not appear at dinner; but, in drinking, she "bravely seconded" the rest of the company. Bruce and Salt have furnished still more particular descriptions. The table, which is low, is first covered with successive piles of tuff cakes, serving to the guests at once as food and as towels with which to wipe their fingers. The company being then seated, the next process is the slaughter of the cattle, which are standing at the door, and the cutting warm steaks from their flesh. Bruce says that these are extracted while the animal is yet alive, and belowing under the pain of the wound. But this disgusting circumstance is not mentioned by any of the earlier writers, and Mr. Salt affirms that the head is separated from the body before the operation of slicing commences. Salt, however, as well as Bruce, admits that the luxury of an Abyssinian feast consists in having the pieces brought in while the blood is yet warm and the fibres palpitating. The female who sits next to each chief then wraps up the slice in a tuff cake, and thrusts into his mouth as large a quantity as it is capable of containing, which is greedily devoured. All parties drink copiously of hydromel, and bouza, the beer of the country. Having satisfied themselves, they rise, and give place to another company of inferior rank, and these to a third, till all is consumed. The gross indecencies which Bruce represents as perpetrated on these occasions, and which he has described with such revolting minuteness, have been denied by Mr. Salt, and it is hardly possible to suppose that they can be other than rare occurrences. Mr. Gobat, the missionary, admits that a feast such as that described by Bruce may have taken place among the most shameless libertines; but he adds, that "excesses of that kind are not customary either as to their cruelty or indecency." The one reported by Bruce, and which subjected him to a little ridicule, of cutting steaks from a living animal on a journey, and then closing up the wound and driving it on, appeared at first quite unfounded to Mr. Salt; but in his second journey he witnessed it, and found that it was called by a peculiar name—*cutting the Shulada*; which certainly goes a good way to prove its frequency, though that also is disputed by Mr. Gobat, who denies its occurrence, unless, perhaps, in cases of extreme hunger.

Just as in Abyssinia is altogether barbarous, cruel, and corrupt. When a person accused of a criminal offence is found guilty, he is detained in prison till he has made satisfaction to the accuser; or, if he have committed murder, till he be disposed of by the relations of the deceased, who may either put him to death or accept a ransom. The latter is generally fixed at 250 dollars for a man, but the relations are under no obligation to accept it. Mr. Gobat says that the Taccaze is never passed on either side in pursuit of murderers, so that they must very frequently escape without even the pretence of a trial. When a murdered person has no relations, the priests take upon themselves the office of avengers.

Marriage in Abyssinia is a very slight connection, formed and dissolved at pleasure. The most formal mode of concluding it is, when the lover, having made certain engagements to the parents, and obtained their consent (for that of the bride is seldom asked), seizes her and carries her home on his shoulders. A magnificent feast is then given of brande and bouza; and at a fixed period of twenty or thirty days afterwards, they go to church and take the sacrament together. It is in a few rare instances only that even this slight ceremony is used. In most cases, mutual consent, and a plentiful administration of raw meat and bouza, form the only preliminaries. The will of either party, or of both, is at any time sufficient to dissolve the connection. If they have several children, they divide them; if they have but one, and he is under 7 years of age, he belongs to the mother; if above 7, to the father. Gobat says that after a third divorce they cannot contract another regular marriage, nor partake of the communion *unless they become monks*; Bruce, however, mentions being in a company at Gondar, where there was a lady present, with six persons, each of whom had been successively her husband, although none of them stood in this relation to her at the time: nor do either party consider themselves bound to observe with rigidity this slight engagement, even while it lasts. Manners may be considered, in this respect, as in a state of almost total dissolution. Slaves are common in all parts of Abyssinia. They consist of Shangallas, a race of savage Negroes inhabiting the low countries on the N. N. W. and N. E. frontiers. They are very numerous in Gondar and other places of Amhara, and also in Tigre; are well treated, and escape many of the privations to which they are subject in their wild state.

The only display of architectural magnificence in Abyssinia is in the churches. They are built on eminences; are of a circular form, with conical summits and thatched roofs; and are surrounded with pillars of cedar, within which is an arcade, which produces an agreeable coolness. The houses of the sovereigns and

grandees are also large and commodious; though, in this warlike country, the camp is considered as their more proper residence. All the houses are mere hovels of a conical form, with a thatched roof. Their dress consists chiefly of a piece of cotton cloth, 24 cubits long by 14 in breadth, which they wrap round them like a mantle, with close drawers reaching to the middle of the thigh, and a girdle of cloth. Their food consists of the different species of grain already enumerated, fish, fruits, honey, and raw meat at festivals. The most general drink is *bunza*, a species of sour beer, made from the fermentation of their cakes, particularly those left at entertainments. *Tocouso*, the coarsest grain, produces *bunza* equal or superior to any of the others. *Hydromel* is also made in great quantities. Agriculture, the only art much cultivated, is very far behind the perfection which it has attained even in the most backward parts of Europe. The ploughs, of the rudest construction, from the root or branch of a tree, are drawn by oxen. The land is twice ploughed; after which women are employed to break the clods. In the course of ripening, the corn is carefully weeded. As previously stated, there are two or three crops in the year. The worst grain is commonly used for seed. In general, every family cultivates for itself, and little is brought to market. The poor people live miserably on black teff and *tocouso*, and even persons of consideration use little except teff and *bunza*.

The Abyssinians profess Christianity, but it has little influence over their conduct. At present they are split into three parts: violently opposed to each other. They retain a great number of Jewish observances, abstaining from the meats prohibited by the Mosatic law, practising circumcision, keeping both the Saturday and Sunday as Sabbaths, and holding fasts as essential. But their fasts, though at times long and rigorous, are dispensed with on payment of a sum of money, according to the rank and wealth of the party. The Coptic patriarch of Cairo continues still to be the nominal head of the church, from whom the Abba, the resident head, receives his investiture. They have monasteries, both of monks and nuns, who are far, however, from professing that rigid austerity which is the boast of the Romish church. Their veneration for the Virgin is unbounded, as the Catholic missionaries found that they completely outdid in this respect, their own ultra zeal. Their saints are extremely numerous, and surpass, in miraculous power, even those of the Romish calendar. They represent them by paintings, with which their churches are lavishly adorned; but they do not admit any images in *relievo*. The clergy do not attempt to prohibit divorce, or even polygamy, the propensity to which in the nation is probably too powerful to render any prohibition effectual.

Monumetichians, as well as Jews, are also found in Abyssinia. The former appear to have increased since Bruce's visit; at present they are most numerous in Adowa and its vicinity. Few of them have any knowledge of the Koran. They engage more in traffic than the Christians, and have more money. They are said to enslave the whole tribes in slaves; the Christians, according to Mr Gobat, never taking any part in it.

Though low, as compared with Europe, the manufactures of Abyssinia occupy a prominent place among most of the African nations. It supplies itself with all the most indispensable articles. Cotton cloths, the universal dress of the country, are made in large quantities, the best sort at Gondar, and the coarse at Adowa. Being unable to dye their favourite dark blue colour, they unravel the blue Surat cloths, and weave them again into their own webs. Coarse cloth circulates as money. Manufactures of iron and brass are also considerable, the material being procured from Sennaar, Valcayt, and Baren; knives are made at Adowa and spears at Amoyor. The business of tanning is well understood in Tigre, and at Axum sheepskins are made into parchment. Saddles and all sorts of horse furniture, are good. The foreign commerce of Abyssinia is carried on entirely by way of Massau, whence the communication with the interior is maintained by the channel of Adowa. The imports are chiefly lead, block tin, gold foil, Persian carpets, raw silk from China, velvets, French broad cloths, coloured silks from Egypt, glass beads and decanters from Venice. The exports consist of gold, ivory, and slaves. The slaves are reckoned more beautiful than those which come from the interior of Africa.

Progress of Discovery.—The ancients never acquired any accurate knowledge of Abyssinia. To it, along with Sennaar, they, in a peculiar sense, applied the comprehensive name of Ethiopia; for though that term was made to extend generally to the interior of Africa, and even to a great part of Asia, yet *Ethiopia sub Egypto* was regarded as the proper Ethiopia. Descriptions of Ethiopian nations are given by the ancients at considerable length; but they serve chiefly to show the im-

perfection of their knowledge, and are tinged with a large admixture of fable. Kennell supposes, seemingly on good grounds, that the Macrobians, or long-lived Ethiopians, said to live farther to the south than the others, belong to Abyssinia. The ancients had no distinct knowledge of more than two Ethiopian kingdoms: the first and only one known to the earliest writers is Merop, or the Peninsula, which they erroneously supposed to be an island formed by the successive union of the Nile with the Atabaras and the Atapiis (Blue River and Tarazze). The chief city of Merop was placed by them on the Nile, in lat. 16° 25'; and Bruce, in passing through Sennaar, saw, near Chendi, immense ruins, which probably belonged to this celebrated capital of Ethiopia. The other kingdom became known after the Greeks, under the successors of Alexander, extended their navigation along the eastern coast of Africa. It was that of the Axumites, situated upon the Red Sea, and occupying part of Tigre. Its capital, Axum, still remains, and though in a state of decay, exhibits remains so vast as amply to attest its former greatness. The inscriptions discovered here by Salt show, that the Axumites had received amongst them the religion and the arts of foreigners, and that they made use of the Grecian language in the inscriptions on their monuments. The port of Axum, Adulis, was the channel by which the finest ivory then known was exported, and a commercial intercourse maintained with the coasts both of the Red Sea and the Indian Ocean. Salt, though unable to visit it, seems to have ascertained its situation near Massauah.

Prior to the middle of the fourth century, Abyssinia was converted to Christianity, which it has ever since nominally professed.

After the rise and rapid spread of Islamism, those of the Egyptians who were reluctant to change their faith being compelled to fly southwards before the sword of the Saracens, Nubia and Abyssinia became filled with Jewish and Christian refugees. And as both these communities were at that time Christian, the Arabian geographers, who have fully described other parts of the continent, make a very slight mention of them; so that Abyssinia remained almost unknown till near the era of modern naval discovery. In 1445, the emperor of Abyssinia sent an ambassador to the senate of Florence, and wrote a famous letter to the priests his subjects at Jerusalem. This, and the favourable reports of the Abyssinian priests now referred to, gave rise to the most exaggerated reports. It was said that a Christian prince, to whom the Portuguese gave the fantastical name of *Prester or Priestly John*, ruled over a vast, highly civilised, and rich empire, in the centre and E. of Africa. This statement inflamed at once the spirit of discovery and of religious zeal, the two ruling principles in that age. The Portuguese monarchs, who took the lead in exploring the eastern world, immediately devised measures for acquiring a knowledge of so remarkable a region. The passage to India by the Cape of Good Hope had not yet been discovered; Abyssinia was therefore viewed as a tract through which the commerce of India might be conducted. Two expeditions, Alvarez and De Paiva, were therefore sent, under the direction of Prince Henry, upon a mission to explore it. They went by way of Alexandria, and descended the Red Sea. De Paiva perished by some unknown accident; but Covillham, after visiting different parts of India and Eastern Africa, entered Abyssinia, and arrived, in 1490, at the court of the emperor, residing then in Schoa. Being brought before the sovereign, he was received with that favour which novelty, when there is nothing to be feared from it, usually secures; and being a man of address and ability, he contrived to maintain this friendly disposition. The reports which he transmitted of the country were favourable; and having prevailed on the emperor to send an ambassador as an ambassador to Portugal, whose arrival excited a great sensation in that country, the Portuguese sent out several other embassies. Of these the most remarkable is that described by Alvarez, in 1520. He remained six years in the country, and traversed it from north to south, visiting the provinces of Amhara, Schoa, and Efat. Paéz, Almeida, Lobo, and several others successively undertook journeys into Abyssinia. Paéz, who resided in the country from 1603 till his death in 1622, visited, in 1618, the sources of the Bahr-el-Azrek or eastern arm of the Nile, and describes them nearly in the same terms as Bruce, who absurdly claims the honour of being their discoverer. From the accounts of these and other missions, Tellier first (1660), and afterwards Ludolph (1681), principally compiled their histories and descriptions of Ethiopia. Ludolph, who was well versed in the language, derived a considerable part of his information from the communications of Gregory, an Abyssinian monk of the province of Amhara, then in Europe.

Public curiosity, however, with respect to Abyssinia gradually subsided, till, towards the close of last century

(1790), it was revived by the publication of Mr. Bruce's *Travels*. Many of the circumstances he relates are so very extraordinary as to give to his descriptions a good deal of the appearance of romance. The authenticity of his work was in consequence very generally doubted; and it must be admitted that some of his statements have been shown to be unfounded, and that others are of very questionable authority. But the accuracy of the leading features of his work has been fully established by Mr. Salt and other late travellers.

Our limits will not permit of our attempting to lay before the reader any sketch of the history of Abyssinia; and though we had abundance of space, the subject is too uninteresting to attract attention. Dr. Lee has prefixed a short notice of the church of Abyssinia to the *Journal of Mr. Gobat's Residence* in that country. An excellent summary of the information as to Abyssinia, contained in the earlier travellers and historians, will be found in the *Modern Universal History*, vol. xv. pp. 1—204. 8vo ed. Besides it, we have consulted, in drawing up this article, the *Travels of Bruce, Salt, and Lord Valentia*; Mr. Gobat's *Journal*; the account of Abyssinia in Ritter's *Geography*; Prichard's *Researches on Man*, ll. pp. 128—164. 3d ed., &c.

ACAPULCO, a celebrated sea-port and town of Mexico, in the intendency of that name, on the coast of the Pacific Ocean, 190 m. S.W. Mexico, lat. 16° 50' 29" N., long. 99° 46' W. Pop. 4,000 (?). The harbour is one of the finest in the world. It is familiar, says Captain Hall, "to the memory of most people, from its being the port whence the rich Spanish galleons of former days took their departure to spread the wealth of the Western over the Eastern world." It is celebrated, also, in Anson's delightful *Voyage*, and occupies a conspicuous place in the very interesting accounts of the Buccaneers: to a sailor therefore, it is classic ground in every sense. I cannot express the universal professional admiration excited by a sight of this celebrated port, which is, moreover, the very *beau-ideal* of a harbour. It is easy of access; very capacious; the water not too deep; the holding ground good; quite free from hidden dangers; and as secure as the basin in the centre of Portsmouth dock-yard. From the interior of the harbour the sea cannot be discovered; and a stranger, coming to the spot by land, would imagine he was looking over a sequestered mountain lake. (South America, ii. p. 172.) There are two entrances to this splendid basin, one on each side of the small island of Roqueta or Grifo, the broadest being nearly 1½ m. across, and the other from 700 to 800 feet. The town, commanded by the "extensive and formidable" (Hall) castle of San Carlos, is poor and mean. Since it ceased to be the resort of the galleons, it has ceased to be of any considerable importance; and, when visited by Captain Hall, had only 30 houses, with a large suburb of huts built of reeds, walled in open basket work to give admission to the air. The climate is exceedingly hot and pestilential. To give freer circulation to the air, an artificial cut was made through the chain of rocks by which the town is surrounded. But, though this has been of considerable service, it still continues to be very unhealthy. Its natural insalubrity is increased by the poisonous vapours exhaled from a marsh situated to the E. of the town. The annual desiccation of the stagnant water of this marsh occasions the death of innumerable small fishes, which, decaying in heaps under a tropical sun, diffuse their noxious emanations through the neighbouring air, and are justly considered a principal cause of the putrid bilious fevers that then prevail along the coast. Some trade is carried on between Acapulco and Guayaquil, Callao, &c.; but, owing to the extreme tediousness and difficulty of the voyage from Acapulco to Callao, the intercourse between Mexico and Peru is confined within very narrow bounds. (Hall, loc. cit.; Humboldt, *Nouvelle Espagne*, 2d ed. iv. p. 88.)

ACERENZA (an. *Acherontia*), a small and very ancient archiepiscopal city of Naples, prov. Basilicata, 14 m. N. E. Potenza. Pop. 3,600. It is situated, according to the description of Horace (*Od. lib. iii. car. 4. l. 14.*), on an almost inaccessible hill, *Nidus clausæ Acherontia*, the foot of which is washed by the Brindano. It has a castle, a cathedral, two convents, a grammar school, and an hospital. The archbishop resides at Matera. This town was looked upon by the Romans as one of the bulwarks of Apulia and Lucania.

ACERNO, a town of Naples, prov. Principato Citra, 16 m. N. by E. Salerno. Pop. 2,500. It has a cathedral, a parish church, a *mont de piété*, which makes advances of seed to indigent cultivators, a fabric of paper, and a forge.

ACERRA, a town of Naples, prov. Terra di Lavoro, 9 m. N. E. Naples. Pop. 6,300. It has a cathedral, a seminary, and a *mont de piété*. The country is fruitful, but unhealthy. This is a very ancient town. In the second Punic war it was destroyed by Hannibal, the in-

habitants having deserted it on his approach. (*Liv. lib. xxlii. c. 17.*) Under Augustus it received a Roman colony.

ACHERN, a principality occupying the north-west extremity of the island of Sumatra (which see).
ACHERN, the capital of the above principality, situated near the N. W. extremity of Sumatra, on a river, about 3 miles from the sea, lat. 6° 35' N., long. 95° 45' E. It is very populous, being said to contain 8,000 houses built of bamboo and rough timber, and raised on posts, to secure them from inundations. A good deal of trade is carried on with Singapore, Batavia, Bengal, &c. Owing to a bar at the mouth of the river, none but small vessels pass up to the city.

ACHERN, a town of the G. D. Baden, on the Acher, 14 miles N. E. Kehl. Pop. 3,000. Within a short distance of Acher is the village of Sasbach, contiguous to which is a granite monument, erected at the expense of the French government in 1829, on the spot where the Marshal de Turenne, one of the greatest generals of modern times, was killed by a random shot on the 27th July, 1675. His bowels were interred in the chapel of St. Nicholas at Acher. — (*Schreiber's Rhine; Biographic Universelle*, art. "Turenne.")

ACHIL, or EAGLE ISLAND, an island on the W. coast of Ireland, co. Mayo, separated from the main land by a narrow channel. It is about 30 m. in circumference, and contains about 23,000 acres. Pop. 5,277. It is mountainous; and eagles — whence its name — breed in its inaccessible fastnesses. The inhabitants speak the Irish language, and are in an extremely depressed, miserable condition.

ACHMIN, or ECHMIN, a town of Upper Egypt, on the right bank of the Nile, 230 m. S. Cairo. Pop. 3,000. Streets well disposed, broad, and straight, which is very unusual in Egypt; so that this would be a handsome town, were the houses built of better materials than baked bricks cemented with clay. It was anciently called Panopolis, or Chemmis; the former being the Greek, the latter the Egyptian name. It contains a church of some antiquity, and held in much veneration; but its chief ornament is the granite pillars taken from the ruins of Panopolis.

ACHMUNEIN, a large village of central Egypt, prov. Minyeh, on the site of the ant. *Hermopolis Magna*, lat. 27° 43' N., long. 30° 53' E. In the environs is the portico of an ancient temple, covered with hieroglyphics, and regarded as one of the finest remains of Egyptian architecture.

ACHONRY, a parish of Ireland, co. Sligo, which gives name to a bishopric, now united to Killala. 16 m. W. Sligo. Pop. of parish 15,357.

ACI-REALE, a sea-port town of Sicily, prov. Catania, cap. cant., at the foot of Mount Atna, 9 m. N. E. Catania. Pop. 19,762, incl. cant., of which the town may have about 15,000. It stands on a vast mass of basaltic lava, about 400 feet above its port, the *Marina di Aci*, and is supported on arches constructed with great labour and expense through ten alternate strata of lava and earth. The situation is healthy; the town is regularly built, clean, with many churches, convents, and public buildings, the whole giving evidence of a thriving and industrious population. A considerable trade is carried on, particularly during the fair in July, in wine, fruit, gold, filigree-work, cotton, flax, and diaper, the last being bleached in great quantities in the plain below the town on the banks of the Acque Grande. The port is small; the mole is formed out of a mass of lava, and there are some good warehouses. During the servile war Aci-Reale was the head quarters of the consul Aquilino, who succeeded in suppressing that dangerous revolt, anno 101 B. C. — (*Smyth's Sicily*, p. 182. &c.)

ACKEN, a town and castle of the Prussian states, prov. Saxony, on the Elbe, 10 m. E. S. E. Calbe. Pop. 3,000. It has manufactures of cloth and tobacco, and tanneries.

ACONCAGUA, a province of Chili (which see). This also is the name of the cap. of the same prov., a town containing about 5,000 inhab. — (*Miers's Chili*, p. 420.)

ACQUA, a village of Tuscany, 15 m. E. E. Leghorn, celebrated for its baths.

ACQUAPENDENTE, a small ill-built town of the Papal dominions, 15 m. W. Orvieto. Pop. 2,400. It has a cathedral and 6 churches.

ACQUA-VIVA, a town of Naples, prov. Terra di Bari, 18 m. S. Bari. Pop. 5,300. It is surrounded by walls has a handsome parish church, some convents, 2 hospitals, and a *mont de piété*.

ACQUI, or AQUI, a town of the Sardinian States, cap. prov. same name on the left bank of the Bormida, 47 m. E. S. E. Turin. Pop. 6,700. It has a citadel, a cathedral, two churches, and a seminary; and is celebrated for its warm sulphurous baths. The inhabitants are principally employed in the silk manufacture.

ACRA, a small district on the Gold coast of Africa, belonging to the Ashantes, nearly under the meridian of Greenwich. The English, Dutch, and Danes have forts at Acra.

* This is not quite accurate. There is one shoal of limited extent on which a vessel was lost in 1761. But being mentioned in the charts it is easily avoided. — Humboldt, *Nouvelle Espagne*, iv. p. 90.

ACRE, AKKA, or ST. JEAN D'ACRE, a town of Syria, cap. pachalik of same name, on the coast of the Mediterranean, lat. $32^{\circ} 54' 35''$ N., long. $36^{\circ} 6' 5''$ E., 33 m. S.S.W. of Tyour (an. *Tyrus*), and 35 m. W. Lake Tabaria or Genezareth. It is situated on a promontory, forming the N.E. limit of a fine semicircular bay (the Bay of Acre) opening to the N., bounded N.W. by Cape Carmel, at the extremity of the mountain of that name. The harbour of Acre, on the S. side of the town, within the bay is shallow, and accessible only to vessels drawing little water; but opposite to Caipha, a small town at the foot of Mount Carmel, on the W. side of the bay, there is good anchorage ground in deep water. Few towns are more advantageously situated as a centre of commerce or seat of political power; but these advantages, by making its possession of importance, have served to expose it over and over again to hostile attacks. The climate is unhealthy; the winter rains, descending in torrents from the mountains, fill the adjacent plain with stagnant lakes, from which, and the decomposition of vegetable remains, constant malaria is produced, forming a striking contrast to the healthy atmosphere of the neighbouring mountain land. Cotton and corn are the chief products of the plain of Acre, and these form its staple exports.

Previously to 1832 the population of Acre was loosely estimated at 15,000 to 20,000; but the siege of that year having ended in its almost total destruction, it is impossible to state the number of its present inhabitants. The same cause operates to make an account of the place historical rather than descriptive of its existing state. Even before the period alluded to, a few broken columns of granite, and other dilapidated and neglected relics, were the only remains of antiquity; but of the Gothic age there were, at this epoch, the cathedral churches of St. Andrew and St. John. The mosque of Djazzar Pacha was a fine quadrangular building, paved with white marble, and surmounted by a cupola supported on pillars brought from the ruins of Caesarea. The same governor also constructed a large fountain, of incalculable advantage to the town.* The bazaars were numerous and good, being arched over, and well supplied with commodities. Houses built of stone, and flat-roofed, the terraces on their tops forming agreeable promenades; the more useful, as the streets were extremely narrow. At present, however, Acre is, or at all events within a year or two was, little better than a mass of ruins; of all its buildings, public or private, the fountain of Djazzar was the only one that escaped unscathed from the effects of the siege by the Egyptians in 1832.

Although the modern town be of comparatively recent date, its site has been occupied by buildings from the remotest antiquity. Here stood a Hebrew, or perhaps a Phœnician city, called *Accho*. Being improved and enlarged by the Greek sovereigns of Egypt, they gave it the name of *Ptolemais*; and it was justly regarded by them and their Roman successors as a port of great importance. Syria was one of the first conquests of the Mohammedans (see *ARABIA*), into whose hands Ptolemais fell, A.D. 636. It then received the name of *Akka*, which continues to be its Saracenic appellation. In 1104 it was captured by the first crusaders, and formed for eighty years part of the kingdom of Jerusalem, when it was taken by the famous Sultan Saladin. About four years afterwards Richard Cœur de Lion and Philip Augustus appeared before its walls, and after a siege of twenty-two months it surrendered to their arms in 1191. It subsequently remained in the possession of the Christians exactly a century; and under the government of the Knights Hospitallers of St. John attained considerable importance and prosperity. It derived from the magnificent cathedral erected by these soldier monks to their patron saint its common western name of *St. Jean D'Acre*. In 1291, however, the knights were driven from Syria, and Acre was the spot on which their last desperate but useless struggle took place. From 1291 till 1317, it formed part of the Caliphate, when it passed, with the last paltry wrecks of the once mighty power, into the hands of the Turks. Neglected by the government, and exposed to the depredations of every wandering tribe, it continued to decay, till, in the beginning of the 17th century, it was seized by Fak'r-el-din, the celebrated emir of the Druses, under whose wise and energetic government it began to show symptoms of returning prosperity; but in the latter part of his life Fak'r-el-din, apprehending a Turkish invasion, destroyed the harbour, and thus left the place in a worse condition than that in which he found

* However bloodthirsty and selfish, it is evident, from the accounts of those who were little inclined to partiality, that Djazzar (the butcher) Pacha possessed many of the qualities that constitute an able and energetic ruler. Under his firm, though iron way, the melancholy rose to an importance which made it be respected alike by the Pacha and by all the unruly spirits in its neighbourhood. When his own passions did not interfere, he saw clearly and advanced steadily the interests of those beneath his government, as the public buildings he erected and his steady encouragement of European trade sufficiently evince. His subjects too were safe from all oppression except his own; a species of security which, though little valued in Europe, is no light matter in many parts of the East.

it. Another century of decay and misery ensued, till, in 1749, the Bedouin Arab Daher expelled the Turkish aga, and made Acre the capital of a territory which for more than 30 years was virtually independent of the Porte. Daher partially fortified Acre, partly cleared its ruins, and settled colonies of Greek and Mussulman farmers, harassed and despoiled in the neighbouring countries, in the surrounding plain. On Daher's fall in 1775, Acre reverted to the dominion of the Turks. For once, however, the change of masters was not productive of ruin. Djazzar, who was immediately appointed pacha, how inferior soever to Daher in personal character, seems to have resembled him in his political energy, promptness, and decision. He strengthened the fortifications, and embellished the town. The determined and successful resistance which it made in 1799 to the arms of Napoleon have rendered it famous in modern history. There is, indeed, good reason to think that the termination of the siege had a powerful influence over the future fortune of that extraordinary person, and consequently of the world. (See *Voyage du Maréchal Marmont*, iii. p. 76, &c.) Acre continued to prosper till 1832. Though fettered by imports and monopolies, it carried on a considerable foreign trade, and had resident consuls from most of the great states of Europe. During its siege by Ibrahim Pacha in 1832, which lasted 5 months and 21 days, its private and public buildings were mostly destroyed. But its great importance to its Egyptian masters has already made them repair its fortifications, and render them stronger than ever; and no doubt also its streets and houses will be again re-opened and rebuilt. — (*Foley's Travels in Syria*, ii. passim; *Robinson's Travels in Palestine and Syria*, ii. 196–201; *Hogg's Travels to Alexandria*, ii. 156–172; *Russell's Palestine*, 317–337; *Voyage du Maréchal Marmont*, iii. pp. 76–83.)

ACRI, a town of Naples, prov. d'Alabria Citra, cap. cant., on the Murone, in a healthy situation, 12 m. N. E. Cosenza. Pop. 7,000. It has 6 parish churches and an hospital. The surrounding country is very fruitful.

ACTIUM. See *ACTA*, GULPH OF.

ACTON, a village and parish of England, formerly resorted to for its mineral waters. Pop. 1,925. 5 m. from London.

ACUL, an inconsiderable sea-port town of Hayti, on its N. coast. Lat. $19^{\circ} 47' 40''$ N., long. $72^{\circ} 27' 13''$ W. It was called St. Thomas by Columbus.

ADALIA, or SATALIEH, a sea-port town of Turkey in Asia, Anatolia, cap. Saingak Tchéli, on the gulph of the same name, near the mouth of the Jordan-soo, lat. $36^{\circ} 52' 15''$ N., long. $30^{\circ} 43' 3''$ E. Pop. 8,000 (??) two thirds Turks and one third Greeks. It is finely situated, being built on amphitheatre-wise round a small harbour on the declivity of a hill, the summit of which is surmounted by a castle. It is enclosed by a ditch, a double wall, and a series of square towers about 50 yards apart. Streets narrow, and houses mostly of wood. It is the residence of a pacha and of a Greek archbishop; and has numerous mosques, churches, baths, caravansaries, &c. The surrounding country is beautiful, and the soil deep and fertile.

Adalia is supposed to occupy the site of the ancient Othia; and the fragments of its remains and other remains of antiquity found within its walls attest its former flourishing state. — (*Beaufort's Karamania*, p. 126; *Dict. Geographique*, &c.)

ADAM'S PEAK, the highest mountain in the island of Ceylon, altitude 6,152 feet; 45 m. E.S.E. Colombo. It has a sugar-loaf shape; and its summit, supposed to be the point where Buddha ascended to heaven, is esteemed sacred, and is resorted to by pilgrims.

ADANA, a town of Asia Minor, the capital of a district or government of the same name on the Sihon (*Sarus*), about 25 m. above where it falls into the sea, lat. $36^{\circ} 59' 59''$ N., long. $35^{\circ} 16' 16''$ E. Pop. 10,000. It is very ancient, stands on a declivity, surrounded on all sides by groves of fruit trees and vineyards; is large, well-built; has a castle; a bridge over the river, said to have been built by Justinian; and a noble portico in the middle of the bazaar. It carries on a considerable trade in wine, fruits, and corn. In summer it is rather unhealthy, and the majority of the inhabitants retire to the country. — (*Kinnier's Asia Minor*, &c. p. 131.)

ADANAD, a town or place of Hindostan, prov. Malabar, div. Shrinada, the residence of a class of Brahmins called Namubries. This sect refuse to eat or drink with other Brahmins. The elder sons marry as many wives as they can support, and live with them; but the younger sons of the family seldom marry, in order to prevent the decline of their dignity by their becoming too numerous.

ADARE, an ancient town of Ireland, co. Limerick, with some fine ruins, now much decayed, situated on the Maig, over which it has a bridge of 9 arches; 130 m. S.W. Dublin. Pop. 766.

ADDA, a celebrated river of Italy, formed by the junction of several rivulets near Bormio, in the Valteline.

Having traversed that province it passes Sondrio, enters the lake of Como near its northern end and issues from its southern extremity, and passing Lodi and Pizzighettone, falls into the Po 6 m. W. Cremona.

ADELSBERG, a village and cavern in Illyria, about half way between Laybach and Trieste. The cavern is decidedly the most magnificent and extensive hitherto discovered in Europe. It has been explored to the entrance of between 1 and 2 miles (1310 fathoms) from the entrance and is terminated by a lake. It is believed, however, that this is not the end of these vast hollows, and that, were it carefully examined, its extent would be found to be much greater. The cavern is placed under the care of an officer in the adjoining village, who appoints guides to conduct strangers through it. It is easily accessible, and may be visited without any risk. The entrance is situated about a mile from the village, in the face of a cliff, below a ruined castle. At this point the river Poik, after winding through the plain, disappears beneath the mountain, sinking into the rock below a natural penthouse formed by the slope of the limestone strata. The entrance for visitors is a small hole above this, closed by a door. At a distance of 150 yards from the mouth, a noise of rushing waters is heard, and the Poik may be seen, by the light of the taper, struggling along at a considerable depth below; and on a sudden a vast hall 100 feet high, and more than 300 long, called the Dome, is entered. The river having dived under the wall of rock on the outside, here re-appears for a short space, and is then lost in the bowels of the mountain. It is believed to be identical with the Unz, which bursts forth at Planina; planks of wood, thrown into the stream of the cavern, appear there, it is said, after ten or twelve hours.

The Dome was the only part of the cavern known down to 1819, when a labourer, working in the cave, accidentally broke through a screen of stone, and discovered that this was to use the words of Russel, "but the vestibule of the most magnificent of all the temples which nature has built for herself in the region of the night." Rude steps, cut in the rock, lead down the sloping sides of this chamber to the level of the river, which is crossed by a wooden bridge; and the opposite wall is sealed by means of a similar flight of steps. Here the visitor enters the newly-discovered part of the cavern, consisting of a range of chambers varying in size, but by far the most interesting, from the variety, beautiful purity, and quantity of their stalactites. Sometimes uniting with the stalagmite below, they form a pillar worthy to support a cathedral; at others a crop of minute spiculate rises from the floor; now a cluster of slender columns reminds one of the tracery of a Gothic chapel, or of the windings or interlacings of the ascending and descending branches of the banyan tree. The fantastic shapes of some masses have given rise to various names, applied by the guides, according to the likenesses which they imagine they can trace in them, to real objects; such as the throne, the pulpit, the butcher's shop, the two hearts, the bell, which resounds almost like metal, and the curtain (Vorhang), a very singular mass about an inch thick, spreading out to an extent of several square yards, perfectly resembling a piece of drapery, and beautifully transparent. The stalactical matter pervades almost every part of the cavern; it paves the floor, hangs in pendants from the roof, coats and plasters the wall, cements together fallen masses of rock, forms screens, partitions, and pillars. The only sound in the remote chambers is produced by the fall of the drops of water charged with lime, which are found, on examination, to tip each pendant mass, forming an ascending spire, or stalagmite, on the spot where it descends. One of the long suite of chambers, larger and loftier than the rest, and with a more even floor, is converted once a year (in May) into a ball-room. On that occasion the peasant lads and lasses assemble from miles around, and the gloomy vaults re-echo with sounds of mirth and music. — (*Murray's Handbook for Southern Germany*, p. 385.)

ADEN, a small state of S. Arabia in Yemen, lying between 12° 32' and 13° 2' N. lat., and between 43° 30' and 45° 30' E. long. It extends from E. to W. about 115 m., its greatest width being about 30. The mountains in this part of Arabia are close upon the sea, and, for an Arabic district, it is well supplied with water; and from both these causes the heat of the climate is considerably mitigated, and vegetation flourishes upon a more extensive scale than in most other parts of the peninsula. It has a considerable forest. The cultivated parts produce wheat, dhourah, and cotton; the woods consist of mangoes, sycamores, and pomegranates, and the surface of the whole country is interspersed with date trees. Wellsted (*Travels*, ii. 409.) states that in purity of atmosphere, richness of soil and verdure, nature of vegetation, and proximity of production and desolation, this country resembles Egypt. The barren parts are represented as *peculiarly* so; but they occur in comparatively small patches, and in the midst of fertility. The inhabi-

bitants are mostly agriculturists; but such is the miserable state of the country, that the husbandman never goes to his labour without being armed, and resorts to the towns for security during the night. The town inhabitants of the interior carry on an extensive trade with the Bedouins, who bring to market their ghee (butter), frankincense, and milk, receiving in return grain and cloth. Manufactures limited to a fine striped cloth or silk, used for the dresses of the superior classes, the weaving of which occupies about 30 looms in the town of Lahjedje. — (*Niebuhr, Descr. del' Ar. par. ii.* pp. 221, 222; *Voy. en Ar. ii.* pp. 52, 53; *Wellsted's Travels in Arabia*, ii. 400–411.)

ADEN, a sea-port town of Arabia, cap. of the above state, on the Indian Ocean, lat. 12° 45' N., long. 45° E. It stands upon a lofty promontory, called the *Peninsula of Aden*, connected with the main land by an isthmus about 200 yards in breadth. When Salt was here, in 1809, this isthmus was overflowed at every high tide, and constant communication between Aden and the main land was preserved only by a large causeway of seven arches. A striking proof of the rapidity with which buildings vanish and coast lines change in Arabia, is afforded by the fact, that on Wellsted's visit to the same spot in 1833, the causeway existed only in an "old map"; the isthmus was never under water, but a narrow channel, still farther to the S., separating Aden from the rocky islet of Sirah, became dry at every ebb tide. On the N. and W. the town is overhung by a steep and craggy mountain, on the pinnacles of which are several towers, now all but inaccessible, the decaying nature of the rock having made the ascent much more precarious and abrupt than it was when they were built. The E. or outward harbour of Aden, formerly (and apparently at a recent period) large and commodious, is now nearly filled up with sand; but the water which washes the W. and N. sides of the promontory, called "*Aden Road Bay*," affords a convenient and secure haven. From this bay the approach to the town, situated 2½ m. S., is over a low ridge of the mountain, and in some parts cut through the solid rock. Strong fortifications formerly existed, now buried in sand, or falling into rapid decay; and some enormous guns, which once formed an impregnable battery towards the sea, now serve only as monuments of departed strength and greatness. In the 17th century Aden had a population of 30,000; at present the inhabitants do not probably exceed 800, of whom 250 or 300 are Jews, and about half that number Banu Indians.

About 100 houses, with some wretched huts and three or four minarets, the mosques belonging to which have fallen, are the only buildings remaining in Aden; the rest of its area is occupied by heaps of rubbish, tombs, mounds, and the rudeness walls of older dwellings. In 1707, De la Roche noticed some spacious baths, lined with jasper and surmounted by domes; but these have entirely vanished. There are reservoirs, however, of solid masonry, 64 feet long and 20 deep, cisterns cut in the solid rock, three of which are 80 feet square; and aqueducts to bring the water from the upper parts of the mountains, all evincing that Aden was once the home of industry, wealth, and science.

This town, or one occupying its site, was known to the Greeks as the channel through which the treasures of India were conveyed to the coast of Egypt. Some time after the direct passage across the Indian Ocean had been achieved by Hippalus, A. D. 50, the Romans, to secure the monopoly of the Indian trade, caused Aden to be destroyed. When or by whom it was rebuilt is unknown; but from the 11th till the 16th century it was the great, or rather the exclusive, entrepot of Eastern commerce. The discovery of the passage by the Cape of Good Hope was the first great blow to its importance; and simultaneously with the appearance of the Portuguese in India, the Turks under Solymán the Magnificent took possession of many Arabic ports, Aden among the number. The Turks erected the fortifications, the ruins of which excite the admiration of every traveller, and which repelled the attacks of the famous Portuguese general Albuquerque. From this date, however, Aden has declined; nor did the expulsion of the Turks, which took place in the middle of last century, retard its downfall. Its ruin seems more complete than could have been anticipated; for its convenient harbours and plentiful supply of water make it a desirable port. But though it be still the chief mart for the myrrh, aloes, libanum, mastich, and other commodities brought by the Soumaalee traders from the N.E. coast of Africa, not more than twenty families are engaged in commerce; the rest gain a miserable subsistence by supplying the shipping and Hindu boats with wood and water, or by fishing. The exports consist of rice, tobacco, and cloth brought by the Hadj boats. The African trade is carried on wholly in Soumaalee bottoms (see ARABIA), and nearly all the resident merchants are Banians.

We have been thus particular in noticing the past and present state of Aden, because it is most probably destined again to become of very material importance. It

is understood that the town, and the peninsula on which it is built, have been ceded to the E. I. Company, who intend making it a depot and bathing place for the Steamers employed in the passage between Bombay and Suez. It is admirably situated for such a purpose. And its natural strength, the excellence of its port, and its convenient situation for commerce, will no doubt render it, when under British rule, a flourishing emporium. It is quite as well situated as Mocha for carrying on the trade in coffee; of which it will, most likely, come to be the centre.

One of the few perennial streams of Arabia, the Meddan, is in the state of Aden, and falls into the sea at Sheikh Ahmed, 5 m. W. of the town. Niebuhr describes this river, but doubts have since been entertained with regard to its existence. The recent visit of Mr. Wellsted has, however, established the perfect accuracy of Niebuhr's statement.

But the abundant supply of water, for which Aden is remarkable among Arabic towns, is drawn not from this river, but from the ravines and gulleys of the surrounding mountains; and from the land springs, which are abundant on the sea shore.

Aden is 180 m. S. S. E. Sanaa, and 140 m. E. S. E. Mocha.—(Niebuhr, *Descr. de l'Ar. par. II.* pp. 221, 222; *Voy. en Ar. II.* 51, 52; *Saïd, Voy. to Abyss.* pp. 105—111; *Wellsted, II.* 382—389.)

ADJYGHUR, a town of Hindostan, prov. Allahabad, lat. 24° 50' N., long. 80° 2' E. It has a fortress at the top of a steep hill that was taken by the British in 1803, after a stout resistance.

ADIGE, a large river of Italy, the *Atesius* or *Altesius* of the ancients. It is formed by several rivulets which have their sources in the Rhetian Alps, and unite near Glurns; thence it flows E. till near Bolzano it is joined by its important tributary, the Eisack. It then takes a southerly course past Trent, where it becomes navigable, Roveredo, and Pontone. It then changes its course to the E. and passing Verona, Legnago, and Aquilina, falls into the Adriatic, 20 miles S. Venice. It is deep, rapid (*Felox Altesis*, Claud.), and is usually navigated with difficulty. In spring, on the melting of the snow in the mountains, it is liable to sudden floods, to prevent the injurious influence of which in the Polesino of Rovigo and other low grounds, it is fenced by strong banks, while a part of the surplus water is carried off, and is exclusive of the Eisack, its principal affluents are the Noce, Avisio, and Agno.

ADMIRALTY ISLAND, an island on the W. coast of America, between George the Third's Archipelago and the continent, about 90 m. long and 25 broad. Lat. 57° 2' to 58° 24' N., long. 225° 10' to 226° 31' E.

ADMIRALTY ISLANDS, a cluster of 20 or 30 islands in the South Pacific Ocean, of which the largest, called Great Admiralty Island, is from 55 to 60 m. in length; in about 2° 10' S. lat., and from 126° to 128° E. long. They were discovered by the Hollanders in 1611, and are inhabited.

ADOLF, a town of Saxony, on the Elster, 15 m. S. E. by St. Plauen. Pop. 2,500. It manufactures all sorts of musical instruments, with cloth and cotton stuffs.

ADOUR, a considerable river in the S. W. of France. It has its source in the Pyrenees, 6 m. E. Barages, whence it flows N. by Bagueres and Tarbes to Oise; here it takes an easterly course, and passing St. Sever, Dax, and Bayonne, falls into the sea a little below the latter. It is navigable to St. Sever. The Oleron and the Pau are the most considerable of its affluents.

ADOWA, the capital of Tigre, in Abyssinia, partly on the side and partly at the foot of a hill, commanding a magnificent view of the mountains of Tigre. Lat. 14° 12' 30" N., long. 38° 5' E. The houses are all of circular form, prettily regularly disposed into streets, or alleys, interspersed with trees and small gardens. Pop. probably 8,000. It has manufactures of cotton cloths; and an extensive trade in cattle, corn, salt, and slaves.

ADRA, a sea-port town of Spain, cap. district same name, prov. Granada on the Mediterranean, 45 m. S. E. Granada. It is situated near the mouth of the Adra. In its vicinity are some of the richest lead mines in the world, the produce of which constitutes the principal article of export from the town.

ADHAMYT, a town of Turkey in Asia, Anatolia, about 4 m. from the E. extremity of the gulph of the same name, 78 m. N. Smyrna, lat. 38° 29' N., long. 26° 37' 15" E. Pop. 8,000 (?) Streets narrow, ill-paved, and filthy; houses, with few exceptions, mean, and miserably built. The olives produced in the adjoining territory, with large quantities of wool from the interior, are principally shipped for Constantinople; little except galls being shipped for other parts of Europe.—(Turner's *Levant*, III. p. 265.)

ADRIA (an. *Adria* or *Hadria*), a town of Austrian Italy, deleg. (formerly the Polesino of) Rovigo on the Castagnaro, between the Po and the Adige, 12 m. E. Rovigo. Lat. 45° 2' 57" N. long., 12° 2' 55" E. Pop.

circa 10,000. This is a very ancient city, being supposed to be of Greek origin, and having afterwards formed part of the dominions of the Etruscans. It was originally a sea-port of such magnitude and importance as to be able to give its own name to the great arm of the Mediterranean on which it stood; but owing to the gradual extension of the land, in consequence of the mud and other deposits brought down by the rivers, the port of Adria has been long since filled up, and it is now an inland town 18 or 19 m. from the sea. When Strabo wrote, it had become a comparatively unimportant place, and it subsequently suffered much from inundations and war, particularly from the attacks of the barbarians. During the twelfth century it began to revive. Its climate, which had become very unhealthy, and its environs, have both been materially improved by the drainage effected by opening the canal of Portovico. It is the seat of a bishopric, has a fine collection of Etruscan and Roman antiquities found in the vicinage, with manufactures of silk, leather, &c. The surrounding country is productive of corn, wine, and cheese.—(Cramer's *Ancient Italy*, I. p. 116. Balbi Abregé ed. 1837.)

ADRIAMPATAM, a town of Hindostan, on the sea-coast of Tanjore, 37 miles S. E. Tanjore, long. 79° 30' E., lat. 10° 20' N.

ADRIANOPOLE (called *Edreneh* by the Turks), a celebrated city of Turkey in Europe, prov. Roumelia, on the Maritza (an. *Hebrus*), where it is joined by the Toonga and the Arda, 134 m. N. W. Constantinople, lat. 41° 48' N., long. 26° 29' 15" E. Pop. variously estimated at from 80,000 to 140,000. According to the Hon. Mr. Keppel it contains 23,000 houses and 90,000 inhabitants, of whom 45,000 are Turks, 30,000 Greeks and Bulgarians, and the remainder Armenians and Jews. It is beautifully situated in one of the richest and finest plains in the world, on the sides and base of a low hill, and when viewed from a distance has a magnificent appearance; but, as is the case in most Turkish towns, the illusion vanishes on entering. The streets are narrow, crooked, and filthy; and in certain periods of the year it is unhealthy. Some of the houses are three stories high, and their shelving roofs project so much as to meet those on the opposite side. In the centre of the town an old wall, supported by massive towers, the work of the sultan, the former of the Lower Empire, encloses a space occupied by the rayah population. Originally it may have been the citadel; but it is now useless as a defence. Among the public buildings the most distinguished are the ancient palace of the sultans, in a state of decay; the famous bazaar of Ali Paşa, appropriated to the warehousing and sale of various descriptions of commodities; and the numerous mosques. Of the latter, the one erected by Selim II. is the most splendid; and ranks, indeed, among the finest Mohammedan temples. There are numerous booths and retail shops stored with all sorts of merchandise. There are also numerous baths and fountains supplied by water conveyed into the city by an aqueduct. A madrasah, or school, is attached to the mosque of Sultan Selim, and there are a number of other schools. The Maritza is navigable up to the city during winter and spring, but in summer the sea craft only ascend as high as Demotica. Enos, at the mouth of the Maritza, is properly the sea-port of Adrianople. It formerly admitted large vessels; but owing to the carelessness of the Turks, who have allowed a sand-bank to accumulate, it is now accessible only to vessels of comparatively small burden. With the exception of tanning, which is rather extensively carried on, manufactures are inconspicuous. It has, however, a pretty extensive commerce. The exports consist, principally of the raw products of the adjacent country, comprising excellent wool, cotton, silk, good wine, olive oil, raisins, figs, &c. The imports consist principally of manufactured goods; as cottons and hardware from England, woollen stuffs from Germany, &c. The trade is principally carried on by Greek merchants. It is the seat of a Greek archbishop.

In early times Adrianople was the capital of the Bessi people of Thrace, and was then called Uskadama. It derives its present name from the emperor Adrian, by whom it was improved and embellished. The Turks took it in 1360; and it continued to be the seat of their government from 1366 till the taking of Constantinople in 1453. It was occupied by the Russians in 1829; but was evacuated on a treaty being concluded between them and the Turks in September of that year. (Keppel's *Journey across the Balkans*, I. pp. 250—263., *Macnicobar's Journey from Moscow to Constantinople*, p. 156.; *Alsh's Journey from Constantinople to England*, p. 144.; *Dict. Geographiq.* art. "Andrinople," &c.)

ADRIATIC SEA, or GULPH OF VENICE (*Mare Adriaticum* or *Superum*), is that great arm of the Mediterranean extending S. E. and N. W. between the coasts of Italy on the W. and those of Illyria and Albania on the E., from about 46° to 45° 55' N. lat. Its southern extremities are the Capo di Leucini, or St. Mary's, in Naples;

and the Isle of Fano to the N. of Corfu; and its northern extremity the bottom of the gulph of Trieste. It derived its ancient name from the once flourishing sea-port town of Adria (which see), now 18 m. from the shore, and its modern name from Venice. Its W. or Italian shore is deficient in harbours, is generally low, and from the entrance to Rimini has deep water; but from the latter northwards it has been partially filled up by the deposits brought down by the Po and the Adige, and is edged by lagoons, marshes, and shoals. On the E. side its coasts are generally high, steep, and rocky, and are broken into deep bays and gulphs formed by the numerous islands by which it is fenced. With the exception of those already mentioned, it receives no river of any considerable magnitude; and the saltness of its waters is said to exceed that of the ocean. The ebb and flow are considerable at Venice and other places. The *bora* or N. E. wind is the most formidable obstacle to its safe navigation. It comes on in sudden and impetuous squalls, which generally continue for three days, and in an advanced season from 9 to 15 or more. A vessel overtaken by it should always make for a port or anchorage ground on the E. coast, those on the W. being open and unsafe. The S. E. wind throws up a heavy sea; but is not dangerous, as vessels may easily get to an anchorage on the E. shore. Venice, Trieste, Ancona, and Fiume are the principal trading ports on the Adriatic. — (*Dict. Geographique; Purdy's Directions for the Gulph of Venice, &c.* p. 23. &c.) AERSCHOT, a town of Belgium, prov. S. Brabant, on the Demer, 9 miles N. E. Louvain. Pop. 3,722. It was formerly fortified; and has some breweries and distilleries.

AFGHANISTAN, the name applied to a country of Central Asia inhabited by the Afghan nation; and, sometimes, to a kingdom of which that country formed the principal part. In the latter sense, the boundaries of Afghanistan have been subject to the same political changes which have affected other Asiatic states. In the former, considered as the country of the Afghan people, it may be described as extending from the 30th to the 35th degree of N. latitude, and from the 62d to the 71st degree of east longitude; having the Indus on the E., the crest of the Himálach or Hindoo-Coosh, and part of the Paropamesan or Goor mountains on the N.; the districts of Seewecstan, Cutch Gundava, and Sarcawan, with part of the desert of Beloochistan on the S.; part of Seistan, with Ghorian of Khorasan on the west; and Mergháb, and the Hazareh country on the N. W. This rather indefinite bounding line will exclude the Eymauk country, as well as the Hazarehs, neither of these tribes being of Afghan descent; while it includes Herát and its dependencies, which are entirely inhabited by genuine Afghans.

History and Political Changes. — Afghanistan having, from the remotest period of authentic record, followed the fortunes of its more powerful neighbours, or formed but the centre of a greater whole, cannot correctly lay claim to any history of its own, until after the death of Nader Shah. For though several dynasties sprung from its soil, they never erected there a separate kingdom of any duration, unless perhaps in the instance of Subutagen, father of the celebrated Mahmud of Ghiznee, who resided at that city before the rise of his son's power — a power which extended over great part of Asia. On the murder of Nader, in Khorasan, Ahmed Khan Abdallee, after an indecisive conflict with the Persian troops of that conqueror's army, fought his way with 3,000 Afghan horse to Kandahar, where, seizing on a convoy of treasure on its way to Nader's camp, he assumed the ensigns of royalty; and, at the age of 23, in October 1747, was crowned as king, the Dooránee, Kuzilbash, Belooche, and Hazára chiefs assisting at the ceremony. Wise and prudent beyond his years, Ahmed consolidated the discordant mass of the Afghan tribes by employing them in the congenial occupations of foreign conquest and plunder; in which he was so successful, that before his death, in June 1773, after a reign of 26 years, his dominions extended from Nisálpour of Khorasan to Sirhind of the Panjáb, and from the Oxus to the Indian ocean. He was succeeded by his son Timour Shah, a weak and indolent prince, who died in 1793.

Zemaun Shah, the son of Timour, who was placed on the throne by a faction headed by the queen, began his reign with a promise of energy and talent which the event but ill redeemed; for after a seven years' reign of ill-directed enterprises, domestic rebellions, and dark conspiracies, he fell a victim to the revenge of a chief whom he

had provoked, and who first opposed, then seized the Shah, and delivered him to Mahinood, his half-brother and most formidable competitor, who blinded the unfortunate Zemaun.

Mahmood, however, was in his turn soon opposed by Shujah-ool-Moolk, full brother of Zemaun, who, seizing the treasure at Peshawur, proclaimed himself king. But his prosperity was short-lived. Mahmood, who had been made prisoner, escaped, and joining with Futeh Khan, the able chief of the Baurikzees, who had caused the ruin of Zemaun, raised a rebellion against Shujah. At this period the British mission under Mr. Elphinstone arrived at Peshawur; and before it had well quitted the country, the ill-fated Shujah was forced to fly and seek a refuge with Runjeet Sing, chief of the Sikhs, from whose persecutions he afterwards with difficulty escaped to throw himself on the protection of the British government at Loodheana. Mahmood, a king only in name, became a pageant in the hands of Futeh Khan. This minister, turning his arms westward, seized Herát, but soon after fell a victim to treachery and the feelings of disgust which his arrogance had excited in the mind of his royal dependant, being first blinded and then put to death by order of Mahmood and his son Camrán Meerza. His numerous brothers alarmed at this act, fled to their various governments and strongholds, exciting discontent and rebellion throughout the kingdom, until nothing of his dominions remained to Mahmood, save Herát and its immediate dependencies. Since then, till the present day, the affairs of Afghanistan present but a series of civil broils, crimes, and murders, with scarcely a fact worth recording, except the advance of the Sikh chief Runjeet Sing, who has stripped it of Cashmere and subdued Peshawur, with the country between it and the Indus. The remaining Afghan country is now principally in the hands of three chiefs: Dost Mahomed Khan, brother of the murdered Futeh Khan, who possesses Caubul and its dependencies; Khon Dil Khan, another brother, who holds Kandahar, with a smaller territory; and Camran, son of the late Mahmood Shah (who died a few years ago), who still holds possession of Herát and the district belonging to it, in spite of the efforts of the Shah of Persia, who has made more than one attempt to annex it to his own territories.

Divisions and Aspect of the Country. — The former depending rather upon natural features and formation than upon political or artificial arrangement, will best be noticed in describing the latter. This, so far as is known, presents an aggregation of mountainous groups and ranges, diverging from certain principal points, and thus becomes divided into numerous valleys of greater or lesser size, which are watered by streams of corresponding magnitudes, and which sometimes stretch out into plains of considerable extent. The south face of the Hindoo-Coosh is furrowed by a variety of subordinate glens and ravines, which carry their waters to the Caubul river. This stream, which rises near Ghiznee, but drains also the highlands of Kohistan, runs in a large and frequently very broad valley from that city to the Indus, which it enters at Attock. It separates the mountains of Hindoo-Coosh from those to the southward, which, originating in the huge peak of Speengur or Suffeed-koh (White Mountain), spread east and west, confining the Caubul valley on the south, and stretch in a variety of huge ranges in that direction: one of these uniting with that of the Tucht-e-Solymaun, extends to Dereh Ghazeekhan; another enters Seewecstan; and another, tending more to the westward, by Shawl and Pisheen, sinks into the deserts of Beloochistan and Seistan.

The Caubul valley is the most important of the natural divisions thus constituted. It contains the largest river, the finest plains, and the principal cities of the country, including the ancient town of Ghiznee; and extends from the westward of Bauman to the Indus, a distance of more than 200 miles. It is subdivided into several sections, of which the western is formed by Kohistan or "the Highlands," comprising the valleys and lowlands of Nijrow, Punjshéer, Ghorebund, Tugow, and Oozebeen, which are all blessed with a delightful climate, embellished

with the finest scenery, produce the finest fruits in abundance, and are well watered and cultivated.

Lugmaun, also on the north side of the river, comprehends the valleys of Alingâr and Alisheng, with numerous subordinate glens, all equally rich and beautiful. The fertile plains of Jelallabad afford the produce of both torrid and temperate climates. The Dell of Coonur forms but a bed for the rapid river of Kashkâr, which, traversing Kafferistan, here pierces the Himâleh range to join that of Caubul. The small valleys of Punjecora and Bajour pour their streams into the more extensive and very fertile district of Swaut, where forest, pasture, and cultivated land are found admirably blended, and every valuable fruit and grain is produced. The same description will apply to Boonere, Choomla, and all the glens that discharge their waters into the Caubul or Indus rivers from the north. Peshawur, the lower division of the great Caubul valley, is divided from the plains of Jelallabad by a range of small hills, which stretch from the Hindoo-Coosh across to the Suffeed-koh. It is well watered and extremely rich, but suffers from heat in summer.

Damaun, which signifies the "skirt," and is the tract between the foot of the Solymaun mountains and the river Indus, is poorly cultivated and thinly inhabited; being chiefly hard tenacious clay, scantily covered with tamarisk and thorny shrubs. It is bounded on the north by the Salt range of the Khuttuk country, and stretches southward to Dereh Ghazee Khan. A wide extent of mountains intervenes between this district and the valleys which furrow the western face of the Solymaun range; but even in this wild region we hear of fertile tracts. The plain of Boree, for instance, is compared by the natives to that of Peshawur for extent and richness; the rivers Zhobe and Goomul water some fine valleys; and Tull, Chootealee, and Urrah are mentioned as well peopled and cultivated.

Among the valleys opening westward, those of Shawl, Burshore, Pisheen, Ye-soon, Salch, Urghessan, Quashtâ, are described as interspersed with well cultivated spots, but as more generally suited to pasturage than agriculture; but the two first are stated to be rich and productive. Beyond these, to the N. W., the river Turnuk, rising near Ghiznee, but on the southern slope of the country, runs through a poorly watered and ill cultivated district, till, to the westward of Kandahar, it is joined by the Urgundâh, and both fall into the great river Helmund. The district of Kandahar is fertile and highly cultivated, but is circumscribed within narrow limits by the desert. In like manner the valley of Herât, which may be 30 miles long by 15 wide, constitutes the most important portion of that district.

A vast and varied surface, such as has been described, must naturally exhibit much diversity of aspect and fertility. Of the mountainous tracts, some are covered with deep forests of pine and wild olive trees; others afford excellent pasturage for sheep and cattle, while others again are bare, rocky, and sterile. Of the valleys, as we have seen, many are fertile, well watered, and wooded, especially those which pierce the Hindoo-Coosh range; while others, particularly to the south, are bare, or covered only with tamarisk and thorny shrubs.

Mountains. — These have been already mentioned. The chief ranges are those of Hindoo-Coosh, or Himâleh, Saffed-koh, Suffeed-koh, called Râjûn by Captain Burnes, and

from which joins the Solymaun range; and perhaps that of Khojeh Amrân, which seems to be the prolongation of a spur from the last-mentioned range. The Hindoo-Coosh, or Himâleh, is described by Mr. Elphinstone as rising above the level of Peshawur in four distinct ridges, the lowest of which, clear of snow on the 24th of February, was clothed with forests of oak, pine, and wild olive, and a profuse variety of fruit trees, and graceful herbs and flowers. The second was still more densely wooded; the third was at that time white with snow; and beyond rose the glittering and stupendous crest of the true Himâleh, spiring into sharp peaks and bold masses.

Captain Burnes states that the term Hindoo-Coosh, though applied generally to this chain, which is a continuation of the Himâleh, belongs properly to one single peak, forming the western buttress of the range, which beyond that point declines in height, and is lost in the Paropamesan or Ghôr mountains. The peak of Koh-e Baba, estimated by him at 18,000 feet high, is the only one covered with perpetual snow to the westward of the passes. Little is known of the height of the other ranges, but the Suffeedkoh obtains its name from its snowy cap. The Tucht-e-Solymaun is estimated at 12,000 feet in height; and there is a very lofty peak to the south-west, named Kund.

Rivers. — The principal of these have also been mentioned. They are the Caubul, the Helmund, the Turnuk, and Urghundâh; the Goomul, the Zhobe, the Lorah. The courses of the three last are little known, and their waters are lost in the sand, excepting in the time of floods. The river of Kashkâr (called Kama in Arrowsmith's map to Captain Burnes' Travels), which comes from the north-east, running by Chitrâl, can be only considered as partially belonging to this country: the same may be said of the Helmund.

There are no lakes of any consequence known to exist in Afghanistan.

Climate and Soil. — These, as remarked in the general description, vary in an extreme degree, according to locality. In the eastern part of the Caubul valley and in those to the south, bordering on Cutch Gundava, the heat is sufficient to mature all the products of India, such as the sugar-cane, indigo, and some of the tropical fruits; while the northern valleys abound in the productions of cold regions, and the mountains are covered with forests of pines. The plain of Peshawur must, according to Captain Burnes, be one of the most fertile regions of the earth, and wants only industry to become one of the richest and most productive. "The soil," says he, "is a rich mould; it is intersected with water on all sides; and it is said, continues green during the whole year. It yields a succession of three crops annually; and if we reckon the barley (which is cut twice before it ears, and given to horses), we have no fewer than five returns in the year!" (*Travels*, iii. p. 258. 12mo ed.) After this statement we need not be surprised to learn that wheat is sold in Peshawur for less than 1s. 6d. a bushel, and barley for less than 1s. In like manner with regard to fertility, the plains of Jelallabad, Swaut, Boonere, Boree, Shawl, &c. are composed of rich loam and alluvium, yielding the most abundant crops; but the baked clay of Damaun is almost impracticable to the plough; and the vast tracts of secondary mountains and undulating plains, to the west, are only suited for grazing lands, and are lost in the sandy deserts of Setkan, &c. *Mineralogy.* — The mineralogy, as well

as the geology, of Afghanistan, is but little known; but enough is known to render it probable that the mineral riches of its mountains are great. Gold, copper, iron, and antimony have been already produced. Burnes tells us of two sorts of sulphur, of wells of petroleum or naphtha; and, above all, of what may prove still more valuable, of coal, which exists in the district of Cohat, below Peshawur. This, with the discovery of the same mineral in Cutch, may, by facilitating steam navigation, have a powerful effect on the condition of Central Asia.

Agriculture is in the same rude state as in Persia and most Asiatic countries. The soil is broken by a crooked log of wood, sometimes shod with iron, which is generally dragged by oxen; and irrigation is resorted to wherever rain does not fall in sufficient abundance to bring forward the crops. Only the richest and most promising tracts are thus employed; so that, as the seasons are usually regular, the harvest afforded, even by so rude a process, is for the most part abundant. Wheat, barley, rice, maize, form the produce of the more temperate regions; while in the warmer, the smaller grains common to India, as *moongy, chunna, joar, dāl, &c.*, with the sugar-cane, cotton, tobacco, indigo, madder, &c., reward the farmer's labours. Horticulture is carried to a considerable extent in the neighbourhood of the principal towns; and to the fruits of Europe, in high perfection, are added grapes, pomegranates, figs, the mango, orange, lemon, guavas, plantains, and other fruits of India. Vegetables are also reared in great abundance, and of excellent quality; of these two, the rhubarb (*ruwaish*) and the assafœtida plant, deserve mention: the former is used when young and tender, blanched artificially, and is eaten both raw and dressed in great quantities, as a very wholesome delicacy; the latter is not only cultivated for its valuable gum, but is eaten roasted, when it springs young from the earth, like the flower of a cauliflower in appearance. It is esteemed a great delicacy; but it smells so strong, that to those unaccustomed to its odour, one head of it, while being cooked, is enough to poison the air of a whole camp.

Manufactures are confined to home-made stuffs of cotton and wool, and a little silk, which serve for the dress of the inhabitants: little or nothing is manufactured for export.

Commerce.—The disturbed state of the country for a succession of years has been unfavourable to trade; and the large and valuable caravans which formerly carried the rich productions of India and Cashmere to Caubul and Herât, for the consumption of the courts at these cities, or for transit, by Yez, into Persia, now no longer venture to traverse lands where robbery and extortion combine to ruin the merchant. There is still, however, a less extensive traffic carried on, chiefly by a pastoral tribe called the Lohânees, occupying much of the country between the Indus and Ghiznee, who at certain periods of the year repair to India to make their purchases, or receive goods from those who have brought them from thence, at the ferry of Kaheree. With these they return, carrying them on their own camels, through their own country, by the Go-lairee pass, and the valley of the Goomul, not only to Ghiznee and Caubul, but northward, across the mountains, to Berkharâ. Captain Burnes tells us, that a thousand camel-loads of English and Indian chintzes, calicoes and muslins, brocades, shawls, Punjab turbans, spices, &c. are yearly consumed in Caubul; in return for which are sent back horses in great numbers, madder, saffron, assafœtida, and fruit, both fresh

and dried, in large quantities, &c. This trade is increasing, and will probably continue to do so, provided tranquillity and security of property be established in the country, and the present moderate scale of duties levied at Caubul be not increased: and the expected opening of the river Indus for trade, a channel which, with the Caubul river, will enable goods to be conveyed into the heart of Asia, cannot fail to stimulate the commercial propensities of the people, and give rise to a vast increase of civilisation as well as traffic.

Population.—There are no data on which to ground a tolerably accurate estimate of the population of this country. It must vary greatly in different districts. The rich tracts bordering the Caubul river, and the fertile glens that penetrate the Hindoo-Coosh, are certainly more densely peopled than the high and bleak pastoral countries to the west. Mr. Elphinstone, from the best information he could obtain, has mentioned the supposed numbers of several of the principal clans; but it is to be feared that these are not to be depended on. Thus the Eussufzehees, who occupy a very small district at the extreme N.E. corner of the country, are set down as 700,000 souls at least; and the whole of the Berdoorânees, a collection of tribes including the Eussufzehees, who inhabit a country of about 15,000 sq. m., are estimated at nearly 1,400,000, or 90 to the square mile. The Doorânees, on the contrary, who occupy at least 52,000 sq. m., are said to amount to only 800,000 or a million, being from $1\frac{1}{2}$ to $19\frac{1}{2}$ per square mile. The Ghiljees, in like manner, from 500,000 to 600,000 souls, are spread over 1,500 sq. m., or about 40 per square mile. This is on a calculation of five individuals to a family, which is too little in these countries.

Now the whole of Afghanistan as here defined does not quite amount to 170,000 sq. m. of surface, of which suppose the richer parts, such as, and including the,

	sq. m.	per sq. m.	Pop.
Berdoorânee country, to be Country of secondary fertility	30,000	at 90	2,700,000
Poor high land, such as much of the Doorânee country	20,000	40	800,000
The remainder, taken at a low average	60,000	18	1,080,000
	60,000	20	1,200,000
	170,000		5,780,000
Add estimated amount of Tanjiks, &c. scattered over the country and in cities	-	-	1,500,000
			7,280,000

And this is independent of Hindoos, &c., who are stated to be numerous.

This estimate, founded on the vague numbers stated above, would give to Afghanistan a population of more than 7 millions, or nearly 43 to the sq. m., which, taking into account the vast tracts of high and unproductive lands on the west of the Sulciman range, and north of Kundahar and Zemeendawur, is undoubtedly far beyond the truth. The rate of population in Persia does not most probably exceed 10 per sq. m.; and if double be assigned to Afghanistan, it may be received as an ample rate for that country, notwithstanding the large extent of desert in the former and the many fertile districts in the latter. Upon grounds of analogy and probability, therefore, rather than from any existing data, the population of Afghanistan may, perhaps, be regarded as little exceeding four millions.

Tribes.—The Afghan nation is composed

of a great number of tribes, who claim a common origin, and assuredly differ intrinsically very much from all their neighbours. This origin is very obscure: a lately translated history derives them from *Saul** the king of Israel, whose progeny was carried away in the time of the captivity; but no proof of this is adduced, and Mr. Elphinstone classes this among other fabulous genealogies. The name *Affghan* is not known to the people, who call themselves *Pooshtoon*, in the plural *Pooshtoonch*, from whence, by corruption, *Prután* or *Patán*, the name they have obtained in India; and of their great antiquity there is no reasonable doubt. The tribes of Soor and Lodi, from both of which kings have sprung, are mentioned as owing their origin to the union of an Arab chief, Khaled ibn Abdoolla, with the daughter of an Affghan chief, in A. D. 682; and Mahmood of Ghiznee, though sprung from another race, ruled over the Affghans in the ninth century. According to their own traditions, the whole of the tribes descended from the sons of one Kyse or Knis Amdor-resheed, who, whether a real or imaginary character, is the person to whom all their genealogies refer; but as it would be impossible to examine all these, the following classification must suffice to enumerate the principal tribes, with their *habitats*, as they at present exist:—

EASTERN DIVISION. — Berdoorances.

Basundichee,† Oman Kheil. Turkomanes.	Peshawar tribes. Khyberes.	Bungush. Khuttuk.
---	-------------------------------	----------------------

Neighbourhood of Salt range.

Esawkhell. Nisotucks.	Bummoos. Dowra.	Khootes.
--------------------------	--------------------	----------

Tribes of Damann.

Dowlythkheil. Mankheil.	Baloora. Nisoonjeanes.	Gundepoorces.
----------------------------	---------------------------	---------------

CENTRAL DIVISION. — Including mountain tribes.

Jauges. Zaorees. Jadrans.	Vizeerees. Mirichils. Munakheil.	Zimurees. Sik-ranees. Spentorees.
---------------------------------	--	---

WESTERN DIVISION. — Dooranees.

Zecruk.	Punggepaw.

Alko-zehuk.	Ali-zehuk.
Baurik-zehuk.	Isakuk-zehuk.
Atchik-zehuk.	Kougane.
	Makoo.

Ghilgees.

Tooran.	Rooran.
Hutkees. Tokhees.	Solymankhell. Atikhell. Udler. Turrakees.
Sheerpah. Kharotees.	Wurdurka. Baratkees. Tor Turetees.

National Character.— This aggregation of tribes, though exhibiting considerable diversity in customs, dress, and appearance, among themselves, form, taken together, a nation singularly homogeneous; yet Mr. Elphinstone remarks, that "amidst the contrasts which are apparent in the government, manners, dress, and habits of the different tribes, I find it difficult to select those great features which all possess in common, and which give a marked national character to the whole of the Affghans." And this becomes the more perplexing, because even the virtues and attributes on which they most value themselves, and which separate them most from their neighbours, are apt to be misunderstood

or overlooked by strangers. Thus an English stranger might regard their wild freedom as but a savage mixture of anarchy and arbitrary power. Alarmed at the absence of any organised government, or regular courts of justice, and witnessing the summary inflictions of retributive and customary law, he might fancy that violence and revenge entirely usurped the place of justice and equity; while the rude hospitality, the bold and simple manners, and martial and lofty spirit of the people, would scarcely in his mind compensate for their proneness to violence and rapine—to the deceit and fraud which are the vices necessarily engendered by the lawless freedom in which they exult.

The traveller from India, on the other hand, sickened with the servile vices of its plant, timid, and indolent inhabitants, would probably be favourably impressed, not less with the bold and independent bearing of his new acquaintance, than with their sobriety, their superior energy, their strong and active forms, their fair complexions, and features marked and striking even to harshness; and he might view, in the stormy independence of their mode of life, a favourable contrast to the apathy of that which he had left. The result in both cases might be, that, mingled with many a vice and failing, he would find the germ of many a virtue and noble quality; and that however much he might lament their great failings, he would not be able to deny them a portion of his esteem.

One of the strongest characteristics of this people, according to all travellers, is their hospitality, which is founded on national feeling, and there are some usages connected with this principle which deserve mention. The first is that of *Nannuwautee* (two Affghau words, signifying, "I have come in"), by which a person having a favour to entreat goes to the house of the individual on whom it depends, but refuses to sit on his carpet or partake of his food until the boon be granted; and this, if in the power of the party besought, custom makes it imperative on him to concede. A still stronger appeal is the second, being made by a woman, when she sends a person her veil, and implores assistance for herself or for her family.

All persons, even a man's bitterest enemy, is safe under the protection of his roof; but this protection extends not beyond the lands of the village, or at most of the tribe; and it is not uncommon for the stranger who has benefited by it, and experienced the kindest treatment, to be robbed and plundered when once beyond its influence. "There is no point in the Affghau character," remarks Mr. Elphinstone, "of which it is more difficult to get a clear idea, than the mixture of sympathy and indifference, of generosity and rapacity, which is observable in their conduct to strangers. . . . So much more do they attend to granting favours than to respecting rights, that the same Affghau who would plunder a traveller of his cloak if he had one, would give him a cloak if he had none." In this, as well as in their regard for hospitality, their customs much resemble those of the Desert Arabs.

The pastoral tribes in the west are more addicted to robbery and theft than the agricultural ones; but, in general, a previous understanding with the chiefs, confirmed by the presence of a single man, ensures safety; and the Affghans, it

* Burnes says, the Affghans call themselves "Bin-I-Israel, or children of Israel; but consider the term of 'Yahoodies,' or Jew, to be one of reproach.

† The termination *zhee* corresponds exactly to the Scotch *Pick* Mar, or the Arab *Ben*; thus *Basundichee* means "the sons of Basund," *Kheil* means *Clan*, or subdivision of a tribe.

‡ Both the *Suddoochee* and *Baurikzhee*,—the first the tribe

of the kings, the second that of their ministers and of Futehkan — are divisions of the *Peshawares*.

§ A striking instance of this is given by Captain Burnes, who saw on a dung-hill the mangled and hardly dead bodies of a woman, caught in an act of infidelity by her husband, and of her paramour, both of whom had fallen victims to the sanguinary, but here justifiable rage of the injured party. — *Travels*, ii. p. 80.

is said, are less prone to add murder to plunder than most other rapacious tribes. They are reproached with ignorance, barbarism, and stupidity, by the Persians, but on no sufficient grounds. They are less polished, it is true, and have less of worldly knowledge than their reproachers; but are in general prudent, sensible, and observant, and are less indifferent to truth than most of their neighbours. Like most mountaineers, they are proud of their lineage, and will hardly acknowledge one who cannot prove six or seven descents. Like Highlanders too, they are highly national. Love of individual freedom, strong though it be, is exceeded by devotion to family and clan, and this seems by no means to prejudice their love of country at large; for the "*Nung du Poosh tauneh*," or, honour of the Affghan name, which is one of the feelings warmest in their breasts, appears to be equalled by local attachments, so strong in all mountaineers. A native of the wild valley of Speiga, who for some offence had been forced to wander abroad, declared, on his return, that he had "seen all Persia, India, Georgia, Tartary, and Beloochistan, but in all my travels I have seen no such place as Speiga." "To sum up their character in a few words," says Mr. Elphinstone, "their vices are, revenge, envy, avarice, rapacity, and obstinacy; on the other hand, they are fond of liberty, faithful to their friends, kind to their dependants, hospitable, brave, hardy, frugal, laborious, and prudent; and they are less disposed than the nations in their neighbourhood to falsehood, intrigue, and deceit."

Customs, Manners.—The former of these heads comprehends the internal government of the tribes. This is patriarchal. Tribes are subdivided into branches, which are termed *ooloos*, and each of these are commonwealths, which have their chief or *spoon-zherah* (literally white beard), or *mulik* (master), if small; or if large, a khan, who is always chosen from the oldest family, and is sometimes selected by the king, sometimes by the people. These carry on the internal government in conjunction with certain assemblies of heads of divisions, which are called *Jeerga*, and which determine all matters of consequence. In civil actions the statutes of Mahomet are generally adhered to; but criminal justice is administered according to *Poostumvullee*, or Affghan usage, a system sufficiently rude, and founded on the law of retaliation. This, however, as tending to perpetuate feuds and quarrels, is modified by judicial *jeergas* composed of khans, elders, and moollahs, who inflict suitable penalties on offenders; and in fact this whole system is subject to various and considerable modifications.

A family forced or induced to quit its *ooloos* may be received into another; and once received, it is treated with peculiar attention, and placed in all respects on an equality with the original members of the community. Every *ooloos*, moreover, has many persons called *Humsayahs* (or companions), who are not Affghans, and who are regarded with consideration, but not permitted to share in the administration of affairs. Of such *kheils oolooes* and tribes the nation is composed; and when placed under one sovereign, has seldom yielded him a full or implicit obedience. Mr. Elphinstone has compared it to that yielded by Scotland of old to its kings, who ruled pretty absolutely over the principal towns and country in their vicinity, but whose authority diminished as it extended to the extremities of the kingdom; whose court nobles were inordinately proud, and whose more distant chiefs were nearly independent.

Women, Marriage.—Their customs with regard to their females are nearly those of most Mohammedan countries; those in towns are jealously secluded, those in the country have greater liberty. They purchase their wives, who therefore are regarded as property. The husband can divorce at pleasure; a man marries the widow of a deceased brother*, and it is a mortal affront for any other man to take her without his consent; but she is not forced to marry at all. The age for marriage is twenty among men, sixteen for women. In towns, courtships resemble those in Persia, &c. In the country, matches are made more according to the liking of the parties. If a lover can cut off a lock of his mistress's hair, or snatch away her veil, and in doing so proclaim her his affianced wife, no other will approach her with these views, and he generally obtains the consent of her parents on payment of her price; if not, they elope; and this offence, which ranks not less gravely than a murder, is settled by intervention of parties. Among some tribes the bridegroom earns his wife by service, as Jacob did Rachel; some permit not the least familiarity before marriage, others an excessive and perilous degree of it. Polygamy is permitted, as in other Mohammedan countries, but less practised; the poor content themselves with one, those of middle rank with two wives, and perhaps as many concubines. The wives of the rich live in luxury and indolence; the poor not only employ themselves in household, but in field labour. In towns they go about, as in Persia, veiled from top to toe; in the country they only veil in the presence of strangers, and that more from decency than obligation. The Affghan women are said to be correct in conduct and deportment; but adultery or incontinence is punished with death to both parties upon the spot, by the injured relative. (See *ante*, p. 17. note.)

Education is conducted much as in the common countries. A village moollah, or schoolmaster, teaches the children of the poor to say their prayers and to read the Koran; the rich keep *lallas*, or private tutors, in their houses; the village schoolmasters are paid in allotments of land and some small fees. Those intended for the learned professions go to towns, and live in colleges instituted for the purpose of instruction.

Literature is at a very low ebb. The Pooshtoo language is an original stock, embracing a good deal of Persian, with some Zend and Sanscrit words: they use, in writing it, the Niskee character of the Persian alphabet; but there are few or no works of much repute in the language.

Religion.—The Affghans are all Mohammedans of the Soonee persuasion, and are superstitious enough, believing in alchemy, astrology, and magic; but are far from being intolerant to others. Hindoos remain unmolested, on paying a slight tax. Christians sustain neither persecution nor reproach; they are called people of the book, as deriving their tenets from a written source, which they themselves respect, instead of being pagans, as the Hindoos. Sheahs are detested more than any sect: yet the country is full of Persian sheahs, many of whom held important offices under the crown, and now do so under the several chiefs. Sooffeism (or free-thinking), though denounced by the moollahs, is common, and gains ground among the higher orders. The priests and moollahs, like those of Persia, are avaricious, hypocritical, and bigoted, as well as arrogant and overbearing, and they

* This looks like a relic of Jewish custom, and tends, *pro tanto*, to indicate the Israelitish descent they claim.

exert a very absolute and dangerous power over the people. This is strengthened by the occasional exercise of good offices, and by the influence of some rare examples of wisdom and virtue, evincing in repressing bloodshed and violence. But the blind regard of the Afghans for these holy impostors is chiefly attributable to their ignorance and superstition, which lead them almost to adore all dervishes and other ascetics, and to visit their tombs as those of canonised saints.

Personal Appearance, Amusements.—The men of Afghanistan are for the most part robust, generally lean, though bony and muscular. They have elevated noses, high cheek bones, and long faces; their hair is commonly black, sometimes brown, rarely red; they wear long thick beards, but shave the middle of the head: the western tribes are stouter than those to the east; the latter have darker complexions, and more strongly marked features: their demeanour is frank and open, equally free from stateliness and puerility; they are very social, delighting in dinner-parties, smoking after dinner, and sitting in a circle telling stories of kings, viziers, and genii, or singing songs, generally about love, to the sound of instruments like rude guitars, fiddles, and hautboys: they take much snuff, of a high-dried fine-powdered sort, like the Scotch: they are fond of the chase, driving the game into some valley, and killing great quantities; also of coursing hares, foxes, and deer with greyhounds; and they ride down partridges in the open ground, firing them out till they can knock them down with sticks: they are also fond of horse-racing and fighting cocks, quails, rams, dogs, and even camels. The western Afghans have a dance, called the attum or ghoomboor, in which ten or twenty people move in strange attitudes, shouting and clapping hands in a circle, round a single person, who plays on an instrument in the centre. The national costume appears to consist of a loose pair of trousers of dark cotton stuff; a large shirt like a waggoner's frock, reaching a little below the knees; a low cap, the sides being of black silk or satin, and the top of some sort of brocade; half-boots, lacing up to the calf; and a cloak of soft grey felt, or of well-tanned sheepskin with the wool inside. The women wear a shirt like that of the men, but much longer and of finer materials, coloured or embroidered with silk; their trousers are tighter than those of the men; a small cap of bright-coloured silk, embroidered with gold thread, comes down to the forehead or the ears; and they throw over their head a large sheet of plain or printed cotton, with which they hide their face when a stranger approaches; they divide the hair on the brow, and plait it into two locks which fasten behind; they wear round their head strings of Venetian sequins, and chains of gold or silver, which are hooked up, and end in two large balls hanging down on either side: ear rings, finger rings, and nose pendants are worn. In towns the fashions more approach those of Persia, particularly to the westward.

Of individual Tribes.—What has been said applies to the nation in general; but almost every tribe has its peculiar characteristic, which can be but shortly touched upon. The Berdooranees, who occupy the north-eastern districts, are brave but quarrelsome, active, industrious; but selfish, bigoted, and remarkable for vice and debauchery. Their quarrelsome disposition is thought to have given origin to a sort of federative alliance, offensive and defensive, among

tribes and subdivisions called *Goondees*, which were held more binding than ties of blood. From these *Goondees*, however, were excepted the *Eussuffzees*, the most powerful and numerous, as well as most haughty, insolent, and turbulent tribe of the Berdooranees, who are said to number 700,000 souls. They now occupy Swaut, Buncro, Puijceora, &c., and are notorious for the anarchy which reigns among their *oolooses*. Though an agricultural people, they do not themselves labour; this is left to their *fakirs*, a species of *villains* or servants, consisting of strangers or individuals of conquered tribes of other nations, reduced to serve these invaders, and protected by them for their services. Their masters, or *klawunds*, can beat or kill them at pleasure, but are bound by custom to protect them; and provided they pay the customary tax, and do their work, they may engage otherwise in trade as they please, and are commonly treated mildly.

The *Tookolanees*, who are brave, active, industrious, and cheerful, are all subject to one powerful chief, who exercises over them a very powerful authority.

The *Khyberies*, who possess the upper branches of the Lagul or Spengur mountain, and derive their name from the formidable pass of Khyber, are the most rapacious and treacherous robbers of all Afghanistan: no previous agreement secures the traveller from their assaults; they watch the approach of the caravan, matchlock in hand, and choose their victims with certainty and security. They are a lean muscular race, capital marksmen, and carry swords and short spears in addition to their matchlock; they are altogether more uncouth than most of their countrymen.

The *Khuttuls*, occupying the banks of the Indus, from the Caubul river to the Salt range, are a tall well-favoured people, as remarkable for honesty and orderly conduct as is their country for dreary and rugged barrenness.

The tribes of *Damanu* are said to be more simple and honest, less bigoted and litigious, less vicious and debauched, than the northern tribes. They are a more bony and fairer race than the Berdooranees, and universally wear long hair and beards. They owe the greater order which prevails in their *oolooses* to an establishment of magistrates, formed some fifty or sixty years ago, which has been eminently efficient.

The *Gundeepors* are a particularly thievish and quarrelsome race, in spite of a commercial turn, which leads many of them to make annual trading journeys to India and Kherasan.

The *Baboors* are a civilised tribe, much employed in merchandise. The *Stooranees* were shepherds, till robbed of their pasture lands by the *Caukers*, when they betook themselves to agriculture. These agricultural tribes shave all *fakirs*, or *villains*, like the *Eussuffzees*.

Of the central division, the *Jangees* and *Toorees*, hereditary enemies, live in the glens and valleys of the Solymaun range. The country of the former is colder, wilder, and higher than that of the latter; the mountain sides are covered with pines. The *Jaudrais*, who dwell in a pleasant district westward of the rich plain of Bunnoo, are remarkable only for their disgusting vices.

The *Sheeranees*, who inhabit the borders of the Tukhtu-e-Solymaun, a wild inaccessible country, are very poor and uncivilised, plunder every one, and are at war with all the world; yet they never break their word, and a single individual of their tribe suffices to secure the safety of a party: they are described as wild and savage in their ap-

pearance, as in their habits and mode of life. The *Zmurrees*, neighbours of the last, resemble them closely, but are less inveterately predatory. The *Vizeerees*, N. W. of the two last-mentioned tribes, live in little societies, among pine-covered mountains, and are equally uncivilised and addicted to plunder; yet the smallest escort ensures safety, and the chiefs, powerful khans, are, it is said, remarkable for their love of peace. The *Vizeerees* are divided into a fixed and erratic population. The long valley of Zawra, which opens on the plain of Tull and Chooteallee, is inhabited by the white and black (*speen* and *tor*) *Zereens*, great carriers of merchandise between Upper Sindh and Candahar.

The two most noble and important tribes, however, are the *Dooranees* and *Ghiljees*. Their territory consists chiefly of high bleak downs, interspersed with hills, in some parts desert, in others sparsely cultivated, in all open, bare, and fit chiefly for pasture. They are therefore chiefly a pastoral people, with patriarchal habits, and live for the most part in tents of black wool. These (*kizhdees*) are from 20 to 25 feet long by 10 or 12 broad, and 8 or 9 high, supported by a row of three poles, and closed all round with a curtain. In winter they are lined with felt, and are warm and comfortable. The country of the *Dooranees* is 400 miles long by 130 broad, extending from the Paropamesan mountains to the Khojeh Amrân range. They were formerly called *Abdallees*, till the late Ahmed Shah, their chief and sovereign, changed the name, in consequence of the dream of a famous saint, he taking that of Shah Dooree Doorân. They may amount to 800,000 souls; the *Siddoozhees*, from whence sprung the king, is a subdivision of the *Populzehees*. The king is their hereditary chief, and military commander of the whole: he claims a horseman's service for every plough of land; and the officers commanding them are the civil magistrates of their respective districts, besides being employed in offices of state at court, when there was a court. The internal government of the clans is better maintained than among other tribes, and the progress of improvement and civilisation among the agricultural *Dooranees* has been correspondingly great. They are generally handsome stout men, with good complexions and fine beards. They are brave and hospitable; and though not quite strangers to rapacity, still may be esteemed the worthiest of their race.

The *Ghiljees* occupy the upper valley of the Turnuk, and great part of the Caubul valley, to the Berdooranee country; a tract which contains some of the principal cities, with some fine districts of land, but the climate of which is cold. The *Ghiljees* were formerly the leading tribe of Afghanistan. It was a branch of them that conquered Persia and broke down the power of the Sassanian kings; and they are still a high-minded, brave, and numerous people.

The *Hotekees* and *Tokhees* are the noblest of their clans, having produced — the first, kings; and the second, their viziers; and they are a hospitable and good people, ranking deservedly as the second of the Afghan tribes: they amount to about 100,000 families, and resemble much the *Dooranees* in appearance, customs, manners, and dress, though hating them, as their successful rivals, with an unquenchable hatred. They are perhaps the fairest and handsomest of all the Afghans.

There is yet another class, which, though not strictly Afghan, still, as amalgamated with that

people, ought to be mentioned — the *Tâjiks*. The word is used in opposition to that of *Toork*, the peaceable to the warlike; and it was applied to the subdued Persians by their Tartar masters. In Afghanistan they are supposed to be descendants of Arabs displaced by their conquerors, who now live scattered over the land which they might once have cultivated as their own. As tenants or servants, they are mild, sober, peaceable, and industrious, and live on good terms with the Afghans, who, though they regard them as inferiors, do not treat them with contempt. They are most numerous in and around the great cities, and are all zealous soonnies. Mr. Elphinstone calculates the *Taujiks* as numbering 1,500,000 throughout the whole country.

Government Chiefships. — Afghanistan, it has been said, is now split into three principal chiefships. Dost Mahomed Khan, who resides at Caubul, rules the country from Baunian and the Hazara mountains to and including Ghiznee on the south, and to Néculla in the Caubul valley on the east. When Captain Burnes was there in 1831-2, his revenues amounted to 18 lacs, or 180,000*l.* a year, and he maintained 9,000 Afghan horse, well appointed, with 2,000 foot, and 14 guns, besides auxiliaries and village troops, that is, contingents; and both revenue and military forces have increased since then. This chief is very attentive to business, superintending personally the distribution of justice; he encourages trade — his own country is safe to the merchant; he is zealously orthodox, remarkably intelligent and inquisitive, and of excellent manners and address. He is even now but little past 40; so that with his great natural abilities and excellent disposition, he may be the author of much good to his country. Unfortunately he is on bad terms with his brothers, particularly with those at Kandahar.

These are — Kohn Dil Khan, Ruhn Dil Khan, and Meer Dil Khan, who rule Kandahar together; the first, however, being regarded as chief. His territory is less defined and less valuable than that of Caubul, extending south towards Cutch-Gundava, and the Sindian frontiers. His revenues in 1832 were about 8 lacs of rupees, or about 80,000*l.* a year; his military force, 9,000 horse and 6 pieces of artillery; but this, were his government popular, which it is not, he might greatly increase, as Kandahar is close to the *Dooranee* country. He has none of the abilities of his brother at Caubul, and his acts of oppression will prevent his power or influence from increasing.

Kamrân, son of the late Mahmood Shah, retains Herât, as we have said, and maintains the shadow of a court on the ancient Abdallee model. But it is rather in consequence of the claims set forward by Persia to this province, than his own intrinsic power, that he has been permitted to remain unmolested. The Afghans came forward, as is understood, to assist this last descendant of their kings in his late successful struggle with Persia, and Kamrân took the field with a considerable force. He is said still to possess some of the crown jewels of Caubul; and he derives a considerable revenue from the transit of goods through the city. Connolly states the nominal amount of duty levied in the city at 21,429*l.* sterling, but says that much more is really extorted, and that Kamrân's annual revenues are 89,248*l.* sterling. But he is a cruel,

* In Persia the inhabitants of great part of the northern provinces bordering on the Caspian Sea are *Tâjiks*, or *Tuts*. They are held to be the aboriginal people of the country, and speak a peculiar language, supposed a mixed dialect of ancient Persian.

capricious, and rapacious tyrant, and not likely ever to consolidate any considerable share of power.—(We are indebted for this valuable article to J. B. Fraser, Esq., the celebrated traveller.)

AFIUM-KARA-HISSAR (or *Black Castle of Opium*), a city of Asiatic Turkey, in Anatolia, cap. Smyrna, 1841 N. E. Smyrna, lat. $38^{\circ} 45'$ N., long. $30^{\circ} 56'$ E. It is situated on the declivity of a mountain range, and is defended by a citadel, built on a high and almost inaccessible rock. Pop. estimated by Kinnear at 12,000 families, or from 50,000 to 60,000 individuals. It is pretty well built; but the streets are exceedingly narrow, and in many parts very steep. Some of them are washed by streams that descend from the adjacent mountains. It has numerous mosques, two Armenian chapels, six khans, and five public baths; an extensive manufactory of black telt, fire-arms, short sabres or *yagars*, with stirrups, bridles, &c. But it is principally celebrated for the great quantity of opium grown in its vicinity; from which, indeed, it derives its modern name. It is said by D'Anville to be the *Amacea* of the Greeks and Romans; but the latter was situated a good deal further W. According to the Turkish annals, it was founded by Aladdin, one of the Seljukian sultans. It was the patrimony of Othman, the founder of the Turkish empire, of which it has ever since formed a part.—(*Kinnear's Journey*, p. 223; *Onicer*, vi. p. 469.)

AFI-KOLA, a town in Naples, prov. Terra di Lavoro, 5 m. N. N. E. Naples, in a plain. Pop. 3,000. It has manufactures of straw hats; and a great annual fair, which commences on the second Sunday of May.

AFRICA. A vast peninsula, one of the great divisions of the globe, situated to the S. of Europe, and to the W. and S. W. of Asia. It is separated from the former by the Mediterranean Sea and the Strait of Gibraltar; the two continents approaching at the latter within about 10 m. of each other. It is separated from Asia by the Red Sea, at whose southern extremity, the strait of Bab-el-mandeb, the shores of the two continents are only 16 m. apart. But at the most northerly extremity of the Red Sea, Asia and Africa are united by the isthmus of Suez; the Mediterranean being there about 72 m. from the Red Sea.

The most southerly point of Africa, Cape das Agulhas (Cape Needles), is in lat. $34^{\circ} 52'$ S.; and the most northerly, Cape Blanco, opposite Sicily, in lat. $37^{\circ} 21'$ N. Cape Gardafui, the most easterly point, is in long. $51^{\circ} 30'$ E., and lat. $11^{\circ} 50'$ N.; and Cape Verde, the extreme western point, is in long. $17^{\circ} 33'$ W., and $14^{\circ} 43'$ N. lat. The distance between the most southerly and most northerly points is consequently about 5000 m., and between the extreme eastern and western points not much less. The area probably falls little short, if it do not exceed, 12,000,000 sq. m.

1. Africa is distinguished from the other continents by its coasts extending mostly in continuous, unbroken lines, having but few indentations of the sea, and no extensive peninsulas; so that it forms a more compact and undivided mass of land. The uniformity of its outline seems to be in accordance with the uniformity of its interior. The surface of the latter does not present that endless succession of changes which are met with in Europe and southern Asia, and which are found in both Americas, but on a greater scale and at greater distances. It resembles rather the northern parts of Asia, exhibiting large elevated table-lands and low plains, both of immense extent and of remarkable uniformity. The whole of Africa south of the equator, and north of it up to 10° lat., seems to constitute an extensive table-land, fringed in most parts by a comparatively narrow strip of low land along the sea. North of this table-land, between 10° and 30° N. lat., extends an immense but low plain, the greater part of which is occupied by the Great Desert, or Desert of Sahara. A comparatively narrow tract of mountainous country, including Atlas and its dependencies, separates the desert from the Mediterranean. On the E. the desert does not reach the Red Sea; being separated from it by the mountains of Abyssinia and the rocky countries extending from them northward along the Red Sea to the shores of the Mediterranean.

1. The elevated table-land in South Africa is less known than any other portion of the continent, the nature of its surface rendering it extremely difficult to penetrate

from the sea-coast into the interior. We are only well acquainted with the southern extremity, which forms the Cape Colony. Here Africa presents to the Indian Ocean a broad line of coast, running east and west nearly along the 34th parallel from 18° to 26° E. long., or from the Cape of Good Hope to Algoa Bay. Along this coast extends an undulating country, intersected with a few elevations deserting the name of hills. Its width varies between 10 and 50 miles. North of this the table-land rises in terraces. The first terrace, called the Long Kloof, is enclosed by the double ridge of the Zwart Berg, or Black Mountains, of which the northern, or the Groote (Great) Zwart Berg, rises to about 4,000 ft. above the sea. North of this range is the second terrace, called the Great Karroo, which is about 100 miles across, and 3,000 feet elevated above the sea. It is bounded on the N. by the Nieuveveldt Bergen, a chain of which some summits are considered to rise to 5,000 or 10,000 feet. On its northern side the table-land seems to have attained its mean elevation, which probably is not less than from 4,000 to 5,000 feet.

At both the eastern and western extremities the two above-mentioned ranges run N. W. and N. E. parallel to the sea-shore, at a distance of from 30 to 200 miles; the intermediate space being likewise occupied by two or more terraces. The ranges along the W. shore do not extend further than about 25° S. lat., where they terminate in isolated hills and with a high bank on the Gariep or Orange River. N. of this river the coast, when seen from the sea, presents only high sand-hills without any traces of water, and is, consequently, entirely destitute of vegetation. It extends as far as Cape Negro (18° S. lat.). The interior east of the western ranges and of this coast is an elevated sandy desert, with few wells and little rain. Only that portion lying S. of Gariep river has been visited, the remainder, and by far the greater portion, is less known than the Sahara itself. This desert country, which presents a level without hills or mountains, extends over half the breadth of the continent as far as 24° E. long.

The eastern half of the table-land from the Cape Colony to 18° S. lat. offers a different aspect. A great number of mountain-ranges, of moderate elevation, traverse it in different directions; and at the foot of these ridges the country is well watered and fertile; though here, too, extensive sterile tracts occur, but they are not continuous. We are, however, only acquainted with the southern part, up to 26° S. lat. Farther north, about 20° , a high mountain range is said to exist, called the Limpata Mountains, but this is doubtful. The descent from the table-land to the Indian Ocean is also formed by two or three terraces, the highest edge of it being about 50 or 100 miles distant from the shore. This edge, formed by a mountain ridge, prevents the rivers of the table-land from escaping to the Indian Ocean; so that they either run westward, and fall partly into the Gariep river, or are partly lost in the sands of the desert.

North of the Zambesi river (about 18° S. lat.), which appears to have the greatest part of its course on the table-land, the interior of its eastern parts is entirely unknown. A lake, called Moravi, is reported to extend over many degrees of lat., but its existence is doubtful. The eastern descent of the table-land resembles that farther south, being formed by terraces. This, however, extends only to the equator, or the mouth of the river Zaire; for farther north, up to Cape Gardafui, the coast itself is formed by high rocks, rising to 400 feet and upward, and no mountain ranges are visible from the sea. A few rivers, apparently of considerable size, break through the rocks along the coast.

It would seem that on the western side of the continent, between 18° and 40° S. lat., there is a considerable depression in the table-land. This country, which is known under the name of Lower Guinea, has low shores, behind which at a considerable distance the surface seems to rise, but not to a great height. Then follows an uneven plain, watered in its lower parts by numerous rivers, among which the Zaire or Congo and the Cuana are the largest; but towards the sources of these rivers the country is mountainous, and it is even reported that some of the mountains are always covered with snow. In the plain numerous lakes of considerable extent are met with.

North of the river Zaire, at about 40° S. lat., the country again rises at no great distance from the sea to a great height. Its high ground is called Serra Capilde. Its W. declivity extends N. W. by degrees approaching nearer the Atlantic, till it reaches the innermost corner of the Bay of Biafra, where it comes close down to the sea, and forms for more than 30 miles the shore, rising, under the name of Cameroon Mountains, to 18,000 feet above the water. These great mountain masses seem to form the W. extremity of an extensive range, which at about 50° of N. lat. seems to traverse the whole continent, and of whose central parts we get some information from the Arabian geographers, by whom it is called

Djebel-el-Kumri, or the Moon Mountains. This range, which seems to constitute the higher edge of the table-land to the north, appears to stretch eastward toward the Straits of Bab-el-mandeb, until it unites to the mountain system of the Abyssinian Alps. North of this range, as far as about 10° N. lat., a mountainous country extends between 10° and 25° E. long., which may be considered as the terraces by which the table-land descends gradually to the low plain, which extends farther north.

The extensive mountain region which has obtained among us the name of Kong may be considered as a continuation of the high table-land of southern Africa, being separated from its northern terraces only by the narrow valley of the Quorra, between 7° and 8° N. lat., and farther south from the Cameroonian Mountains by the extensive delta of that river. East of the meridian of Greenwich it approaches by degrees nearer the sea, whilst its northern edge draws off in a N. W. direction, until between 4° and 5° W. long. it approaches 15° N. lat., so that between 5° and 12° W. long. it extends over ten degrees of lat. It terminates rather abruptly near 12° W. long., but its rocky masses come down close to the shore between Cape Palmas and Cape Sierra Leone. This mountain region, in which a great number of fertile valleys and plains are combined, is of very moderate height in its eastern and more narrow portion, rising hardly to more than 3000 feet; but farther west it is higher, and between 5° and 8° W. long. it is reported to be crowned by several peaks which pass the snow line. But only a very small portion of it has been visited by Europeans. In its western districts are the sources of the Quorra.

2. **The Great Plain,** which, on the south, is bounded by the high table-land of southern Africa and the Kong Mountains, and hence stretches northward to Mount Atlas and the ridges depending on it, contains two different countries, a fertile and a sterile. The former called Soodan, and the latter Sahara.

Soodan, under which name the lower terraces of the table-land seem also to be comprised, extends from the E. descent of the Kong Mountains to the banks of the Bahr-el-Ablal (the W. branch of the Nile), occupying, inclusive of the lower terraces of the high table-land, the country lying between 5° and 15° N. lat. Its lower districts, which lie contiguous to the Sahara, are, according to a vague estimation, from 1000 to 1200 feet above the sea, but the terraces of the table-land rise to 3000 feet and upward. In many parts it is well watered by rivers, which descend from the table-land or originate in the low ridges by which the country is intersected; such districts are covered with immense forests, and are very fertile where cultivated. In other parts water is rather scarce, and some of them partake largely of the nature of the Sahara. Its climate is extremely hot, nevertheless it sometimes happens that during night the thermometer descends to the freezing point.

The Sahara, or sea of sand, covers perhaps nine tenths of the whole plain. East of the meridian of Greenwich, it extends from the foot of the Kong Mountains (15° N. lat.) to that of Mount Atlas (about 30°), occupying the whole width of the plain, which is here 1000 miles across. Farther east, where it is bounded on the south by Soodan, it is some what less wide, which is produced by some mountain ranges connected with the Atlas, extending in an E. S. E. direction. But its breadth is nowhere less than 760 m. It is divided into two parts by a tract of stony country, by which it is traversed from N. to S., between 13° and 15° E. long., and which in parts offers some cultivable land, while in others the stony surface is covered with sand. By following this stony tract Messrs. Denham and Clapperton, who set out from Tripoli, succeeded in reaching Soodan. That portion of the desert which extends between this tract and the Atlantic Ocean is called *Sahal*, and is almost entirely covered with a fine sand, which being agitated by strong easterly winds, appears like the surface of the sea, and often rises in the air in the form of sand-pouts. Low hills and wells occur in a few places; and water, in many parts, is only buried at a depth of more than 100 feet. In that division of the desert which extends between the above-mentioned stony tract on the one side and Egypt and Nubia on the other, the surface is covered rather with gravel than with sand, and in many places with a hard clay; elevations, and even ridges of low hills are here much more frequent, and consequently also wells. All the western part of the Sahara would, owing to its burning heat and the want of water, be totally impassable, were it not that it is here and there interspersed with verdant well-watered spots or oases, which appear like islands of the best in the midst of desolation. The ancients compared them to the spots on a leopard's skin. (*Strabo*, p. 120.) These oases are mostly of very limited dimensions, but some of them, particularly those on the east side of the great desert, are very extensive: the country of Fezzan, for example, is in fact an oasis. They are usually surrounded by higher land,

which serves to account for the springs, and consequently the verdure, for which they are so celebrated. But there seems to be much probability in the shrewd conjecture of Major Rennell, that the oases are indebted for no inconsiderable portion of their reputed beauty and delicious freshness to the striking contrast between them and the parched desert by which they are surrounded. — (*Geography of Herodotus*, 8vo. ed. ii. p. 185.) Those only who have toiled for days amid a pathless burning sand, can form a proper idea of the delight experienced in falling in with one of

—— the tufted lilies,
That verdant rise amid the Libyan wild.

In England or France they might be thought nothing of; but in the Sahara they seem more than a paradise. The famous temple of Jupiter Ammon was erected in the oasis of Siwah, in the N. E. angle of the great desert, in lat. $21^{\circ} 12'$ N., long. $26^{\circ} 18'$ E.

3. **The Abyssinian Mountains,** which are little known to us, except in their north-eastern and northern declivities, where they approach the strait of Bab-el-mandeb and the shores of the Red Sea, and terminate at about 12° N. lat., seem to constitute an extensive mountain system, whose centre is placed between 8° and 9° N. lat. In the countries called Narea and Effat. In this part it seems to approach the snow-line, but not to rise above it. It is less elevated at the source of the Barbel-Azrek or Blue River, one of the upper branches of the Nile, where it rises, according to Bruce, at from 9,000 to 10,000 feet above the sea. We do not know whether or in what manner the Abyssinian Mountains are connected with the Gebel-el-Kumri, or whether they are separated from the high table-land, or constitute its N. E. boundary, which seems to be the more probable hypothesis. The valleys of this mountain system are fertile and well-cultivated.

From the northern declivity of the Abyssinian Mountains extends along the shores of the Red Sea as far as the isthmus of Suez a rocky country, which, between 12° and 20° N. lat., occupies in width an extent of between 300 and 400 m., but farther north by degrees grows narrower. Between 23° and 30° N. lat. it is only from 150 to 200 miles across. Near its western border it has a deep, but comparatively narrow depression, in which the river Nile flows N. from the Abyssinian Mountains to the Mediterranean. This long valley is mostly very fertile. The small portion of the rocky country which lies to the west of this valley, and which forms the eastern boundary of the Sahara, does not rise to a great height, rarely to more than about 1000 f. above the valley. But the countries east of the valley of the Nile and between it and the Red Sea are more elevated. They form a table-land, mostly of an uneven surface, which however in many places exhibits extensive plains, whilst in others it rises into ranges of high hills. Many of the plains are covered with sand, and resemble the eastern portion of the Sahara; other districts afford pasture ground, but very few places are fit for agriculture and cultivation.

This rocky country terminates on the banks of the Nile in the parallel of Kahira (Cairo), from the neighbourhood of which its northern boundary runs off in an E. N. E. and W. N. W. direction. The former constitutes the isthmus of Suez, and reaches to the Mediterranean between the Lake of Menzaleh and Ras Kazaroon in Syria; farther east it joins the mountains of Arabia Petrea. This rocky country lies to the E. of the delta of the Nile. On the W. of the delta the rocks run from the Kahira W. N. W. to the Arabs' Gulph, where they approach the Mediterranean near the Arabs' Tower (31° N. lat. and $29^{\circ} 30'$ E. long.). From this line the rocky country extends westward with a width of about 70 m. at the outset, which, however, increases as it advances farther W. so as to occupy between 200 and 300 miles at 20° E. long., where it suddenly terminates. In the neighbourhood of the Egyptian delta, the rocks are hardly a hundred feet above the plain, but farther W. they rise into high hills and mountain-ridges (Gerdobah Mountains), and terminate with the high table-land of Barca, whose mean elevation above the sea is estimated to be about 1500 feet. Where the table-land of the Barca terminates with a rather abrupt descent (near 26°) a narrow strip of the Sahara comes up to the very shores of the Mediterranean, at the most southerly corner of the Gulf of Sydra or Kibbir (the Great Syrtis), where it terminates on the beach with sand-hills. This strip of the Sahara separates the rocky region of the Nile from the mountain system of the Atlas.

4. **Mount Atlas and its dependencies,** by far the most celebrated of the African chains, occupy that portion of the continent most to the north and nearest to Western Europe. It seems to begin on the E. near the eastern boundary of the country of Fezzan, whence two ridges of moderate elevation run W. N. W., and in the beginning are called Karush. Farther E., however, they receive

other names. This mountainous country, which traverses the N. of Fezzan and the S. of Tripoli, is nowhere probably more than 120 miles in width; but the ridges of low hills which issue from it advance to the very shores of the Mediterranean, between Cape Mesurata and the Gulf of Gabes (the Lesser Syrtis), so that the whole region may be from 180 to 200 m. across. At the Gulf of Gabes, however, the region of Mount Atlas enlarges considerably towards the N., and thence to its western extremity on the shores of the Atlantic Ocean its mean breadth exceeds 350 miles. The highest ridge seems to traverse the region in an oblique line, beginning on the east opposite Sicily, at Capes Bon and Bianco, and terminating on the shores of the Atlantic at Capes Geer and Non. The mountains which occur in that line do not appear to rise above the line of congelation, or at least only in a few insulated points. The country which extends N. of it to the shores of the Mediterranean is mountainous, and contains a number of fertile longitudinal valleys. Farther W. (about 3° W. long.), however, where its northern slope is directed W. to the Atlantic Ocean, it extends in large plains, which follow each other in the form of terraces. The tracts of country which lie to the S. of the highest ground cannot be called mountainous, their surface being formed by wide, broad-backed ridges, of very moderate elevation, and by slight depressions between them in the form of shallow valleys. These latter tracts partake of the hot and dry character which distinguishes everywhere the African continent: whilst the district situated towards the Mediterranean and the Atlantic Ocean resembles more the countries of southern Europe. (See *ATLAS*.)

5. *Climate*.—By far the greater part of Africa lies within the torrid zone, those countries only which are situated towards its southern and northern extremities being beyond the tropics, or within the temperate zones. Owing to the vast extent of its arid plains, and the general want, in so far as we are able to discover, of the tempering influence of extensive inland lakes or seas, the temperature of Africa is decidedly higher than that of any other of the great divisions of the globe. The parts without the tropics are destitute of that regular succession of four seasons which is considered as a characteristic feature of the temperate zone. Here, as between the tropics, the year is divided into the dry and rainy seasons; but with this difference, that between the tropics the rainy season sets in when the sun approaches the zenith, whereas it occurs in the countries beyond the tropics when the sun approaches the opposite tropic, and consequently is at the greatest distance from their zenith. The rainless zone, or the space intervening between the countries which have the rainy season in summer and those which have it in winter, occupies in Africa a much wider extent of surface than in the other divisions of the globe. In the northern hemisphere, the tropical rains cease on the southern borders of the Sahara at about 16° N. lat., and the winter rains begin at its northern border about 28°; so that the rainless region here occupies twelve degrees of lat. In the stony country E. of the Sahara, the tropical rains cease between 18° and 19° N. lat., and the winter rains between 27° and 38°; here therefore the rainless season occupies nine degrees of lat. We are less acquainted with the climate of the countries lying contiguous to the southern tropic; but it is certain that on the western side of Africa, between 28° and 20° S. lat., a great sandy desert extends over the greatest portion of the table-land, in which there falls very little if any rain. The eastern declivity of the table-land, which is exposed to the immediate influence of the north-east monsoon, has a regular succession of dry and rainy seasons.

The great extent of the rainless regions seems to be one of the principal causes of the high temperature of this continent. Nearly all the countries of Africa are hotter than those of Asia and America situated under the same parallels. The highest degree of heat is experienced in the Sahara and the countries bordering the great desert. It is, however, worthy of remark that in Soudan, in about 10° N. lat., and at no great distance from the Sahara, the temperature sometimes descends at night to the freezing point.

6. *Rivers*.—Though Africa, being mostly situated between the tropics, has the full advantage of the abundant tropical rains, it is less favoured with running waters than the other divisions of the globe. This is partly ascribable to the great extent of the rainless regions, and partly to the elevation of the table-land occupying the southern half of the continent. The countries which are well watered are not numerous, and occupy but a small portion of the whole surface. Such are the northern declivity of Mount Atlas, the countries embosomed within and lying contiguous to the Kong Mountains, Soudan, the valleys of the Abyssinian Mountains, the western coast between 4° and 18° S. lat., and the comparatively narrow strip of country lying along the east coast from the Cape of Good Hope to the equa-

tor; to which are to be added the deltas of the Nile and the Quorra.

The largest river is the Nile, which probably has a course of not less than 2500 m.; but as the source of its remotest branch, the Bahr-el-Abiad (the White River), is still unknown, its length cannot be determined with any degree of precision. It is equally impossible to determine the length of the Quorra or Joliba, the Niger of the ancients. For though its middle portion was ascertained by Mungo Park, and its lower by Clapperton and the Landers, its upper portion, which seems to traverse the high table-land enclosed by the Kong Mountains, has not been visited. Its whole length does not probably exceed 2000 m. The course both of the Senegal and Gambia are known; the former running about 1000 and the latter 700 m. The rivers traversing the high table-land of Southern Africa are only known at their mouths and a short distance inwards. These are the Congo or Zaïre, and the Cuanza, which fall into the Atlantic Ocean; and the Zambesi, which falls into the channel of Mozambique. The river Gariep, or Orange, which flows a short distance to the N. of the Cape Colony, is pretty well known in its whole course, and may run about 900 miles.

7. *Lakes*.—These are neither numerous, nor generally of great extent. In the older maps a large lake is laid down to the W. N. W. of Mozambique, called Moravi or Zambre; but its existence is problematical. The largest lake by far of which we have any certain account is that of Tchad, made known and partly explored by Messrs. Dauban and Clapperton. It is situated almost in the centre of the continent, in Soudan, to the S. of the great desert, near the 15th degree, of N. lat., and under the 15th degree of E. long. The lake Delo, or Dohbe, in the same lat., and under the 5th degree of W. long., traversed by the Niger or Djoliba, though considerable, is of very inferior dimensions. Some lakes are met with in the ranges of Mount Atlas, especially towards the Gulf of Gabes, among which that of Lowdejah is the most extensive. The greater number of lakes seem to occur within the depression of the table-land of southern Africa, between 4° and 18° S. lat.; but our information on this as on most other points connected with the geography of Africa is in the last degree vague and unsatisfactory. The lake of Decoula, in Abyssinia, traversed by the Bahr-el-Azrek, or Eastern Nile, is also of very considerable magnitude.

8. *Minerals*.—The mineral riches of Africa are very imperfectly known; but the probability seems to be that in this respect it is but little if at all inferior to any of the other great divisions of the globe. Gold dust, principally obtained from the sands in the upper parts of the rivers, forms a principal article of import from Africa; and iron, the most useful of all the metals, is known to be very generally diffused. Salt is wanting in Soudan and some other very extensive districts; but on the other hand it is found in immense quantities both to the S. and N. of this central district.

II. *Races of People*.—Although we are accustomed to consider the inhabitants of Africa as being generally of the Negro race, the actual number of varieties of the human family occupying this portion of the globe is not only much greater than those found in Europe, but the differences in colour, form, and stature are much wider. There are about seven ascertainable varieties, which may be enumerated as follows, beginning with the southern extremity of the continent; viz., the Hottentot, Kaffer, Abyssinian, Egyptian, Numidian, Nubian, and Negro. We shall give a brief description of each race in this order. In the *Hottentot* the colour of the skin is a yellowish brown, and has been compared to that of a "faded leaf." The cheek bones are high, and much spread out in the lateral direction; and from these the face is suddenly contracted below to a very narrow and pointed chin. Nose remarkably flat and broad towards end. Colour of the eyes a deep chestnut; they are long, narrow, and removed to a great distance from each other. The hair of the head is of a singular nature; it does not cover the whole scalp, but grows in small tufts at certain distances from each other. When kept short, it has the appearance and feel of a hard shoe-brush; with this difference, that it is curled, and twisted into small round lumps about the size of a marrowfat pea. When suffered to grow, it hangs on

the neck in hard twisted tassels like fringe. There is little beard; and the hair on other parts of the body is either scanty or altogether wanting. The stature of the Hottentot is very short, about four feet six inches being considered about the middle size for the men, and four feet for the women, which is about fourteen inches short of the average stature of Europeans. Their form is slender, delicate, and not ill proportioned; but altogether they may be pronounced a very ugly race. The sex is distinguished from all others of the human race by a pendulous rugose elongation of the *nymphæ* of from two to five inches long, and by a vast accumulation of fat over the *glutei* muscles, which invariably takes place after the first conception. Both these appearances are well ascertained to be natural, and in no way the result of art. The language of the Hottentots is as singular as their persons. Its pronunciation has been compared to the clucking of a turkey. There are numerous guttural sounds produced deep in the throat, and pronounced with a peculiar clack of the tongue, which is quickly struck against and withdrawn from the teeth or palate. The aspirated gutturals are combined with harsh consonants in a manner unpronounceable by Europeans, except those who have acquired the language in infancy. No portion of this race, unconnected with Europeans, has advanced beyond the rudest stage of the pastoral state of society. When discovered, they had domesticated the ox and the sheep, the flesh and milk of which afforded them food, and their skins, with those of wild animals, clothing; they knew nothing of tillage, had no fixed dwellings, and practised no mechanical art except that of fabricating the bow and arrow. The ancient country of the Hottentot variety may generally be described as that which now constitutes the British colony of the Cape of Good Hope.

The immediate neighbours of the Hottentots, and lying N. and N. E. of them, are the *Kaffers* — a very different race. The colour of the Kaffer is neither black, like that of the Negro, nor of the colour of a faded leaf, like that of the Hottentot, but of a deep brown. Hair short, curling, and woolly; but it is not of the wooliness of the Negro. Nose tolerably elevated; lips large and thick; but the lower maxillary bone does not project in the remarkable manner of the Negro, and consequently the facial angle is much greater. The body, instead of being, as in the Hottentot, diminutive and feeble, is muscular and athletic, and the stature is equal to that of the European race. The peculiarities of the female form in their southern neighbours have no existence among them, and the genius of their language is distinct and peculiar. In the useful arts they have made considerable progress. Besides domesticating the ox and sheep, they have also tamed the horse and goat; and their agriculture extends to the cultivation of barley and millet. It is a singular and distinctive trait that they practise universally the rite of circumcision. Of the origin of the practice they can give no account; and it has most probably been derived from intercourse, at some remote period, with some people by whom it was practised.

The *Abyssinian* race is entirely different from those previously mentioned. Their colour is nearly black; but the hair is long, and generally lank, like that of an Arab or Hindoo. Features regular, after the European model, and the nose often aquiline. The stature equals that of the European; and the whole person is generally

well formed, and occasionally handsome. The nations comprehended under this race have made considerable progress in the useful arts. They have domesticated most of the useful animals, as the ox, sheep, horse, ass, and camel; and cultivate most of the common corns, as wheat, barley, and millet. They also work, with some skill, articles of iron, copper, and brass; and except the ancient Egyptians, and probably the Numidians, are the only native race of the entire continent who have invented an alphabet or possessed a literature.

The *Egyptian* race is represented by the Copts of Egypt. These have long hair, a yellowish dusky complexion, neither Grecian nor Arabian, a puffed visage, swollen eyes, flat noses, and thick lips; and in short, according to Volney, much resemble Mulattos, or the mixed offspring of the European and Negro. It is almost unnecessary to add, that this was one of the earliest civilized races of mankind; and that at least thirty ages ago it had already tamed the useful animals, cultivated the most valuable plants, smelted the useful and precious metals, and erected architectural monuments which for their durability, extent, and grandeur, still astonish the world. They were also among the first to invent hieroglyphic and alphabetic writing.

The next race to be named is the *Numidian*. The people, not yet mentioned, who inhabit the northern portion of Africa from about the 18° of N. latitude to the Mediterranean, and known by the various names of Moors, Berbers, Tuanghis, and Tibbans, are, in some cases with an admixture of Arab blood, probably the aboriginal inhabitants of the country before the settlement of the Phœnicians, Romans, Vandals, or Arabs; — that is, they are the descendants of the Lybians, Numidians, Mauritanians, &c. With this race the hair is long and black; eyes dark; the colour of the skin a light brown, little deeper than that of the inhabitants of Spain; the features are European, but the nose generally not very prominent, and never aquiline, as is often the case with the Arabian. Although apparently superior at all times in civilization to any Negro nation, this race appears at no period to have made any remarkable progress in arts or arms, and scarcely any in letters; for it has been ascertained only of late years, rather as a matter of curiosity than any thing else, that they once possessed the art of alphabetic writing. Their language, indeed, is but the jargon of a rude people, destitute of terms to express the most common distinct ideas, such as *shortness, roundness, sloth, death*, &c. Such ideas are either expressed by circumlocutions, or in more difficult circumstances recourse is had to the Arabic language. Their inferiority is indeed most decidedly implied by the facility with which they have given way before every successive race of conquerors, during a period of at least 2500 years.

The next race to be described may be called the *Nubian*; and, with the exception of the Abyssinians, will comprehend nearly all the people of Africa from about 8° of N. latitude to the southern confines of Egypt, and from the Red Sea and Indian Ocean on the east to about the 25° of E. longitude westward. In this race will be included the people called Barabra or Nuba, the people of Sennar, the Sumuli, the Suaking, the Bishari, the Abagdah, the Galla, and others. A long oval countenance; a curved nose, somewhat rounded towards the top; rather thick lips, but not protruding excessively, like those of the Negro; a retreating chin; scanty beard; lively

dark eyes; strongly frizzled, but never woolly hair; a finely formed person of the middle size, with a bronze complexion—are the physical characteristics of this race. Some of the nations of this race have made considerable progress in the common arts of life, but they have no indigenous literature.

With the exceptions now mentioned, the rest of the African continent may be said to be peopled by the *Negro* race, which commences at the southern boundary of the great desert, and, embracing both the western and eastern coast, with the island of Madagascar, extends to about 20° of S. latitude.

The following are the leading characteristics of this well-known variety of our species:—Skin and eyes black; hair black and woolly; skull compressed laterally, and elongated towards the front; forehead low, narrow, and slanting; cheek bones prominent; jaws narrow and projecting; upper front teeth oblique; chin receding; eyes prominent; nose broad, thick, flat, and confused with the extended jaw; lips, particularly the upper one, very thick; palms of the hand and soles of the feet flat; tibia and fibula convex; pelvis narrow; knees turned in, toes turned out. The stature and physical strength are equal to that of the European, while the latter exceeds that of any other race. Many of the Negro nations have made considerable progress in the necessary and useful arts,—a progress which, it may be safely affirmed, greatly surpasses that made by any native nation of America. They cultivate many useful grains, roots, and fruits; have appropriated the services of the most useful of the domestic animals, such as the ox, horse, ass, camel, goat, sheep, and hog, all of which appear to be indigenous. It is singular, however, that no Negro nation, nor even any native African nation, has ever had the ingenuity to tame and train the elephant, a service to civilization which has been performed by almost every Asiatic nation to whose country this animal is indigenous, and which there is abundant evidence to show was done by the Carthaginian and Roman settlers in Africa.

It is a still more striking fact that no Negro, and indeed no African nation, save the Egyptians, Abyssinians, and partially the Numidians, ever possessed a literature, or had ingenuity to invent any alphabet, however rude.

The general character thus sketched belongs with more or less intensity to the whole Negro race within the limits we have assigned to it; but it is not at the same time to be forgotten that there is much variety—a greater perhaps than exists among the European or any other family. We shall endeavour to describe a few of the most remarkable and best ascertained of these. The *Mandingos* are a numerous people, occupying the mountainous country on the west side of the continent which lies towards the sources of the rivers Senegal and Gambia. They possess the true Negro features, but not in an exaggerated form. The colour is black, with a mixture of yellow; the person strong, symmetrical, and above the middle stature. Of all the Negro races the Mandingos have exhibited the greatest aptitude for improvement. They are industrious, enterprising, and, compared with their neighbours, of an open and generous character. They have adopted the Mohammedan religion, and with it the letters and literature of Arabia. The *Foulahs*, or *Pauls*, inhabit the same portion of Africa. The colour of the skin with this race is a sort of reddish black. Their countenances are regular, and their hair longer

and not so woolly as that of the ordinary Negro. They are robust, courageous, industrious and enterprising, and like the Mandingos have adopted the literature and religion of Arabia. Altogether they make a considerable approach to the family which we have before described under the name of the *Nubian*. The *Sulnins* are a squat robust Negro race, not exceeding 5 feet 8 inches high. They are remarkable for their courage and hardihood, and have made considerable progress in the common arts of life, but have not adopted Mohammedanism or the Arabic letters. The *Jolofs* inhabit both the maritime and mountain country on the south banks of the Senegal, and are, in fact, the first Negro nation we encounter on the western side of the continent after quitting the Berbers. Their complexion is a fine transparent deep black. With the exception of thick lips and a nose much rounded at the end, their features make some approach to the European. The hair is crisp and woolly, the stature tall, and the figure good. To the south of the Gambia, and extending to Cape Palmas, we find the race called *Feloups*, of a deep black colour; with longish woolly hair; features so regular as to be thought to bear some resemblance to the Hindoo; and of slight and short stature, but much agility. These are nearly in a savage state. To the south of the Feloups are the *Papals*, a race of very ugly Negroes, of dull, gross, and ferocious aspect, with very flat noses, and of a dirty livid colour. These and some other races resembling them are followed in proceeding southward by the *Bullom*, &c., of a fine black colour, of good features, and well made, with persons above the mean stature. Proceeding southward, and more to the Gold coast and the country lying inland from it, we find the *Intor*, *Fantee*, and *Asantee* nations, which appear to constitute another distinct variety of the Negro race. It is of the mean stature, and well proportioned. The face is of an oval form; the eyebrows lofty and thick; the lips fresh, red, and not hanging down as in the extreme forms of the Negro; and the nose not so flat. The hair is rather curled than woolly, and occasionally so long as to reach to the shoulders. Now and then are to be seen examples rather Asiatic than African. No nation of this variety has ever possessed the art of writing, either springing up among themselves or borrowed from strangers; and, although they have all made considerable progress in several of the common arts of life, they are in the habitual perpetration of cruel and ferocious rites, not to be paralleled by any other race of mankind. From the Bight of Biafra down to 20° S. latitude, where we encounter the *Kassers*, there is comparatively little variation from our general description of the Negro family. In the interior of Africa lying between the Mountains of the Moon, which cross, or are supposed to cross, the entire continent in about 10° of N. latitude, and the great desert, we have, as far as our very imperfect information extends, little variety from the common type of the Negro. This is the country which the Arabs call *Soudan*; a word which means the country of “black men,” and is exactly equivalent to the Persian word *Hindustan*. On the east coast of Africa, between the *Kaffer* and *Nubian* races, we have nothing but true Negroes. It is, however, to be observed of these, that although the woolly head, black skin, flat nose, thick lips, and projecting jaws are never absent, their excess which is found in general on the western coast does not exist. Under the same denomination, though shorter and feebler, is to

be included the inhabitants of the great island of Madagascar; who, because their language contains probably about 100 or 150 words of Malayan, are absurdly supposed by some writers to be of the Malayan race, which they no more resemble than they do Europeans. The introduction of such terms has in fact been satisfactorily accounted for by the drifting of boats with crews of Malays from the shore of the island of Sumatra, two or three authentic examples of which have occurred within our own times. The fact of such occurrences having taken place is a sufficient answer to the apparent difficulty of open boats with their crews performing a voyage which cannot be less than 3000 nautical miles. The manner in which such events would take place is, we think, obvious enough. A trading or fishing boat with a few cocoa nuts, affording meat and drink to the crews, and known to be a constant sea-stock in such cases, driven from the coast of Sumatra in the height of the N. E. monsoon, would in due course be carried into the S. E. trade wind, and going with a flowing sheet before the wind (the only course she could pursue), would be carried to the shore of Madagascar in a shorter time and with more safety than might at first be imagined.

Such is a brief and necessarily imperfect account of the races of men inhabiting Africa. The subject is indeed full of difficulty; not only from its extent, variety, and complexity but also from the imperfect information, and indeed in most cases the entire ignorance, which exists regarding it. The number of different nations, and even of distinct languages, is proportional to the barbarism of the people; and there is no quarter of the globe, America excepted, in which the number of both is so great. In our inquiry we have been able to detect at least 200 languages, and indeed the empire of Bornou alone is said to contain no less than thirty.

Amount of Population. — There are no means whatever by which to form any estimate of the population of Africa. Hence the great discrepancy among the guesses that have been made of its amount. According to Balbi it contains 60,000,000, whereas Malte-Brun gives it 70,000,000, and the Weimar Almanac 101,000,000.

111. *Animals of Africa.* — These, at its northern extremity, where it approaches Europe, and at its eastern, where it approaches, or rather joins Asia, are generally the same as those of these two portions of the globe; but throughout its greater part they are not only different from the European and African species, but equally also from the animals of the two portions of America, and from those of the Oceanic continent and islands. We shall confine our observations chiefly to those more immediately subservient to the uses of man.

Of 1270 known species of terrestrial *Mammalia* there have been discovered in Africa, although more imperfectly explored than any other portion of the globe, no fewer than 290, of which 242 are peculiar to this continent. Of the *Quadrumanæ*, comprehending apes, monkeys, and lemurs, there are 55 species, of which 48 are peculiar to it; not one of them being identical with the species found in Asia or America. The most remarkable of the whole tribe is the *Sinua troglodytes*, or chimpanzee, which, after a careful anatomical comparison with the *orang utan* of Borneo, is now considered to make in physical formation a nearer approach to man than the latter, while it is unquestionably more lively and intelligent. Of the *Cheiroptera*, or bats, there are 30 species in Africa, 4 of which only are

common to it with Europe and Asia. The carnivorous animals of Africa are 66 in number, of which 14 only are found in other parts of the world. The most remarkable of these is the lion, which is known historically to have once existed in the east of Europe and west of Asia. With the exception of an inferior variety found in some parts of northern Hindostan, this animal, so renowned in the fable, poetry, painting, and sculpture of almost every nation of the old world, from China to Spain, is now confined to Africa (*Leonum arida nutrix*); which it ranges from its N. to its S. extremity. Panthers, leopards, and many small species of the feline race also exist; and the cat has been domesticated, though it be much more rarely found in this state than in Europe, Asia, or even America.

Of the Canine family, Africa contains the dog, wolf, fox, jackal, and hyena. The dog has not been found there in the wild state, but many varieties exist in a semi-domesticated condition, living in troops in the towns and villages, as it does in almost all the countries of Asia. The Africans have never, that we are aware of, used it for food or labour, or even for the chase. Jackals and foxes are numerous. Africa may be considered the peculiar country of the hyena; for of four existing species one only, belonging to Hindostan, is found out of its limits. Of the *Fuerra*, or civets, several species exist in Africa; among which is the true civet cat, domesticated by the natives to produce civet; and a species of the Mongoos, viz. the celebrated Ichneumon, or rat of Pharaoh. Of bears, which either still exist, or are known to have existed, in almost every country of Europe, Asia, and America, no example has yet been found in Africa.

The Marsupial order of animals, or that of which the females have a double womb, is wholly wanting in Africa, as it is in Europe and continental Asia. Of the Rodent *Mammalia*, or gnawers, Africa yields many species of rats, squirrels, and four or five species of hare; while the rabbit is thought to have been originally brought to Europe through Spain from the African coast of the Mediterranean. The *Pachydermata*, or thick-skinned order, is very abundant; more so indeed than in any other part of the world. We find among these the horse, ass, zebra, dromedary, and quagga; the elephant, rhinoceros, hippopotamus, common hog, and lingallo or African boar. Although the horse cannot be asserted to be a native of Africa, not being found in the wild state, it has been domesticated there from the earliest ages of history. The Numidians had their cavalry when the Romans first became acquainted with them; and the horse does not appear to have been a stranger even to the ancient Egyptians; though among the mummies of quadrupeds found in the catacombs that of this animal does not appear. The most improved of the Negro tribes possess the horse, and have often a numerous cavalry; but, like Asiatics, generally the Africans do not apply the horse to draught or burthen, and confine its use to war or pleasure. When the Arabs conquered Egypt and northern Asia, they introduced their own breed, which, mixed in some degree with the native one, constitutes the barb and Egyptian horse — little inferior to the pure Arabian blood itself. The Dutch and English introduced into the colony, at the southern extremity of the continent, their respective national breeds; and the soil and climate of Africa being found generally congenial to the constitution of the horse,

It has thriven and multiplied there as every where else.

The ass is most probably not a native of Africa, or we should still, in a country so little occupied by man, find it in its wild state, as we do in so many countries of Asia. It has, however, been introduced into Egypt and Barbary,—possibly by the Arabs,—and thrives extremely well in both. The zebra, the dromedary, and the quagga, quadrupeds peculiar to Africa, and beautiful, at least as to colour, are found in troops all over its arid plains and deserts. But from a natural indolence or waywardness of temper, or from the unskillfulness of the African people,—probably, indeed from both causes,—and the possession of the horse and ass, they have never been tamed and applied to economical uses.

Ruminating animals are not less abundant than the *Pachydermata*. Of the 157 species of those which are ascertained to exist, 73 are found in Africa; and, with the exception of 10, all of them are peculiar to it. The dromedary, or single-humped camel, is now abundant in all the dry parts of Africa, and is the principal beast of burthen. In the earliest portion of scriptural history it is mentioned as being employed in carrying on the trade between Syria, Arabia, and Egypt, and therefore it is fairly concluded that it was well known to the ancient Egyptians. It is also found sculptured on some of the earliest Egyptian architectural monuments. Egypt, however, from position, physical character, and civilization, was always more an Asiatic than an African country; and from the fact of the camel's existing there, its general diffusion over the country cannot be inferred. It does not appear to have been known in the portion of Africa lying along the coast of the Mediterranean during its possession by the Romans; and it seems not improbable, therefore, as some have conjectured, that its general diffusion over the continent was the work of the Arabs, after their adoption of the Mohammedan religion in the 7th century. The *Giraffe*, known to the Romans, and used in their games, is exclusively an inhabitant of the dry parts of Africa. Notwithstanding its size, strength, and gentleness, it has never been applied, in its domesticated state, to any useful purpose of man; and from its eccentric and awkward form and movement, is probably unfit for any.

Horned cattle, or oxen, of many varieties, are general among all the more civilized tribes of Africa; and in Egypt the existence of the ox is coeval with the earliest records of the country. Mummies of this animal have been found in the catacombs, supposed to be not less than three thousand years old. Whether the original stock was imported or was indigenous, cannot be ascertained; but most probably the latter, for the common ox in the wild state is not known to exist in any part of this continent as it does in many parts of Asia and its islands, and as it is known once to have done in Europe. The buffalo (*Bos bubalus*) has been naturalised in Egypt since the middle ages, having been introduced from India through the conquests of the Arabs. One species of the ox family only is ascertained to be indigenous to Africa, and is peculiar to its southern extremity. This is the buffalo of the Cape, or *Bos Caffer*; an animal of great size and ferocity, which has never been tamed, and is probably untameable.

Sheep and goats exist throughout all the drier parts of the continent; but neither are found in the wild state, and have probably been introduced. The prevalent variety of the first is that

with the fat tail, of from 10 to 30 pounds weight, the same which is so general in Persia, Arabia, and Tartary; and which, though long looked upon as a rarity and a monstrosity, is probably as extensively diffused over the globe as the variety more familiar to us. The wool and flesh of the fat-tailed sheep are greatly inferior to those of our own breed; but the flesh of the lamb is thought to be superior. There are said to be but two species of deer—one or which is the common fallow deer—existing in this continent, and these are confined to the countries bordering the Mediterranean. This is compensated by the existence of not less than 60 species of antelope, all peculiar to it; a number far exceeding that of the genus found in every other part of the world. Some of the species, as the gazelle, do not exceed a foot and a half high, and are remarkable for the beauty and gracefulness of their form. Others are equal in size to a large ass or zebra; as the gnu, which has the body, tail, and paces of a horse. The most numerous species is perhaps the springbok; which, in the wide plains of southern Africa, is said to be found in herds of 10,000, or even 50,000. Not one of the whole family has ever been domesticated for the purposes of food or labour by the natives, as the rein and fallow deer have been in Europe.

The elephant is found in all the wooded and low parts of Africa, from the northern limits of the great desert to the southern cape; and generally in greater numbers than any where else in the world, if we except Ceylon and the countries lying between Hindostan and China. The African elephant differs, specifically, from the Asiatic. The crown of the tooth is marked by a lozenge instead of ribbon stripes; the hind foot has three toes instead of four; the forehead is convex instead of concave, and the ears are longer. In point of size, general form, sagacity, and docility, there is probably no great difference. No native African people, that we are aware of, ever tamed the elephant. When an African is told that this is done in the East, he is as incredulous as a European would be if an African told him that his countrymen tamed the hippopotamus, and used it as a beast of burden. The only hint we have seen that such a thing may be, is given by Mr. Campbell, the African traveller, who informs us that he was told by a people of the interior whom he encountered, that another people more advanced in civilization than themselves, the Mahalasley, "wear clothes, ride on elephants, climb into their houses, and are gods." That the elephants used by the Carthaginians were of the African species there cannot, we think, be the least question. One of the conditions of the treaty forced upon them by the Romans after the battle of Zama implies this clearly enough. They were to surrender all the elephants which they had tamed, and to tame no more for the future.* It is obvious enough that had the elephants been Asiatic, they would only have been brought to Africa when already tamed. The Carthaginians being of an Asiatic, and not an African stock, form no exception to our previous remark. The Egyptians, the only people of Africa from whose ingenuity we might have looked for the domestication of the elephant, had

* "Perfugas, fugitiosque, et captivas omnes redierunt Romanis, et naves, rostratas, prætor decem triremes fruerent, elephantisque, quos habebant domitos; neque domarent alios."—(Livy, lib. xxx. c. 57.) The elephants of Pyrrhus were, no doubt, Asiatic, and received through the Macedonian conquests. His invasion of Italy was but 47 years after the Indian invasion of Alexander; and therefore considering the long age of the elephant, the very individual animals in the army of Pyrrhus may have been the same which Alexander brought from the banks of the Indus.

none to tame; nor was their highly cultivated country well suited for their use, if they had. As a contrast to the Africans, it may be observed, that there is no people of Asia whose country produces the elephant by whom it has not been domesticated and used as a beast of burden, from the Hindoos, the most civilized, to the Malays, the least so. The Africans consider the elephant only as a beast of chase, and hunt it for its ivory, its flesh, and its hide; and the herds are so numerous, and the population so scanty, that the supply, according to present circumstances, appears for all practical purposes inexhaustible.

The two-horned rhinoceros, of a different species from the two-horned rhinoceros of Sumatra, inhabits the same localities as the elephant, and is hunted with the same avidity by the natives for its tough and thick hide and its horns. Traces for ox-harness, but above all shields, are made of the former, which are in repute throughout all eastern countries; and the latter are used for their supposed medical virtues, and are a regular object of traffic. It may be observed of this species of rhinoceros, as well as of the two which belong to India and its islands, that their docility and capacity for domestication are not inferior to those of the elephant itself. The slow and sluggish movements of this animal make it, notwithstanding these qualities and its great strength, an unsuitable beast of burthen, especially in countries where the elephant, the ox, the buffalo, and the horse exist; and, consequently, it has never been applied to such a purpose.

The hippopotamus is exclusively a native of Africa, inhabiting the rivers and fresh-water lakes of the whole continent, from the southern confines of the Sahara nearly to the extreme cape. It was well known to the Greeks and Romans as an inhabitant of the Nile; from which, however, it has now disappeared every where below the third cataract. In the rivers and lakes of tropical Africa it still exists in undiminished numbers, being from its locality difficult to come at by the hunter.

The common hog, in the wild state, is said to be found at the two extremities of the continent, where it approaches Europe and Asia, viz. Barbary and Egypt; but there is no evidence of the existence, anywhere else in Africa, of this animal, which was at one time general throughout Europe, and is still general throughout Asia and its large islands. Its place seems to be taken by the lingallo, or masked boar. This animal, which has teeth of a formation and growth resembling those of the elephant, and a large pendulous protuberance supported by a bony process on each cheek, giving it a hideous appearance, is not only found on the continent, but in Madagascar and the Canary Islands. It has never been domesticated, but the common hog has to a limited extent.

The native Ornithology of Africa does not present the same number of subjects subservient to man as that of Asia, or even of America. The common fowl, goose, and duck are all of them probably strangers, and there is no doubt that this is the case with at least the first. They are bred by the native inhabitants, but only to a very limited extent. The only bird which Africa has contributed to the poultry-yard is the Guinea hen; of this genus there are four or five species found abundantly on the western coast and its islands. The bird, as its Latin name, *Numida*, implies, was known to the Romans, and bred by them. Most probably they received it do-

mesticated from the Carthaginians. It is very remarkable that it is now wholly unknown to any African people in the domestic state, except as imported by European colonists—a singular proof of apathy and dulness in the whole race. This bird seems to supply, in Africa, the place of the common fowl of Europe, the peacocks and pheasants of Asia, and the turkeys and alcedos of America. The ostrich, which once extended to the nearest parts of Asia, is now confined to Africa; and the Arabs are said to have introduced the practice of breeding them in the domestic state, in order to obtain their feathers in greater perfection. Of our summer birds of passage many pass their winters in Africa; as the cuckoo and nightingale, some swallows, and the common quail and land-rail. The cheerful and active period of their lives, therefore, is passed among us, and the note of the cuckoo and song of the nightingale are wholly unknown to the people of Africa. The woods of tropical Africa abound with birds of the parrot family, from those which are no bigger than a lark, to some which are equal in size to a large falcon. As in South America, the Indian Islands, and Australia, they are remarkable for the variety and brilliancy of their plumage, their dissonant and incessant notes, and their utter inutility to man. Proportional to the number of graminivorous and frugivorous birds, and of wild mammals and reptiles, is that of eagles, hawks, vultures, and other birds of prey.

Among Reptiles are to be found a great variety of the lizard family, from the chameleon up to the crocodile; and of snakes (a few poisonous, but the greater number harmless), some species not exceeding a few inches long, up to the python, which measures 30 feet in length. All the species of this class differ from those of Asia and America, not to say of Europe, or the Indian Islands, or Australia. Africa, of course, abounds in the insect tribe. Of these the bee alone is directly useful to man, but has never been domesticated by the Africans. Africa yields no useful insect, such as the kermes of Europe and Western Asia, the lac of Eastern Asia, or the cochineal of South America.

IV. *Plants of Africa.*—In reference to its Flora, Africa may be divided into three regions, the Atlantic, the Equinoxial, and the Austral; to which we may add the principal islands on its western and eastern side, viz. the Canaries and Madagascar, with the Mauritius and Bourbon. The plants of the Mediterranean coast differ little or nothing from those of the opposite shore of Andalusia. Wheat, barley, maize, rice, the grape, the fig, and olive, thrive here in perfection, as does the date. It is not until we reach as far south as Egypt that the Flora assumes a character intermediate, as it were, between European and Tropical; and here, to the plants already enumerated, may be added the sugar-cane, cotton, indigo, and coffee. In Upper Egypt, Nubia, and Abyssinia, we have a somewhat peculiar vegetation; and here we find the *acacias*, which produce gum-arabic, and the *cassias*, which yield the medicinal senna. In Abyssinia first appears the Scitamineous family of plants, the same which in the East yields ginger, turmeric, and cardamoms. The coffee plant still grows wild in the same region, which is indeed supposed to be its native country.

In the Equinoxial part of Africa a totally new vegetation presents itself, entirely differing from that of Europe, and almost equally so from those of tropical Asia and America. One conspicuous forest tree of great size, however, the

Bombax pentandrum, is common to the three continents. Another forest tree of vast magnitude, the Baobab, or *Adansonia*, is supposed to afford examples of the oldest living organized matter on our globe; some specimens, by counting the number of their concentric circles, being estimated at near 6,000 years old. The African oak, or teak, which, however, is probably neither the one nor the other, though its botanical place has not been as yet ascertained, is an inhabitant of the same region. The bamboo, so common and so useful in Asia and America, is unknown to Africa. Whole plains in this quarter are occasionally overspread with the papyrus plant, to the exclusion of every other. Peculiar palms of course abound; among which, however, the date is no longer found. The most useful of these is that which yields the oil of commerce, the *Elaïs Guineensis*. Whether from the barbarism of the natives or the uncongeniality of the soil and climate, corns are little grown, and their place is taken by hardy farinaceous roots, pulses, &c.; as the *Dioscorea* or yam, the *Arachis* or ground nut, and the pigeon pea or *Cytisus cajan*. The fruit of tropical Africa, in comparison with those of Europe, Asia, the Asiatic islands, or America, are few in number and of indifferent quality. The most remarkable are the nitta or donna (*Parkia africana*), a species of custard apple (*Annona Senegalensis*), the safu, the cream fruit, the negro peach (*Daucocarpus laurina*), the moukey apple, pigeon plum (*Chrysobalanus*), the Rammee apple (*Mammea africana*), and the star apple (*Chrysophyllum*). The pine apple, a native of America, grows luxuriantly in the forests, as if it were indigenous.

As we approach the southern extremity of the continent, a new form of vegetation presents itself, differing essentially from that of every other part of the world, but bearing the nearest analogy to that of Australia. Its character is suited to the arid nature of the soil and climate; and the prevailing genera are euphorbias, aloes, crassulacae, and heaths, of endless species, and often of great beauty; plants generally with fleshy leaves, and slender roots, which are nourished more by dew than by the moisture of the earth. The grasses are generally coarse, and forest trees are only found in the moister parts near the banks of rivers.

In the Canary Islands the species are for the most part European, but their growth and luxuriance is tropical. The great island of Madagascar has on its western side plants common to Africa, and on its eastern some that are common to the Indian archipelago. But generally both here and in Bourbon and the Mauritius, the Flora is peculiar and local.

From this brief sketch of the native Flora of Africa, we shall be disposed to conclude, that although it may be equally varied, grand, and beautiful with those of Asia and America, it yields far fewer objects ministering directly to the uses of man. To Asia, or Egypt (a country African only by position), Africa probably owes the banana, the orange, lime and lemon, the tamarind, the cocoa-nut, cotton, and sugarcane. It may even be conjectured that it owes to the same source, and perhaps through the Phœnician settlers, wheat, barley, the grape, fig, and pomegranate. To America it unquestionably owes maize, tobacco, manioc, and the pine apple.

If Africa be excelled by Europe, Asia, and America, in its turn it immeasurably exceeds Australia, which yields neither useful corn, root, nor fruit.

V. Religion.—Fétichism, in its most degrading and offensive form, is the religion of the greater number of the inhabitants of Africa, being professed by almost all the Negroes, and by nearly all the natives of Madagascar. They appear generally to admit a good and an evil principle, have their lucky and unlucky days; and their priests claim the power of preserving men and animals from the influence of evil spirits. Several of these nations have a national and supreme *fétiche*: the people called Ouidah or Widah, for instance, worship the serpent, an order of priests and priestesses being set apart to minister to this reptile. The Bissagos worship the cock; and the tribes on the Bight of Benin, who regard their own shadow as a *fétiche*, have a lizard for their principal divinity. Other tribes worship alligators, hyenas, leopards, &c.; and in some instances immolate to them human victims. The Agows, who reside near the sources of the Nile in Abyssinia, have, with less absurdity than most others, from time immemorial, offered sacrifices to the genius of that river. The narrative of the Moor Sydy Hammed represents the inhabitants of Wassenah and some tribes of Nubia, and of other countries in the region of the Nile and the interior of Africa, as worshippers of the moon; and those contiguous to Cape Mesurado in Guinea as worshippers of the sun. The Galla hold as sacred certain trees and stones, the moon; and some of the stars. Sometimes the Negroes frame idols with a human countenance; and Capt. Tuckey and Dr. Smith were surprised to see, on the banks of the Zara in the interior of Africa, idols with European figures, and resembling the Egyptian, or rather the old Tuscan statues. The Betjouanas have a kind of high-priest, who ranks as the most important personage after the king. At Dagoumba, in central Guinea, there is a famous oracle, the resort to which renders it the entrepôt of a flourishing commerce. According to M. Douville (who, though referred to by Balbi, is a very doubtful authority), the Cassange, Molouas, Muchingi, Moucangama, and other nations of southern Nigritia, like many tribes in its centre, unite to idolatrous superstitions the horrible practice of human sacrifices; and though of an hospitable disposition, are said to be cannibals. Such are the dreadful aberrations to which uninstructed and uncivilized man is exposed.

Among these nations, human sacrifices, according to M. Douville, take place only on the accession of a sovereign or on the occurrence of some great epidemic. The victim is always selected out of the country, and, if possible, at a great distance from the place of sacrifice: it must be a young man or woman, and ignorant of the fate that awaits him or her till the moment of immolation. Should any one reveal the fearful secret, death is the inevitable penalty. During the interval between the selection and the sacrifice the victim is kept with the greatest care, and every possible means is adopted for the purpose of making him fat. On the arrival of the fatal moment, he is suddenly put to death in the midst of imposing solemnities, and in the presence of the king, grantees, and people assembled to witness the spectacle. His body is

* *Fétichism* is the worship of natural objects, whether animate or inanimate. The word is derived from the Portuguese *Fético*,—something enchanted, sacred, or divine; and comes most probably from the Latin *fatum*, *falsum*, *fieri*. Any thing, however vile or worthless, may be a *fétiche*, that places the fancy of a nation or an individual, and requires merely to be consecrated and set apart as a special object of adoration. When this is done it is regarded with every mark of the most profound veneration and respect—is referred to on all occasions of difficulty, sworn by, &c. See the *Traité de l'culte des Dieux Fétiches* (by the President, Debrosses), 12mo. 1760, cap. 1. &c.

usually quartered, and immediately roasted, to be portioned out among the spectators according to their rank, and devoured on the spot. But enough of these brutalizing enormities perpetrated in the sacred name of religion.*

With the exception of Abyssinia and the colonies founded in modern times on some points of the African coast, where Christianity is professed, Mohammedanism prevails in all the countries of Africa not devoted to Feticism and idolatry. It is very widely diffused, having extended itself over the whole of Barbary, Egypt, Nubia, &c., and being professed by a considerable number of the more advanced Negro nations. Its introduction has been, perhaps, the greatest boon ever conferred on Africa, and has tended materially to improve the habits and morals of the people. The Koran is the only recognized code in many countries; and what is singular, the Arabic is every where throughout Africa, with the exception of Abyssinia, the language used by such of the natives as either read or write. It was introduced in the first age of the Hegira, and has participated but little in the improvements that have since been made upon it in Asia. Arabic has been for some centuries the language of the Copts or descendants of the ancient Egyptians.

The Christianity that prevails in Abyssinia is largely alloyed with debasing practices and observances; and the priests are as ignorant and worthless as can well be imagined. With the exception of the Cape Colony, the seats of Christianity in other parts of the continent are too trifling to deserve notice; but a considerable number of Christians of various denominations, and of Jews, are found in countries where Mohammedanism and Feticism are prevalent.

VI. *Language*.—Balbi has given a classification of the people of Africa according to their languages. Perhaps it was impossible to have selected a worse standard. We know little, and sometimes literally nothing, of the people in some very extensive countries, and if it be possible we know still less of their languages. Our knowledge of the latter is indeed in most instances exceedingly imperfect; so that any classification of the people bottomed on it must necessarily be little else than a tissue of errors. The Arabic, as we have just seen, is the learned language of the entire continent. The Berber is the vernacular idiom of the Barbary states; the Sangoa is used in Guinea; and the Poul, the Iolof, &c., bear the names of the people by whom they are spoken. The Ambounda is the language of all the tribes between the Congo and the coast of Mozambique. As was to be expected from the low state of civilization of those by whom they are used, these languages are all miserably poor. The reader will find in the article Abyssinia some account of the language of that singular portion of the African continent.

VII. *Government*.—Most forms of government may be found in Africa. Despotism, however, in its worst and most offensive shape, is by far the more prevalent. In some states there exists a sort of feudal aristocracy, and in others an aristocracy depending on the rude distinctions of superior strength and prowess in war, which participates to a greater or less extent in the rights of sovereignty, and in some they are occasionally shared by the people. Some large states consist of a kind of confederacy of petty chiefs, who, however, are very frequently at war

with each other. In fact, with but few exceptions, slavery and anarchy reign triumphant throughout Africa. And it would be to no purpose, even if we were accurately informed as to the discrepancies in the forms of government established in different parts, to waste the reader's time by detailing in what respect one barbarous and generally fluctuating system of government differed from another.

VIII. *Industry* in Africa is at the lowest ebb.

Except where they are associated with or have been instructed by Europeans or Arabs, the Africans have made little progress in the arts. All the more laborious occupations are devolved on females; and in some parts the wives of kings or petty princes are made to till the land for the support of their barbarian lords. Even the most necessary arts are in an extremely backward state. The ground, after being soaked with rain or covered with the mud brought down by the rivers during the inundation, is not ploughed, but merely scratched with a hoe. There are no doubt sundry exceptions to the extreme indolence, stupidity, and barbarism that seem to distinguish the bulk of the native races. The Mandingoes have made considerable advances in civilization, and are advantageously distinguished among the people of the west coast; but the Ovas of Madagascar are said to be in this respect discriminated from the others, and to be not only the most industrious people of that great island, but of the whole African continent, Egypt and Barbary excepted. The Ashantees, too, seem to be in this as in some other respects superior to the bulk of the Negroes; and this, indeed, is one of the grounds on which they have been supposed to be not of Negro but of Abyssinian or Ethiopic origin.—(*Bowditch*). It is farther true, as has been remarked by Balbi, that the cotton and other manufactures of Egypt have recently attained to considerable importance. But their progress has been, as every one knows, forced and factitious. In point of fact, too, they are carried on wholly under the superintendence of Europeans, and are no evidence whatever of the improvement of the Africans in manufacturing industry.

It is a curious fact, that the smelting and working of metals, which would seem to require a degree of intelligence or of traditional knowledge hardly consistent with their backward state in other respects, is pretty extensively carried on by several of the Negro tribes.—(*Bulbi*, p. 844.). Generally, however, the arts practised by the natives are of the most limited description, and are restricted to those necessary to supply the most indispensable wants. The tanning of leather, the weaving of cotton cloths, and the manufacture of mats are every where carried on; and in parts the articles produced are of a very good quality, and have much beauty. But the natives are for the most part ignorant of the use of the shuttle; and in weaving pass the threads of the woof between those of the warp one after the other, by the unassisted agency of the hand; taking a month or two to despatch as much work as a European could effect by means of his loom in as many hours! In all their works, in fact, they display little contrivance or design, but generally only a sort of indolent, stupid routine.—(*Mod. Universal History*, xiv. p. 31.)

IX. *Commerce*.—It may appear a singular and not easily explained fact, that notwithstanding the low state of the arts in Africa, and the difficulties of the country, an extensive intercourse has been carried on, from the remotest antiquity, between very distant parts, of that con-

* Those who wish for further details may consult Balbi, 3d ed. p. 240, &c.

tinent. This, no doubt, has been owing to the natural productions in greatest demand being confined to certain localities; and to the facilities afforded for traversing the vast deserts which intersect Africa by the aid of the numerous oases with which they are studded; and the employment of the camel, or *ship of the desert*. Salt and dates are the principal articles conveyed from northern to central Africa. The extensive region of Soudan, to the south of the great desert of Sahara, is completely destitute of these valuable articles. Both of them, but especially salt, are, however, in great demand in it; the latter being, in many parts, so highly prized and so scarce as to be employed to perform the functions of money. This necessary article is found in various places in the desert, while dates are found in the greatest abundance all along its north frontier, the country adjoining to it being called from this circumstance Biledulgerid, or the *country of dates*. But, though destitute of these important products, central Africa has others; such as gold dust, ivory, gums, palm oil, feathers, and above all slaves, for which there has always been a ready market in Barbary and Egypt. In consequence of this natural adaptation of the products of one part of the continent to supply the wants of another, an intercourse has subsisted amongst them from the remotest antiquity. Even so early as the days of Herodotus, the merchants engaged in the interior traffic had penetrated as far as the Niger, or one of the rivers flowing into lake Tchad; which the venerable father of history correctly describes as a considerable river beyond a sandy desert, which it required many days to cross, flowing eastward, and infested with crocodiles! (11 § 32.) Egypt and different towns in the N. or Barbary states have always been, and continue to be, the great seats of this trade. It is carried on at present as it was 3,000 years ago, wholly by caravans. These consist of an indefinite number of camels, seldom less than 500, and often as many as from 1,500 to 2,000. They do not follow a direct course across the desert from their point of departure to where they are destined, but diverge to the oases, or verdant spots, where they procure water and refresh themselves. If they be disappointed in finding water at one of these resting-places, or be overtaken by a land-storm, the consequences are often most disastrous. In 1805, a caravan proceeding from Timbuctoo to Tafillet, not having found water at a resting-place, the whole persons belonging to it, 2,000 in number, with about 1,800 camels, perished miserably!—(*Jackson's Morocco*, p. 339. See also the excellent chapter in *Heeren*, on the Land Commerce of the Carthaginians.)

Exclusive of this internal commerce, Africa has carried on a considerable commerce by sea, since the discovery of her W. coasts by the Portuguese; but the probability seems to be that she has lost more than she has gained by this commerce. Slaves have been the staple article of export from the African coast; and in some years as many as 110,000 or 120,000 have been carried across the Atlantic. It has been said, and no doubt truly, that the opening of this new and vast outlet for slaves was advantageous to Africa, by lessening the odious practice of cannibalism, and preventing the immolation of the captives taken in war. But, admitting this, it seems notwithstanding abundantly certain that the slave-trade has been productive of a far greater amount of misery than it has suppressed.

Without stopping to inquire whether death might not be preferable to slavery, it has multiplied the

latter in no ordinary degree. Formerly the peace of the country was comparatively little disturbed by wars; but now a wholesale system of brigandage and robbery is organized in many extensive districts; the bulk of the people being hunted down like game by the petty princes, and by the Mohammedans, who affect to believe that they are entitled to capture and sell the "idolaters," to serve as beasts of burden in another hemisphere. Hence it is that the suppression of occasional instances of cannibalism, and of the sacrifice of human victims, has been supplanted by a widely diffused system of rapine, productive of a total want of security, and subversive of every thing like good government and good order.

Until this state of things be totally changed, it would be idle to expect that civilization should make any progress in the countries where it exists. Its abolition is indispensable as a preliminary measure to give them even a chance of emerging from the barbarism in which they have been so long involved.

There seems to be a reasonable prospect that the meritorious efforts of Great Britain for the suppression of the slave-trade will, at no very distant period, be crowned with success, in so far at least as the nations of Europe and America are concerned. But it is quite otherwise with the slave-trade carried on from the interior with the Barbary states, Egypt, and Arabia. There are no grounds for supposing that it will be speedily suppressed. Probably, indeed, it is destined for a while rather to increase. Luckily, however, it is much less extensive than that carried on from the W. coast, the entire export of slaves rarely amounting to so many as 10,000 in a single year, and it is not accompanied by so many disastrous results.

Exclusive of slaves, palm oil, gold dust, ivory, gums, teak, timber, wax, hides, feathers, &c. are the principal articles imported into W. Europe and America from Africa. The most exaggerated notions seem to have been always entertained of the value of the trade and of its capacity of extension. That it may be materially increased is, no doubt, true; but the fair presumption seems to be, that the wants of the native Africans, and their industry, are much too contracted to admit of their ever becoming extensive demanders of European produce.

Carthage, the first maritime power of antiquity, though situated in northern Africa, was a Phœnician colony, and her fleets were principally manned from her colonies in the Mediterranean. Since the fall of this powerful republic, no African people has had the smallest claim to be called maritime. The most advanced nations are at this moment, and have always been, nearly ignorant of the art of ship-building. It is to European engineers and carpenters that the Pacha of Egypt is indebted for his ships; and every one knows that this was formerly the case with the deys of Algiers, Tunis, &c. In some few places the natives fit out a sort of large cutters; not, however, for the purpose of trade or fishing, but to engage in piracy.

Besides salt, to which we have already alluded, gold dust or *tibbar* and cowries are the articles principally used as money in Africa. The latter, a species of small shell gathered on the shores of the Maldivé islands, are used in small payments throughout Hindostan; but in the interior of Africa their value is about ten times greater than in Bengal.

X. *The social condition of the people of Africa* is as depressed as their industry and their science. But what else could be looked for where Fétichism,

idolatry, and the most revolting superstition are so very prevalent? Polygamy may be said to be diffused all over Africa; and though forbidden in Abyssinia, the marriage tie is there so slight as hardly to have any sensible influence; and morals are, in this respect, in a state of almost total dissolution. That cannibalism formerly existed to a frightful extent in many parts of Africa, cannot be doubted; and though it has greatly declined, partly because of the introduction of Mohammedanism, and partly, and principally, perhaps, because of the ready and advantageous markets that have long been opened in the West Indies and America for the slaves or captives taken in war, there seems to be no doubt that it still exists among certain tribes. Among some considerable nations the exposure of children, and the slaughter of those that are deformed or maimed, is not tolerated merely, but enforced. In some parts human blood is reported to be mixed up with the lime or mortar used in the construction of temples. And it is said to be usual among the greater number of the nations on the coast of Guinea for rich individuals to immolate human victims once in their lives to the manes of their fathers!—(*Balbi, Abrégé*, p. 849. 2d ed.) Atrocities like these are, however, principally confined to the least improved tribes of the Negro race. But, speaking generally, barbarism, cruelty, and the most degrading superstition are universally prevalent among by far the greater number of the nations of African origin. — (See art. ASHANTER.)

As already stated, with the exception of Egypt and Abyssinia, all the science and literature to be found in Africa are of Arabic origin. The Arabs have schools established in Cairo, Merou, and Darfour, in the region of the Nile; in Morocco, Fez, Algiers, Tunis, &c., in Barbary; and there are schools among the Mandingoes, Foulahs, Jolofs, and other Mohammedan nations of central Nigritia or Soudan: these are placed under Mohammedan teachers, and assist in disseminating the rudiments of Arabic learning and science. The European colonies at the Cape, Algiers, and various other places along the coast, have been regarded as so many centres, whence the language and literature of Europe might be expected gradually to spread over the whole continent. But our anticipations in this respect are far from sanguine; and the presumption seems to be that if barbarism and ignorance are not to be immortal, they are, at all events, destined to a prolonged existence in Africa.

XI. *Causes of the Inferiority of the Africans.*—The low state of the arts in Africa, and the barbarism that so generally prevails in it, have been variously accounted for; and, perhaps, we are yet without the means of coming to any satisfactory conclusion in regard to either matter. But it would seem that the first, or the low state of the arts, is mainly attributable to the climate, which supersedes the use of many articles indispensable in regions more to the N. and S. Manufacturing industry is principally devoted, in European and Asiatic countries, to the production of articles of clothing; but where clothes are an incumbrance, and most of the people are satisfied if they have a piece of coarse common cotton stuff to wrap round their middle, it would be absurd and contradictory to expect that this great department of manufacturing industry, and its many dependent and subsidiary arts, should make any progress. The agriculture, too, of the greater part of Africa is exceedingly unfavourable to the development of a spirit of

enterprise and invention. The seasons differ but little from each other; and in those tracts not condemned to perpetual sterility, that is, in the tracts watered by the periodical rains, or by the overflowing of the rivers, the rudest husbandry is sufficient, the heat of the sun operating on the moisture of the soil being all but enough to produce the most luxuriant crops. The houses, too, in tropical climates may be constructed at comparatively little expense; and, except for the cooking of victuals, fires would be a nuisance. It is idle, therefore, to wonder at the backward state of industry in Africa. It would be as reasonable to expect to find a manufactory of freezing machines at the North Cape, as to expect to find extensive cloth factories in Nigritia. The industry of a country always bears some proportion to the wants and necessities of its inhabitants; and few comparatively of those things which employ a large part of the industry of Europeans being wanted in Africa, they are but little produced.

It is true that besides the great articles now referred to, there are others, such as articles of show and ostentation, arms, &c., for which it might be supposed the taste in Africa would be as strong as in Europe. But these are costly articles; and, in point of fact, are never found generally diffused in any country not distinguished by its industry. Men are not instinctively laborious or enterprising. Industry is with them only a means to an end—a sacrifice they must pay to obtain supplies of the necessities and conveniences of human life. Wherever the sacrifice required to procure food, clothes, and other necessary accommodations is considerable, the population is generally industrious; and a taste for labour being widely diffused, those who are not obliged to apply themselves to the production of necessities, engage in the production of superfluities. But wherever the principal wants of man may be supplied with but little exertion, indolence becomes the distinguishing characteristic of the population; and instead of employing their spare time in the production of articles of ostentation and luxury, they usually waste it in idleness and apathy.

In addition to the circumstances now mentioned explanatory of the low state of the arts in Africa, and the barbarism prevalent in it, the Negroes and other African races have been supposed by some philosophers to be naturally inferior in point of intellect, and not to possess the same capacity for improvement as the Europeans, or people of the Caucasian variety. This supposition has, however, been vehemently denied; and it has been contended over and over again that the peculiar circumstances under which they have been placed sufficiently account for the condition of the Africans—for their want of a literature and their low civilization. That great weight should be attached to the considerations now mentioned is true; but still we do not think that they are sufficient wholly to account for the existing state of things. Egypt was, at a very remote period, the principal seat of science and of art; and various nations of Africa were in contact with, and had a pretty extensive intercourse with the Egyptians, and also with the Phœnicians, and afterwards the Romans. But they seem to have profited little or nothing by this association. And while the people of Greece, Asia Minor, and Magna Græcia raised themselves in a comparatively brief period to the highest pitch of civilization and refinement, the nations of Africa continue, without a solitary exception, down even to the present day,

immersed in the grossest barbarism. Surely, however, during the space of 3,000 or 4,000 years, opportunities must have been afforded to some of them to make some advances. But if so, not one has had sagacity to profit by them. Africa, in fact, does not seem to have produced a single great man. She has had no Hercules, no Minos, no Theseus, no Confucius, no Manco Capac. Among all the varieties of superstition that exist in it, we look in vain for hero-worship—for the divine honours paid in rude but improving nations in other parts of the world, by the public gratitude, to departed heroes, legislators, and authors of important discoveries in the arts.

With the exception of that of the ancient Egyptians and Ethiopians, whose descent is involved in the greatest uncertainty, almost all the civilisation that exists in Africa seems to be of foreign origin. The introduction of Mohammedanism, though in a debased form, has, as previously stated, gone far to banish cannibalism from many countries; and some of them have also adopted the letters and literature of Arabia. But the progress they have hitherto made is not such as to lead to any very sanguine anticipations as to their future advancement; and it would not, indeed, be very philosophical to suppose that those who have been wholly unable to produce any thing original should attain to much eminence in the practice of foreign arts and sciences.

It is unnecessary to enter into any examination of the *nebula question* whether the varieties of the human race in Africa originally sprung from different sources, or whether they all belong to the same stock, but changed to the state in which we find them by the influence of circumstances in the lapse of ages. Whatever conclusion may be come to on this point cannot in anywise affect the question as to the comparative intelligence of the African people. The same circumstances that are supposed by those who contend for the original identity of the races to have so greatly affected their appearance and physical capacities, could hardly fail to have an equally powerful influence over their mental faculties. This in fact is substantially admitted by Dr. Pritchard, who has ably contended for their common origin, and the equality of their intellect with that of the other races. "The tribes," says he, "in whose prevalent conformation the negro type is discernible in an exaggerated degree, are uniformly in the lowest stage of human society; they are either ferocious savages, or stupid, sensual, and indolent. Such are the Papals, Bulloms, and other rude hordes on the coast of Western Guinea, and many tribes near the Slave coast, and in the Bight of Benin; countries where the slave trade has been carried on to the greatest extent, and has exercised its usually baneful influence. On the other hand, wherever we hear of a Negro state, the inhabitants of which have attained any considerable degree of improvement in their social condition, we constantly find that their physical characters deviate considerably from the strongly marked or exaggerated type of the Negro. The Ashantee, the Sulema, the Dahomans, are exemplifications of this remark. The Negroes of Guber and Hausa, where a considerable degree of civilization has long existed, are, perhaps, the finest race of genuine Negroes in the whole continent, unless the Jolofs are to be excepted. The Jolofs have been a comparatively civilised people from the era of their first discovery by the Portuguese."—(*Researches into the History of Man*, ii. p. 338. 3rd ed.)

Here we have it distinctly laid down that the

existence of the distinguishing features of the Negro race in a strongly marked degree is uniformly associated with the lowest state of barbarism; and that as they recede from this strongly marked type, we find a greater degree of civilization and improvement. The inevitable conclusion is, that every variety of the Negro type, which comprises the inhabitants of almost all central Africa, is indicative of mental inferiority; and that docility and stupidity are the characteristics of those tribes in which the peculiar Negro features are found most developed. We believe that this is a perfectly correct statement; and we do not know that anything that can be said could show more conclusively the radical inferiority of the great bulk of the African people.

But we do not form our opinion as to their inferiority on their configuration and appearance, but on the fact that while numberless European and Asiatic nations have attained to a high state of civilisation, they continue, with few exceptions, in nearly primeval barbarism. It is in vain to pretend that this is the result of the unfavourable circumstances under which they have been placed. An intelligent enterprising people contend against unfavourable circumstances, and make them become favourable. But the Africans, with the questionable exception of the ancient inhabitants of the valley of the Nile, have never discovered any considerable degree of enterprise or invention, or any wish to distinguish themselves either in arts or arms. From the remotest antiquity down to the present day they have been hewers of wood and drawers of water for others, and have made little or no progress; and the only legitimate inference from this lengthened induction seems to be, that they are incapable of making it; that civilization will not spring up spontaneously amongst them; and that if it ever grow up it must be introduced from abroad, and fostered and matured under foreign auspices.

XII. Divisions.—Africa has been variously divided, according as one standard or another has been adopted. Owing to the barbarism of the people, our ignorance of the different states into which the continent is divided, and the revolutions to which they are perpetually subject, any distribution of the country founded on its political divisions would be almost impossible; and however accurate at the time, would speedily become quite obsolete. A better method would be to distribute it according to the races of people by which it is principally occupied; but as these are in parts very much blended, and it is sometimes no easy matter to say which predominates, it seems, on the whole, the better way to distribute it according to the great natural features of the country. On this principle, Africa may be distributed as follows, beginning with the North:—

1. *The Barbary States*, including the whole country N. of the desert of Sahara, and W. of the 25th degree of E. long.
2. *Sahara*, or the Great Desert.
3. *The Region of the Nile*, including Egypt, Nubia, Abyssinia, Senaar, Kordofan, and all the country drained by its affluents.
4. *Nigritia*, which may be subdivided as follows, viz.:
 - a. *Soudan*, or N. Nigritia, being the country to the S. of the Sahara and N. of the Kong mountains, watered by the Senegal, Gambia, Niger, and the rivers flowing into the great lake of Tchad.
 - b. *Central Nigritia*, being the region between the Kong mountains and the N. shore of the gulph of Guinea to the Bight of Biafra.
 - c. *Southern Nigritia*, including the countries from the Bight of Biafra along the coast to Cape Negro, and inwards to the sources of the rivers flowing through it to the coast.
5. *Southern Africa*, or the region S. of Cape Negro on the W. and of the Zambese river on the E.
6. *Eastern Africa*, or the region N. of Zambese river, round by the sea coast to the confines of Abyssinia and the Gebel-el-Komri, or Mountains of the Moon.
7. *The islands of Africa*, including the Madeira, Canary, and Cape de Verde islands on the W. coast, with those of St. Helena, Ascension, &c.; and on the E. coast the great island of Madagascar, the Isles of France and Mauritius, Socotra, &c.

XIII. *Progress of Discoveries*.—Africa, among the quarters of the globe, has always been the chief object of curiosity and discovery. Her Mediterranean coast indeed was well known to the ancients, and included in their circle of civilized states. But her eastern and western limits, stretching an indefinite extent southward, long baffled the attempts to reach their termination and that of the continent; while immense deserts barred the access into the interior. A peculiar difficulty was also found in tracing the source, and sometimes the termination, of the mighty rivers by which its inland regions are watered.

Tyre, the earliest seat of a flourishing commerce, might be expected to seek a route to the distant parts of Africa. In the curious account given by Ezekiel, Tarshish is mentioned as both the most remote and most important place with which she trafficked. The learned, however, have been much divided respecting its site; but the Tarshish to which the Tyrians sailed down the Mediterranean, whence they imported iron, silver, lead, and tin, the products of Spain and Britain, was most probably either Carthage, or the S. part of Spain. Carthage made violent efforts to prevent other commercial powers from penetrating beyond Sicily, thus seeking to monopolise the exclusive trade of the remoter countries, of whose products her merchants would, of course, keep an assortment.

Mention, however, is made of another route to Tarshish, by the Red Sea, which has singularly perplexed geographers. It was opened by Solomon, during the most prosperous period of the kingdom of Judæa, and aided by an alliance with Hiram, king of Tyre. To reconcile these two voyages, M. Gosselin supposes the term to mean "the ocean" as distinguished from inland seas or gulphs: so that one voyage was to the Atlantic, the other to the Indian Ocean. But all the modes in which Tarshish is mentioned—the fare of a vessel thither, its merchants, its kings—seem inconsistent with so very vague a sense; nor does there appear any room to think the Jews ever viewed the Mediterranean as an inclosed sea. We are disposed therefore to prefer the suggestion of Mr. Murray, in the *Encyclopædia of Geography*, that the Tyrians gave the name of Tarshish to the whole continent, of which it formed for them the most important part. Tarshish, in this larger sense, becomes nearly synonymous with Africa; the one voyage was along its northern, the other along its eastern coast.

Ophir is another country much celebrated in the Jewish scriptures, particularly for its gold. Many learned men have sought it in India, though gold was not then an article of export from that country, but the contrary; and no one staple of Indian trade is mentioned as brought from Ophir. Indeed its position seems clearly fixed, when we find the Red Sea voyage to Tarshish described elsewhere as one to Ophir. The latter, then, was on the eastern coast of Africa, where gold is no where found north of the Zambeze. Here accordingly we find Sofala, long the chief emporium of that river; and it may be observed that Ophir is called in the Septuagint Soopheira, while the modern Arab term is indifferently Zofar or Zofot.

This intercourse did not survive Solomon, whose successors, weakened by the division of the kingdoms, were unable to maintain it.

Our next information is derived from Herodotus, who, during his residence in Egypt, made very careful inquiries of the priests and learned men. He gives a very curious report of no less

an exploit than the entire circumnavigation of Africa. Necho, one of the greatest Egyptian princes, engaged for this purpose Phœnician mariners, who descended the Red Sea, and having reached the ocean, landed, sowed a crop, reaped it, and renewed their voyage. Thus they proceeded for two years, and in the third entered the Pillars of Hercules. They remarked that, in rounding Africa, they had the sun on the right, that is, on the south, which must have been correct. This brief relation has given rise to a mass of controversy, greater perhaps than the slight narrative can well support. The curious reader may consult Rennell in favour, Gosselin against it.* On the whole, we are disposed to conclude in favour of its authenticity. The time is adequate; and, as Rennell observes, the flat-bottomed vessels of the ancients, keeping always close to the shore, might avoid dangers that arrested larger ships in the open sea. That the event should be afterwards forgotten or discredited, would be only a common occurrence in those early periods, when knowledge was very little diffused.

Herodotus has given a detailed account of the wild and wandering tribes behind the Atlas ridge, extending to and somewhat beyond Fezzan.—He adds an interesting narrative of an expedition to explore the interior, undertaken by some youths from the country of the Nasamones lying inland from Cyrene. They passed, first, a verdant and cultivated territory; then a wild region filled with wild beasts; next entered into an arid dreary desert. Here, while plucking some wild fruits, a party of black men surprised and carried them along vast marshes and lakes to a city situated on a river flowing eastward. These last features, after they were within the desert, could not be found short of central Africa; but it is doubtful whether they refer to Timbuctoo and the Niger, as supposed by Rennell and Heeren, or to the lake Tchad, and the Yeou or river of Bornou.

Another singular circumstance mentioned by Herodotus relates to a traffic for gold carried on by the Carthaginians with a people beyond the straits, and managed in a peculiar manner, without the parties seeing each other. There is no gold in Africa north of the Senegal or Niger; but whether the Carthaginians penetrated thither, or the gold was brought by natives across the desert, there seem no means of certainly determining.

The records of Carthage, which would have thrown so much light on ancient commerce and geographical knowledge, have unfortunately perished. There remains only one valuable document, the narrative of a voyage by a commander named Hanno, sent to found colonies on the western coast, and to push discovery as far as possible. He is said to have carried with him 60 vessels, and no less than 30,000 men, women, and children. After passing the straits, he founded successively four colonies in convenient situations; then sailing three days along a desert coast, came to Cerne, a small island in a bay. In its vicinity he visited a lake through which flowed a large river; and another stream full of crocodiles and hippopotami. Then, returning to Cerne, he sailed twelve days along the coast of the Ethiopians, a timid race, who fled at the approach of strangers. His party then reached and sailed for several days along a coast, where

* Herodotus, iv. 42. Gosselin, *Géographie des Anciens*, t. 1. 199—216. Rennell, *Geog. Herodotus*, s. 24, 25.

† Herodot. lib. ii. 52.

they observed many striking objects. In one place the earth was so hot that it could not be trodden; torrents of flame were seen to roll along it and rush into the sea. During the day there appeared only a vast forest; but in the night, the air was filled with the sound of musical instruments and of human voices. Landing on an island they found a singular race of beings, in human shape, but with rough skins, leaping from rock to rock with preternatural agility. Towards the close of their voyage, there appeared a very lofty mountain, seeming to reach the skies, called the Chariot of the Gods.

This voyage has been the subject of elaborate dissertation by learned men, who have differed very widely as to its extent. Bougainville carries it to Cape Three Points on the Gold coast, Rennell to Sierra Leone; while Gosselin restricts it to the river Nun in Morocco. The first space exceeds 3,000 miles; the latter falls short of 700. The difficulties are very great; not a single name coincides; the descriptive features are too slight to fix any one spot with precision. The period, estimated only at 38 days, seems scarcely adequate to so long a voyage of discovery along an unknown coast. Yet the aspect of man and nature; the Ethiopians or black races; the garillæ, evidently large apes, whose form resembled the human; the great rivers, full of crocodiles and hippopotami; the conflagrations, apparently occasioned by the still prevalent custom of burning the grass at a certain season; silence during the day, with music and gaiety in the night,—all these strongly suggest tropical Africa. Gosselin indeed maintains that the coast of Morocco, in its then comparatively rude state, would much more than now resemble the Negro countries; but this seems scarcely to account for all the above particulars.*

The Persians, who entertained an almost superstitious dread of the sea, were little likely to extend maritime knowledge. Yet Xerxes showed some interest in the subject. Having condemned to death Sataspes, a Persian nobleman, he was persuaded to commute the sentence to that of circumnavigating Africa. Sataspes passed the straits, but soon terrified by the stormy ocean and rocky shores, he returned, and declared to his sovereign that the vessel had stopped of itself, and could not be got forward. The monarch indignantly rejected this apology, and ordered the original sentence to be executed.† The attempt was not renewed; and under this empire, the knowledge of Africa seems to have on the whole retrograded. When Alexander sent an expedition down the Persian gulph to seek its way into the Red Sea, it returned without success; whence the inference was made that no communication existed.

Under the Ptolemies, though they were an enterprising dynasty, and a learned school of geography was then formed, little progress was made. The prevailing hypothesis of an uninhabitable torrid zone at once indicated the limited amount of knowledge, and tended to perpetuate it. The map of Eratosthenes makes Africa an irregular trapezium, of which the N. and S. sides were nearly parallel, and the whole terminated N. of the equator. The coasts beyond the Straits of Gibraltar and Cape Gardafui, being observed on both sides to converge, were supposed to continue in that direction and meet. A navigator named Eudoxes, partly aided by

Ptolemy Evergetes and by the merchants of Cadiz, made several spirited attempts to perform this voyage, of which he did not suspect the extent; but he returned always without success.‡

The Romans did not much advance the knowledge of interior Africa. Mela, without any additional information, adopts the system of Eratosthenes, with some fanciful additions. Pliney, however, had access to all the information collected by the Roman chiefs and commanders. Scipio had sent Polybius to explore the western coast, which was surveyed by that officer for about 800 miles, consequently not beyond the limits of Morocco. Suetonius Paulinus had penetrated into the region of Atlas, describing its lofty and rugged steeps richly clothed with forests. Under Vespasian, Cornelius Balbus made an expedition into the desert, receiving the submission of Cydamus (Gadamis), and Garama (Gerna), but we can scarcely identify Boin with Bornou.||

Alexandria meantime, under the impulse given by the luxurious consumption of Rome, acquired a great extension of commerce. She opened a regular communication with India, and also to a considerable extent along the eastern coast of Africa. Both are described in an important commercial work written in the first century, called the *Periplus of the Erythrean Sea*. The African course terminates at Rhapta, a promontory and flourishing port, the position of which, however, from the usual causes of changed names and vague descriptions, is open to controversy. Vincent fixes it at Quiloa, while Gosselin makes it Magadorea, not quite a third part of the distance from the ascertained point of Cape Aromata (Gardafui). But the former has one conspicuous feature; five successive large estuaries, which Gosselin owns himself unable to find within his limits, but which actually occur a little north of Quiloa, in the mouths of the great river Quillimanci. There seems little room to hesitate therefore in fixing Rhapta at Quiloa. The gold of the Zambeze had not reached this port, the exports from which consisted only of ivory, tortoise-shell, and slaves.¶

About a century after Ptolemy published his geographical work, the most complete of any in ancient times. On the eastern coast he adds to that described in the *Periplus* an additional range, stretching south-east from Rhapta to another promontory, and port called Prasum; considerably south-east from which lay a large island, Menu-thias, evidently Madagascar. According to Gosselin, Prasum is Brava, while Vincent makes it Mozambique; but the south-easterly direction of the coast seems to limit it to Cape Delgado. This too would harmonize with Ptolemy's singular theory of a great austral continent extending from Prasum to the coast of the Sinæ (China), thus making the Indian-Ocean an immense inland sea.

In regard to the W. boundary, Ptolemy's ideas seem by no means very precise. His graduation shows an extent of coast which would reach far into tropical Africa; yet the Canaries are placed opposite to his most southern limit, which would thus seem scarcely to have reached beyond Morocco. Gosselin accuses him of having employed the materials afforded by three different voyages along the same line of coast, supposing them to apply to separate and successive parts, thereby trebling its extent; but we must hesitate

in imputing to this eminent géographer an error so flagrant.*

On the side of central Africa, Ptolemy delineates a very extensive region, reaching far south, which he names Interior Lybia. It contains two spacious lakes, the Lybian and the Nigritian, receiving the great rivers Gir and Niger, derived from chains of lofty mountains. A number of cities are inserted which cannot be recognised by modern names. But the remarkable circumstance is, that these objects appear contiguous to, and even connected with others, that unequivocally belong to northern Africa. Hence Gosselin and other writers conclude that his interior Lybia was not central Africa, but merely the region along the northern borders of the desert. We must observe, however, that the former, described as a region of mountain, river, and lake, all on a great scale, bears very little resemblance to the desert border of northern Africa. Our impression is that Ptolemy, receiving his intelligence from caravans coming E. from Bornou to the Nile, not from those crossing the great desert, was ignorant of the extent of the latter, and consequently of the interval separating northern from central Africa; and that he hence supposed and delineated the two as almost in contact. Yet this géographer had received intelligence of two marches, one by Julius Maternus from Cyrene, the other by Septimius Flaccus from Garama, who during periods respectively of three and of four months had penetrated into the country of the Ethiopians. Ptolemy scarcely gives credit to routes of such an extent; but he lays down Agysimba (perhaps Agudiz), into which they penetrated, as the most southerly known region. As it contains neither rivers nor lakes, it cannot be central Africa; but if, in the manner above supposed, he was ignorant how far south that region lay, the length of the marches would necessarily oblige him to protract Agysimba beyond it.†

In the seventh century a grand revolution changed the face of the world. The followers of Mohammed, inspired by fanatical zeal, issued forth from Arabia, and not only shook the Roman empire, but spread their conquests and settlements over countries never visited by the Roman arms. To Africa particularly they gave an entirely new face. Along its Mediterranean coast, they established several flourishing and civilised kingdoms. Their wandering habits, and the use of the camel, an animal expressly formed for sandy deserts, enabled them to overcome obstacles that baffled the Romans. The Sahara, across which no regular route appears to have been known to the ancients, was penetrated by them in different directions. Their dispersion was aided by the great schism between the dynasties of the Abbassides and Ommiades. The vanquished party, in large bodies, crossed the desert, and formed settlements, where, under the title of Fellatas or Foulahs, they still exist as a race entirely distinct from the Negroes. Their possessions extended along a great river called by them the Nile of the Negroes, which, however, was not, as long supposed, our Niger, but a tributary flowing into it from the east, termed by Clapperton the Quarrama or Zirmie. Ghana, the modern Kano, was then the chief seat both of empire and commerce. The sovereign displayed a pomp unrivalled in Africa, having his throne adorned with a mass of pure gold, indi-

cating the commerce by which the city was enriched. This gold was found in a country to the south called Wangara, intersected by numerous branches of the Nile, and where the metal was extracted from alluvial earth. There is evidently some confusion here, as gold, in alluvial deposits, is only found in countries far to the west: the error probably arising from the channel by which it was brought. Farther east, on the Nile of the Negroes, Edrisi represents Berissa and Tirka, which seem to have been recognised by Clapperton in Bershee and Girkwa, still considerable towns. Farther in that direction, Kuku, a great and flourishing kingdom, is evidently Bornou, the capital of which still bears that name; while Kaughia, twenty days to the south, and distinguished by its arts and industry, appears pretty clearly to be the Loggun of Denham. Returning to Ghana, and proceeding down the river, we are conducted to Tocru, an inferior yet large and powerful kingdom. It appears evidently to be Soccatoo, which, in a document quoted by Clapperton, is even called Takror. Sala, two days' journey lower, cannot now be identified. Farther west, the knowledge of the Arabians became most imperfect. They considered the ocean as only 500 miles beyond Tocru, when it is nearly 2000. They notice in that direction the island of Uili, at the mouth of the great river, whence all the countries on its banks were supplied with salt. This was pretty evidently suggested by Walet, the great mart for the salt of the northern desert; and its being reached across the great lake Dibbie might attach to it the idea of an island.‡

About four centuries after Edrisi, central Africa was visited and described by Leo, a Moslem Spaniard, who was even surnamed Africanus.|| A great change had now taken place, Timbuctoo having risen to be the most powerful city, the chief seat of commerce and splendour, the mart for gold. The neighbouring states, including even Ghana, called now Kano, had become its tributaries. This writer mentions Bornou under that name, and adds for the first time other states that still subsist — Cassina, Guber, Zegzeg, and Zanzara. Eyye, under the name of Gango, is justly described as a large and fine kingdom, 400 miles south-east of Timbuctoo. In a western direction, Ghinea or Gheneoa, distinguished for its great commerce, is the Jenné of Park. Thus all this part of the continent had assumed nearly the shape which it has ever since retained.

Soon after began that grand career of maritime enterprise, which terminated in the circumnavigation of the African continent and the discovery of a passage to India. It was carried on entirely by the Portuguese, and proceeded by gradual steps, from the rounding of Cape Bojador in 1433 by Gilianez, to the memorable passage of the Cape of Good Hope in 1497 by Vasco de Gama. During this long period, at every successive point, vigorous efforts were made to penetrate into the interior. These were inspired, not only by the report of gold mines and other objects of commerce, but still more by a hope of reaching the court of a mysterious personage named Prester John. This name appears to have originated in reports brought by Rubruquis and other early travellers of a ruling Nestorian bishop in central Africa. When, however, notices arrived of a Christian prince in Abyssinia, the name Prester

John settled down upon him; and, ignorant of the breadth of the continent, they supposed that, at no very great distance from the western coast, his dominions might be found. The commanders were therefore instructed on every new discovery to make their first inquiry concerning Prester John; and though total ignorance was everywhere professed, they persevered, and really appear to have sent embassies even to Timbuctoo. Di Barros has given a pretty correct account of the position of that city, and of Genni (Jenné) its rival. The English and French found a considerable Portuguese population on the Senegal and Gambia, and many words of that language current among the people of Bainboug. Yet nothing was done to correct the Arabian idea of the Niger rolling westward into the ocean; and the Senegal was therefore considered as forming its lower course, though Di Barros expresses wonder that after passing through so many regions it should not have rolled a greater body of waters.

The Portuguese formed leading settlements at Elmina on the Gold coast, and at the mouth of the river Formosa, which has now proved to be that of the Niger. They learned that the rulers here, on their accession, were accustomed to send ambassadors about 250 leagues into the interior to the court of a prince named Agané, from whom, as from a superior lord, certain symbols were received, which formed the prince's investiture. This potentate, during the interview, was screened from view by a silk curtain, and only at the close his foot was put forth, to which they did homage.* Major Rennell, with seeming reason, presumes this to be the king of Ghana; and in the maps of the sixteenth and seventeenth centuries there appears a very large lake named Guardia, which, from the site and a rude resemblance of name, we suspect to be the Tchad; but D'Anville, finding no authority in its support, expunged it. The Portuguese also formed considerable settlements on the coast of Congo, which to a certain extent they still retain; and their missionaries penetrated to some distance inland. After passing the Cape, and on the way to India, they sailed along nearly the whole of the eastern coast as far as Melinda and Mombasa. The king of Portugal had previously sent out two envoys, Covilham and De Payva, to reach India by way of the Red Sea. Their notices and observations, coupled with those of the circumnavigators, first conveyed to Europe a full view of the outline and circuit of this vast continent.

Covilham in returning settled in Abyssinia, and transmitted such accounts as induced his sovereign to send thither a succession of missionaries, through whom copious accounts were received of that remarkable country, scarcely at all known to the ancients. They did not, however, carry discovery far into the interior of the continent; and indeed such ignorance prevailed on the subject that in the maps of the seventeenth century Abyssinia and Congo are brought nearly into contact, while the Nile rises almost in the vicinity of the Cape of Good Hope.

In Europe meantime a growing interest was excited respecting the course of the Niger, the country of gold, and the trade of Timbuctoo. It was heightened by the conquest of that city by the emperor of Morocco in the end of the sixteenth century.† In 1618, an English company was formed for the purpose of penetrating thither, by ascending the Gambia, supposed one of the

mouths of the Niger. They sent out Captain Thompson, who, leaving his vessel at Kassar, went in a boat to Tenda, which no European had yet reached; but he was killed in a contest with the natives, another body of whom, incited by the Portuguese, attacked and massacred most of the men in the vessel. Another crew, sent to reinforce him, fell almost all victims to the climate. In 1620, Captain Richard Jobson came out with a larger armament, and, undismayed by these evil tidings, made his way considerably higher than his precursors. He even supposed, on erroneous information, that he was near Timbuctoo, and returned with the intention of actively resuming his researches, but was prevented by a quarrel with the merchants, who lost courage, and dropt the undertaking.‡

A century elapsed without further effort, till the Duke of Chandos, director of the African Company, entertained the idea of enlarging its scanty profits by opening a communication with the country of gold. He sent out, in 1723, Captain Bartholomew Stibbs, who having procured canoes, pushed vigorously up the river. On passing the falls of Barraconda, however, the stream became in many places so extremely shallow, that even his little boats could scarcely be dragged upward. He was finally obliged to stop nearly at the point which Jobson had already reached. His information led him to conclude that "the original or head of the river Niger is nothing near so far in the country as by the geographers has been represented." The Gambia, at a little distance upwards, was described as dwindling into a mere rivulet. It had no communication with the Senegal, or with any lake. He no where heard the Niger named, and had great doubts if such a river existed. Moore, a zealous agent of the company, strenuously repelled this conclusion, and endeavoured to overwhelm him by quoting Pliny, Ptolemy, Leo, and other high authorities; but Stibbs, though unable to meet him on this ground, continued not the less steadily to affirm what he had seen with his own eyes.§ In fact, notwithstanding one or two other attempts, the English made no farther discoveries in this quarter, nor obtained any intelligence of the real Niger.

The French meantime were making greater exertions on the Senegal, which they early chose as their place of settlement. About 1630, a commercial intercourse had been opened by some merchants of Rouen and Dieppe, without any settlement, the crews merely erecting temporary huts during their stay.¶ They were obliged, however, in 1661, to give way to the great West India Company, whose privilege included also western Africa. In nine years, however, it fell; and on its ruins was erected a second, succeeded by a third, fourth, and fifth, which last was merged in the Mississippi scheme. These, like similar mercantile associations, were all disastrous; but each had its interval of activity, during which a good deal was done to extend discovery and trade. The chief efforts were made by the Sieur Brue, appointed governor in 1697. From Port St. Louis, where a settlement was now formed, he immediately sailed up the river, with a view to adjust some differences with the Siratik or king of the Foulahs, and open a trade with its upper regions. He succeeded in his negotiations, and had hoped to reach Gallani, but was obliged to stop at Ghiorel, where he erected a fort. In

1696 he reached Gallam, and arrived at the rock of Felu, which stops the navigation for large barks. At Dramanet he fixed on a position for a fort, which was soon after erected under the name of St. Joseph, and became the centre of French interior trade. Through the exertions of one Compagnon, he acquired a full account of Bambouk, and its gold mines, the most productive in Africa. He laid before the company a plan for conquering the country, which he undertook to effect with 1,200 men, but could neither obtain the requisite authority nor means. He made diligent inquiries respecting the regions beyond, and obtained pretty distinct accounts of Bambarra, the lake Maberia (Dibbie), and Timbuctoo. Respecting the Niger, two opposite statements were made. According to one, it flowed westward, and divided into the three branches of the Gambia, the Faleme, and the Senegal; while others asserted its course to be eastward. The former continued to be the popular belief; but D'Anville, who bestowed much attention on the subject, and had access to the best documents, became convinced that there was a great river quite distinct from the Senegal, which flowed eastward, and was the one that passed by Timbuctoo. Upon this principle he formed his map of Africa, a wonderful effort of sagacity and ability, and which, in fact, is still tolerably correct as to a great part of that continent.* By restricting Abyssinia and Congo to their true limits, and obliterating imaginary features, this great geographer first exhibited that vast interior blank which so strongly excited the curiosity and enterprise of Europe.

The spirit of African discovery slumbered in Britain till 1788, when it burst forth with an ardour which led to the most splendid results. In that year was formed the African Association, composed of a number of distinguished individuals, among whom Sir Joseph Banks and Mr. Beaufoy took the lead. Ledyard was sent to penetrate by way of Egypt, and Lucas by that of Tripoli. The former, who, with an iron frame, had travelled great part of the world on foot, excited great expectations; but unhappily a fever carried him off before leaving Cairo. Mr. Lucas, long vice-consul at Morocco, had the advantage of understanding perfectly the African languages. He found no difficulty in obtaining the concurrence of the Pacha of Tripoli; and had set out for Fezzan, but was arrested by an insurrection among the Arab tribes. Valuable information, however, was obtained from several intelligent natives, confirmed by the testimony of Ben Ali, a merchant, who happened to be in London, and had travelled far into the interior. From these sources pretty copious accounts were received respecting the great countries of Bornou and Cassina, the latter of which had become the chief among the states of Houssa. The informants described also a great caravan route across the continent, from Tripoli to Asiente or Ashantee, behind the Gold coast. In this course it crossed the great central river, described, however, as flowing to the westward. It was in fact the Arabian Nile of the Negroes, the Quarrama of Clapperton, which in that direction proceeded to the main river, of which it is only a tributary. Rennell, having these materials put into his hands, and not being aware of any central river but one, reversed the direction given by D'Anville to the Niger, making it flow westward to the ocean: by the channel of the Senegal.

At the same time Bornou, understood to be described as bordering on Nubia, was carried far to the north and east of its real position, and the bordering countries displaced in consequence; so that this map, though ably drawn up, formed decidedly a retrograde step in African geography.†

The Association now turned their attention to W. Africa, and engaged Major Houghton, for some time consul at Morocco, to proceed from the Gambia. He went on foot, imprudently loaded with a quantity of valuable articles. He passed unmolested through Medina and Bambouk; but on reaching the territory of the Moors, was seduced by that people into the desert, where he was either killed or abandoned to perish.‡

On receiving this intelligence, the Association lost no time in seeking a substitute, and were fortunate enough to engage Mr. Mungo Park. That gentleman, in December, 1795, set out from the Gambia, and passed through Medina, Bondou, Gallam, Kasson, and Kaarta. Having suffered on the way severe spoliation, he was seized and detained long in captivity by the Moors of Ludamar. He contrived to escape, and though in extreme distress, made his way through the kingdom of Bambarra to Sego, its capital. This formed a crisis in African geography, for he there saw "the long-sought majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward." The extent of the city, its crowded population, and the numerous canoes on the river, presented altogether a scene little expected in the heart of Africa. Mr. Park penetrated down the Niger as far as Silla; but his destitute condition, and the formidable accounts of the bigotry prevailing at Jenné and Timbuctoo, deterred him from proceeding farther.

This traveller's arrival in England in December 1797, with accounts of such important discoveries, raised higher than ever the enthusiasm for African discovery. He retired into private life; but the Association obtained the services of Hornemann, a German, who possessed many requisites of a traveller. He went by way of Egypt to Fezzan, thence into central Africa, and appears to have penetrated by way of Cashna to Nyffe on the Niger, where he fell a victim to the climate. The same fate befell Mr. Nicholls, who attempted to reach the Niger by way of the Gulph of Benin. Some years before, Mr. Browne, an enterprising individual, by his own resources had penetrated by way of Egypt into the interior country of Darfour, about midway between Abyssinia and Bornou. He obtained there some important detached notices respecting the neighbouring nations, and the origin of the White River or main branch of the Nile, said to rise in the mountainous territory of Donga.

Meantime Park's mind was intensely bent upon Africa; and through his acquaintance with Mr. Maxwell, who had commanded a vessel employed in the Zaire or Congo, he became persuaded that that river was the termination of the Niger. Being invited by government to lead an expedition on a large scale, he readily accepted it, and its arrangements were adjusted with a view to his hypothesis. On the 4th of May, 1805, he departed from the Gambia, with a well appointed party of upwards of forty; but the harassing attacks of the natives, with the pestilential influence of the rainy season, reduced

‡ Ib. Lond. 1797.

them to seven before they reached the Niger. He proceeded downward, however, and at Sand-sanding obtained materials for constructing a schooner, 40 feet long, which he named the *Joliba*; and on the 17th November, 1805, set sail to explore the mysteries of interior Africa. It appears that he passed Timbuctoo, and made his way down the river to Boussa, where the king of Youri, indignant at having received no presents, pursued with a large body of men, and attacked him in a narrow and rocky channel. Park and his companions, unable to resist, threw themselves into the water, attempting to reach the shore, but were drowned. His papers are reported to be still in the king's possession, having never been recovered.

A German named Roentgen attempted to penetrate by way of Morocco, and set out in 1809 from Mogadore; but he appears to have been murdered by his guides. Some intelligence was gleaned from Adams and Riley, two Americans, who were successively shipwrecked on the coast of Sahara; but much uncertainty attached to their statements. In 1809, the Association engaged the services of the celebrated Burkhardt, who undertook to accompany the interior caravan from Cairo. While preparing himself for the expedition he made excursions through Nubia, and also through Syria and Arabia, his observations on which have been published, and are extremely valuable. In 1817, however, when about to set out on his main destination, he fell a victim to dysentery.

The public mind continued to be intently fixed on African discovery; partly from a wish to learn the real state of countries so difficult to explore and so different from those of the temperate zone, and partly, and perhaps principally, from absurdly exaggerated ideas as to the value of the commerce that might be carried on with the natives. At length government, on the suggestion of Sir John Barrow, determined to make a more extensive effort than ever. Following up the hypothesis of the identity of the Niger and Congo, two expeditions were prepared; one to ascend the latter river, another to descend the former. Captain Tuckey, who commanded the first, sailed from England in February, 1816, and arrived in June at the mouth of the Congo. The party proceeded for some time with great spirit; but being obliged by the cataracts to leave their boats, and proceed on foot through a rugged country affording little shelter, they became exposed to the baneful influence of the climate. Severe sickness soon assailing the whole party, obliged them to stop short, and ultimately proved fatal to all the officers, including the commander. The other expedition, destined to go down the Niger, was commanded by Major Peddle, who endeavoured to reach the interior through the country of the Foulahs. Having died before the march began, he was succeeded by Captain Campbell, who reached the Foulah frontier; but the sovereign, jealous of their designs, detained them under various pretexts, till exhausted supplies and general sickness obliged them to return. Immediately after Captain Campbell died, and his fate was shared by Lieutenant Stokoe, just as he had planned a new expedition. Captain Gray of the Royal African corps penetrated by another route to Gallam, but could not obtain permission to proceed through Bambarra.

All this series of disaster did not shake the perseverance of the British government. A new opening was afforded through the Pacha of Tripoli, who, inspired with a desire of improve-

ment new in this quarter of the world, cultivated European connection, and through the judicious conduct of consul Warrington was rendered friendly to Britain. Holding Fezzan tributary, and having a commanding influence over the central states, he could secure the safe passage of a traveller through a great part of Africa. Under his auspices, in 1819, Mr. Ritchie and Lieutenant Lyon reached Fezzan; but through the climate, and the treacherous ill treatment of the sultan, they incurred such severe illnesses as proved fatal to the former, and obliged the latter to return.

This failure did not prevent the speedy formation of another expedition, for which a more fortunate destiny was reserved. Its chiefs, Major Denham, Lieutenant Clapperton, and Dr. Oudney, arrived at Tripoli in November, 1821. Next spring they proceeded to Fezzan; but through the neglect of the sultan were unable to procure camels, which obliged Denham to return to Tripoli. Here he received assurances of protection from Boo Khalloon, a great Arab slave-merchant, who was setting out for the very countries which he sought to explore. Under his guidance, the party, in the end of 1822, began their route through the great desert, passing between the territories of the two remarkable native tribes, the Tuaricks and the Tibboos. They then travelled for a fortnight amid hills of moving sand, without the slightest vestige of life or vegetation. Soon after they entered Kanem, the northern province of Bornou. At Lari they came in view of lake Tchad, the great interior sea of Africa, 200 miles long, receiving two great rivers, and containing numerous islands. In proceeding along its eastern shore they visited most parts of Bornou and its chief cities of Kouka (Kuku of Edrisi), New Binie, and Angornou. This kingdom, once the most powerful in central Africa, had about thirty years before been conquered and dreadfully ravaged by the Fellatas from Houssa; but a private individual, by valour and ability, had reasserted its independence and driven out the enemy. That person, under the title of Sheik, exercised all the real power, while he suffered the legitimate king to reign in empty pomp. Major Denham also visited the smaller kingdom of Mandara, bounded by an almost interminable range of mountains filled with savage tribes, who are hunted down for slaves. In Loggum, situated along the great river Shary, which falls into the Tchad, he found a people more ingenious and industrious than those of Bornou.

Meantime Clapperton and Oudney were making an expedition through Houssa, the most interesting region of central Africa. It was found inhabited by the Fellatas, a people having nothing of the Negro features, but apparently descended from the great body of Moslem Arabs, who had migrated many centuries ago. They were quite superior to the Bornonese both in aspect and character, cultivating the land with greater skill and diligence, and manufacturing very fine cottons. The sway of Ghana, and even of Cassina, had been transferred to Sackatoo (Toerur), the sultan of which, about the beginning of the present century, overran all Houssa, and for some time occupied Bornou. Ghana, however, under the name of Kano, was found great in its decay, and still the chief seat of commerce. The transactions were extensive and well arranged; but slaves were the staple commodity. Sackatoo was found considerably larger than Kano, and the traveller was hospitably received by sultan Bello. The river Quarrama

was observed traversing this country, and flowing westward into the Niger, which, at the nearest point to Sackatoo, had a southward course; but accounts varied, whether continuing in that direction it reached the sea, or making a great circuit emptied itself into the lake Tchad. The traveller, having in vain solicited the means of proceeding to the river and the coast, returned to Bornou by a new route, which enabled him to see Cassina, a capital now greatly decayed. Dr. Oudney died early on this journey.

The British government determined to follow up these extensive and important discoveries. Clapperton was employed to land on the coast of Guinea, thence to penetrate to Sackatoo, and on his way explore the termination of the Niger. Instead of attempting to ascend the river of Benin, he was advised to proceed by land from Badagry; but from imprudent exposure to the climate two companions died, and he became sickly. He soon, however, reached the Yarriba, or Kingdom of Eyes, which he found populous and flourishing; and the natives, not imbued with Mohammedan bigotry, courteously received him. In traversing it he crossed the chain of the Kong Mountains, peopled to the summit. Leaving Yarriba, and passing through the large cities of Kiama and Wawa, he reached Boussa on the Niger, where he received a confirmation of Park's death, and even an invitation from the king of Youri, who promised to give him that traveller's books and papers; but this visit was delayed till he should return from Sackatoo. On his way thither he passed through Nyffe, a highly improved territory, though dreadfully laid waste by the Fellatas; and through Zegzeg, also very populous and well cultivated. At Sackatoo, or Soccato, an expedition against the rebel territory of Goober enabled him to procure farther information. The sultan, however, prepossessed with groundless jealousies, treated him with a harshness, which, with previous sickness, brought this spirited traveller to a premature grave. His servant, Lander, after doing the last duties, conceived the plan of himself exploring the termination of the Niger, but was forcibly prevented.

The information attained on this journey afforded the strongest reason to suppose that the Niger terminated in the sea. Lander on his return submitted to government a plan for proceeding to Boussa, and thence navigating the stream downwards. Government agreed to furnish the means, though promising only a very slender reward. In March, 1830, accompanied by his brother, he arrived at Badagry, and proceeded by nearly the former route to Boussa. Thence he visited Youri, which proved a very rich and populous country; but the king treated him ill, and he had no success as to Park's books and papers. On the island of Patashie, below Boussa, he procured, with great difficulty, two canoes, afterwards exchanged for one of larger size, and thus began the navigation down the Niger. He soon found it expand into a most magnificent river, about three miles broad, and bordered by noble forests. The large island of Zagoshi presented an active scene of industry and navigation, and by a large force of armed canoes maintained its independence of the neighbouring states. On the adjoining shore appeared a very large town, named Rabba. Farther down, Egga, another great port on the river, terminated the comparatively civilized territory of Nyffe; below which were only detached states of a very turbulent and lawless character, among which serious dangers were encountered. The next

striking object was the influx from the westward of the great river Tshadda, three or four miles broad, and with a current so strong that they soon gave up the attempt to ascend it. They learned, however, that three days' journey up was Fundah, of whose importance they had often heard. It became more and more evident that their voyage was to terminate in the sea, and that the numerous river branches which open into the Gulph of Benin are the delta of the Niger. Near the large town of Kirree, they passed the one which runs towards Benin. Here the natives were almost entirely clothed in the manufactures of Europe, and had fleets of large canoes adorned with European articles. The travellers, however, were made prisoners, and carried down to Eboe, the great mart for slaves and palm oil, with which trade the natives, who are rude and dissolute, do not hesitate to combine piracy. With great difficulty, and the promise of a high ransom, they succeeded in getting arrangements made for conveying them to the sea. They reached it by the channel called by the Portuguese Nun, by the English Brass River; not the largest of the estuaries, but that which comes in the most direct line from the main trunk. Thus, by very humble agency, was solved that grand problem in African geography, in the search after which so many abortive efforts had been made.

This important discovery, opening a water communication into the very centre of the continent, made a strong impression on the mercantile world. Mr. McGregor Laird, and some other gentlemen of Liverpool, entered into an association for forming a settlement and opening a trade on the Upper Niger. Two steamers, the Quorra and Alburkah, were fitted out; while the Columbine, a larger sailing vessel, was laden with goods. They arrived in the mouth of the Nun in October, 1832, but suffered severely from sickness amid the swamps of the delta; and though before the end of the year they reached a healthier station, the survivors did not regain their health. In the course of the next two years, Mr. Laird ascended the Tshadda, and reached Fundah, nine miles inland, which he found a large city, with nearly 40,000 inhabitants, situated in a very extensive and beautiful plain. Its commerce, however, had been much injured by war, and by the tyranny of its ruler, from whose power Mr. Laird had some difficulty in escaping. Mr. Oldfield in the Alburkah sailed about 100 miles up this river, but neither found its banks so fruitful nor the commerce so active as on the Niger. He also visited Rabba, which proved equally extensive with Fundah. The streets were crowded and dirty, but the markets spacious and well arranged. The state of the vessel frustrated the attempt to ascend to Boussa. Lander had unfortunately died of wounds received in a contest with the natives. The expedition was unfortunate in a commercial view, the only valuable article being ivory, in too small quantity to pay the expense of the voyage. As the natives, however, are active and eager for gain, Mr. Laird conceives that this and other articles could be supplied to almost any extent, if a steady demand were once understood to exist for them.

From the southern extremity of Africa, interesting discoveries have also been made. It was not till 1650 that the Dutch formed a colony at the Cape of Good Hope, which quickly became flourishing. Beyond the Karroo desert they settled rich grazing farms, at the foot of the high interior ranges of the Nienewald and Sneeuwgebirge, compelling the natives to labour as slaves.

Towards the end of the eighteenth century, Sparrman and Vaillant brought interesting accounts of the scenery of this tract, and its natural productions, both animal and vegetable. The settlement having been captured by Britain, Mr. Barrow, as secretary to Lord Macartney, made in 1797 an excursion into the interior, and gave striking pictures of the pastoral life of the Caffres, and of the miserable aspect and condition of the Bosjesmans or mountain Hottentots. In 1801 Messrs. Tritter and Somerville passed the Sneeuwgebirge, discovered the large stream of the Orange River, with the pastoral tribe of the Korannas, and finally arrived at Lattakoo, capital of the Boshuanas, a more industrious and improved people than any yet known in southern Africa. On receiving this intelligence, Lord Caledon sent Dr. Cowan and Mr. Donovan, with a party of twenty, to attempt to penetrate as far as Mozambique; but after proceeding considerably beyond Lattakoo, they were surprised and killed by a party of natives.

The Rev. Mr. Campbell, in his zealous pursuit of missionary objects, considerably extended our knowledge of this part of Africa. Beyond Lattakoo, he passed through a succession of towns always rising in importance. Kurrecbane, the last, was estimated to contain 16,000 inhabitants, who, besides agriculture, showed considerable skill in adorning their habitations, tanning skins, and smelting iron and copper. Dr. Lichtenstein and Mr. Burchell made important observations on the Boshuana people; but neither penetrated so far as Mr. Campbell. In 1823, while Mr. Thompson was at Lattakoo, these districts were invaded by a numerous and formidable Caffre people, from the vicinity of Cape Natal. These, it was discovered, had been driven from their country by a still more powerful tribe, the Zoolas, whose chief, Chaka, could muster 100,000 fighting men. Yet there was found to be in that quarter a large extent of fertile territory, to which a number of Dutch farmers were induced to emigrate; but having been involved in hostilities with this savage tribe, they have of late suffered dreadfully, and many of them have perished.

During the years 1822 to 1826, Captain Owen was employed by government in making a very careful survey both of the eastern and western coasts. He obtained much information respecting the former, which had hitherto been very imperfectly known. In 1837, Sir James Alexander, under the auspices of the Geographical Society, performed an expedition to the north-west from the Cape, into the country of the Damaras, where he penetrated farther than any former traveller.

After all that has recently been done to explore Africa, there still remain very important points involved in obscurity. The most important relates to the courses of the Tshadda and the Shary, flowing respectively into the Niger and lake Tchad. It is a favourite hypothesis with some, that both are one stream, pursuing an unbroken course from the lake to the river; but the fact observed by Denham, that the Shary flowed into the Tchad, renders this physically impossible. It has been recently conjectured that the Youu may be identical with the Tshadda, and thus unite the two great receptacles; but the travellers, who crossed that river and went a great way along its banks, could not well be mistaken in their belief of its flowing into the Tchad. It seems more probable that these two great rivers have their sources in the mighty chain to the south of Mundara; that their sources, and

perhaps some of their branches, may be at no great distance from each other.

Another object should be to connect lake Tchad and the surrounding countries with Nubia and Abyssinia, exploring on the way the source and early course of the Bahr-el-Abud, or principal branch of the Nile. This wide interval has as yet been only broken by Brown's journey into Darfour, and some notices procured by him respecting the adjacent countries. An expedition, we understand, is at present projected from Egypt to the head of the Nile.

There remains still farther to the southward a great mass of unknown territory, between the Portuguese settlements on the eastern and western coasts. The people in these have formed a few stations on the Zambeze, with a view to the traffic in gold and slaves; and they have others on the eastern coast, whence merchants, with similar objects, penetrate to some distance in the interior. Still the great body of the country remains unexplored. The intimations received represent it as occupied by numerous tribes, who have made some progress in culture and the arts. To explore it with any degree of completeness, two expeditions would be necessary; one from the Cape northward as far as Bornou and Housa; the other across the continent, between Congo and Mozambique. Both, however, would be accompanied with considerable difficulty and danger; and though they could hardly fail to add to our knowledge of the physical structure of the country, we incline to think that they would be of little or no importance in other respects.

AFRICA, or MAHADIAH, a sea-port town of Barbary, E. coast reg. Tunis, 110 m. S.S.E. Tunis, lat. 35° 32' N., long. 11° 10' E. It may contain about 3,000 inhab., and is at present a wretched place, surrounded with broken down walls, and without shops or bazars. Formerly, however, it was a sea-port and fortress of very considerable importance. In 1550 it was besieged by a powerful armament, under the orders of the viceroy of Sicily and of Doria the famous admiral of Charles V., who took it after an obstinate and desperate resistance. But being found to be untenable it was subsequently abandoned. (*Temple's Algiers*, &c., i. p. 137.)

ATRIQUE (ST.), a town of France, dep. Aveyron, cap arrond., on the Sorgue, lat. 43° 57' N., long. 1° 47' 15" E. Pop. 4,757. It is situated in a fine valley. Streets broad; but houses mostly old and ill built. It has tribunals of original jurisdiction and commerce, a communal college, and an agricultural society; with manufactures of coarse cloth, coverlets, cotton yarn and hosiery, tanneries, &c.; and a very considerable trade in wool, cheese, &c. It was formerly fortified.

AGABLY, a town of the desert of Sahara, cap. of an oasis, on the caravan road from Tripoli to Timbuctoo, lat. 27° 44' N., long. 4° 25' E.

AGADIR, or SANTA CRUZ, a sea-port town of Morocco, on the Atlantic Ocean, and the most S. in the empire; lat. 30° 26' 39" N., long. 5° 35' 56" W. It is built on the declivity of a hill on the shore of a gulph or large bay of the same name, well defended from the winds, and affording good anchorage for shipping. Agadir belonged at one time to the Portuguese, by whom it was surrounded by walls. It was taken from them by the Moors in 1536, when its fortifications were farther strengthened. It was for a considerable period the centre of an extensive commerce; but having rebelled against the government in 1773, the principal part of its population was transferred to Mogadore; and it had so much declined that it is said by Mr. Jackson, in 1839, not to have had more than 300 inhabitants. The vast sandy deserts of N. Africa commence immediately to the S. of Agadir; and hence its bay is aptly termed by the Arabs *Bab-Soudan*, that is, *Gate of the Blacks*.—(*Jackson's Morocco*, p. 115; *Ritter's Géographie. Trad. France*, iii. p. 161.)

AGDE (an. *Agatha*), a town of France, dep. Hérault, on the river of that name, near where it is traversed by the canal of Languedoc, about 3 m. above where the former falls into the Gulph of Lyons, and about the same distance from where the latter is united with the lake Thau, lat. 43° 18' 40" N., long. 3° 28' 10" E. Pop. 7,965. Ships of 200 tons burden come up to the town by the river, near the mouth of which is Fort Briscou. It has a considerable coasting and some foreign trade, with

ship-building, manufactures of verdigrise and soap, and distilleries. Being entirely built of black basaltic lava, and surrounded by a wall and towers of the same material, it has a grim appearance, and is called by the country people the *Ville Noire*. It made a part of *Gallia Narbonensis*, and was in 506 the seat of a council summoned by Alaric. — (*Hugo, France Pittoresque, dep. Hérault.*)

AGEN (an. *Aginnum*), a town of France, cap. dep. *Lot-et-Garonne*, on the right bank of the Garonne, nearly half way between Bordeaux and Thoulouse, lat. 44° 19' 22" N., long. 1° 36' 35" E. Pop. 12,851. It is ill built; streets narrow, crooked, and dirty. The hotel of the prefect is worth notice, and there is a fine bridge over the Garonne of eleven arches: it is the seat of a *cour royale* for the depts. Lot-et-Garonne, Lot, and Gers; has a college and several literary institutions, a public library with above 12,000 vols., and a theatre. Its situation, though rather unhealthy, makes it the entrepôt of the commerce between Bordeaux and Thoulouse. There is here a sail-cloth manufactory, which recently employed above 600 work-people, and produced annually 130,000 metres of canvass for the navy; there are also manufactures of serges, printed cloths, cottons, braziers' ware, pottery, soap, spirits, &c. Environs beautiful; the *promenade du Graviers* is one of the finest in France. Agen is very ancient, and under the Roman emperors was a prætorian city. — (*Hugo, France Pittoresque, dep. Lot-et-Garonne; Briand, de Verdict Dictionnaire de la France, &c.*)

AGGERHUUS, a bishopric of Norway, and one of the most important divisions of that kingdom; which see.

AGGERSOE, a small Danish island in the Great Belt, near the E. coast of the island of Zealand, lat. 55° 12' N., long. 11° 12' E.

AGHRIM, or AUGHRIM, an inconsiderable town or village of Ireland, co. Galway, 82 m. W. Dublin. One of the greatest battles ever fought in Ireland took place in the vicinity of Aghrim in 1691, when the troops of William III., commanded by Ginkell, afterwards Earl of Athlone, gained a complete and decisive victory over those of James II., commanded by St. Ruth, who fell early in the action.

AGINCOURT, or AZINCOURT, a village of France, dep. *Pas-de-Calais*, 13 m. N.W. St. Pol; famous in history for the great victory gained near it in 1415 by the English monarch, Henry V., over a vastly superior French force.

AGLIE, or AGLIA, a town of the Sardinian states, Piedmont, 10 m. S.W. Ivrea. Pop. 3,240. It has a collegiate church, and a magnificent palace with a considerable library.

AGNES (ST.), one of the Scilly Islands (which see), being the most S. of the group. It contains about 300 acres, and had in 1831 a pop. of 299. It is celebrated for its light-house with a revolving light, in lat. 49° 53' 37" N., long. 6° 19' 23" W. The lantern is elevated 138 feet above high-water mark.

AGNONE, a town of the Neapolitan dominions, prov. Sannio, 18 m. N.N.E. Isernia, in an elevated healthy situation. Pop. 7,000. It has an immense number of churches, an hospital, and five moute-di-piète, which make loans of seed corn to the peasants. It is the seat of the principal copper manufactures in the kingdom. Some writers have affirmed that it occupied the site of the ancient *Aquilonia* of the Samnites.

AGOA DE PAO, a punta-port town of St. Michael, one of the Azores, 12 m. E. Ponta-del Gada. Pop. 3,000.

AGON, a small sea-port town of France, dep. La Manche, 7 m. W. Coutances. Pop. 1462.

AGOSTA, or AUGUSTA, a maritime town of Sicily, cap. cant., prov. Syracuse, on its E. coast, 12 m. N. Syracuse, lat. 37° 13' 35" N., long. 15° 14' E. Pop. 8,667. It stands on a peninsula, and was built in the 13th century by the emperor Frederick, who peopled it from Centurissa, which was razed for sedition. It was nearly destroyed by the earthquake of 1693, when numbers of people were crushed to death under the ruins of their houses, and a sulphurous vapour finding its way to the principal powder magazine, it blew up with a tremendous explosion. Streets regular and parallel, with some tolerable municipal edifices and magazines for articles of commerce; but the houses are low and mean, and the inhabitants have an air of dejection and poverty. Their whole existence depends on the export of salt, and a little oil, honey, and wine. It is strongly fortified both on the land and sea sides. The harbour, though rather difficult of entrance, is deep, spacious, and secure; but in E. and S. gales there is often a heavy swell. The holding ground is excellent. — (*Smyth's Sicily*, p. 159; and *App. p. 14.*)

AGOWS, a people of Abyssinia, inhabiting the territory to the E. of the sources of the Bahr-el-Asrek, or Abyssinian Nile. This district is uncommonly fertile, particularly in cattle and honey, with which it almost exclusively supplies Gondar. The country is also very populous; and though of limited extent, can bring a con-

siderable force into the field. There is another tribe of the same people, called Tcheret Agows, inhabiting a district along the N. bank of the Tacazeze.

AGRA, one of the *subahs*, great divisions, or provinces into which Hindostan, or India N. of the Nerbuddah River, was divided by the emperor Acor. It lies chiefly between 25° and 28° N., and may be computed to contain about 46,000 sq. m., and from 6 to 7 millions of inhabitants.

These subahs or provinces of the Moghul empire were first equal in extent and population to kingdoms. The province of Agra lies in the alluvial plain of the Jumna and Ganges, with an elevation but a few hundred feet above the level of the sea; and the finest portion of it, well known under the name of the Doab, or country of the "two rivers," lies between these streams. By far the greater portion of its surface is a dead flat. Although watered by three great navigable rivers, the Chumbul, Jumna, and Ganges, the country is characterised in general for its drought, the greater part of its irrigation being effected by means of deep wells. It may also be described as eminently deficient of timber. From March to June the climate is dry, and extremely sultry; from June to October, sultry and rainy; and from October to February inclusive, serene, dry, and cold, the thermometer almost every morning falling below the freezing point. With the exception of a few woody portions of the province lying towards its W. extremity, and here only during the season of the periodical rains, the climate is healthy. No metallic mines exist in the province; and its only valuable minerals are the red sandstone, of which nearly all the monuments of the cities of Delhi and Agra are constructed; and a species of tufous limestone, called *kanghar* in the language of the country, and which is the only source from which lime is obtained for economical purposes. The soil is commonly two harvests; the greater crops being reaped before the setting in of the rains in May and June, and the lesser in December and January. The principal corn crops are those of wheat and barley. Rye is not known, and oats hardly so, and rice is not cultivated for want of a sufficiency of water. Of the smaller kinds of corn, those chiefly cultivated are two species of millet, viz. *Holcus Sorghum*, called in the language of the country *Jewar*; and *Holcus spicatus*, called *Rajra*. These two constitute the chief bread corn of the labouring people, who seldom taste wheat. Great quantities of pulses are raised as a winter crop for the food of man and cattle, the most common of which is the *Cicer arietinum*, called grain by Europeans. Mustard seed is raised for oil, and the sugar cane is cultivated for the manufacture of sugar. Cotton is cultivated to a very considerable extent, and Indigo is produced more extensively in this province than in any other part of Upper India. It was, indeed, from hence that the drug, in the earlier periods of European commerce, was procured for the trade of Europe. The great mass of the inhabitants are Hindoos; among whom the two first classes in rank, the Bramminical and Military, are more frequent than to the eastward, or to the south. To the W. of the Jumna, chiefly are found two nations or tribes well known in the history of Upper India, the Jauts and the Memnatis, both distinguished by their warlike and predatory habits. It is remarkable of a country so long subject to Mohammedan rule, and the immediate seat of power, that the proportion of Mohammedans found in this, as indeed in the neighbouring provinces, is smaller than in the more remote one of Bengal.

The inhabitants, of whatever denomination, are of more robust frames and a far bolder spirit than those of the last-named country. The language of the people throughout is the Hindi or Hindustani. The basis of this language is the Hindoo dialect, which was spoken in the kingdom of Kanoje, which is within the limits of this province, on the first Mohammedan invasions. The Persian, the most cultivated tongue, spoken by the conquerors, has been superadded to this local tongue, in the same way as Norman French has been added to the Anglo-Saxon; so that, in short, the history of the formation of the Hindi is exactly a parallel case to that of English. Another Indian dialect, now nearly extinct, was the ancient language of the country near the town of Agra.

AGRA, the name of a zillah, or district, constituting a judicial and fiscal division of the last-named province, lying on both banks of the Jumna. Its computed area is 4,500 Eng. sq. m.; and if it be equally populous with the neighbouring province of Delhi, of the population of which some estimate has been made, and it is probably somewhat more so, it contains 273 inhabitants to the square mile, or near one million of absolute population. In 1813, ten years after this district came into British possession, it was estimated to contain 2,456,214 begahs of land, each equal to near one third of an English acre, of which there were under actual culture 1,322,687; fit for culture 330,807; and waste or uncultivable 902,740. Half the area of the whole district, therefore, was under actual tillage. The land

tax as assessed to the land under culture was at the rate of two rupees and two annas a bégali, or near 12s. an acre; a very high or rather oppressive land tax, for a poor country just recovering from long disorder and anarchy.

AGRA, a city of Hindostan, cap. of the above province and district, on the S.W. bank of the Jumna, which during the season of the floods is here about half a mile broad, and at no season fordable, in lat. $27^{\circ} 11' N.$, long. $77^{\circ} 53' E.$ It is distant from Calcutta 950 m., Madras 1190, and Bombay 860. Agra, like other considerable towns of India, is built of bricks, the houses having terraced roofs; the streets being extremely narrow, and never paved or flagged. Much of it is at present in a state of ruin. No census of its population, that we are aware of, has been taken; but judging by the amount of the town duties, which have been about 60,000 rupees a year, or 6000*l.*, it would appear to be about equally populous with Dacca, Barcelly, and Mirzapore, and may contain about 65,000 inhabitants. It is very conveniently situated for the commerce of W. India and E. Persia, and is the mart of a very considerable inland and frontier trade.

The trading communication is carried on by boats on the Jumna and Chumtuli; and by horses, camels, bullocks, and bullock carts by land. The goods comprising the imports consist of shawls, hosiery, camels, rock-salt, and the dry and fresh fruits and drugs of Persia; cotton wool and coarse cotton fabrics from the S., with European commodities by the Jumna and Ganges. The chief exports consist of raw silks, indigo, and coarse sugar. In 1832, the custom duties levied on these, commonly at the rate of from 7½ to 10 per cent. on the value, were, for the exports 202,980 rupees; and for the imports 1,100,436 rupees. In 1814 the amount of the joint export and import duties was 1,062,157 rupees; so that in 14 years' time the increase was 34 per cent. Agra, in remote times, appears to have been a fortified town of some consequence; but it was not until the year 1556 that it was made the seat of Mohammedan empire. This was effected by the Afghan emperor Shihundur Lodhi. About half a century later the place was greatly embellished by Achiut, by far the most illustrious of all the Indian emperors. It continued to be the seat of government during his reign and that of his son; and Delhi was not restored as the metropolis until the reign of his grandson, Shah Jehan, in the year 1647. When Achiut fixed the seat of his government at Agra, he changed its name to Acbarabad, which continues to be its Mohammedan designation. It contains many fine monuments, all of Mohammedan origin.

The fortress is of great extent, the double rampart and bastions being built entirely of heavy red sandstone, and at least 60 feet above the level of the Jumna, on the bank of which it stands. The most remarkable structure, however, is the Taj Mahal, literally the "Crown of Empires." This stands about 2 m. below the fortress, and on the bank of the river. It is a mausoleum, built by the emperor Shah Jehan in honour of his empress the Begum Narr Mahal; a building of white marble raised on a terrace, and in the ordinary form of a Mohammedan mosque with minarets. The mosaic ornaments of the interior, including even the marble pavement, are extensive, rich, and elaborate, the flowers and arabesques being composed of no less than twelve different stones, such as agates, jaspers, lapis lazuli, and various coloured marbles, and the numerous quotations from the Koran being in black marble. A garden with fountains and highly ornamented gateways surrounds the mausoleum; and the *route caennelle* is supposed, whether for extent, symmetry, *matériel*, or execution, to surpass any thing in the world of the same description. This is the uniform opinion, even of those who have seen the master-pieces of Italian art. "It is possible," says the celebrated and accurate Bernier, "I may have imbibed an Indian taste; but I decidedly think that this monument deserves much more to be numbered among the wonders of the world than the pyramids of Egypt,—those unshapened masses, which, when I had seen them twice, yielded me no satisfaction, and which are nothing on the outside but heaps of large stones piled in form of steps, one upon another; while within there is very little that is creditable either to human skill or to human invention." The architect was a Mohammedan artist of Sahar, and the whole building is said to have cost 750,000*l.* It is kept in excellent repair by the British government, which assigns a handsome annual revenue for this object. The tomb of the emperor Achiut at Secundra, 6 in. from Agra, would be considered a splendid building in any place that had not the Taj Mahal to boast of. It was constructed by his son the emperor Jehangiro. A marble palace of Shah Jehan exists within the fortress; and the neighbourhood of the town, for miles, contains the ruins of palaces and tombs of costly materials and workmanship. Agra, with the district to which it belongs, was conquered by the chief Madhjee Sindhan in 1784, and formed a portion of the jagheer assigned by this prince for the maintenance of

the army, organized on the European system, and officered by Europeans, by means of which he maintained his supremacy in Upper Hindostan. In the course of the military operations which deprived the Mahrattas in 1803 of nearly the whole of their possessions in Hindostan, Agra was besieged by Lord Lake, and surrendered after a practical breach had been effected in one of the bastions. Since that time it has continued in our occupation, and constitutes our only depot or military magazine on the N. W. frontier. The fortress has always a considerable garrison, and about 20 m. beyond its walls is a cantonment where a much larger military force is stationed. Agra was the birth-place of Abul Fazel, the famous prime minister of the emperor Acbar.

AGRA, the name of a new government in British India, founded under the charter act of 1832. The unwieldy size of the Bengal presidency, which is far greater in extent, and contains more than double the population of both, the presidencies of Madras and Bombay, along with the additional duties assigned by the act in question to the governor-general of India, suggested the convenience of erecting a new presidency, and the historical reputation of Agra suggested the name. The new presidency was to have had a governor and council, but all the civil and military establishments were to have been borrowed from Bengal. The inconvenience of this arrangement in this respect soon became obvious in practice, and accordingly an act of parliament was obtained doing away with the new presidency, and substituting for it a lieutenant-governor, named by and subject to the governor of Bengal. By this change the essential administration rests with the latter authority, but local details are conducted by the lieutenant-governor. The authority of this officer extends over all the territories N. and W. of Allahabad inclusive, conquered or obtained by cession since 1801. The names of the districts subject to the lieutenant-governor of Agra are as follow:—Allahabad, Futehpore, Bundelcund North, Bundelcund South, Benares, Ghazepore, Gurruckpore, Junpore, Azimgur, Mirzapore, Agra, Allypore, Furruckabad, Barilly, Shalghapanore, Seharunpore, Meerut, Cawnpore, Etawah, Moradabad, and Bolundshuhur. These are computed to contain 66,510 sq. m. The authority of the lieutenant-governor, however, also extends to other districts possessing a less regular form of civil government, as the hill districts ceded by the Nepalese, which are computed to contain 18,000 sq. m. The population of all the territories now enumerated has been reckoned at 30,000,000. It has further, however, jurisdiction over the districts ceded by the Mahrattas on the Nerbudda in 1817, estimated to contain 29,400 sq. m.; and by the rajah of Berar in 1826, calculated at no less than 55,900 sq. m. No estimate of the population of these two last territories has been made, but they are known to be very thinly inhabited. The political correspondence with the chiefs on the W., N., and S. frontiers of his jurisdiction is also under control of the lieutenant-governor of Agra.

Authorities for these four articles, viz. Agra province, Agra district, Agra city, and Agra government.—*Hamilton's Description of Hindostan*; *Hamilton's East India Gazetteer*; *Bernier's Return of the Population of British India made in 1831 to the H. of Commons*; *Briggs' Persia*; *Trevelyan's Report on the Island Customs of Bengal*.

AGRAM, or ZAGRAB, a fortified city of the Austrian empire, cap. Croatia, and the residence of the governor-general, on a hill on the banks of the Save, lat. $45^{\circ} 49' 2'' N.$, long. $15^{\circ} 4' E.$ Pop. 17,000. Agram is the seat of a bishopric and of a tribunal of appeal for Croatia, the Banat, and Slavonia. It has a superior academy, a gymnasium, a Franciscan convent, and a considerable commerce, particularly in the tobacco and corn of Hungary.

AGREDA, a walled town of Spain, prov. Soria, at the foot of Mount Cayo, celebrated by Martial. Pop. 3,200. It is ill built, has 6 churches and 4 convents, with tanneries and breweries.

AGREVE (ST.), a town of France, dep. Ardeche, cap. cant. Pop. 2,500.

AGUAS CALIENTES, a town of Mexico, prov. Guadaluajara, 100 m. N.E. Guadaluajara, lat. $22^{\circ} N.$, long. $101^{\circ} 45' W.$ It is situated in a fertile district, has a fine climate, and is one of the handsomest of the Mexican towns. Being intersected by several great roads, it has an active and considerable commerce. It is celebrated for its great cloth manufactory which employed, in 1825, 350 hands (Ward), and the hot springs in its vicinity, whence it derives its name. Its pop. may probably amount to 18,000 or 20,000.

AGUILAR DE LA FRONTERA, a town of Spain, prov. Cordova, 22 m. S. E. Cordova.

AGUILAR DEL CAMPOS, a town of Spain, prov. Palencia, on the Pisuerga, 40 m. N. W. Burgos. Pop. 1,600.

AHANTA, a territory on the Gold Coast of Africa, between the rivers Ancobia and Suierin.

AHMEDABAD, a town of Hindostan, presid. Bombay, prov. Gujrat, cap. district of same name, on the navigable river the Sabarmatty. Lat. $22^{\circ} 58' N.$, long. $72^{\circ} 37' E.$ Pop. 100,000. About the middle of the 16th century it was a flourishing city celebrated for the magnificence of its mosques, palaces, and streets; but it has since fallen greatly to decay. It is surrounded by a high wall flanked with towers; and is a great resort of itinerant players and poets. It suffered severely from the plague in 1492, and from an earthquake in 1819. The district of which Ahmedabad is the cap. produces a land revenue of about 120,000*l.* a year.

AHMEDPORE, a town of Hindostan, prov. Orissa, 11 m. S. Juggernaut.

AHMEDNUGGUR, a city and fortress of India, presid. Bombay, prov. Aurangabad, cap. district of same name, on the river Seena, 70 m. N.W. Poonah, lat. $19^{\circ} 5' N.$, long. $74^{\circ} 55' E.$ The town, founded in 1493, is enclosed by a stone wall, and has a handsome marketplace and some pretty walled streets. At present it is the head station of a civil establishment, and has about 20,000 inhab., exclusive of the garrison. The fortress, a little way from the town, is oval shaped, and about 1 m. in circ.: it is built entirely of stone and is surrounded by a broad and deep ditch. It surrendered to General Wellesley (now Duke of Wellington) in 1803.

The district or collectorate of which Ahmednuggur is the cap., contains an area of 9,910 sq. m. with a pop. of about 667,000. The land revenue amounted in 1827-28 to 181,884*l.*, the average rate of assessment being 1*l.* 4*s.* 6*d.* per negah. The total revenue for the same year was 203,400*l.* — (*Part. Papers on Indian affairs; Revenue, Appendix*, p. 660.)

AHMOOD, a town of Gujrat, 20 m. N. by W. Broach, lat. $22^{\circ} 3' N.$, long. $73^{\circ} 6' E.$

AHRBERG, a town and castle of Bavaria, circ. Rezat, 10 m. S. Auspach. Pop. 3,300.

AHRWEILER, a town of the Prussian states, prov. Lower Rhine, cap. arc., on the Ahr, 23 m. W.N.W. Coblenz. Pop. 2,100.

AHUN, a very ancient town of France, dep. Creuse, cap. cant., 10 m. S.E. Gueret, on a mountain at the foot of which flows the Creuse. Pop. 2,183.

AHWAZ, or **AHWUZ**, a town of Persia, prov. Kuzistan, on the Karoon, 48 m. S. Shuster. In former times this was a large and flourishing city, cap. prov. of same name, and the winter residence of the Persian kings. It is now a wretched place, with 600 or 700 inhabitants. Some ruins of the old city are still to be seen. Of these the most worthy of attention are the remains of a bridge over the river, and of a royal palace. The portion of the wall of the latter now standing is built of large blocks of hewn stone, and is about 300 feet in length, and 14 or 15 feet high. A little below Ahwaz, at the deserted village of Sabla, are the remains of a remarkable mound or dam made across the river to procure water for the irrigation of the surrounding country. — (*Kinners's Pers. Emp.*, p. 89.)

AIAS, or **AJASSO**, a ruined sea-port of Asiatic Turkey, on the N. shore of the gulf of Iskenderoon.

AICHACH, or **AICHA**, a town of Bavaria, circ. Upper Danube, on the Paar, 12 m. E.N.E. Augsburg. Pop. 1,600. It is surrounded by walls and ditches.

AIGLE, a town of Switzerland, cant. Vaud, cap. dist. same name, on the torrent Grande-Eau, near the Rhone. Pop. 1,750.

AIGLE (L'), a town of France, dep. Orne, cap. cant., on the Rille, 18 m. N.N.E. Mortagne. Pop. 5,484. Though old and surrounded by the remains of old walls, it is well built, neat, and clean, and is distinguished by its industry. The needles and pins manufactured here are celebrated all over France, and it has also fabrics of iron and copper wire, wire gauze, nails, &c. It has withstood several sieges.

AIGNAN (ST.), a town of France, dep. Loiret, cap. cant., 24 m. S. Blois. Pop. 2,856. There is in the vicinity the only quarry of gun-flints in France. The quantity annually manufactured is estimated at from 35,000,000 to 40,000,000. Those for the use of the army are kept in dépôt in the castle of Ambolse.

AIGRE FENILLE, a village of France, dep. Charente Inférieure, cap. cant., 13 m. N.N.E. Rochefort. Pop. 1,700.

AIGUE PERSE, a town of France, dep. Puy de Dome, cap. cant., 11 m. N.N.E. Riom. Pop. 3,115. Near it is the Château de la Roche, the birthplace of the chancellor of l'Hôpital.

AIGUES MORTES. A town of France, dep. Gard, cap. cant., 30 m. S.W. Nîmes, lat. $43^{\circ} 53' 58'' N.$, long. $4^{\circ} 11' 22'' E.$ Pop. 3,260. Though now about 4 m. inland, **Aigues Mortes** was formerly a sea-port, and was, in fact, the place where St. Louis embarked on his two expeditions to Africa. At present it is connected with the sea by a canal, which is prolonged to Beaucaire on the one hand, while it is united on the other with that of Languedoc.

It is fortified, and, from its position, is an important post for the defence of the coast. Owing to the retrogression of the sea, the town is surrounded by marshes (whence its name *Aqua Mortua*), and is very unhealthy. The salt lake of Peccals, in the neighbourhood, is celebrated as well for the salubrity as for the quantity of the salt obtained from it. — (*Hugo*, art. "Gard.")

AIGUILLE (L'), a celebrated mountain in France, dep. Isere, 4 m. N.W. Corps, height 2,000 m. (6,565 feet). Its upper part has the appearance of a truncated cone, and its upper part is of a conical form. It was long supposed to be inaccessible, and was hence called *Mons Inaccessus*; but in 1409 an officer of Charles VIII. reached its summit.

AIGUILLON, a town of France, dep. Lot et Garonne, at the confluence of the Lot and the Garonne, 17 m. N.W. Agen. Pop. 3,919. It was unsuccessfully besieged by John Duke of Normandy in 1345; when, it has been said, but incorrectly, that cannons were first made use of.

AIGURANDE, a town of France, dep. Indre, cap. cant., 12 m. S.W. Châtre. Pop. 1,945. It is the centre of an extensive cattle trade; and has, or had, an octagonal monument believed to be very ancient, but of which the object is unknown.

AIILAH, or **ELANA**, a decayed town of Arabia, on the gulf of Akabah; which see.

AILSA, an insulated rock in the Frith of Clyde, 10 m. W. Girvan. Its base is elliptical, and it rises abruptly from the sea to the height of 1,098 feet. It consists of columnar trap. The N.W. side is almost perpendicular, being formed of successive tiers of immense columns. It is frequented by innumerable flocks of sea fowl, and is a very striking object from every part of the Ayrshire coast. It gives the title of Marquis to the noble family of Kennedy.

AIN, a frontier department in the E. of France, having the Rhone, which separates it from Savoy on the E. and S., the Saône on the W., and the depts. of Saône et Loire, Jura, and part of Switzerland, on the N. and N.W. Area 532,674 hectares. Pop. 346,188. Exclusive of the Rhone and Saône, by which it is partly bounded, it is divided by the Ain, whence it derives its name, into two nearly equal parts; that to the E. being rugged, mountainous, and principally adapted to pasturage; whereas that to the W., though in parts marshy, is generally level and fit for cultivation. There are in the S.W. portion of this dep. a great number of lakes or ponds, some of which are subjected to a very peculiar species of rotation. It is usual to drain and cultivate them for a season; and when the crop has been gathered they are again filled with water, and with different sorts of fish, according to the nature of the pond; and after being occupied in this way for two years, or thereby, are again dried and subjected to the plough. The extent of the ponds so employed is estimated at nearly 16,000 hectares. This is found to be a very profitable species of cultivation; though, from the humidity it occasions, it is said to render the climate unhealthy. Oxen, of which large numbers are bred, are generally used in tillage. Produce of corn crops sufficient for the consumption. Vintage considerable, three-fifths of the produce exported. Woods very extensive, amounting to about 120,000 hectares. Near Belley are produced the best lithographic stones in France. Manufactures inconsiderable. Great numbers of the inhabitants emigrate annually after harvest to seek for employment in the contiguous departments. Ain returns 5 members to the Ch. of Deputies, and has 1,203 electors. Public revenue of the dep. in 1831, 6,258,042 fr. Chief towns Bourg, Nantua, Trevoeux, Belley, and Gex. But the most celebrated place in the dep. is Ferney, long the residence of Voltaire. — (*Hugo, France Pittoresque. dep. Ain; Franch. Official Tables.*)

AIN-TAB, a large town in the N. of Syria, on the S. slope of the Taurus, lat. $36^{\circ} 58' N.$, long. $37^{\circ} 13' 15'' E.$ 70 m. N. Aleppo, and 30 m. W. Bir, on the Euphrates. Pop. has been estimated at 20,000, which, if the town be two thirds the size of Aleppo, as stated by Maundrell (*Journal*, 210), can scarcely be considered as exaggerated. The inhabitants consist of nearly equal numbers of Armenian and Greek Christians, Kurds, and Mohammedans, among whom a spirit of toleration and unity prevails unparalleled in most other Eastern societies. They use the Turkish language. Houses well built, of a fine stone resembling porphyry, flat-roofed, and generally of only one story. There are 5 mosques, and several large and well supplied bazars. In the centre of the town is a castle on a mound, resembling, in every respect, that of Aleppo, but much smaller. Water abundant, many of the streets having streams flowing through them. On the S. is a large burial ground, which at a short distance resembles an important suburb, and is perhaps not much inferior in extent to the town itself. Manufactures of goat-skin leather, cotton and woollen cloths, are carried on to some extent; and there is some trade in raw and tanned hides, cloth, honey, and tobacco.

Ain-Tab may be regarded as the capital of a limited

but very fine country, consisting of small hills and valleys among the roots of the Taurus. The towns and villages in this little district are very numerous, the most important being Adia, Silam, and Kles. At Adia, 6 or 7 m. distant, is the source of the Koef (the river of Aleppo); and within 10 yards of this stream there runs another, the Sejour, the banks of which are thickly set with trees and villages. The Sejour has a good bridge over it, about 24 m. from Ain-Tah. The air is good and the soil fertile, but cultivation is not much followed, the majority of the rural population being shepherds. Principal agricultural products corn and tobacco. Bees are very plentiful.

Ain-Tah was taken and plundered by Timur Bee in 1400; but its favourable site and the tolerant spirit of its inhabitants have kept the district remarkably free from the usual Eastern casualties. The Turkish pachas, notorious as they are for exaction and oppression, respect the homes and rights of these hardy mountaineers. They have, indeed, been taught this forbearance by some severe lessons, having experienced, in every attempt at tyranny and extortion, a firm and successful resistance. The last of these attempts was made in 1780, when the Turkish forces were completely defeated; since which the men of Ain-Tah and its vicinity have been suffered to enjoy the produce of their fields, flocks, and bees in undisturbed tranquillity. According to Maundrell, Ain-Tah is identical with the *Antiochia-ad-Taurum* of the ancients; but this is doubtful. — (*Maundrell's Journey*, p. 260; *Voincy*, li. 137; *Brown's Travels*, 210.)

AIRDRIE, a bor. and m. town of Scotland, co. Lanark, pa. New Monkland, on a rising ground between two little rivulets, 12 m. E. Glasgow. Pop. 6,504. It consists principally of two parallel streets joined by cross streets, the houses of the labouring population being well built and comfortable. In the early part of last century Airdrie contained only one solitary house. It owes its rapid rise to the coal and iron mines in its immediate vicinity, and to its contiguity to the Monkland canal, to which it is united by railways. The Calder iron works in the neighbourhood employ a number of hands; and within the town there are two iron foundries, in which machinery is made, with distilleries, breweries, malt barns, &c. But the weaving of cotton goods on account of the Glasgow manufacturers has hitherto been the principal source of employment; though this will probably soon cease to be the case, a large cotton factory having recently been erected. It was constituted a royal burgh in 1833. The R. form Act united Airdrie with Hamilton, Lanark, Falkirk, and Livingston in the return of a member to the H. of C. 100 houses in 1831; parlt. constituency 1837-38, 223. — (*Boundary Report*, p. 121, &c.)

AIRR, a river of England, important from its navigation and the numerous canals with which it is connected. It rises in Yorkshire in the central mountain ridge, a little to the E. of Settle. It pursues a S.E. course, till passing Leeds it is joined by the Calder at Castledelf; its course is thence E., with a good many windings, till it falls into the Ouse, a little above Goale. From Leeds to Ferrybridge the Aire flows through one of the richest plains in the kingdom.

AIRG (an. *Vicus Julii*), a decayed city of France, dep. Landes, cap. cant., on the Adour, 80 m. S.S.E. Bordeaux. Pop. 4,028. This is a very ancient city, and has been since the 5th century the seat of a bishopric. The Goths became possessed of it in the 6th century; and it was for some time the residence of Alaric II. It suffered much in the wars with the English, and still more in the religious contests of the 16th century. The fortifications by which it was once surrounded have now wholly disappeared. It is pretty well built, has a cathedral, a college, and a secondary ecclesiastical seminary. A bridge has been recently built over the Adour. — (*Hugo*, art. "Landes.")

AIXE, a fortified town of France, dep. Pas de Calais, cap. cant., at the confluence of the Lys and Laquette. Pop. 5,610. It is pretty well built; has several public fountains; with manufactures of linen, hats, soap, Dutch tiles, Geneva, &c. In a military point of view, it is of considerable importance for the defence of the country between the Lys and the Aa.

AIRVAULT, a town of France, dep. Deux Sevres, cap. cant., on the Thoué, 15 m. N.N.E. Partenay. Pop. 1,923. It is well built, and has the remains of an old castle and monastery destroyed in the 16th century.

AISNE, a dep. in the north of France, between 48° 50' and 50° 4' N. lat., and 2° 56' and 4° 12' E. long.; the principal town, Laon, in its centre, being 75 miles N. E. Paris. Area 728,530 hectares. Pop. 627,098. It is traversed by the Aisne, whence its name, the Oise, Marne, and by several canals. Surface generally flat or undulating, but in parts hilly; soil fertile. The cultivated land amounts to about 500,000 hectares, about 100,000 being occupied with woods, and 42,000 with meadows. Agriculture good; and after providing for the inhabitants there is a large export of corn, as well as of sheep, oxen,

horses, and pigs. It also produces flax and hemp, hops, rape, beet root, potatoes, &c. In the southern part wine is made; but the ordinary drink of the inhabitants is wine and beer. This dep. is celebrated for its manufactures, at the head of which must be placed the cottons, laces, lawns, shawls, table linen, &c. of St. Quentin; the mirrors of St. Gobain; and the bottles, of which Falmahy furnishes about 2,000,000 a year, for the wines of Champagne. It has also cast iron and iron plate foundries, brick and tile works, manufactures of chemical products and of beet-root sugar, bleach fields, &c. It is divided into 7 electoral arrond.; returns 7 m. to the Ch. of Deputies; and had, in 1838, 3,160 electors. Public revenue, in 1831, 18,732,067 fr. Chief towns, Laon, St. Quentin, Soissons, Chateau-Thierry, Vervins, &c. — (*Hugo*, *France Pittoresque*, art. "Aisne;" *French Official Tables*, &c.)

AIX, an ancient city of France, dep. Bouches du Rhone, cap. arrond. and cant., formerly cap. Provence, in a plain at the foot of some hills, 16 m. N. Marseilles, lat. 43° 31' 39" N., long. 5° 28' 47" E. Pop. 18,240. It was founded by Caius Sextus Calvinus, a Roman general, 121 years B.C., and received the name *Aquis Seguntis*, from its famous hot springs. It is a well-built handsome town. Streets generally well paved, wide, and clean. It has a beautiful public promenade, and some good squares ornamented with fountains. A side of one of the squares is formed by what is called the *Palais*, an old building containing some spacious halls, formerly occupied by the parliament of Provence and other public bodies. It has also a town-hall, containing a valuable collection of antiquities, a magnificent cathedral, a museum of pictures, a theatre, and other public buildings. Previously to the Revolution Aix was the seat of a university; and at present it has a royal academy equivalent to a university, with faculties of theology and law, and a valuable library containing above 90,000 volumes. It is also the seat of a *cour royale* for the depts of the Bouches du Rhone, Basses Alpes, and Var, and of an archbishopric; and has several learned societies. Aix has manufactures of silk, wool, and cotton, and its industry and commerce have materially increased within the present century. Inhabitants said to be decidedly aristocratical, while those of Marseilles incline strongly to democracy. The mineral springs, from which the town took its ancient name, were accidentally discovered in 1764, and were identified by the medals, inscriptions, and other Roman monuments then dug up. The establishment of the baths belongs to the hospital. Tournefort, celebrated as a botanist, and one of the best of the travellers that have visited the Levant, was a native of Aix; as were Valerio and Adamson. — (*Hugo*, art. "Bouches du Rhone.")

AIX, an ancient town of the Sardinian States, Savoy, 8 m. N. Chambery. Pop. 2,200. It is celebrated for its hot baths, which were in vogue among the Romans, and are still extensively resorted to. The king of Sardinia has constructed a large and convenient building for the accommodation of visitors.

AIX D'ANGILLOU (LES), a town of France, dep. Cher, cap. cant., 12 m. N.E. Bourges. Pop. 1,414.

AIXE, a town of France, dep. Haute Vienne, cap. cant., 6 m. S.W. Limoges. Pop. 2,645. It has some remains of Roman antiquities.

AIX-EN-OTHE, a town of France, dep. Aube, cap. cant., 18 m. N.W.S.W. Troyes. Pop. 1,707. It has a cotton factory.

AIX-LA-CHAPELLE, (the *Aachen* of the Germans, and the *Aquigrana* of the Italians,) an old and well-built city of the Prussian states, prov. Lower Rhine, near the confines of the Netherlands, lat. 50° 47' N., long. 6° 15' E. It was formerly a free imperial city, and is now the cap. of a reg. of the same name. It is divided into the inner and outer town, and contained, in 1835, 38,383 inhab. It is the seat of a bishop, of a court of appeal, a tribunal of commerce, and has an exchange, a gymnasium or college, a school of arts, a picture gallery, and a public library with above 10,000 volumes. Manufactures considerable, and recently increased. The most important are those of broad-cloth, and cotton; and next to them the famous needle-works, which employ and support large numbers of individuals; watchmaking jewellery, &c., are extensively carried on; and there are also print-works and tan-works. Exclusive of the cathedral, there are 8 Catholic churches, a Protestant church, and a synagogue. It had at one time 21 monasteries and convents, but most of them have been suppressed. Among the public buildings, the most remarkable are the town-house, enriched with portraits of the different ministers present at the negotiation of the treaty of 1748; the cathedral, founded by Charlemagne; the theatre, the fountain in the principal market place, &c. Handsome private houses are to be met with in every street. Aix-la-Chapelle was the favourite residence of Charlemagne, and for some time the capital of his empire; hence it was long customary to hold the coronation of the emperors of Germany in this town; and till 1794, when they were carried to Vienna, the regalia used on

the occasion were to be seen in the convent chapel. Strangers are still shown a sabre of Charlemagne, a copy of the gospel written in gold characters, and an immense number of relics.

Aix-la-Chapelle is celebrated for its hot-baths, which issue from 6 distinct springs. The most celebrated is that called the *Source de l'Empereur*. The water is strongly impregnated with sulphur, and has a temperature of 148° Fahr. The baths are generally opened with much ceremony on the 1st of May. Two celebrated treaties of peace have been concluded in this city; the first in 1648, between France and Spain; and the second in 1748, between the different powers engaged in the wars of the Austrian succession. Here also a congress was held in 1818.

The *Salle des Redoutes*, one of the most splendid gambling-houses on the Continent, is thus noticed in Mr. Murray's *Handbook*: "The lower story is occupied by print and music shops, by a restaurant, and a reading room, where the principal European newspapers are to be found. In the grand suite of apartments, balls are given once or twice during the season; but they are principally devoted to gambling. Games of hazard, rouge et noir, &c. are carried on in them, almost without interruption, not only by night but by day, beginning at 10 or 11 in the morning. The tables are open to all comers except inhabitants of the town and officers of the Prussian army, who are expressly forbidden by a police order to play at the tables. Before 10 p.m. the lowest stake allowed is a kron-thaler; after 10, half a kron thaler is the lowest sum. Public gaming is not tolerated anywhere else in the Prussian dominions. The tables are let out to a company, who are compelled to apply a large portion of the gains to the improvement of the town and the walks in the neighbourhood."

AJACCIO, a sea-port town of the island of Corsica, of which it is the cap., on its W. coast, and on the N. side of a gulf to which it gives name, lat. 41° 55' 1" N., long. 8° 44' 4" E. Pop. 9,003. It has a citadel built in 1554; is the seat of a bishopric; has a royal court and other judicial establishments, a college, a model school, a public library, a good theatre, and a fine promenade along the bay. The latter is spacious and commodious, but exposed to the W. gales. Streets straight and broad, and houses good; but it labours under a deficiency of good water. It has a considerable trade, exporting wine, oil, and coral. Ajaccio will be memorable in all time to come, from its having been the birthplace of by far the most extraordinary, and, perhaps, also the greatest, man of modern times. Napoleon Bonaparte was born here on the 5th of August, 1769. He was descended of a respectable family long settled in the island. — (*Itugé*, art. "Corse.")

AJMERE, a town of Hindostan, cap. district belonging to the British, in Rajpootana, 225 m. S. W. Delhi, lat. 26° 31' N., long. 74° 29' E. It is a well built moderate sized town, on the slope of a high hill, at the summit of which is a fortress, formerly deemed impregnable, and which, with a little improvement from European skill, might easily be made a second Gibraltar. Ajmere is a holy city, having the good fortune to possess the tomb of a saint, whose miracles are renowned all over India. "The emperor made a pilgrimage on foot to the shrine of the saint; and it continues to be resorted to by devotees from all parts of India. It is not uncommon, in Malwa, for pilgrims who have been at Ajmere to set up a brick or a stone taken from the sanctuary near their dwelling, and to become saints themselves, and have pilgrimages made to them! A strong detachment of troops is usually stationed at Ajmere, and the neighbouring town of Nuseerabad."

At a short distance W. from Ajmere is the celebrated Hindoo temple of Pooshkur, on the banks of a sacred pool nearly a mile in circuit. It is annually visited in October by crowds of pilgrims from all parts of India. (*Heber*, II. pp. 440-445.)

AKABAH (GULF) AND CASTLE OF). The gulf of Akabah is a deep narrow inlet, uniting with the N. E. extremity of the Red Sea. It extends in a N. N. E. direction from 26° to 29° 32' N. lat., a distance of above 100 Eng. m.; being, where broadest, 16 or 17 m. across. It communicates with the Red Sea by channels on each side the isle of Tiran at its S. extremity. This gulph, the *Sinus Eilatensis* of antiquity, so called from the port of Elana or Elath, forms the E. boundary of the peninsula occupied by Mount Sinai. It has the appearance of a narrow deep ravine, the cliffs rising in some places 2,000 feet perpendicularly from the sea; and has been very little frequented in modern times. Being exposed to sudden and heavy squalls, and encumbered in parts with coral reefs, its navigation is not a little dangerous.

The castle of Akabah, from which the gulph takes its modern name, is not a place of any strength. It is situated about 180 yards from the beach, on the E. side of the gulph, and about 24 m. from its extremity, in lat. 29° 30' N., long. 35° 3' E. It has a supply of good water, and there are several Arab huts within its walls. The gar-

ison consists of about 30 Egyptian soldiers, kept to guard the corn deposited in it for the supply of the caravans, in their journey from Cairo to Mecca.

Akabah has been supposed to occupy the site of Elan or Elath, from which an extensive intercourse was carried on in the earliest ages with Rhinoculura, now El Arish, on the Mediterranean, only 116 m. distant. There are, however, no ruins of any kind at Akabah, and no port. It would, therefore, seem more probable that the situation of Elath is identical with that of Jezirat Faroun, on the W. side of the gulph, and about 6 m. from its extremity. There are there very extensive ruins, and a natural harbour. Dr. Shaw supposes, apparently with much probability, that Meenap-el-Desahle, i. e. the *Golden Port*, on the W. coast of the gulph, and nearly opposite to Mount Sinai, occupies the site of *Eziongeber*, whence the ships of Solomon sailed to fetch gold from Ophir. It is said by Lieutenant Wellsted to be the only "well-sheltered" harbour in the gulph. — (*See Shaw's Travels in Barbary* &c. 4to. ed. p. 322.; *Laborde's Arabia Petrea*, Eng. Transl., p. 94.; *Wellsted's Travels in Arabia*, II. passim.) AKHEIM AN (an Egyptian name, of a town in Europe, in Bessarabia, on the W. side of the estuary or liman of the Dniester, near its junction with the Black Sea, lat. 46° 12' N., long. 30° 24' E. The statements as to its pop., even in works whose authors may be supposed to have had access to the best sources of information, differ extremely. Probably, however, it may be estimated, suburbs included, at nearly 12,000. The citadel, surrounded by a deep ditch, was constructed by the Genoese during the time that they were masters of the Black Sea. The Dniester being rapid and not well suited for internal navigation, the commerce of the town is not very considerable. The exports consist principally of salt, the produce of the salt lakes in its vicinity, which in 1833 yielded 1,326,000 poods of salt to government, and 2,227,048 poods to individuals. Their produce however is said sometimes to amount to 7,000,000 poods. The salt is sold by government at 66 copecks per pood. The basin of the Dniester having only from 5 to 7 feet water, the larger class of vessels anchor outside the bay, in the Black Sea, about 16 m. from town.

Akerman is distinguished in recent diplomatic history by the treaty concluded here in 1826 between Russia and the Ottoman Porte, by which Wallachia, Moldavia, and Servia were emancipated from all but a nominal dependence on the latter. — (*Schmitzer la Russie*, &c. p. 741.; *Hagermistry on the Commerce of the Black Sea*, p. 81. 131. &c.) AKHISKA (an. *Thyatira*), a city of Turkey in Asia, Anatolia, the seat of one of the Apocalyptic churches, 58 m. N. E. Smyrna. It stands on an eminence elevated but little above the surrounding marshy and alluvial plain. Messrs. Smith and Dwight, the American missionaries, state that, having suffered severely from fire a few years ago, it is now mostly of wood; that its aspect is poor and mean, with but few remains of ancient grandeur; and that the pop. is not supposed to exceed 1,000 families, (5,000 individuals,) of whom 1,500 may be Greeks. — (*Missionary Researches in Armenia*, p. 5. &c.) Mr. Elliott's account is not so unfavourable. He states that, being situated on the direct road between Constantinople and Smyrna, it wears an appearance of comfort superior to that of Anatolian towns in general, that the bazars are large and amply supplied; the khans handsome, clean, and well ordered; and that it contains 1,740 houses, of which 400 belong to Greeks, and 40 to Armenians. If we suppose each house to lodge, at an average, 6 individuals, the town would, according to Mr. Elliott, have a population of about 10,400! — (*Elliott's Travels*, II. p. 151.) Perhaps the truth may lie midway between these conflicting statements. There is in the town a Greek school, attended by 150 children of both sexes.

AKHLAT, a town of Turkey in Asia, in Koordistan, on the N. W. shore of lake Van, at the foot of the Selbandagh. It is very ancient, and was formerly a place of considerable importance; but it is now greatly decayed, not having more than 1,000 houses, or perhaps 5,000 inhab. Its territory is filled with gardens and vineyards. — (*See Kinneir's Persian Empire*, p. 328., where it is noted under the name *Argish*; and the *Dict. Géographique*.)

AKHTYRKA, a town of Russia in Europe, govern. of Kharkoff, 60 m. N. W. Kharkoff. Pop. 12,000. It has a pretty considerable commerce; and among its churches is one that attracts a good many pilgrims to visit a miraculous image of the virgin. — (*Schmitzer la Russie*, &c. p. 477.)

AKISKA, or AKHALZIKH, a city of Asiatic Russia, prov. Georgia, formerly the cap. of a Turkish pachalik, on an affluent of, and at a short distance from, the Kur, 115 m. W. Tiflis, lat. 31° 45' N., long. 43° 1' E. Pop. has been estimated at above 20,000, but at present it does not probably reach half that amount. It is an open town; but is defended by a strong castle situated on a rock. It is remarkable for its fine mosque of Sultan Ahmed, built in imitation of St. Sophia, and for the college and library attached thereto. The latter was

reckoned one of the most curious in the E.; but the Russians have removed about 300 of the rarest and most valuable works to Petersburg. Akkisa is also the seat of a Greek archbishopric, and has about 60 Jewish families and a synagogue. Its environs are productive of silk, honey, and wax; and it has some manufactures. It was formerly a principal seat of the slave trade. The slaves sold in its markets were brought from Georgia, Mingrelia, Imeritia, &c.; and being conveyed to the nearest ports on the Black Sea, were shipped for Constantinople and Alexandria. This commerce is now entirely suppressed. Many of the Turkish inhabitants have left the town since its occupation by the Russians. — (*Baltic Review*, 3rd ed. p. 809; *Missionary Researches in Armenia*, p. 100.)

AKSERAI, a town of Turkey in Asia, in Caramania, cap. sanjak of same name, on the S.W. arm of the Kizil Ernak, 90 m. N.E. Konieh (an. *Iconium*). Pop. uncertain. It has a castle; and its territory is productive of corn and fruits.

AK-SHEHR (the *White City*), a city of Asiatic Turkey, Caramania, cap. sanjak of the same name, 55 m. E. S. E. Allum Karahissar, lat. $38^{\circ} 13' N.$, long. $31^{\circ} 30' E.$ It is situated near the S. extremity of a considerable lake, at the foot of a mountain chain, in a rich and well watered country. Its position is said to be identical with that of the ancient *Thynbriam*, visited by the younger Ptolemy; and, according to D'Anville, it was denominated *Antiochia ad Pisidium*, from its being on the confines of Pisidia, of which prov. it afterwards became the capital. It is mentioned in Turkish annals as the place where Bajazet was confined by Timour, and where he expired. It is supposed by Mr. Klineer to have about 1,500 houses, with many fine gardens in the vicinity. Its principal ornament is a handsome mosque and college, dedicated to the memory of Bajazet. The streets are cleaned by means of streams from the neighbouring mountains that run through them. — (*Kneller's Journey through Asia Minor*, &c. p. 226; *Obituary*, vi. p. 96.)

AKYAB, a marit. town of India beyond the Ganges, cap. prov. Arracan, and of a dist. of same name, on the E. side of the island of Akyah, lat. $20^{\circ} 8' N.$, long. $92^{\circ} 54' E.$ It is built of wood; has broad streets, and markets for grain, and European and Indian goods. Its harbour, though inferior to that of Kyook Phus, is safe; and it is, in most other respects, superior to the last mentioned town as a place of trade. The vicinity is level, fertile, free from jungle, and traversed by several roads. It is the residence of a British commissioner, and is garrisoned by two companies of Sepoys. — (*Pemberton on the E. Frontier of India*, p. 87; *Journal Geog. Society*, i. p. 173.)

ALA, a small town of the Tyrol, on the Adige, 74 m. S. Ruvetud. Pop. 2,400. It has a gymnasium, and a Capuchin convent.

ALABAMA, one of the United States, in the S. part of the Union, between $30^{\circ} 10'$ and $35^{\circ} N.$ lat., and 85° and $88^{\circ} 30'$ W. long., having S. Florida, S. W. Gulf of Mexico, W. State of Mississippi, N. Tennessee, and E. Georgia. Area, 51,770 sq. m. Pop. in 1820, 144,041; in 1830, 309,527, of whom 117,549 were slaves, and 1,572 free blacks. The principal river, the Mobile, formed by the junction of the large rivers Tombigbee and Alabama, both of which flow S., falls into the bottom of Mobile Bay. The Chattahoochee also flowing S., forms in part the E. boundary of the State. The country gradually rises from the low level lands along the Gulf of Mexico, to an elevation of from 1,000 to 1,500 feet in its N. parts. It has in consequence a considerable difference of temperature. Soil mostly very fertile, particularly in the N. counties. Cotton is the staple product, the crop of which, amounting to above 300,000 bales, is rapidly increasing. The sugar cane is cultivated in the S. districts. Indian corn is the principal corn crop. Alabama was erected into a state in 1819. The government is vested in a governor, elected for 2 years, a senate elected for 3 do., and a house of representatives elected annually. Members of the latter receive 4 doll. a day each, and their number is not to fall short of 60 nor to exceed 100. Judges of the supreme and circuit courts are elected by a joint vote of the two houses of assembly for 7 and 6 years. Several canals and railways have been completed, and more projected. Liberal provision has been made for education; and a state university, well endowed, and on a large scale, has been founded near the cap. Tuscaloosa. The principal foreign trade of the state is carried on from Mobile (which see). The value of the domestic produce, principally cotton, exported during the year ended 30th September, 1835, amounted to 7,572,126 doll. The salubrity of the climate, the fertility of the soil, its suitability for the production of cotton, and the great facilities it enjoys for internal navigation and foreign commerce, sufficiently account for the rapid progress made by this state. — (*Darby's United States*, p. 485; *American Almanac*, &c.)

ALABASTER, or *LEUTHIERA*, one of the Bahama or Lucayo Islands, which see.

ALAIS (an. *Alenia*), a town of France, dep. Gard, cap. arrond., on the Gardon d'Alais, at the foot of the Cevennes, 25 m. N.W. Nîmes, lat. $44^{\circ} 7' 22'' N.$, long. $3^{\circ} 4' 25'' E.$ Pop. 11,749. It is ancient, and pretty well built. During the religious wars of France the inhabitants were distinguished by their attachment to the Protestant party, and to bridle them Louis XIV. constructed a fort in the town. It has a communal college, a tribunal of primary jurisdiction, a theatre, a public library, a consistorial Protestant church, &c. It has, also, manufactures of riband, silk stockings, and gloves; with a glass work, potteries, copperas works, &c. besides its own products, it has a considerable trade in the raw and dressed silks, oil, grain, &c. of the surrounding country. There are mines of iron and coal in the vicinity. — (*Hugo*, art. "Gard"; *Dict. Géographique*.)

ALAND (ISLANDS OF), a group of islands at the entrance of the Gulf of Bothnia, between $59^{\circ} 50'$ and $60^{\circ} 32' N.$ lat., and $19^{\circ} 10'$ and $21^{\circ} 7' E.$ long., consisting of more than 80 inhabited and upwards of 200 uninhabited islets and rocks (*Såron*), occupying an area of about 470 sq. m., and divided into three oblong clusters by the straits of Delet and Lappväst. The Baltic bounds them to the S.; on the W. the straits of Alandshaf separates them from Sweden, its width being about 24 m.; and on the E. the straits of Wattusshet, which are scarcely two m. broad where they are narrowest, and about 14 where they are broadest, interpose between them and the Finland shore. Pop. 14,000, of Swedish extraction. Most of the islands stand at a considerable elevation above the level of the sea, and are intersected by chains of granite rocks, which occasionally rise into peaks and are full of hollows. There are no rivers, but many small lakes. The surface is either a thin layer of clay or rich mould, slate-stone, or sand. The climate, though keen, and at times severe, is more temperate than that of Finland. There are extensive forests, chiefly of birches and pines, the pasture grounds are very poor, excepting a small part of the coast; and the arable land, on which rye and barley are mostly grown, produces a sufficiency for domestic consumption, the best yielding seven-fold. Hops, cabbages, parsnips, carrots, and other roots, potatoes, and a little flax are likewise raised. Nuts form an article of export. The horned cattle, of which there are upwards of 12,000, are small in size, and few of the cows have horns; the latter furnish the "Aland cheeses," which are much sought after, and made principally in the island of Fagloe. Of sheep there are above 13,000, the wool of which is converted into coarse stuffs and sail-cloth; horses and goats are also bred in considerable numbers. The fisheries are productive, particularly of (*atomizing*) herrings and seals, the first of which 6,000 tons and upwards are salted. Watertail abound. The exports consist of salt meat, butter, cheese, hides and skins, dried and salted fish, wood for fuel, &c.; and the imports of salt, colonial produce, ironware, woollens, cottons, and other manufactures, &c. The Alanders are excellent seamen, and navigate small vessels of their own that trade with the adjacent parts: they are Swedes in their language, manners, and usages. There are a number of good harbours, many of which have been fortified by the Russians, who keep up a disproportionately large military force in the islands, as well as a numerous flotilla, called the "Skaerenflott." The islands contain 8 parishes and as many churches, and 7 churches or chapels of ease. The island, the largest island, is nearly circular, being about 17 miles in length and 16 in breadth; it contains above 9,000 inhabitants, and has an excellent harbour at Uternes, on the W. side. It is divided by a narrow strait from Ekerö, the westernmost island, which has a telegraph. On the E. coast of Aoland is the old castle of Castleholm, now in ruins. Kumlinge has a pop. of 3,000. These islands were wrested by Russia from Sweden in 1809; and give the former a position from which they may easily make a descent on the Swedish coast.

ALA-SHEHR. (The exalted city, an. *Philatelia*.) A city of Turkey in Asia, prov. Natolia, famous as the seat of one of the Apocalyptic churches, and as the seat of one of the roots of the Gogams, partly in the plain, and partly on one of the roots of Tmolus, which, separated by a valley from the posterior range, and rising to a very considerable elevation, is the site of the Acropolis. The old wall of the town formed of small stones, held together by a strong cement, and strengthened with towers, is broken down in many places, and the Acropolis is also in ruins. The modern houses are mean and irregular, and the streets narrow and filthy. The ruins of the church of St. John are of great antiquity, and ancient relics meet the eye at every step. "Here, a broken Ionic column forms the angle of a house, and an architrave its top; there fragments of a rich cornice are built into a wall; a modern mosque is supported by the truncated shafts of antique columns; and sacred sar-

ophagi are decorated by conversion into common water troughs; fountains in the dirtiest streets, and the very pavement on which one treads, teem with vestiges of antiquity; and in a neglected spot, near the S. wall of the city, amid dirt and rubbish, we remarked two venerable marble pillars lying unheeded on the ground."—(Elliott.) According to Mr. Elliott, Ala-Shehr contains nearly 3,000 Turkish and 250 Greek houses; so that, supposing this statement to be correct, the pop. may be estimated at from 15,000 to 19,000. It is the seat of a Greek archbishop, and divine service is regularly performed in 5 Christian churches. The Greeks, at present, as in the time of Chander, are exceedingly ignorant; and though few of them know any language except Turkish, the liturgy is always read in the language of their forefathers. The country round is very fruitful;—the waters are said to be excellent in dyeing; and being situated on one of the most frequented roads to Smyrna, it is much resorted to by caravans, and has a good deal of trade. It is held so sacred, even by the Turks, that they occasionally convey their dead thither for interment, from Constantinople; and apply to it the epithet of *Ala*, or the exalted.

Philadelpia derived its name from Attalus Philadelphus, brother of Eumenes, by whom it was founded in the second century B. C. Strabo says, that it suffered much from repeated shocks of earthquakes; and it was one of the fourteen cities which were partially or wholly destroyed by a subterranean convulsion in the reign of Thiberius. Anciently, indeed, it was matter of surprise, that it was not abandoned; but it continues to be a considerable place; and the church of Philadelpia is still erect, "a column in a scene of ruins." It was the last city of Asia Minor that submitted to the Turks. "At a distance from the sea, forgotten by the emperors, encompassed on all sides by the Turks, her valiant citizens defended their religion and freedom, above fourscore years; and at length (in 1390), capitulated to the proudest of the Ottomans, (Bajazet)."—(*Chandler's Asia Minor*, 4to ed. p. 286; *Elliott's Travels*, li. p. 85; *Gibbon*, cap. 64.)

ALASSAC, a town of France, dep. Correze, 5 m. N. N. W. Brive. Pop. 4,029. There are vineyards in its vicinity.

ALASSIO, or ARRACI, a sea-port town of the Sardinian States, prov. Albenga, cap. district, 5 m. S. S. W. Albenga. Pop. nearly 5,000, industrious, active, and daring seamen. There is good anchorage opposite to the town, which consists of a long narrow street. Fine coral is fished on the coast. A good harbour for the largest class of vessels might be formed between Cape Mele and the island of Galinara; but this has always been discouraged by the Genoese, the former masters of this part of Italy.—(*Rampoldi's Corografia dell' Italia*, art. "Alasio.")

ALATHI, a city of Italy, Papal States, prov. Campania, dioc. Frosinone, 6 m. N. E. Frosinone, lat. 41° 44' N., long. 13° 12' 15" E. Pop. circa 8,000. It is the seat of a bishopric, has a cathedral, a collegiate church, and some convents. Antiquities are frequently dug up in the environs, which abound in olives and vines.

ALATYR, a town of Russia in Europe, gov. Simbirsk, at the confluence of the Alatyur with the Sura, 90 m. N. N. W. Simbirsk. Pop. 3,000. It is built of wood, has tanneries, a glass work, and a considerable trade in corn.

ALAYA (an. *Coracesium*), a sea-port town of Turkey in Asia, Anatolia, cap. sanjak of the same name, on the E. side of a lofty promontory, lat. 36° 31' 51" N., long. 32° 29' 54" E. Pop. 1,500 or 2,000. The promontory on which this town is built bears a striking resemblance to that of Gibraltar. It is joined to the continent on the N. by a low sandy isthmus, from which it rises abruptly; and its W. and S. sides consist of perpendicular cliffs 500 or 600 feet high. The E. side, on which the town is built, is also so steep that the houses seem to stand on the top of each other. "In short, it forms a natural fortress that might be rendered impregnable; and the numerous walls and towers prove how anxiously its former possessors laboured to make it so." At present it is of trifling importance. Streets and houses miserable; mosques few and mean. When visited by Captain Beaufort it had no signs of commerce. The bay is open to southerly winds, and the anchorage indifferent.

Coracesium shut its gates against Antiochus when all the other towns of Cilicia had submitted; and at a subsequent period it was the place selected by the pirates as a base to make a last stand in their struggle with Pompey.—(*Beaufort's Karanania*, p. 172, &c.)

ALBA, a town of the Sardinian States, in Piedmont, cap. prov. same name, on the Tanaro, 32 m. S. S. E. Turin. Pop. 7,000. It has a tribunal of original jurisdiction, a cathedral, 3 parish churches, a college, and a considerable trade in cattle.

ALBACETTE, a town of Spain, prov. Murcia, 9 m. N. W. Chinchilla, agreeably situated in a vast and fruitful plain. Pop. of town and suburbs, 11,508. It has

manufactures of coarse cloth and soap. Great quantities of wine and saffron are collected in its vicinity; and a great cattle market is annually held in September.

ALBAN (ST.), a town of France, dep. Lozere, 22 m. N. N. W. Mende. Pop. 2,428.

ALBANIA, a large prov. of European Turkey, bounded N. by Dalmatia and Servia, E. by Macedonia and Thessaly, S. by Livadia, and W. by the Adriatic, along with that part of the Mediterranean called the Ionian Sea. It thus comprehends, in its widest acceptation, the ancient Illyria and Epirus, and is at present included in the Turkish government of Romania.

ALBANO (TOWN, LAKE, AND MOUNTAIN OF), in the Papal dominions, in the *Campagna di Roma*. The town is situated in the line of the Appian Way, on a hill, near the S. W. side of the lake, about 14 m. S. S. E. Rome. Pop. 4,200. This town is not built, as some have supposed, on the site of *Alba Longa*, which stood on the other side of the lake, but on the ruins of Pompey's villa. Its situation, at a moderate elevation above the level of the plain, fine salubrious air, shady walks, and magnificent views of the "eternal city," the Campagna, and the sea, make it a favourite retreat of the more opulent Roman citizens, particularly during spring and autumn. It is the seat of an archbishop; it was built; has a cathedral and some convents, with many fine palaces, among which may be specified those of the Corsini and Barberini families. At a little distance, on the margin of the lake, is Castel Gandolfo, the summer residence of the Pope. The adjacent country is almost wholly appropriated to the culture of the vine; and the wine which it yields still maintains its ancient reputation.

The lake of Albano, a little to the N. E. of the town, is surrounded on all sides by very high banks, except towards the N., where they are a little lower. It has the form of an irregular ellipse, and there would appear to be little doubt that it occupies the crater of an extinct volcano. The distance round the crater, or summit of the basin of the lake, is estimated at about 8 m., and that round the water's edge about 1 m. It is in parts very deep; a variety of fish are found in it, among which are eels of an immense size and highly esteemed.

But the subterranean conduit or tunnel, called by the Italians an *emissario*, for conveying away its surplus water, is the feature most worthy the attention of the intelligent traveller who visits this lake. This tunnel, intended to prevent the waters of the lake from injuring the surrounding country by overflowing its banks, and to keep them always at their present level, was completed at an early period of the Roman history (about 400 years B. C.) and bears unequivocal proof of the sagacity and perseverance of those by whom it was executed. It is cut right through the mountain, and mostly through solid rock, a distance of considerably more than a mile, being generally about 3 feet 10 inches wide, and from 6½ to 7 feet in height; at its entry from the lake, and its issue in the plain, it is solidly built round with large stones, arched at top, and is in perfect preservation.* This great work is said to have been completed in about a year; but it has been objected to this, that as only three or at most four men could have wrought together, and these at the outer end of the tunnel only, the other end being under water, it must have taken many years for its completion. But Piranesi has shown that after tracing the line of the tunnel above ground, shafts had been sunk, by which workmen might have been let down in various places, and the work completed within the stated time.†

The Alban Mount (*Monte Albano*), now *Monte Cavo*, lies a little to the E. of the lake. It is about 2,900 feet in height; and the view from its summit, extending over Latium and a great extent of country, is one of the noblest that can be imagined. It was crowned by a temple in honour of Jupiter Latiaris, where sacrifices were annually offered up by deputies from the various Latin states, with the Romans at their head, to their common father and protector. Here, also, the Roman generals, refused the honour of the great triumph in the city, performed the lesser triumph, or ovation, and sacrificed to Jupiter Latiaris. Some fragments of this famous temple existed in 1750; but they have since disappeared. (Heideke the authorities referred to, see the excellent work of *Lunardon on the Antiquities of Rome*, pp. 453—465.)

ALBAN'S (ST.), an ancient borough of England, co. Hertford, occupying the summit and sides of a low hill, on a feeder of the Colne, 20 m. N. N. W. London. The old borough had, in 1831, a pop. of 4,778; and the new parl. borough a pop. of 5,771. It has long had the privilege of returning 2 m. to the H. of C.; the right of voting having been vested in the freemen, whether

* For an account of the circumstances which are said to have occasioned the undertaking of this work, see *Aldrich*, lib. v. p. 12, 16, and *Cic. de Divinatione*, lib. i. p. 44. No direct evidence is now made, as Cicero has elsewhere said, ad utilitatem agri suburbanum non ad agrum urbanum referendam. (*De Divinat.* li. i. p. 24.)
† M. Raimond has repeated this objection (*Tour in Italy and Sicily*, p. 315.), apparently unconsciously of what Piranesi had stated in his *Descrizione e Disegno dell' Emissario del Lago Albano*.

ALBAN'S HEAD (ST.)

resident or not, and in scot and lot householders. It is very ancient, and is either on or very near the site of the ancient Roman *Verulamium*. The abbey church is the most imposing object in the place; and is celebrated alike for its antiquity and great magnitude. It lately underwent a thorough repair. In the church of St. Michael is the tomb of the famous Lord Bacon, with a fine marble monument to his memory. There is a free grammar school, with several charitable institutions. The town is thriving. Straw plait is the principal manufacture; and there are besides a cotton mill and a silk mill, but neither on a large scale. There is a market each Saturday. No. of 102 houses in Parl. borough 507; constituency in 1837, 606. — (*Boundary Report, &c.*)

ALBAN'S HEAD (ST.), a cape of England, on the English Channel, co. Dorset, lat. 50° 38' 10" N., long. 2° 47' 15" W.

ALBANY, a city of the United States, cap. state of New York, on the W. bank of the Hudson, 145 m. N. New York, lat. 42° 39' 37" N., long. 73° 44' 57" W. Pop. in 1825, 15,971; in 1845, 28,100. Besides being the seat of government, it is, in population, wealth, and commerce, the second city in the state. It is finely situated at the head of the river navigation of the Hudson, and is now connected by canals with Lake Erie and the Mississippi on the one hand, and with Lake Champlain and the St. Lawrence on the other, so that it has become one of the principal centres of internal commerce in the Union. A fine basin has been constructed for the accommodation of the shipping on the river and the canals. Among the public buildings are the capitol, the state house, an academy, a splendid museum, a jail, with numerous banks and places for public worship. The steam-boats perform the voyage from N. York to Albany in about 10 hours.

ALBANY, a district of S. Africa, belonging to Great Britain, at the E. extremity of the Cape Colony. It has on the E. the Great Fish river, on the W. the Bushmans river, on the N. an imaginary line, drawn from the junction of the Great and Little Fish rivers to the Komap, and on the S. the ocean. Its area has been variously estimated, but may probably amount to about 2,000 sq. m. or 1,280,000 acres. Its aspect is highly pleasing, being diversified with hill and dale, its verdant pastures and smooth grassy knolls, contrasting agreeably with the dark masses of forest, which clothe the broken ground near the river courses. Soil very various. The stiff clayey lands would be the most productive, were they sufficiently watered; but as rain is precarious, and the rivers are said not to be suitable for irrigation, light friable soils are preferred. Climate temperate, salubrious, and suitable for European constitutions. Lions, wolves, and leopards, are occasionally met with; but are every day becoming rarer. Elephants are now seldom seen within the limits of the district. Horses, cattle, sheep, goats, hogs, &c., thrive remarkably well, and their produce forms the great dependence of the colonists. The country is traversed by numerous streams, of which the Great Fish river is by far the most important. Previously to 1829, there were not more than 10,000 Europeans in the district; but government having given encouragement to emigration to this quarter, 3,720 emigrants landed in 1820, at Algoa Bay, whence the greater number proceeded to this district. For the first 4 or 5 years, the colonists suffered severely from a failure of the wheat crops; but their progress from 1825 down to 1835, was comparatively rapid; and presented a picture of prosperity and advancement, not often to be met with in the early annals, even of the most successful colonies. At the last-mentioned epoch, however, this career was suddenly arrested by an irruption of the Kaffers, who destroyed a great quantity of valuable property, and killed several of the colonists. This invasion having been repelled, and peace having been again restored with the Kaffers, a lieutenant-governor was appointed to the E. province, and the district is fast recovering from the losses it had sustained. In 1837, it had a population of 11,728, of which 11,500 were whites. During the same year, the births were 700, and the deaths only 150. The value of the produce exported in 1836, was 47,397*l.*: the principal articles being — hides, 13,476*l.*; wool, 7,353*l.*; skins, chiefly goat, 5,743*l.*; tallow, 4,427*l.*; ivory, 2,546*l.*; with horses, beef and pork, butter, &c. The colonists had in 1835, 38,945 head of cattle, 104,000 sheep, and 5,755 hogs. Graham's Town, the cap. of the E. prov. and the residence of the lieutenant-governor, is situated almost in the centre of this district. It contained, in 1834, 512 houses; and 1800 inhab. exclusive of the military. A town, called Port Francis, has been founded at the mouth of the Kowie river; but as the access to it is obstructed by a dangerous bar, it is doubtful whether it will ever become of any material importance. The entire shipping trade of the district is at present carried from Port Elizabeth on Algoa Bay. — (See *Cape Almanac* for 1834 and 1838; *Parl. Pap.* Session 1837, &c.).

ALCALA DE HENARES.

49

ALBARRAZIN, a fortified town of Spain, prov. Aragon, on the Guadalquivir, with a cathedral, in a bleak and barren district. Pop. 2,327.

ALBEMARLE SOUND, United States, coast of N. Carolina, in the N.E. part of the state, being 60 m. long from E. to W., and from 4 to 15 wide. It communicates with Pamlico Sound and the ocean by several narrow inlets, and with Chesapeake Bay by a canal cut through Dismal Swamp.

ALBENGA (an *Albium Ingaunum*), an ancient seaport town of the Sardinian States, cap. prov. same name, 44 m. S. W. Genoa, on the Centa. Pop. 4,000. It is the seat of a bishopric, and has several remains of antiquity. The situation is unhealthy; but the surrounding country is productive of oil and hemp. This is the birthplace of Proculus, a competitor with Probus for the throne of the Cæsars.

ALBENQUE, a town of France, dep. du Lot, cap. cant., 10 m. S.S.E. Cahors. Pop. 1,584.

ALBERT, a town of France, dep. Somme, cap. cant., on the Miraumont, 15 m. E.N.E. Amiens. Pop. 2,542. It has a cotton mill, with print works, bleachfields, paper mills, &c. In its vicinity is a cave or quarry where there are a variety of petrifications.

ALBINO, a town of Venetian Lombardy, prov. Bergamo, on the Serio, 7 m. N.E. Bergamo. Pop. 2,300. It is very well built, the castle and gardens of Count Spini being particularly worthy of notice. There are silk filatures, with a manufactory of agricultural implements, and machinery for polishing whetstones renowned all over Europe.

ALBION (NEW), a large tract of the N.W. coast of America. This designation was given by Sir Francis Drake to California and part of the adjoining coast; but recent geographers, and among others Humboldt, limit the denomination of New Albion to that part of the coast which extends from the 43d to the 46th deg. N. lat. It was carefully explored by Vancouver in 1792.

ALBONA, a small town of Istria, 25 m. E. Rovigno, whose vicinage is celebrated for its olives and vines.

ALBUFEIRA, a sea-port town of Portugal, S. coast Algarve, 28 m. E. Lagos, lat. 37° 7' 30" N., long. 7° 19' 12" W. Pop. 3,000. Large vessels may anchor in the port, which is defended by a citadel and batteries. The inhabitants mostly subsist by fishing.

ALBUJERÍA, a town of Spain, Estremadura 14 m. S.S.E. Badajoz, on the river and near the mountain of the same name. Here, on the 16th May, 1811, a sanguinary conflict took place between the allied British, Spanish, and Portuguese troops under Marshal Beresford, and a French force under Marshal Soult. Each army lost about 7,000 men in killed and wounded. On the allied side the chief brunt of the action fell on the British, who suffered severely. In the end Soult, who commenced the attack, was compelled to retreat.

ALBUQUERQUE, a town of Spain, with an old castle, prov. Estremadura, on the frontier of Portugal, 22 m. N.N.W. Badajoz. Pop. 5,300. It has cloth and cotton manufactures.

ALBY (*Albige*), a city of France, cap. d.p. Tarn, on the Tarn, which is crossed by an old-fashioned bridge, lat. 43° 55' 46" N., long. 2° 8' 23" E. Pop. 9,367. It is situated on a hill, and has few public buildings worth notice, except the cathedral, begun in 1277 and finished in 1480. It is ill-built; the houses being gloomy, and the streets narrow, crooked, and dirty; but the shady *promenade de la Luce*, on the side next the country, is universally admired. It has a public library, a museum, and barracks, with various manufactures of coarse cloth, sack, table linen, handkerchiefs, cottons, hats, paper, &c. foundry for bells, &c. The preparation of wood has been long carried on in the vicinity. Alby has suffered much at different periods for its attachment to Protestantism.

ALCALA DE GISEVIRT, an ill-built town of Spain, prov. Valencia. Pop. 3,000.

ALCALA DE HENARES (*Complutum*), a city of Spain, prov. Madrid, on the right bank of the river of the same name, 17 m. E. N. E. Madrid. Pop. 5,800. Though much decayed from what it was in the 16th century, this is said by Mr. Townsend (i. p. 245.) to be one of the handsomest, best built towns of Spain. It is surrounded by walls flanked with square towers, has a fine Gothic cathedral, a magnificent palace of the archbishop of Toledo, with numerous churches and convents. It is the seat of a university founded in 1510 by the illustrious statesman Cardinal Ximenes, which, next to Salamanca, is the most celebrated seminary in Spain: it had, in 1831, 17 colleges and 31 professors. The cardinal also bequeathed his library to the university, and founded in it a printing press, which produced, at his expense, in 1512-17, the famous Polyglott Bible, denominated the *Biblia Complutensis*; an imperishable and noble monument of his piety, learning, and liberality. The remains of the cardinal were interred in the college church. But it is the chief glory of Alcala de Henares to have given birth, in 1547, to Cervantes, the intimate author of Don Quixote.

ote; it is, also, the birth-place of the poet Figueroa, of Solis the historian of Mexico, &c.

ALCALA DE LOS GAZULES, a town of Spain, prov. Cadiz, in a hilly and bleak district, totally unfit for tillage, but well adapted for rearing sheep, which accordingly constitutes the chief employment of the people:—it is at a very short distance from the river Barbate, which flows into the sea 35 m. S. E. Cadiz. Close to the town, are the remains of an old Roman castle. Dist. 38 m. E. Cadiz, and 48 m. S. Seville. Pop. of town and sub. 17,916.

ALCALA LA REAL, a town of Spain, prov. Jaen, on the Gualcotin, at an elevation of more than 2,700 feet above the level of the sea, 30 m. W. S. W. Jaen. Pop. 4,374. It had, and perhaps still has, a rich abbey, with various churches, convents, and an hospital. On the 28th January, 1810, the French defeated the Spaniards in the vicinity of this town.

ALCAMO, a town of Sicily, in the Val di Mazzara, on the great road from Palermo to Trapani, 24 m. W. S. W. Palermo. Pop. said by Swinburne to be 8,500; perhaps it may now be estimated at 10,000, the pop. of the district being, in 1831, 15,589. Streets straight, but ill paved and dirty. It is situated on high ground, in a fine open, cultivated country, and is well sheltered by large woods of olive trees. Within the district of Alcamo, and at no great distance from the town, finely situated on an eminence, are the magnificent ruins of an ancient Doric temple,—all that now remains of the once powerful Segesta! It is a parallelogram, 162 by 66 feet, and has 36 columns, which, when examined by Swinburne, were all, with one exception, perfectly entire. (For an account of the ruins, see *Swinburne's Two Sicilies*, ii. p. 236. 4to ed.)

ALCANDATE, a town of Spain, prov. Jaen, in a rugged mountainous country at a short distance from the river Guadajoz, lat. 37° 45' N. long. 4° 12' W. The Roman inscriptions seen here show its antiquity. Pop. 6,500.

ALCANIZ (Arab. for *treasury*), a town of Spain, prov. of Ternel, Aragon, on the r. bank of the Gaudaloupe on a hill side, above which is a castle, built by James I. of Aragon, 92 m. S. E. Saragossa. Pop. 5,844. A handsome collegiate church, with a noble portico, is the chief building. It is encircled by walls; and is connected by a canal, constructed by the Moors, with the Ebro. There are in the vicinity rich mines of alum, and thriving plantations of mulberry and other trees; there is also in its vicinity a pond which produces remarkably large fine eels.

ALCANTARA, (from the Arabic *al-cantar-at-al-sif*, the bridge of the sword,) a fortified town of Spain, prov. Estremadura, lat. 39° 41' 30" N., long. 6° 49' W., and the cap. of a dist. having the same name, Pop. 3,832. It stands on a steep hill, close to the E. bank of the Tagus (running here N. W.), was called by the Romans, its founders, *Norba-Caesarea*, and they in the reign of Trajan erected the famous bridge, whence its present name is derived. It was of granite, its length 577 ft., breadth 22 ft., span of the two centre arches 110 ft., thickness of piers, 38 ft., height above river-level, 175 ft., in the middle of the bridge, was a triumphal arch 46 ft. high, with a Roman inscription. (*Laborde's Voyage Pittoresque*; where see views and sections of the bridge. Ponz. viii. 63.) This fine relic of antiquity was unfortunately destroyed, together with some adjoining buildings, by the British troops, June 10, 1809, owing to a mistake of military orders. (*Napier*, vol. ii. 316.) The river was once navigable up to this town, and before the separation of Portugal, in 1580, a large trade in fruit was carried on with Lisbon (*Mithana*); but it now serves only to turn a few mills, and to supply the people with dace, barbel, eels and other fish, which greatly abound (*Pons*). It is joined a little below Alcantara by the Alagon, Jurtin and Salor. At the expulsion of the Moors in 1213, which was aided by the knights of San Julian del Pereyro, the defence of the town was entrusted to them, and they thenceforward assumed the title of knights of Alcantara. The order is now a dignity of some value, and the monarch has been the grand-master since 1495. The knights in 1506, built a handsome convent and church, which still exist. A cloth manufacture once existed here; but it has perished. Brick-making and tanning are all the signs now to be seen of industry.

ALCANTARA, a sea-port town of Brazil, prov. Maranhão, on a hill, 15 m. N. W. San Loui de Maranhão. The surrounding territory is productive of excellent cotton and rice; and the salt lakes, a little to the N. of the town, might yield the largest supplies if they were properly managed. Its port admits only small vessels.

ALCANTARILLA, a dist. and town of Spain, prov. Murcia, lat. 37° 56' N. long. 1° 13' W. 4 m. from the l. bank of the Segura. Dist. 5 m. S. W. Murcia, and 60 S. W. Alicante. Pop. 4037.

ALCAREZ, a town of Spain, prov. La Mancha, on the Guadarama, 45 miles W. S. W. Manzanares. Pop.

ALDBOROUGH.

8,300. It has a citadel, manufactures of cloth, mines of calamine and copper, and an aqueduct.

ALCAZAR DE SAL, a town of Portugal, prov. Estremadura, on the r. bank of the Sado, 29 m. S. E. Setubal. It is delightfully sit. in the midst of an extensive and fertile plain, and is chiefly distinguished for its salt works and sedge-mat factories.

ALCAZAR DE SAN JUAN, a town of Spain, prov. La Mancha, lat. 39° 25' N., long. 3° 15' W., and the cap. of a dist. so called, which contains 16 towns and villages. The dist. (besides its pasture, corn, oil and fruits, which are abundant,) produces salt-petre, and other minerals, supporting above 500 workmen and their families. The town contains 12 soap-factories, and had formerly 40. Dist. 5 m. N. E. Ciudad Real, 50 m. S. E. Toledo. Pop. of dist. 7000.

ALCESTER, a pa. and m. town of England, co. Warwick, 103 m. N. W. Lond., 16 m. W. S. W. Warwick. Pop. 2,406. The town, situated at the confluence of the Alne and Arrow, has a handsome Gothic church, a free school, a good corn market, and carries on a pretty large needle manufacture.

ALCIRA, a town of Spain, prov. Valencia, on an island of the Xucar, 23 m. S. S. W. Valencia, and so low that the river by rising 12 ft. above its usual height inundates the town, lat. 39° 6' N. long. 0° 25' W. Pop. 8,413. It is fortified and flanked with towers; has several churches, convents and hospital, with two fine bridges over the Xucar. This is a very ancient town, having been successively occupied by the Carthaginians, Romans and Moors. The inhab. are thrifty and intelligent farmers, superior to most in Spain, and in the immediate neighbourhood of the town they raise excellent pimientos and tomatoes, in addition to the rice and other produce of the district. About 2 m. E. are some limestone hills, among which is a stalactitic cave, (*Cueva de las Maravillas*), visited as a natural curiosity. (*Boyles*.)

ALCKMAER. See **ALKMAAR**.

ALCOBAZA, a town of Portugal, prov. Estremadura, lat. 39° 36' N., long. 9° W., 15 m. S. S. W. Leiria, and within 5 m. of the sea, at the confluence of two small rivers. Pop. according to Mhano, 1,716. It contains a very handsome and extensive Cistercian monastery, founded by Alfonso I., possessing a good library with valuable MSS., and a collection of pictures, among which are portraits of all the Portuguese kings, from Alfonso I. to Donna Maria I. The cotton manufacture is carried on here to some extent; the Marquis de Pombal set 250 looms at work in the monastery; but the late disturbed state of the country has very much impaired the industrial resources of this place.

ALCOLEA DEL REI, a town of Spain, prov. Seville, 26 m. N. E. of that cit., near the r. bank of the Guadalquivir, in the midst of a fine and productive plain. Pop. 2000. When the Guadalquivir was more navigable than at present, this town appears to have been of some importance; the completion of the projected canal will perhaps restore it to its former prosperity.

ALCORA, a town of Spain, prov. Valencia, 48 m. N. Valencia, in a country watered by the Mjares. Pop. 6,000. Its agricultural and industrial products are not important.

ALCOVER, a town of Spain, prov. Catalonia, on the banks of the small river Angura. In the time of Alfonso VIII., it was a place of some importance; but the oppressions of the French, at different times, have driven away the principal landholders; and the people seen now to be in a very wretched condition. 13 m. N. N. W. Tarragona. Pop. 2,300. Contrib. to rev. 39,000 reals v.

ALCOY, a town of Spain, Valencia, at the source of the Alcoy, 24 m. N. Alicante. Pop. town and district 14,600. Besides churches and convents, it has a college, a considerable manufactory of fine cloth, soap works, and paper works; the contiguous territory is very fertile.

ALCUDIA, a town belonging to Spain, near the N. extrem. of the Isle Majorca, on a small peninsula between the bays of Pollensa and Alcudia, lat. 39° 50' N., long. 3° 8' E. Pop. 1018. Two stagnant pools, or Albuferas, lie between it and the bay; and the exhalations from them greatly injure the health of the inhabitants, a sickly and miserable race. The pools might be drained, and the soil rendered useful, if the natives were possessed of any enterprise or energy. Coral-fishing employs some 40 vessels in the bay. At about 3 m. S. E. is a stalactitic cave, visited, and well described by Antillon. (*Grav.* p. 76.)

ALCUDIA DE CARLET, a town of Spain, prov. Valencia, in a plain about 8 m. from the Xucar, whose water supplies its rice grounds with nourishment. It is on the royal road of Madrid, about 18 m. S. Valencia. Pop. 2,000.

ALDBOROUGH, a borough of England, W. I. co. York, wapentake Claro, 185 m. N. N. W. Lond., 18 m. W. N. W. York. Pop. in 1831, 620. Its former importance was wholly derived from its having enjoyed since

the sera of Philip and Mary the privilege of returning 2 members to the H. of C. It was disfranchised by the Reform Act.

ALDBOROUGH, or **ALDEBURGH**, a sea-port town of England, co. Suffolk, hund. Plumegate, 85 m. N.E. Lond. Pop. of bor. and pa. 1,341. It returned 2 m. to the H. of C. from the 16th Eliz. down to the passing of the Reform Act, when it was disfranchised. It has suffered much from encroachments of the sea.

ALDEA DEL RIFY, a town of Spain, prov. La Mancha (Ciudad Real), on the l. bank of the Jabalon, an affluent of the Guadiana, 17 m. S. Ciudad Real. Pop. 2,800. The climate is very unhealthy, owing to inundations of the river, which a very slight industry might obviate. Here is a palace of the knights commanders of Calatrava.

ALDEIA CALEGA, a town of Portugal, prov. Estremadura, estuary of the Tagus, on the E. side of the bay of Montijo, well known as a ferry station between Lisbon and the great road to Badajoz and Madrid. Pop. 2,480.

ALDERNEY, an island belonging to Great Britain, in the English channel, 55 m. S. from the Isle of Portland, and 15 m. W. Cape la Hague in Normandy. The chain of Alderney and the latter, called the Race of Alderney, is dangerous in stormy weather from the strength and rapidity of the tides. This island is about 3½ m. in length by ¾ m. in breadth, and had in 1831 a pop. of 1,946. It is a dependency of Guernsey, and is principally celebrated for a small breed of cows, which afford excellent milk and butter. It has no good harbour.

ALDSTONE MOOR, a par. and m. town of England, co. Cumberland, lath. ward, on the borders of Northumbria. The town stands on a hill washed by the Tyne. The parish contains 35,050 acres. Pop. 6,858. It is chiefly celebrated for its lead mines, formerly the property of the earls of Derwentwater, and now of Greenwich Hospital. Their present (1838) annual produce is estimated at from 3,900 to 4,000 tons of pure metal.

ALEDO, a town of Spain, in the prov. of Murcia, sit. on a mountain side, 6 m. from the l. bank of the San gonia, a branch of the Segura, and about 25 m. W. S. Murcia. Pop. 2,330.

ALENÇON, a town of France, cap. dep. Orne, in an extensive plain of the same name, on the Sarthe, near the southern boundary of the dep. 56 m. S.S.E. Caen, lat. 48° 25' 40" N., long. 0° 5' 22" E. Pop. 13,277. The town is agreeably situated and well built; streets generally broad and well paved; the walls by which it was formerly surrounded have nearly disappeared, and it has several considerable suburbs. Among the public buildings may be specified the cathedral church, the town-house embodying two well preserved towers, the only remains of the ancient castle of the Dukes of Alençon, the courts of justice, the corn-market, &c. It has a communal college, several hospitals, a public library, and an observatory. Its manufactory of the lace, known by the name of *Point d'Alençon*, established by Colbert, still preserves its ancient celebrity, and it has in addition manufactures of muslin, of coarse and fine linen, buckram, serges, stockings, straw hats, &c., with tanneries. There are freestone quarries in the neighbourhood; and at Haras, a little to the W. of the town, are found the stones, called Alençon diamonds, which w^{re} cleaned and polished are said to be little inferior in respect of lustre, to the genuine gem. Several fairs are held in the town, which is the seat of a considerable commerce. During the religious wars, Alençon, which was generally attached to the Protestant party, suffered severely. — (Hugo, art. *Orne*; *Dictionnaire Géographique*, &c.)

ALENQUIR, a town of Portugal, prov. Estremadura, 26 miles N.N.E. Lisbon. Pop. 3,000. It is one of the principal points for the defence of Lisbon.

ALENTEJO, a prov. of Portugal, which see.

ALEPPO, a city in the N. of Syria, called by the natives, Haleb-es-Shaban (an. *Chalchab* and *Berzan*), lat. 36° 11' 25" N., long. 37° 10' 15" E.; 76 m. E. S. E. In 1699, it had 70,000; though from the middle of the 17th to the beginning of the present century it was variously estimated at from 200,000 to 250,000. According to Russell, it had in 1794, 235,000 inhab., of whom, 30,000 were Christians, and 5,000 Jews, the rest being Mohammedans; but, according to Volney, the pop. in 1785 did not exceed 100,000, which we incline to think is the more probable statement. Aleppo occupies an elevation in the middle of an open plain; and is surrounded by walls 30 ft. high and 20 broad; supposed, from the massive style of their architecture, to be Saracenic. The city, within the walls, is about 3½ m. in circ. but including its suburbs, it occupies a circuit of more than double that extent. Houses of freestone: they are said to be elegant and durable, and those belonging to the better classes exhibit an elaborate degree of ornament in their lofty ceilings decorated with arabesques; and their large windows of

painted glass. Roofs flat, as in most Eastern towns; during the summer months, the inhabitants pass their nights upon them, unprotected by tents or awnings of any kind. These flat roofs form also a continuous terrace, upon which it is easy, by climbing over the low partition walls, to pass from one end of the town to another. Streets broad, well paved, and clean, remarkable qualities in the East; the latter may, perhaps, be owing, in part, to the drainage, occasioned by the slight elevation of the town and neighbourhood above the surrounding plain. The seraglio, or palace of the Pacha, which used to be admired for its magnificence, was destroyed in 1819-20 during the siege of the town by Khourchid Ahmed Pacha. Mosques numerous, but nearly all have been injured, and many of them are in ruins, from the effects of the earthquakes which have so often shaken this part of Syria; the Djameé, Zacharie, and El-Halawe, are, however, fine remnants of the ancient Roman style; they were originally Christian edifices, the latter built, it is said, by the Empress Helena. There are ten or twelve Christian churches, three Christian convents, and several wakfs, the conventual establishments of the Mohammedans. An ancient aqueduct conveys a plentiful supply of good water from two springs. This work is an object of much care; and it is singular, that being certainly constructed before the time of Constantine, it should have remained uninjured amid the frequent convulsions to which the town has been subject. In the centre of the city* is a castle, partly in ruins, built upon an artificial mount, of considerable height, and ½ m. in circumference; this is surrounded by a broad and deep, but dry ditch, crossed by a bridge of 7 arches. From this spot is commanded a very extensive view, bounded N. by the snowy tops of the Taurus, W. by the elevated rock bed of the Aazzy; while to the S. and E. the eye reaches over the desert, as far as the Euphrates. Here are several large khans, principally occupied by Frank and other foreign merchants. These are handsome and convenient buildings, containing counting-houses and store-rooms ranged round an interior court, in which are stands for loading and unloading the beasts of burden, and a fountain to supply them with water. At present, however, Aleppo can be regarded as little more than the shadow of its former self: slight earthquakes are frequent in its neighbourhood, but in 1822 a tremendous shock overturned most of the public buildings, and reduced the greater part of the city to a heap of ruins. This calamity has occasioned the erection of a new suburb, materially altering the appearance, and injuring the beauty of the town. The houses in this suburb, intended at first for the temporary shelter of the population that had escaped from the town, were hastily constructed of wood, lath, and plaster; but from want, either of funds to repair their more substantial dwellings, or of energy to set about the work, or probably from a fear of returning into the city, these hastily constructed edifices have become permanent residences, while many, perhaps the greater number, of the large and convenient stone buildings in the city are either in ruins or tenanted.

Although upon the borders of the desert, Aleppo is advantageously and agreeably situated. A small stream, called the Koek (an. *Kahab*), waters the W. side of the town. This brook, which is about the size of the New River, and flows dry, swells in the rainy season to a formidable and rapid current; it rises at the foot of Mount Taurus, about 70 m. N., and after a course of 80 or 90 m. loses itself in a large morass full of wild birds and pelicans. The upper course of the Koek lies between naked rocks, but near Aleppo, and S. of that town, it flows through an extremely fertile valley, in a high state of cultivation. This river, and the aqueduct before mentioned, furnish an abundant and unfailing supply of water; and besides the public fountains and baths, every private individual, who chooses to be at the expense of pipes, may have his house served with water in the European fashion.

The far famed *gardens of Aleppo* are situated to the S. E. of the city, upon the bank of a small rivulet, one of the very few adjuncts of the Koek. They are rather orchards than gardens, consisting of fruit trees, with vegetables growing between them, but scarcely any flowers. They are pleasant spots, from the luxuriance of their productions, and the nightingales that resort to their shades; but very little taste is exhibited in their arrangements. W. of the town the banks of the river are covered with vines, olives, and fig-trees, and towards the E. are some plantations of pistachio trees, which, though still extensive, are only the remains of much more majestic groves, for which this country was formerly famous.

The air of Aleppo is dry and piercing, but accounted salubrious both to natives and strangers; the former, however, are subject to a peculiar disease, said to attack

* This is Volney's statement. Robinson describes the castle as situated at the N.E. corner; the apparent discrepancy probably arises from the one including, and the other excluding the suburbs. The N.E. corner of the walled town would be nearly the centre of the whole mass of buildings.

them once, at least, in their lives, the *habal-es-sine*; "ulcer;" or "ringworm of Aleppo." It is, at first, an inflammation of the skin, subsequently becomes an ulcer, continues for a year, and generally leaves a scar for life. It usually fixes in the face, and an Aleppine is known all over the East by the mark left by this disorder, the cause of which is unknown, but suspected to be owing to some quality of the water.

Aleppo appears to have risen to importance on the destruction of Palmyra. Like the latter, it was a convenient emporium for the trade between Europe and the East, so long as it was carried on over land. The productions of Persia and India came to it in caravans from Bagdad and Busora to be shipped at Iskenderoun and Latakia for the different ports of Europe. Aleppo communicated also with Arabia and Egypt, by way of Damascus; with Asia Minor, by Tarasus; and with Armenia, by Diarbekir. It rose to great wealth and consequence under the Greek sovereigns of Syria, and into still greater under the early Roman emperors. In 638, A. D. it resisted the arms of the Arabs for several months; but being finally taken, it became of as much importance under the Saracens, as it had before been under the Romans or Greeks. In the 10th century, it was reunited to the empire of Constantinople, by the arms of Zimiscus; but it soon after fell into the hands of the Seljukian Turks, under whose sway it remained during the time of the Crusades. It suffered considerably during the irruptions of the Mongols, in the 13th century, and again, by the wars of Tamerlane, or Timur Bec, in the 15th. Selim I. annexed it, in 1516, to the Turkish empire, of which it continued a part till 1832, when it opened its gates to Ibrahim Pacha, without a summons. Its political revolutions, with the exception of its two captures by the Tartars, affected its prosperity only temporarily and in a slight degree; but the discovery of a passage to India by the Cape of Good Hope struck a deadly blow at its greatness. Since that event it has continued to decline, and the earthquake of 1822, together with the wars which have distracted Syria, by causing extensive emigrations, have reduced it to comparative insignificance. Its capabilities are however very great, and under judicious treatment it is more than probable it would speedily regain a considerable share of its former prosperity. It is the most convenient centre for the trade between Persia and the interior of Arabia, on the one hand, and Asia Minor and Armenia on the other; it is, beyond all comparison, the cleanest and most agreeable town in Syria; and still, even amid its ruins, better built than almost any other between the Black Sea and the Euphrates; its inhabitants, a great proportion of whom are sheriffs (descendants of the Prophet), are the mildest and most tolerant among the professors of Mohammedanism. These circumstances have made it the resort of strangers, and they are not likely, in peaceable times, to have less influence in future.

Aleppo formerly possessed several manufactures, and before the earthquake, it was said to contain 12,000 artisans, chiefly weavers of gold and silver lace, silk and cotton goods, shawls, &c. These works are now languishing, but they still exist, and, with the pistachio nuts, form the chief part of its remaining trade. Its imports are goats' hair, from Asia Minor; gall nuts, from Kurdistan; and Indian goods, such as shawls and muslins. From Europe, it receives cotton stuffs, cloth, sugar, dye stuffs, &c.; W. I. coffee, though a prohibited article, is also introduced, and is cheaper than that of Mocha.

About 20 miles N.W. of Aleppo, is the convent (in ruins) of St. Simon Stylites, where some fragments of the pillar on which that famous ascetic passed so many years are still exhibited. The ruins of the convent attest its former magnificence, and a great number of deserted villages, in this direction, evince the former populousness of the neighbourhood. — (*Olivier, Voy. dans l'Em. Oth. iv. 169—209; Russell, Nat. Hist. of Alep. ii. et passim. Volney, ii. 124—130; Robinson, ii. 260—266; Browne, 394.*)

ALESEINA, a town of Russia in Europe, gov. Toula ca. district, on the Oka, 24 m. N. W. Toula. Pop. 2,300. It has several breweries; and manufactures hats, soap, &c.

ALESSANDRIA, or ALEXANDRIA, an important town and fortress of the Sardinian states, prov. of the same name, in a marshy country on the Tanaro, near where it is joined by the Bormida, 47 m. E.S.E. Turin, lat. 44° 56' N., long. 8° 36' E. Pop. 36,000. It has a very strong citadel, and was surrounded by Napoleon with extensive fortifications, which have been demolished since his downfall. It is well built; has a cathedral, numerous churches, palaces, and hospitals; a handsome town-house with a gymnasium, theatre, public library, and large barracks. It has manufactures of silk, cloth, and linen, and some trade. The latter is promoted by its two fairs, held the one at the end of April, and the other on the 1st of October; they are both well attended, not only by Italians, but also by French and Swiss.

Alessandria was founded in the 12th century, and has frequently been taken and retaken. It has always been reckoned one of the bulwarks of Italy on the side of France. The village and battle-field of Marengo lie a little to the E. of the town.

ALEUTAN, or ALEUTIAN ISLANDS, a chain of islands in the N. Pacific ocean, stretching from the peninsula of Kamtschatka, in Asia, to Cape Alaska, in N. America, comprised in the Russian government of Irkutsk. They are very numerous, occupying a circular arc, extending from 158° to 169° E. long., whose chord is in 55° N. lat., and above 600 m. in length. Apparently, this insular chain consists of the summits of a range of submarine mountains. In 1735, a volcanic island rose from the sea, in the middle of the line, which, in 1807, was found to be enlarged to about 20 m. in circuit, and lava was then flowing down its sides. There are always amongst them several volcanoes in activity, and some, known to have emitted flames, are now quiescent. Earthquakes are common, and sometimes so violent as to throw down the huts of the inhabitants. Behring's Island, Attoo, and Oonalsanka, are the largest, the first being 104 m. in length, but many are only considerable rocks. They are intersected by channels, various alike in width, and in the safety of navigation. All exhibit a barren aspect; high and conical mountains, covered with snow during a great portion of the year, being the most prominent features. Vegetation scanty; there are no trees nor any plants surpassing the dimensions of low shrubs and bushes. But abundance of fine grass is produced in the more sheltered valleys, and different roots, either indigenous or introduced recently. The seas abound in fish, and the feathered tribes are numerous. The hunting the sea otter, whose skin affords a fur of the finest quality, was, formerly, carried on to a great extent: they were wont to be caught in thousands; but their indiscriminate destruction has greatly reduced the number of those now taken. The seal is particularly valuable, affording the inhabitants a constant supply both of food and clothing; the thin membrane of the entrails is also converted into a substitute for glass. Foxes are the principal quadrupeds. The natives are of middle size, of a dark brown complexion, resembling an intermediate race between the Mongol Tartars and N. Americans. Their features, which are strongly marked, have an agreeable and benevolent expression. Hair strong and wiry; beard scanty; eyes black. They are not deficient in capacity, and the different works of both sexes testify their ingenuity. They are indolent, peaceable, and extremely hospitable; but stubborn, and revengeful. Tattooing, which was common among the females, is on the decline, but they practise a hideous mode of disfiguring themselves, by cutting an aperture in the under lip, to which various trinkets are suspended. These deformities, however, are less common than when the islands were discovered, the fiercest youthful females having learned that they are no recommendations in the eyes of their Russian visitors. A man takes as many wives as he can maintain; they are obtained by purchase, and may be returned to their relations; or the same woman may have two husbands at once; and it is not uncommon for men to exchange their wives with each other. Their subsistence is principally obtained by fishing and hunting. Their dwellings are spacious excavations in the earth, roofed over with turf, as many as 50 or even 150 individuals sometimes residing in the different divisions. Only a few of the islands are inhabited; but in former times the population is said to have been more considerable. Its decrease is ascribed to the exactions of the Russian American Company, who have factories in the islands. Its present amount has been variously estimated, at from a few hundreds to 6,000. The islands were partially discovered by Behring, in 1741.

ALEXANDRETTA. See ISKENDEROUN.

ALEXANDRIA (Arab. *Iskenderiyeh*), a celebrated city and sea-port of Egypt, so called from Alexander the Great; by whom it was either founded, or raised from obscurity, 332 years B. C., about 14 m. W. S. W. of the Canopic, or most W. mouth of the Nile, on the ridge of land between the sea and the bed of the old lake Mareotis, lat. 31° 12' 35" N., long. 29° 53' 23" E. Its situation was admirably chosen, and does honour to the discernment of its illustrious founder. Previously to the discovery of the route to India by the Cape of Good Hope, Egypt was the principal centre of the commerce between the E. and W. worlds; and it so happens that Alexandria is the only port on its N. coast that has deep water, and is accessible at all seasons. It has not, it is true, any natural communication with the Nile, but this defect was obliterated in antiquity by cutting a canal from the city to the river. After Alexandria came into the possession of the Saracens, this canal was allowed to fall into disrepair; and it was not to be supposed that any attempt would be made to re-open it, while Egypt continued subject to the Turks and Mamelukes. But Mohammed Ali, the present ruler of Egypt, being anxious to acquire

a navy, and to revive the commerce of the country, early perceived the importance of Alexandria, both as a station for his fleet, and a centre of commerce. In furtherance of his views he has greatly improved, beautified, and strengthened the city, and has restored the ancient canal from Alexandria to Foush, a distance of 48 m., opened, in 1810. It is to be regretted that its construction is in several respects defective; but it is not without a great advantage. Alexandria is built partly on a peninsula, consisting of the island of Pharos, so famous in antiquity for the lighthouse or pharos, whence it has derived its name, and partly on the isthmus by which that island is now connected with the mainland. The principal public buildings, as the palace of the Pacha, the arsenal, the hospital, &c., are on the peninsula, and the town principally on the isthmus. The ancient city was situated on the mainland opposite the modern town; and the vast extent of its ruins would sufficiently evince, were there no other evidences, its wealth and greatness.

Alexandria has two ports. That on the W. side of the city, called the old port, *Jeannet* of the ancients, is the largest and by far the best; but the entrance to it is narrow and rather difficult; but when in, ships may anchor off the town in from 22 to 40 feet water, and there is good anchorage in deep water all along the shore. The new harbour, or that on the E. side of the town, is very inferior, being comparatively limited, having a foul and rocky bottom, and being exposed to the N. winds.

The change in the appearance of Alexandria during the last dozen years has been quite extraordinary. — "J'allai," says Marshall Marmont, "visiter l'arsenal et l'escadre. J'étais extrêmement impatient de voir cette création étonnante, et, pour ainsi dire, incompréhensible. En 1828, il n'existant sur la presqu'île d'Alexandrie qu'une plage aride et déserte, je la trouvais, en 1834, couverte par un arsenal complet, bâti sur la plus grande échelle; par des cales de vaisseaux, de atteliers de tous les genres, des magasins pour tous les approvisionnements, une curserie de mille quarante mds de longueur (dimension égale à celle de la corderie de Toulon). J'y trouvais rassemblés des ouvriers nombreux, habiles dans tous les métiers qui se rattachent au service de la marine, et qui tous étaient Egyptiens; tout cela organisé, en mouvement, en plein service. Et ce cet arsenal, dont les fondations datent de six ans, il est sorti dix vaisseaux de ligne de cent canons, dont sept étaient armés, au vent d'un navire, et trois étaient sur le chantier, prêts à être lancés à l'eau. Je ne parle pas des frégates de divers rangs, des corvettes et des bricks, qui portent la flotte à plus de trente bâtiments armés. Ces prodigieux résultats ont été obtenus avec cette promptitude et grandeur, dans un pays où il n'y a ni bois, ni fer, ni cuivre, ni ouvriers, ni matebots, ni officiers de marine; aucun des éléments, enfin, qui peuvent servir à la création d'une escadre. Je ne crois pas que l'histoire du monde entière, ait jamais présentée dans aucun temps rien de pareil."

A dry dock is at present (1837) in course of being constructed. Naval and military hospitals have been established, the former under the direction of an English, the latter of a French doctor. A quarantine board exists under the direction of the consular body, to which the Pacha has confided this branch of service, and connected with which a large and commodious lazaretto has lately been erected outside the walls. Vessels arriving from any of the infected ports of the Levant, are subjected to quarantine, the same as in Europe; there is also a school for the marine, and a board composed of the admirals and higher officers of the fleet, for examining into the merits of candidates, maintaining the discipline and regulating every matter connected with that branch of service. The French system has been adopted in every department of the service, and to the French the Pacha is chiefly indebted for the advances he has made.

On the peninsula has been erected the *Schuma*, or range of warehouses for the reception of the surplus produce of Egypt, and hither it all comes, with the exception of that exported from Suez and Cosseir, for the maintenance of the army and fleet in the Red Sea. According to the Pacha's monopolizing system, the whole produce of the country comes into his hands, at prices fixed by himself, without the option of resorting to other markets being allowed to the grower. And not only does this apply to the produce of Egypt, but to that of the adjacent countries, wherever the Pacha's influence extends, embracing the coffee of Mocha, the gums and drugs of Arabia, the tobacco of Syria, elephants' teeth, and frathers from the Interior, &c., all of which are purchased for him in the first instance, the prohibition of trading in them applying to every one, and carrying with it the risk of confiscation, if contravened; — the whole of this produce, native as well as exotic, being collected in Alexandria, is sold by public auction, in the same way exactly as auctions are conducted in Europe, the upset price being fixed according to the latest report of the markets, the merchant having the privilege of examining the article in the *Schuma* before the sale, and being required to pay in cash

the price at which it is knocked down to him within a limited number of days, when delivery takes place. The principal articles thus disposed of, are cotton, which is by far the largest, rice, opium, indigo, gums, coffee, senna, hemp, lintseed, and the *comestibili* of the country, wheat, barley, beans, lentils, &c., of which however there has latterly been very little sold, there being barely enough produced for the home consumption. Ten years ago, a million of quarters of corn were generally exported, but now every thing yields to cotton, which is found more profitable to the revenue. The cotton, gums, coffee, indigo, lintseed, and some other articles of less importance, go to the markets of Trieste, Leghorn, Marselles, and Liverpool; the rice and opium to Smyrna, the Greek Isles, and Constantinople. England sends in return, iron, lead, coals, ordnance, cables, anchors, machinery, and some manufactured goods, though not much. France, Switzerland, Italy, and Germany, return wines, spirits, oils, manufactures of silk and cotton, articles of dress of every description, furniture, hardware, trinkets, and other things, suited not only to the consumption of Egypt, but of Abyssinia and the countries in its interior. Australia sends timber and other articles. From Turkey and the Isles are received silks, tobacco, oils, and some wood and fruits. There is also a little commerce with Malta and the Barbary states, in grain chiefly.

According to official statements furnished by the French consul, the value of the imports into Alexandria, in 1837, amounted to 71,817,000 fr. (2,872,000*l.*), and that of the exports to 55,687,000 fr. (2,227,000*l.*) The imports were derived from and the exports shipped for the undermentioned countries, as follows: —

Imports.		Exports.	
	Fr.		Fr.
England and Malta	15,158,000	-	5,491,000
Austria	13,838,000	-	14,552,000
Belgium	5,699,000	-	218,000
France	10,714,000	-	11,165,000
Greece	1,359,000	-	821,000
Sardinia	116,000	-	111,000
Sweden	117,000	Holland	85,000
Tuscany	102,500	-	3,128,000
Turkey	14,651,000	-	12,176,000
Barbary	4,151,000	-	1,511,000
Syria	2,719,000	-	6,598,000
Total	71,817,000	-	55,687,000

The description of articles imported and exported, and the value of each, were as follow: —

Imports.		Exports.	
	Fr.		Fr.
Arms of all kinds	258,000	Coffee	126,000
Timber for building and fuel	9,242,000	Corn	1,625,000
Woolen caps	18,110,000	Cotton	21,269,000
Cashmere	421,000	Denim	1,238,000
Copper and copper wire	1,541,000	Tortoise shell	188,000
Coal	756,000	Incense	1,026,000
Cash	5,928,000	Gum	5,112,000
Drugs	1,881,000	Horn	162,000
Tin plates and iron wire	3,892,000	Indigo	1,591,000
Fresh and dry fruit	1,165,000	Dried fruit	900,000
Oil	1,112,000	Mother of pearl	562,000
Paper	1,166,000	Mats	538,000
Jewellery, haberdashery and cutlery	2,555,000	Opium	374,000
Sugar	16,263,000	Skins	65,000
Cotton stuffs	1,940,000	Strich feathers	3,749,000
Woolen, do.	2,325,000	Rice	Senna and other medicines
Silk, do.	645,000	Linen cloth	1,784,000
Glass	712,000	Different articles	1,408,000
Wines and liquors	20,587,000		1,641,000
Different articles			10,928,000
Total	71,817,000	Total	55,687,000

The effect of the present monopoly system of the Pacha has been to drive out of the field large classes of traders, who before his time were rich, and had considerable influence; such as the coffee and tobacco merchants, to whom Napoleon, in his wants, never applied in vain; and to reduce all the native merchants and retailers to comparative beggary, as well as the Fellah or peasant, whose condition is now little better than that of serfs, without interest in the produce of their labour. If his successor persevere in the same system, the country must ultimately be ruined, and that at no very distant period. A few Frank merchants (by which name the Europeans generally are designated), have alone thriven and arrived at wealth under the present system, not in the ordinary course of commerce, but by enjoying the confidence of the Pacha, acting as commission agents for him, negotiating his finance transactions, and by fortunate speculations in cotton, that is, by having taken cotton in payment of their advances, which they afterwards sold at a profit.

There is no doubt that the population has trebled or quadrupled since the opening of the Mahmoudieh canal.

and is still on the increase. It may amount, in all, to from 20,000 to 40,000. A good deal of this increase has taken place at the expense of Rosetta, which has lately very much declined. The population is of a mixed character, consisting, besides the native Turks and Arabs, of Armenians, Greeks, Smyrniotes, Syrians, Moghrebins, or men from the Barbary states, Maltese, Jews, and Europeans of almost every nation, in such numbers, that it may be questioned, whether the strangers, in a commotion, would not be more than a match for the natives. The English have 10 commercial houses, independently of those engaged in other pursuits, yet they are considered about the weakest in numbers, the French, Italians, and Greeks, being the most numerous. Amateur French and Italian theatres exist, the performances in which rival those of the Académie Royale and San Carlos; balls and routes are given in the most approved style of fashion; a commercial journal has been established in the Italian language, which however does not treat of politics; French *modistes*, tradesmen in all departments, and shops displaying every article of furniture, and of male and female attire, from the Parisian bonnet of the latest fashion to the very humblest article of dress, all conspire, in conjunction with the style of the buildings, and pretty equal balance of hat and turban, to take away from this place the appearance of an Oriental city; and it is only after leaving it, and pursuing his way to Cairo, that the stranger truly feels that he is in the East. Here also exist Catholic and Greek convents, where divine service is performed on Sundays and holydays to the people of those persuasions; the Armenians, Syrian Christians, and Jews, have also places of worship, Protestants alone being without a temple. There is little intercourse between the natives and Franks, except in the way of business. They occupy distinct quarters of the city, the former secluding their families, and maintaining all the reserve of Oriental life, the siesta, pipe, and coffee sipping up three fourths of their time; the latter adhering to the customs of their own country, in dress, furniture, the use of carriages and horses, and indeed in all things but the siesta, the pipe, and immuring themselves during the heat of the day, wherein they imitate the Orientals. Latterly also, after the example of some of the higher Turks, several of the richer Frank merchants have obtained grants of land from the Pacha, on the banks of the canal, and built houses and made gardens, which serve to beautify and give interest to the neighbourhood; but the great architect in this way is Ibrahim Pacha, the son of Mohammed Ali, whose garden is destined to become very shortly the chief attraction of the place.

The Turkish quarter of the city consists of a number of narrow, irregular, tortuous, filthy and ill-built streets and bazars, with hardly any good houses but those of the Pacha's officers, and without a single public building, mosque, or other object worthy the least attention, the bazars being mean, and but very indifferently provided. The Frank quarter, on the other hand, presents several streets of well built substantial houses, with good shops; the particular the square, which is the residence of the consuls and principal merchants, called the *Piazza Grande*, that may well bear comparison for the size and style of its buildings, with some of the best streets of Paris or London. Ibrahim Pacha is the owner of the greater part of these houses, which he built on speculation, and for which he draws rents, varying from 200*frs* to 240*frs* per annum. The whole town is built of stone and brick, dug up from the foundations of the ancient city.

During part of the year Alexandria is supplied with water from the canal; and during the other portion, from the cisterns of the ancient city (the only portion of its public works that has been spared) which, at the period of the inundation, when the canal is full, are thence filled, and to which recourse is only had, when the water of the canal, by being stagnant, becomes unfit for use. As the inundation advances, the old stagnant water is run off into the sea, and the canal, being filled brim full with fresh, is shut up at both ends, and so remains till the following year, serving in the mean time for navigation, for the use of man and beast, and for the irrigation of those small portions of land on its banks, that have been reclaimed from the desert, and brought into cultivation. The climate of Alexandria, is considered very salubrious, the heats of summer, which rarely exceed 85° Fahr., being tempered by the Etesian, or N.W. winds, which prevail for nine months of the year. In winter, a good deal of rain falls, which however is confined to the coast, and is probably the cause, coupled with the wretched habitations and misery of the poorer classes, why the plague so often makes its appearance here. Were the labouring classes better clad, housed, and fed, there is little doubt that this scourge would soon be no longer heard of.

The municipal government of the city is entrusted to the governor, Moharrem Bey, son-in-law of the Pacha, who has under him a commandant de place, and an officer, called the *Bashaga* or chief police magistrate, whose duty it is

to see that order and quiet be maintained. The city is besides divided into quarters, over each of which a sheikh presides, who is responsible to the governor for the peace of his district; and moreover, each trade and profession has its sheikh, whose duty it is to collect the taxes, and to see to the good behaviour of the members. Guard-houses are also distributed all over the city, and the military are instructed to take all riotous and disorderly parties into custody, the officer of the guard, if the offender be a native, having authority to inflict summary punishment by the bastinado; but if a Frank, he must send him to his own consul, to be punished according to the laws of his own country. This system works so well, that a more orderly place, or one freer from riot or crime, is rarely to be seen: indeed, when crime is committed, it is usually by Frank upon Frank; and then, from defects in the consular system, it almost always escapes detection. Besides the *Bashaga* or police court, there is the *Meh-kemeh* or Kadi's court, where all civil questions between natives are determined; and a commercial court, with Frank judges, but presided over by a Turk, for deciding questions between the Franks and natives, where the latter are defendants: the Franks themselves, besides exemption from all taxes and burdens of every sort, being amenable only when defendants to their own consular courts, and to the laws of their respective countries. These immunities have been secured to the Franks by convention with the Porte, and are rigidly insisted upon here as well as in every other part of the Turkish empire. The garrison usually consists of about 2,000 men, besides the *toygers* or gunners, who man the forts.

There can be no doubt that Alexandria will profit much by the recent establishment of a steam communication with India, by way of Egypt, as well as by the lines of steamers now connecting it with Marseilles, Trieste, and the whole of the Levant. It is true that a considerable change must take place in the commercial system of the Pacha, before these advantages can have their proper effect; — but, independently of this, it is quite clear that, in the novel circumstances under which the world is now placed, Egypt, and consequently Alexandria, must, from its position, become every day of more and more importance.

Sketch of History, &c. The Ptolemies, to whom Egypt fell on the demise of Alexander the Great, made Alexandria the metropolis of their empire; and it became under their liberal and enlightened government one of the greatest and most flourishing cities of antiquity. When it was annexed by Augustus to the empire of Rome, it is said to have occupied a circumference of 15 miles, and to have had 300,000 free inhabitants, besides slaves, who were probably quite as numerous. It was regularly and magnificently built; and was traversed by two great streets, each more than 100 feet across, and the larger extending more than 4 m. from E. to W. Under the Ptolemies and the Romans, Alexandria was the entrepôt of the principal trade of antiquity, being the market where the silks, spices, ivory, slaves, and other products of India, Arabia, and Ethiopia, and the corn of Egypt, were exchanged for the gold, silver, and other products of the W. world. The inhabitants were distinguished by their industry: either sex and every age were engaged in laborious occupations, and even the lame and the blind had employments suited to their condition. Among the principal manufactures were those of glass, linen, and papyrus, the paper of antiquity. Under the Roman emperors, Egypt became a principal granary for the supply of Italy; and its possession was reckoned of the utmost importance, and watched over with peculiar care. Various privileges and immunities were conferred upon Alexandria; many of her inhabitants were admitted to the rights of Roman citizens, and her wealth and prosperity continued undiminished.

But Alexandria was still more distinguished by her pre-eminence in literature and philosophy than by her commerce and riches. The foundation of her pre-eminence in this respect was laid by the Ptolemies, who founded the museum and library (*elegantia regum curaque cæregium opus*, Livy), that afterwards became so famous, at the same time that they gave the most munificent encouragement to literature and learned men. This patronage being continued by the emperors, Alexandria was, for several centuries, a distinguished seat of science, literature and philosophy. Generally, however, her literati were more distinguished for learning and research than for original genius. She produced a host of grammarians and critics; and the names of Euclid, Apollonius of Perga, Ptolemy, Eratosthenes, Nicomachus, Hero-philus, Zopyrus, &c., are but a few of those most distinguished in the schools of geometry, astronomy, geography and medicine, that flourished in Alexandria. But her philosophy was the most striking feature of Alexandria, in a literary point of view. The influx of doctrines from the E. and W. schools produced a singular conflict of systems; which ended in an attempt

ALEXANDRIA.

of the philosophers Ammonius, Plotinus, and Porphyry, to establish an eclectic or universal system by selecting and blending doctrines taken from the principal existing systems, particularly from those of Pythagoras and Plato. Christianity was not exempted from the influence of this spirit; and on its introduction, it was strangely alloyed with Platonism; and principles for expounding of its doctrines were laid down that would now be with difficulty admitted.

The schools of geometry, astronomy, physic, and other branches of science, maintained their reputation till A. D. 640., when, after a siege of 14 months, Alexandria was taken by Amrou, general of the caliph Omar. The conquerors were astonished by the greatness of the prize; and Amrou, in acquainting the caliph with its capture, said, "We have taken the great city of the West. It is impossible for me to enumerate the variety of its riches and beauty; and I shall content myself with observing, that it contains 4,000 palaces, 4,000 baths, 400 theatres or places of amusement, 12,000 shops for the sale of vegetable food, and 40,000 tributary Jews. The town has been subdued by force of arms, without treaty or capitulation."

It was on this occasion that the famous library is said to have been destroyed, conformably to the fanatical decision of the caliph, that "if the writings of the Greeks agreed with the book of God, they were useless, and need not be preserved; if they disagreed, they were pernicious and ought to be destroyed." This barbarous judgment being carried into effect, the books and manuscripts were distributed among the 4000 baths belonging to the city; and so prodigious was their number that six months are said to have been required for their consumption! Such is the tale that has so often excited the indignation and regret of scholars and the admirers of ancient genius. But Gibbon has shown that it has no good foundation: it rests on the solitary statement of Abulpharagius, who wrote six centuries after the event, and is not noticed by those more ancient annalists, who have particularly described the siege and capture of the city. It is besides repugnant to the character of the caliph and his general, and to the policy of the Mohammedans. Even if it did occur, the loss has been much exaggerated. Great part of the library of the Ptolemies was accidentally consumed by the fire which took place during the attack on the city by Caesar; and either the whole, or the principal part of the library subsequently collected was destroyed A. D. 389, when the temple of Serapis, the most magnificent structure of the city, was demolished by the enthusiastic zeal of the Christians.

It would be useless to pursue farther the history of Alexandria. It continued progressively to decline till, in 1497, its ruin was consummated by the discovery of the passage to India by the Cape of Good Hope. But there can be no doubt, as previously stated, that it is destined to recover some portion of its ancient importance. It will necessarily become the centre of the communications now carried on by steam between Europe and India; and will, most probably, again become a considerable emporium.

The clisterns which, as already seen, are still in pretty good preservation, are the principal monuments of the ancient city that have outlived the injuries of time, and the ravages of barbarians. The cataracts are also comparatively entire. The magnificent column, improperly called Pompey's Pillar, seems to have been erected in the reign of Diocletian; its shaft consists of a single block of granite, 64 feet in height. Two obelisks, vulgarly called Cleopatra's needles, of which only one is erect, are said to have formed the entrance to the palace of the Cæsars. — (For further particulars, see *Dict. Géographique*, art. "Alexandria;" *Voyage du Maréchal Marmont*, tom. iii. passim; *Matter sur l'Ecole d'Alexandrie*, passim; *Gibbon*, caps. 10. 28. and 51.; and private information from residents in Egypt.)

ALEXANDRIA, a city and port of entry of the United States, dist. Columbia, on the W. bank of the Potomac, 6 m. S. Washington. Lat. 36° 49' N. long., 77° 18' W. Pop. in 1830, 8,221. It is well built, the streets crossing each other at right angles, and it has commodious harbour with deep water, the largest ships coming close to the wharfs. But notwithstanding these advantages it has been, unlike most other American cities, nearly stationary for some years past. It is expected that the opening of the canal from Washington to the Ohio, will add materially to the trade and importance of Alexandria. — (*Encyclopædia Americana*.)

ALEXANDROVSK, a town of Russia in Europe, gov. Ekaterinoslaff, cap. district on the Dnieper at the bottom of the cataracts, 140 m. N. E. Cherson. Pop. 3,400. It is fortified; and displays considerable activity from its being the place where merchandise conveyed from Ekaterinoslaff by wagon, to avoid the cataracts in the river, is again shipped.

ALFARO, a town of Spain, prov. Sorla, on the banks of the Alhama, close to its junction with the Ebro, 12

ALGIERS.

55

m. W. by N. Tudela. There is a military road between this place and Logrono. Pop. 6,450.

ALFELD, a town of Hanover, prov. Hildesheim, at the conflux of the Lelme and Warne. Pop. 2,800. It has a normal school and 3 hospitals.

ALFRETTON, a par. and m. town of England, co. Derby, hund. Scarsdale, 16 m. N. N. E. Derby. Pop. 5,691. The inhabitants of the town are principally employed in the manufacture of stockings and earthenware, and in the adjoining collieries.

ALGARINEJO, a town of Spain, prov. Granada, close to the frontiers of Cordoba, near the right bank of the Genil, in a country whose abundant and fertilizing streams fall into that river. Pasturage and tillage form the chief business of the population. Pop. 3876.

ALGARROBO, a town of Spain, prov. Granada, 2 m. from the Med. Sea, in the midst of a country particularly rich in lemons, oranges, figs, and other fruits belonging to the south of Spain, 164 m. E. Malaya, and 33 m. S. S. W. Granada. Pop. 2,500.

ALGARVE, the most S. prov. of Portugal, which see. ALGERIAS, the *Cærtia* of Roman Geography, a town of Spain, prov. Cadiz, on the W. side of the bay of Gibraltar, opposite to the celebrated rock and peninsula of that name, from which it is distant about 7 m. by water, and 17 m. by land. Lat. 36° 8' N. long., 5° 31' 7" W. Pop. 4,500. It has a good harbour and some trade in the export of coal. It was built by the Moors, and taken from them after a two years siege, in 1844.

ALGERI, or ALGIERO, a town and sea-port of the island of Sardinia on its W. coast, 15 m. S. S. W. Sassari, lat. 40° 25' 50" N., long. 8° 10' 45" E. Pop. 6,700. It is built on a low rocky point, jutting out from a sandy beach, in the shape of a parallelogram with stout walls flanked by bastions and towers; the walls are in good repair; but being commanded by two heights it could not oppose any vigorous attack from the land side. To the S. W. of the town there is tolerable summer anchorage in from 10 to 15 fathoms, good holding-ground. Though narrow, the streets are clean and well paved. It is the seat of a bishopric, has a cathedral and 12 churches and convents, with public schools which carry their scholars through a course of philosophy; and a surgical institution. It has a small theatre. The town was long occupied by the Spaniards, and their language and manners still prevail. The country round is well cultivated, producing wine, butter, cheese, &c. In addition to these the exports consist of wool, skins, tobacco, rags, anchovies, coral, and bones. — (*Smyth's Sardinia*, p. 240.)

ALGIERS, now frequently called *ALGERIA*, a country of N. Africa, and till recently the most powerful of the Barbary states, comprising the *Numidia* Proper of the ancients, or the *Numidia* of the *Massyli* and the *Numidia Massasylæ*, afterwards called *Mauritania Cæsarionensis*, with some portion of the region S. of the greater Atlas anciently inhabited by the Gétulæ and Garamantes. The N. parts have been since 1830 in possession of the French; but for more than three centuries previously they formed a subordinate part of the Turkish empire, and were during that period the seat of an extensive system of piracy and Christian slavery.

Situation, Extent, Boundaries. — Algiers lies between 1° 48' W. and 9° 16' E. long.; its greatest N. lat. is 37° 5'. It is bounded N. by the Mediterranean W. by Fez (Morocco), and E. by Tunis; its S. boundary is doubtful, but it extends beyond the greater Atlas range to the confines of the desert of Sahara: it is above 300 m. in length; its breadth, which is greater in the E. than in the W., varies from about 40 to about 200 m. The pop. has been variously estimated at from 1,700,000 to 2,300,000, and may probably amount to about 2,000,000. It used to be divided into 4 provinces: 1. Algiers (*Al Jezair*), including the capital, and a small surrounding territory; 2. Titteri, to the S. of Algiers; 3. Oran, or Tlemcen, to the W.; and, 4. Constantine, to the E. of that city. But these provinces are generally understood to include only the *Tell*, or land N. of the greater Atlas, excluding the territories of Zaab or Wail-reag, S. of that range; for though the villagers in the latter either paid the taxes imposed by the Turks, or gave other tokens of submission to them, the greater portion

of the population was independent. — (*Shaw*, p. 3. 4to ed.)

Mountains. — Algiers is mostly mountainous: the little Atlas, which runs along the coast parallel to the greater Atlas, varies from 3,000 to 4,000 ft. in height; its loftiest point is S. of Chiffa; opposite to Cape Matifou its elevation is little more than 2,000 ft. The abrupt mountains of Titteri, belonging to the greater Atlas, reach in some points to an elevation of 9,000 ft., and send off three principal ridges: N. W. towards Cape Ivy; N. towards Algiers; and N. E. towards Bugia. Many of these mountains are remarkable; as Wannashrees (*Zalacus*), prov. Oran, very lofty, and Jurjura, S. E. of Algiers, both capped with snow during winter; the Titteri Dosh, or rock of Titteri, is also a remarkable ridge of rugged precipices. The Jibbel Aures (*M. Audus* of Ptolemy) S. part prov. Constantine, is not, as the name would imply, a single mountain, but an extensive tract, 120 m. in circuit, of mountainous or rather hilly ground. It is interspersed with several fine vallies; and both its lower and upper parts are extremely fertile, it being, in fact, the garden of the prov. — (*Shaw*, pp. 26. 36. 56.)

Plains. — The principal is that of Metidjah, immediately S. of Algiers, 50 m. by 20; fertile, well watered, and covered with an abundant vegetation, but in parts marshy and unhealthy. In the W. prov. are several plains, especially that through which the Shelliff runs; and another S. W. of Oran, sandy and saltish, dry in summer but inundated in winter. In the S. prov. are the rich plains of Hamza, watered by the Nasava. Many luxuriant plains are found in the E. prov., as those of Sateef, Majanah, and that skirting most part of the E. coast, which is, however, in many parts marshy. — (*Shaw*, pp. 24. 37. 44. 47. 50. 53.)

The Rivers are separated by the greater Atlas range into those which run N. and S. Of the former, or those which discharge themselves into the Mediterranean, the principal is the Shelliff (an. *Chindaph*), which rises S. of the Wannashree M., and after a tortuous course of 200 m., during which it passes through the Titteri Gawle or lake, falls into the sea under Cape Jibbel Iddis. In the rainy season it overflows its banks, and interrupts the communication between Algiers and Oran. The Wad-el-Kebeer (an. *Ampsaga*), which falls into the sea N. of Constantine, in 6° E. long., is the second in magnitude; the others are the Seibous, or river of Bona, the Booberac, Yissa, Zowah, Wad-y-Zaine, &c. The large rivers, the Adjedi and Abiad, run S. E., and empty themselves into the *Meligg*; and several rivers of inferior dimensions empty themselves into the *Shott*. These are two very extensive salt marshes; the former on the S. the latter on the N. side of the greater Atlas; they consist partly of a light opzy soil, as dangerous as quicksands to travellers. — The lakes are those of Titteri; two near Oran, which dry in summer, and from which salt is collected; some salt marshes near Cape Matifou, and others along the coast from Bona to the borders of Tunis. (*Rozet*, p. 19.; *Shaw*, p. 55.)

Climate — Of the Tell, i. e. between lat. 34° and 37°, is generally wholesome and temperate. Shaw states that for twelve years during his experience it only froze twice at Algiers; yet the heat was never oppressive unless during S. winds. The mean temperature of the year at Algiers is 70° F., in July and August about 86° F.; but ranging occasionally during the prevalence of the khamain, simoom, or hot wind from the Sahara, as high as 110°, or even more. Luckily, however, the latter seldom or never continues

for more than 5 or 6 days at a time, and rarely occurs except in August or September. In winter the temperature is usually from 55° to 65° F. The heat is mitigated by the N. winds, which with the E. prevail during summer. About the equinoxes violent S. W. winds occur; N. W. winds are common from November to April, at which time storms and showers of rain are most frequent; but in summer these winds bring dry weather; the E. and S. winds are also dry, and quite unlike what they are on the opposite European coasts. The barometer varies only from 29 and 1-10th to 30 and 4-10ths in. There are about 50 wet days during the year, chiefly in March, along the coast and on the lesser Atlas. The quantity of rain varies greatly in different years; but, at Algiers, it may average from 27 to 28 inches: little falls during summer. Dews are abundant, and the air on the coast is damp. At the end of December the trees lose their leaves; but by the middle of February vegetation is again in full activity, and the fruit is ripe in May. — (*Shaw*, pp. 133—136.; *Rozet*, i. pp. 140—149.; *D'Arzac*, art. "Alger.") The atmosphere is very clear and the country healthy, excepting in the marshy districts.

Geology and Minerals. — The primary rocks consist in part of granite, but chiefly of gneiss and micaceous schist. Travertine is found on the coast; near Oran a greyish quartz, but no volcanic rocks; in the interior a lime formation often alternates with a schistous marl. The secondary deposits consist in many places of a lias formation and calcareous strata, containing few organic and no vegetable remains. At Oran the lias contains bivalve but no univalve shells. The tertiary deposits are mostly calcareous, in the Metidjah of a yellowish grey colour; sometimes a blue clay enclosing a laminary gypsum and a little iron, in other parts sandy and much impregnated with salt. All the chain of Atlas has a tertiary clay deposit. The W. province appears to be the richest in minerals. Salt is extremely abundant, in springs and beds, on both the E. and W. frontiers; near Constantine, the Titteri Dosh mountains, the Meligg and Shott marshes, &c. The salt pits near Arzew occupy a space of 6 m. circ., forming marshes in winter which dry in summer, when large quantities of salt are collected. Nitre, though not found pure, is very plentiful in the W. province, Getulia, &c. Iron is most abundant. Copper is found in various places; and there are some very rich lead mines, the ore of those of the Wannashrees being said to yield 80 per cent. of pure metal. There are also fullers' earth, potters' clay, talc, pyrites, &c. Diamonds (verifying what was reckoned the apocryphal statement of Pliny, *Hist. Nat.*, lib. 37. § 4.) have been found in the sands of the Wad-el-Kammel that runs by Constantine, mixed with small quantities of gold dust, silver, tin, and antimony. Saline hot and cold springs are exceedingly abundant, more so, in fact, than those of fresh water. The latter, however, are by no means rare, and may everywhere be found by digging through a crust of flaky soft stone lying at different depths, but near Algiers and Bona immediately below the surface of the ground. — (*D'Arzac*, art. "Alger.")

Vegetation in the N. parts of Algiers is nearly the same as in the S. parts of Spain, Provence, Italy, and the rest of the Mediterranean shores. The mountains of the little Atlas are covered with thick forests, in which are found several different varieties of oak, the Aleppo pine, the wild olive, the shumac tree (*Rhus cotinus*), with arbutus, cypress, myrtles, &c. S. of the greater

Atlas are found the date-bearing palm, and other trees belonging to a warmer climate.

Animals. — Lions of great size and strength, panthers, hyenas, and leopards, inhabit the mountainous recesses of the greater Atlas, but are never seen near Algiers: wild boars, wolves, and jackals are more common, and there are a few bears. Wild cats, monkeys, porcupines, and hedge-hogs are more or less abundant; as well as antelopes and other species of deer, hares, genets, jerboas, rats, mice, &c. The useful animals are horses, asses, black cattle, sheep, camels, dromedaries, &c. Ostriches are found in the desert on the confines of Morocco; there are also vultures and other large birds of prey; bitterns, curlews, lapwings, plovers, pigeons, and snipes; with great plenty of game and small birds. Some serpents of the Coluber race are met with; and lizards, chameleons, and other amphibia. Tunny and other sea fish abound on the coasts; barbel, perch, eels, &c. are found in the fresh waters, and even in the warm saline streams; conger at the mouths of the rivers; and lobsters and many other crustacea along the shores. Among the insect tribe are scorpions, tarantulas, &c. Locusts seldom commit the same devastations here as in Egypt and Syria. Coral, which is very abundant on the coasts, forms an important article of produce and industry: it is of a larger sort, but less vivid in its colour than that of Sicily. (*Racet*, vol. i. p. 218.; *Shaw*, p. 192.; *Campbell, Letters from the South*.)

People. — There are nine distinct races of inhabitants; viz. 1st, Berbers or Kabyles, who, however, call themselves *Mazagh* (noble) or *Mazerg* (free); they constitute about half the entire population, and are the lineal descendants of the aboriginal inhabitants of the country. They are principally found in the mountain districts; and their lands are occasionally well cultivated and irrigated. 2d, Diskeris or Mozabs, supposed to be the descendants of the Getulæ, living principally S. of the greater Atlas, and comparatively industrious. 3d, Moors; a mixed race, descended from the Mauritanians, Berbers, Carthaginians, Romans, Vandals, and Arabs; they constitute the bulk of the population of the towns and villages. 4th, Arabs, consisting of three tribes: the first, supposed to have descended from the ancient Amalekites, is nearly extinct; the second consists of cultivators of the soil, and is fixed to certain spots; the third, or wandering Arabs, are principally herdsmen and shepherds dwelling in tents. 5th, Negroes, called *Abyd* (slaves) or *Soudan* (black); originally brought thither from the interior, and sold as slaves. 6th, Jews, who form a third part of the inhabitants of Algiers, and a fourth part of those of Oran. 7th, Turks, now very few, nor ever very numerous, although long the dominant race: they were a heterogeneous body, composed of genuine Turks, Greeks, Circassians, Albanians, Corsicans, Maltese, and renegades of all nations; mounted, and forming a militia similar to the Mamelukes. On the conquest of Algiers, in 1830, by the French, the Turks being permitted to withdraw, evacuated the country to the number of about 20,000. 8th, Kolouglis, or descendants of Turks by Moorish mothers; their name literally signifying "sons of soldiers." Although possessed of influence, they did not formerly enjoy the same rights and consideration as their fathers. 9th, Europeans, who may of course be subdivided into various nations, but are mostly French. Amongst the Kabyles of the Aures are a tribe distinguished by a fair complexion, blue eyes, and light hair, believed to be descendants of the

Vandals. Traces of the Huns, Suevi, and other Gothic nations have been also found. (For further information respecting the different native races, see *ARABIA*, *BARBARY*, *MOROCCO*, &c.)

Scenery. — Proceeding from W. to E. a rich champaign country stretches for some distance inland S. of Arzew, bounded towards the sea by steep rocks and precipices; many fertile plains are irrigated by the Sigg river (or *Sikk*, a drain or trench), its waters being diverted by numerous canals for that purpose. Behind Masagran, and near the Shelliff, as far as the sea, is a tract studded with orchards, gardens, and country houses. The country round Shershell is of the most exuberant fertility, possessing large tracts of arable land, and the mountains covered to their summits with plantations of fruit trees, and affording delightful and extensive prospects. The inland parts of the W. province present alternately fertile valleys and high ranges of rocky mountains. "If we conceive," says Shaw, "a number of hills, usually of the perpendicular height of 400, 500, or 600 yards, with an easy ascent, and several groves of fruit and forest trees rising up in a succession of ranges one behind another, and if to this prospect we here and there add a rocky precipice of a superior eminence and difficult access, and place upon the side or summit of it a mud-walled Dashkerah, or village of the Kabyles, — we shall then have a just idea of the atlas bounding the Tell." The verge of the Sahara beyond this presents nothing but scattered villages, and plantations of dates. The plain of Metidjah, adjoining the capital, contains many farms and country houses, producing in perfection flax, henna, roots, pot-herbs, rice, fruit, and corn of all kinds; it is adorned besides with multitudes of oleanders, geraniums, passion flowers, and other luxuriant shrubs. The S. province has the same general character as that of Oran. The Titteri Dosh, 20 m. S. of Medeah, is a towering range of bleak precipices. The Jurjura, S. E. of Algiers, is a similar tract. The sea coast of the E. province as far as the river Zooore is mountainous, and called by the Arabs El-Adwah (the lofty); thence to the Seibous it is hilly; and from the latter to the border mostly level, and sometimes covered with forests. Some distance to the S. are the *M. Thambs* of Ptolemy. The Seibous in some parts wanders through beautiful valleys, clothed with olive trees, lentisks, and a fine turf. The country about the source of the Zenati is broken and irregular, and appears to be volcanic; that to the N. and N. W. of Constantine, from which that city is chiefly supplied, is watered by the Rusuli, which is "bordered by a few villas and numerous gardens, rich in every variety of vegetable and fruit trees, with extensive groves of pomegranate, olive, fig, orange, and citron," and bounded by bold ranges of hills; its fruit is esteemed over the whole province. In the road from Algiers to Constantine, between the plains of Hamza and Majanah, a deep narrow pass, called *Bechan* (the Gates), which a few men might defend against an army, leads through a mountain ridge; and a little farther E. the road is carried by a dangerous track over the crest of a high mountain. S. of Seteef are many rich plains. The territory around Tifesh is the most fruitful in Numidia, and the W. province the finest of the regency. The villages of Zaab, are collections of dirty hovels, surrounded by date plantations; Wad-reag, a similar country, has 25 villages. To the W. extends the vast region of Blaid-el-Jerride, "a dry country," abounding in dates. (*Shaw*, pp. 14—68.; *Sir*

G. Temple, Extracts in the Geograph. Journal, 1838, part ii.)

Antiquities.—Most of the cities and towns bear names little altered from those given them by the Romans. Many ruins remain; those of Tipasa (Tifessad), 13 m. E. of Shershell, stretch for two miles along the coast: on the brink of the Shelliff, in about the same lat., there are several classical remains, Corinthian capitals, &c., probably the ruins of the Colonia Augusta of Pliny. About 14 m. E. of Algiers are the ruins of Rusucurium. At Maliana, N. of the Shelliff, a stone, inserted in a modern wall, bears an inscription, whence it has been inferred that it was the place where Pompey's grandson and great grandson were buried. (See *Martial, Epig. lib. v. Ep. 75.*) Near Bona are the ruins of *Hippo Regius*, and many towns can boast of ancient relics in tolerable preservation. The province of Constantine especially abounds with them, and with Roman roads; and even the remote district of Wad-reag has numerous remains of Roman masonry. Near the capital is a collection of unhewn stones, somewhat similar to those of Stonehenge, which the French call *Druidic*, but others believe to be Phœnician. There are few Christian remains, their buildings having been destroyed by the zeal of the Saracens. (*Shaw*, pp. 21—67; *Sir G. Temple, Extracts.*)

Agriculture.—Much of the land is uncultivated and waste; but the fertility for which it was so famous in antiquity—

Non quicquid Libycis terit,
Fervens area mesibus,—

still continues unimpaired; and requires merely the substitution of regular government for lawless violence, and of industrious colonists for roving herdsmen, to render it once more the granary of Europe. The land in many parts, owing to the quantity of salt with which it is impregnated, is so rich as to require no manure but burnt weeds. But in a dry climate like this every thing depends on the command of water; and the necessity under which the native inhabitants were placed of providing this indispensable element for their lands, had so far counterbalanced their indolence and want of science as to make them pretty expert in the art of irrigation. The French were not, at first, sufficiently alive to the vital importance of this; and some of the Arab works for irrigating were in consequence neglected, to the great injury of the province. The land is usually ploughed and sown in October, or (if with barley) in November; by the aid of April rains a good crop is thought secure, and the harvest takes place in the end of May, or the beginning of June, yielding at an average 8 or 12 for 1. The species of corn mostly grown are the *Triticum durum* (hard wheat), and *Hordeum vulgare* (common barley). Maize is not much cultivated, except in the W. province; white millet for fattening cattle is planted there; rice chiefly in the prov. of Oran. Oats not being grown, horses are fed wholly upon barley and straw. The plough used round Algiers is the same as that of Spain and Provence; but in general is not shod with iron. It is drawn by cows and asses, very rarely by horses; yet with such imperfect ploughing the crops are generally excellent. When reaped, the grain is trodden out by cattle or horses; and after being cleaned by throwing it up against the wind, is deposited in subterraneous caves or magazines. The pulse crops are beans, lentils, kidney beans, pease, and garvanços (cicer pea); turnips, carrots, cabbages, &c. are good and plentiful. Endive, cress, spinach, and

artichokes are in season from October to June; after which come calabashes, mallows, tomatoes, and water-melons. Potatoes are frequently grown, but do not arrive at a large size, and are of inferior quality. The date is the principal fruit, and is by far the most valuable product of the country S. of the greater Atlas. It is propagated chiefly by young shoots, and yields fruit in its 6th or 7th year; it attains maturity at about its 30th year, and is in full vigour for 60 or 70 more, after which it gradually declines, till it becomes extinct when about 300 years old! (*Shaw*, p. 142.) Truly, therefore, might *Palladius* say, *Cui placet curas agere sæculorum de palmis cogitet consequendis.* (Oct. 12.) During its maturity it yields annually from 15 to 22 clusters of dates, each weighing from 15 to 20 lbs. The date-palm (*Phoenix*) when it dies is always succeeded by others from shoots or kernels; whence may probably have originated the fable or allegory of the bird *Phoenix*. The lotus or *sedra* bears a berry sold all over the S. district. Most of the fruit trees common to Europe are found in Algiers; but the fruits are inferior, excepting nectarines, peaches, and pomegranates; there are no hazel nuts, filberts, strawberries, gooseberries, or currants.—The vine is cultivated with much advantage; the grapes ripen by the end of July, and are eaten both fresh and dry by the natives, who seldom make wine; though this, no doubt, will be attempted, and most likely with success, by the French. Oil of a very inferior quality, and always acrid, is obtained from the olive. Melons and Indian figs are largely grown, and form a considerable part of the food of the Arabs. In some grounds near Algiers the sugar-cane is cultivated. Cotton and indigo have been tried, and the climate suits them well; coffee has also been tried, but is not found to succeed.

Cattle constitute the principal wealth of the natives. Sheep are of two kinds: one small, with a thick large tail; the other of a much larger size, chiefly found in the country of the Melano-Getulæ. Sheep of the fine Tunisian breed are not met with. Goats pretty abundant; pigs few, round-bodied, short-legged, and generally black. Cattle usually black; their milk is inferior to that of European cattle; that of sheep and goats is mostly used in the making of cheese, butter, &c. The Arabs seldom diminish their flocks by killing them for food, but live on their milk, wool, &c.; no animals are castrated. The common beasts of burthen are camels, dromedaries, asses, and mules. Dr. Shaw speaks of a singular cross breed between an ass and a cow, called *kumrah*, having a sleeker skin than its sire, no horns, but the dam's head and tail; but Rozet says that he had not been able to find any trace of any such animal. Horses are not of the pure Arab breed, nor altogether well shaped, being lanky and round-shouldered; head small, and not ill formed; ears erect; and they are hardy, fleet, spirited, and docile: those of Oran are accounted the best. They are used only for riding, and like the camels are reared and live in the tents with their owners. (*Shaw*, pp. 2—65. 166—170; *Rozet*, pp. 204—261; *Campbell's Letters from S.*)

Trades and Manufactures.—Almost all the trades of Europe are followed in the towns; but conducted in a very inferior manner, as well because of the indolence as of the ignorance of the natives. The Jews are the most industrious, and monopolise the greater part of the external trade, with the higher branches of art, being the chief jewellers, watchmakers, tailors, &c. The Arabs are merchants, tanners, and carpenters; the Nu-

groes masons, bricklayers, and other artificers; the Kabyles extract iron, lead, and copper from their mountains, and manufacture gunpowder, said to be superior to that made at Algiers. The chief manufactures are coarse linen, woollen, and silk stuffs, the first two forming the greater part of the dress of the population, leather saddles, bridles, carpets, fire-arms, steel and other metal articles, pottery, gunpowder, but very inferior to that of Europe. Women only are employed in the linen and coarse woollen manufactures, as well as in the slavish occupation of grinding corn. European goods are much in request, and are bartered in the S. for gold dust, ostrich feathers, &c.

Trade. — Previously to the occupation of Algiers by the French, the established rates of duty were 5 and 10 per cent. on imported articles, according to the stipulations in the treaties with the countries of which they were the produce. But these general rules were entirely disregarded in practice; and, in point of fact, little or no trade could be carried on, except by those who obtained licences to that effect from government, which were either sold to the highest bidder, or to those who had most interest with the Divan.

Such is the inexhaustible fertility of the soil, that notwithstanding the low state of agriculture, corn and animal products have always formed a principal part of the exports; and Marseilles and other towns in the S. of France, with Genoa, &c. in Italy, used to derive a considerable part of their supplies of corn and butcher's meat from Algiers. Exclusive of these, the principal articles of export were coral, hides, wool, wax, oil, leather, gums, ostrich feathers, dates, kermes, &c. But since the occupation of Algiers by the French, the exportation of corn has in the meantime almost entirely ceased; and besides the supplies obtained in the country large quantities have been imported for the use of the French troops.

The other principal articles of importation are cotton, woollen, silk, and linen stuffs, but particularly the first; wines and spirits; sugar and coffee; arms, hardware and cutlery, &c. Subjoined is an account of the value of the imports and exports since 1831:—

Years.	Imports.	Exports.
	Fr.	Fr.
1831	6,501,000	1,479,601
1832	6,856,980	850,658
1833	7,591,158	1,008,410
1834	8,461,236	2,376,662
1835	16,778,737	2,997,866
1836	22,102,758	5,435,822
1837	35,176,246	2,916,691

It is supposed that of the imports, in 1837, about one third part were on account of the army. No duties are charged on French commodities, nor on foreign commodities required for the subsistence of the inhabitants, or to be used in agriculture or building. On other articles the duties vary from a fifth to a fourth part of those in the French tariff: articles prohibited in France are charged with an *ad valorem* duty of 15 per cent. A tonnage duty of 2 fr. is charged on foreign ships.

The increase of shipping has been quite equal to the increase of trade; and the proportion of both in the hands of the French is rapidly increasing. A regular intercourse is kept up by means of steam packets between Marseilles and Algiers.

The barbarians by whom this fine country has been so long laid waste, while they neglected all the old Roman roads, constructed none themselves; so that the communication between different parts was very difficult, and produce could only be conveyed on the backs of mules and ca-

mels. The French have already directed their attention to the repair of the old and the opening of new roads; measures indispensable alike for their own security and the development of the resources of the country. (*Tableau de la Situation*, &c. pp. 329—357.)

The weights, measures, and money in use are,

Weights. — The Onquayh (4 grammes); Koli a thary = 16 onquayh; Cantar = 100 toli.

Measures of Capacity. — Liquid: Holiab, (16·66 litres) = about 17 pints. Dry: Fan (48 litres) = 51 5-7th pints. *Oy length.* Dyerd & Turkey (650 millimetres) = 2·099 feet Eng.; Dyerd & Kaly (490 millimetres) = 1·574 feet Eng.

Money is as follows. Gold, Sequin = 4s. 6d. Silver, Monvonnah = 7-10ths of 1d.; Real Houzoux = 24 monvonnah. Copper, Derhem Negar 1-25th of a morz.

French money is now, however, in frequent use, and Spanish dollars worth about 3s. 4d.

Revenues. — It is impossible precisely to ascertain the amount of revenue at the disposal of the dey of Algiers previously to the French conquest; but it would seem, according to the best attainable information, that it may be fairly estimated at about 3,000,000 fr., or 120,000*l.*, including therein 550,000 fr., or 22,000*l.* of tribute paid by Naples, Portugal, &c. for exemption from piracy; but it is probable that the taxes paid by the people amounted to at least three or four times as much. The taxes were of various kinds: the principal was the tithe (*aschr*) of all crops; and there were also poll taxes on the Jews, with taxes on professions, trades, &c.; and the government derived a considerable sum from the monopoly of wool, leather, salt, and wax. These taxes have been partly retained by the French; but the more oppressive, with the monopolies, have been abolished. A considerable revenue has been latterly derived from the sale of the public lands and other property belonging to the state, which are beginning to be extensively purchased and occupied by Europeans.

The revenue, which in 1832 amounted to only 1,400,416 fr., had increased in 1837 to 3,039,775 fr. But notwithstanding this increase, the occupation and defence of the Algerine territory entail on France a heavy annual expenditure; and occasioned, for a while, considerable doubts as to the policy of her continuing to hold the country. (*Tableau*, &c. p. 383, &c.)

The tribute of the Arabs was better collected by the Turks than might have been expected; but it was otherwise with the Kabyles. No sooner had the latter got intimation of the approach of Turkish troops to enforce payment than they hastily decamped, carrying with them their cattle and families to fastnesses in the mountains; so that the tribute was seldom paid, unless the dey's troops succeeded in capturing some stragglers from the main body, or some stray cattle, which were usually ransomed.

The Coral Fishery is prosecuted from the middle of April till the end of July. Ten years being generally allowed for the growth of the coral, different spots are annually chosen for the fishery. Foreigners are allowed to fish on paying a rent to government. In 1836 there were 245 boats engaged in the fishery, principally at Bona, the revenue accruing on which to the French was 242,222 fr. (10,084*l.*) The value of the coral exported in 1837 was 1,163,513 fr. (*Tableau*, &c. pp. 337, 353.)

The Government is at present administered by the commander-in-chief of the French forces in Algiers, who is governor-general, and responsible to the French cabinet; there is besides a civil intendant. Previously to 1830 the government was vested in a dey, or pacha, being the officer at the head of the Turkish soldiery in the regency. This officer, who exercised absolute power, was appointed for life, but was rarely permitted

to die in office. He was chosen out of, or rather rose from, the army; and in the words of Dr. Shaw, "any bold and aspiring soldier, though taken yesterday from the plough, might be considered as heir apparent to the throne; and with this farther advantage, that he lay under no necessity to wait till sickness or old age had removed the present ruler: it was enough if he could protect himself with the same scimitar which he had the hardihood to sheathe in the breast of his predecessor." (*Shaw*, p. 248.) The dey notified his accession by an embassy to the grand seignior; by whom it was uniformly confirmed. But he did this merely as an act of deference to the sultan as the chief of Islamism, and not as recognizing in him any real supremacy. The dey received no orders from the Porte; but acted, in all respects, as an independent prince. He presided in the Divan, Dowanee, or council of state, consisting of sixty old officers and other high functionaries, and which nominally formed the government; but though formally convened every Saturday, this body did little but agree to the measures previously decided upon by the dey and his favourites. Their ordinances began with "We superior and inferior members of the mighty and invincible militia of Algiers, and of the whole regency, have hereby resolved," &c. Each of the three provinces, exclusive of Algiers, into which the regency was divided, was governed by a *bey*, nominated by the dey, and responsible to him.

Except in the towns, where they were absolute masters, and in their immediate vicinity, the Turks had but a very limited authority over the rural population. The Arabs and Kabyles affected an almost entire independence, obeying only their sheikhs, and frequently committing hostilities on each other. This state of things has hitherto been but little changed under the French; and it is easy to see that the growth of a regular and efficient system of government can only be gradual, and must principally depend on the spread of agriculture, or on the more extensive occupation of the country by a settled population.

Military and Naval Force. — Under the Turks the dey maintained about 10,000 regular infantry and 6,000 cavalry; but in case of need he could bring into the field a considerable body of irregular troops, bound to serve, like the European forces of the middle ages, for a certain number of days at their own cost. The cavalry was recruited chiefly among the Arabs and Berbers. The naval force, so long an object of terror to the Christian powers, was never very formidable. In 1816, when it was nearly annihilated by Lord Exmouth, it consisted of 4 frigates of from 40 to 60 guns; 1 of 38 guns, 4 corvettes, 12 brigs and goelettes, and 30 gun-boats. In 1824 their corsairs had again begun to infest the seas; and in 1830, on the capture of Algiers, the French found a large frigate in dock, and two others in the port, 2 corvettes, 8 or 10 brigs, several xebecs, and 32 gun-boats. (*Rozel*, iii. pp. 362—380.) The French troops in Algiers in 1837 amounted to 35,474, exclusive of nearly 6,000 native troops. This, however, was a much larger force than had been embodied in any previous year; though, considering the extent of the country and the predatory warlike habits of the natives, it does not appear likely that it can be advantageously reduced.

Justice has been continued by the French, except in political cases, much on the same footing as under the Turkish dominion; being administered by the rabbins amongst the Jews,

and by *qadis* and other officers, according to the Mussulman law, among the Turks, Moors, Arabs, &c. In Algiers, questions among Europeans are decided by a civil court, and a correctional and criminal court. The civil court finally decides upon all cases in which the sum in dispute is under 12,000 fr.; when the sum exceeds this limit, an appeal may be made to the royal court of Aix in France. At Oran and Bona there are French judges, who decide cases under appeal to the courts of Algiers. In their procedure no departure from the French code is permitted.

Religion. — That of the French, and consequently now of the state, is Roman Catholic; but the great bulk of the people profess Mohammedanism. The Negroes, however, are mostly addicted to fetishism; and the creed of the Berbers is scarcely known, as they suffer no strangers to witness their rites: they pay great reverence to their marabouts or *mourabays*, persons who practise a rigid and austere life, and who sometimes affect to perform miracles. They regard them as inspired, and honour their tombs. This custom has crept in amongst the Jews, who venerate the sepulchres of their rabbins, and convert them into synagogues. Since the French occupation a good many mosques have been converted into Christian churches.

Morals are at an extremely low ebb; the inhabitants, particularly the Moors, being in general grossly sensual, debauched, and corrupt. Public women are numerous, and syphilitic diseases common, and endemic. Drunkenness is not very frequent amongst the natives; but the French have lost 3,000 men annually from excess.

Public Instruction. — The Moors and other inhabitants of the towns can for the most part read the Koran and write, which, however, comprise the whole of their instruction; few understand arithmetic, or go beyond the first two rules; and this limited instruction, it will be observed, is enjoyed by the male sex only, women being brought up in the most complete state of ignorance. The Moors often transact business by placing their fingers on different parts of each other's hands, without speaking; each finger and joint denoting a different number. Few books except the Koran, and some encomiastic commentaries upon it, are ever seen or sought after. The education of children in the Koran goes on for three or four years, when their tuition ceases. The French have established schools of mutual instruction in all the principal towns, which are chiefly superintended by Jews, and tolerably well attended. In 1837, there were 1202 pupils at the French schools in Algiers, Oran, Bona, &c.; out of these no fewer than 895 were Europeans, who were mostly instructed in Arabic. The native schools in Algiers were attended by 695 pupils, of whom more than a half were Moors, and the rest Jews. Hitherto very little progress seems to have been made in diffusing a knowledge of French among the Arabic population. (*Tableau de la Situation*, &c. p. 254.)

Arts and Sciences. — The Arabs of Algiers, though descended from the people who gave algebra to Europe, and preserved medicine during the dark ages, have no notion either of arithmetic, or of the correct measurement of time or distance. Their medicine, too, is in the rudest state, and few diseases occur that do not, under their treatment, become either chronic or mortal. Their remedies consist chiefly of superstitious practices, as pilgrimages, &c.; or inert decoctions, as that of mallows. They are accustomed, in cases of rheumatism and pleurisy, to

puncture with a red-hot iron; to dress wounds with hot butter, and sometimes with pepper, salt, and brandy; and on the field of battle to thrust wool into them. When amputation is resorted to, it is performed by the stroke of an ataghan, and followed by the application of hot pitch. Hence, notwithstanding their aversion to change, we need not wonder that latterly the French army surgeons have been in great request by the natives. Hospitals have been established in the principal towns, and vaccination has been introduced. (*Shaw*, p. 196—199.; *Campbell*, Let. 20.)

Buildings, Furniture, &c.—The Berbers or Kabyles live in cabins (*gurbies*) made of the branches of trees plastered with mud and straw, with a low door and narrow glazed holes serving for windows; these huts are collected together in small groups or *daskiras*. The Moors, Jews, Negroes, and most others, except the Arabs, live in houses built on a uniform model, which from the earliest times has not varied. An open court-yard forms the centre, around which are various apartments, opening upon galleries supported by light pilasters: the roofs are flat, surrounded by a battlement breast high, and built with a composition of sand, wood ashes, and lime, mixed with oil and water, called *terrac*; whence our word. The rooms are floored and cisterns are made of this composition. Water-courses are composed of tow and lime only, mixed with oil; this mixture, as well as the former, soon acquiring the hardness and imperviousness of stone. In most habitations there is in each apartment a raised platform for sleeping on, the bed being composed of junk, matting, sheep-skins, or more costly material, according to circumstances. The other furniture consists, among the nomadic tribes, of two large stones for grinding corn, wrought by women; a few articles of pottery and bronze, and a rude frame for weaving. The better classes have cushions and carpets to their rooms, the lower part of their walls being adorned with coloured hangings, and the upper part painted and decorated with fret work. The tents of the Arabs (the *magalia* of the ancients) are sometimes called *khymas*, from the shelter they afford; and sometimes *bet-el-shaur*, or houses of hair, from the webs of goats' hair of which they are made. They are constructed at this moment precisely in the way described by Livy (lib. xxix. § 31.), Sallust (*Jell. Jug.* § 21.), Virgil, &c. They are of an oblong shape, not unlike the bottom of a ship turned upwards, and are easily set up and taken down. (*Shaw*, pp. 206—222.)

Dress, Food, &c.—The dress of the Berbers is very rude and coarse; that of the other classes varies greatly; but it is common with both sexes to wear abroad a *kaik*, or toga, and a *bermous*, which covers the head and shoulders: the faces of the women are very much concealed. Vegetables form the chief diet of all classes, not a fourth part of the animal food being consumed by them that is consumed by an equal population in Europe. Bread, couscous (a kind of Irish stew), legumes, potatoes, tomatas, and other vegetables, dressed with spices, oil, butter, or aromatic herbs; Indian figs, raisins, melons, and other fruits; with water, sherbet, and coffee,—form the main articles of consumption. (See ARABIA and BARBARY.)

Amusements.—Drinking coffee and smoking tobacco constitute never-failing amusements. Almost all the male inhabitants of the towns have a pipe attached to the button of their vest; and the more indolent and opulent will sit for days in cafés, unmiudful of their families, smoking

incessantly, or playing at chess. In the country, fowling, hawking, and hunting the wild boar and lion are actively pursued. Theatres are now opened in the principal towns.

The Language is mostly Arabic, but mixed with Moorish and Phœnician words. The Kabyles have a peculiar language, so very poor that it is without conjunctions or abstract terms, and is indebted to the Arabic for these, and for all terms of religion, science, &c. In conversing with Europeans a *lingua Franca* is made use of; a mixture of Spanish, Italian, French, Portuguese, &c. (See BARBARY.)

History.—This country formed part of the Roman empire; but during the reign of Valentinian III. Count Boniface, the governor of Africa, having revolted, called in the Vandals to his assistance. The latter having taken possession of the country, held it till they were expelled by Belisarius, A. D. 531, who restored Africa to the E. Empire. It was overrun and conquered by the Saracens in the 7th century; and was soon after divided into as many kingdoms as there are now provinces. Ferdinand of Spain having driven the Saracens from Europe, followed them into Africa, and in 1504 and 1509 took possession of Oran, Bugia, Algiers, and other places. The natives, wishing to throw off the Spanish yoke, had recourse to the famous corsairs, the brothers Aroulj and Khayr-ed-Dyn, better known by the names of Barbarossa I. and II., who had distinguished themselves by the boldness and success of their enterprises against the Christians. The brothers speedily succeeded in expelling the Spaniards from all their possessions in Africa, with the exception of Oran, which they held to the end of the 18th century. Algiers became the centre of the new power founded by the Barbarossas; the survivor of whom obtained, in 1520, from Sultan Selim, the title of Dey, and a reinforcement of 2,000 troops. Since then it has been governed nearly in the manner described above; and has, with few interruptions, carried on almost incessant hostilities against the powers of Christendom, capturing their ships and reducing their subjects to slavery. Attempts have been made at different periods to abate this nuisance. In 1541, the emperor Charles V., who had successfully achieved a similar enterprise at Tunis, arrived with a powerful fleet and army in the vicinity of Algiers; but the fleet having been immediately overtaken and nearly destroyed by a dreadful storm, the troops, without provisions or shelter, underwent the greatest privations; and the emperor was compelled forthwith to reembark such of them as had escaped the fury of the elements and the sword of the Turks. (*Robertson's Charles V.*, cap. 6.) This great disaster seems for a lengthened period to have discouraged all attempts at capturing Algiers. France, however, as well as England and other powers, repeatedly chastised the insolence of its banditti by bombarding the town; but in general the European powers preferred negotiating treaties with the dey, and purchasing an exemption from the attacks of the Algerine cruisers, to making any vigorous or well-combined effort for their effectual suppression. In 1815, the Americans captured an Algerine frigate; and the dey consented to renounce all claim to tribute from them, and to pay them 60,000 dollars as an indemnification for their losses. But the most effectual chastisement they ever received was inflicted so late as 1816 by the British under Lord Exmouth; when Algiers was bombarded, the fleet in the harbour destroyed, and the dey compelled to conclude a treaty, by which he set the Christian slaves at

liberty, and engaged to cease in future reducing Christian captives to that ignominious condition. But it is exceedingly doubtful whether these stipulations would have been better observed than others of the same kind previously entered into by his predecessors.

The last of the Algerine deys got entangled in altercations with the French government. Provoked by the discussions that had taken place, and the claims that had been put forward, he had the temerity to strike the French consul on the latter paying him a visit of ceremony. Redress was, of course, demanded for this gross insult; but instead of complying with any such demand, the dey took and demolished the French post at La Calle. This was equivalent to a declaration of war; and France determined on being avenged. In this view, she fitted out a powerful armament, including a land force of nearly 38,000 men, with a formidable train of artillery, under the command of General Bonremont. The armament arrived on the Algerine coast on the 13th of June, 1830; and having effected a disembarkation on the following day, Algiers capitulated, after a feeble resistance, on the 5th of July. The dey was allowed to retire with his personal property unmolested to Italy, and his troops to wherever they chose.

The French found in the treasury of the dey gold and silver, coined and uncoined, of the value of 47,639,011 fr., exclusive of stores of various kinds valued at 7,080,926 fr.

The towns of Oran and Bona soon after submitted, and the bey of Titteri was also reduced to obedience. But the bey of Oran, or Tiemsén, carried on for a lengthened period a series of contests and negotiations with the French, which were terminated in 1837 by the treaty of Tafna; by which he agreed to abandon the maritime parts of the province, and to recognize the supremacy of the French in Africa. The bey of Constantine was less easily dealt with. Trusting to the strength of his principal city, its distance from Bona, the nearest port, and the badness of the roads, he braved the hostility of the French. In November, 1836, a force of 8,000 men, under Marshal Clausel, advanced against Constantine. But the expedition, having been too long delayed, encountered the greatest difficulties on its march, from the severity of the weather, and the impracticable nature of the country; so that when it arrived before Constantine, it was unable to undertake the siege of the place, and with difficulty effected a retreat. To wipe off this disgrace a powerful army left Bona in the following autumn for the attack of Constantine, before which it arrived on the 6th of October. The Arabs made a vigorous resistance; but breaches having been effected in the walls, the city was carried by storm on the 13th. The French commander-in-chief, General Damremont, was killed during the siege.

The occupation of Algiers by the French has excited some jealousy in this country, but without any reason. Such a conquest must undoubtedly weaken, instead of increasing, the power of France. But though in this respect it were otherwise, the benefits which it cannot fail in the end to confer on humanity are so great and obvious as to outweigh all other considerations. The French, ignorant of some of the peculiarities of Mohammedan law, and especially of the practice of bequeathing property in trust for individuals to the church, appear to have committed some injustice. But abuses of this sort will speedily disappear; and it is impossible to overrate the advantages that must result from the

introduction of European laws, arts, and sciences into this part of Africa. Its wealth, population, and influence in antiquity show what it may become. But it was idle to expect that it should ever make any improvement so long as it was dominated over by a brutal soldiery, or till it was placed under an enlightened government capable of enforcing order, and of making its regulations and itself be respected. It were, in fact, much to be wished that all N. Africa were taken possession of and occupied by the European powers. It would be impossible for them to extend their empire in this quarter without putting down intolerance, barbarism, and ignorance, and establishing in their stead liberality, civilization, and science. (The best authorities in relation to Algiers, are the excellent work published by the Minister of War, in Paris, entitled, *Tableau de la Situation des Etablissements Français dans l'Algérie*, Paris, 1838; and Dr. Shaw's learned and invaluable Travels.)

ALGIERS (Al Jezair, or the Islands), a maritime city of N. Africa, cap. of the above country now in possession of the French, on the Mediterranean coast, on the W. side of a bay about 11 m. in width, and 6 deep, lat. $36^{\circ} 48' 30''$ N., long. $3^{\circ} 1' 20''$ E. It is built amphitheatrically, on the face of a pretty steep hill, having for its highest point the *Kasba* or citadel, 700 feet above the level of the sea. It is nearly 2 miles in circ. being surrounded by thick and high walls, flanked with towers and bastions. The fortifications towards the sea are comparatively strong; but those on the land side are incapable of any very vigorous defence, and are, in fact, commanded by the adjoining heights. Algiers had, previously to the French invasion, 5 gates, 2 on the sea, and 3 on the land side; about 160 streets, 5 squares, 2 palaces, 4 large and 30 small mosques (some of which are now converted into Christian churches), 2 large and 12 small synagogues, many buildings for the military, and about 10,000 private houses. The pop. was formerly estimated at from 110,000 to 180,000; but there can no longer be any doubt that the lowest of these numbers was very far beyond the mark. It appears from a census taken on the 12th of February, 1838, that the pop. amounted at that epoch to 25,962 individuals, exclusive of about 3,000 Kabyles and others not classified. It is true that a considerable emigration of Turks and others took place after the occupation of the city by the French; but estimating the number of emigrants as high as 10,000, which is probably beyond the truth, still the population would not exceed 40,000. Of the classified population in 1838, about 7,500 were Christians, 6,000 Jews, and 12,300 Mohammedans. The city has a very imposing appearance from the sea, looking like a succession of terraces, the houses, which are all whitened, giving it a brilliant aspect; but, on entering, the illusion vanishes: the streets are filthy, dark, crooked, and so narrow that, until lately, the widest was but 12 feet across. The French have, however, taken down many buildings to enlarge the streets, amongst others the principal mosque, in the view of making the *Place du Gouvernement*, in the centre of the city, a large and handsome square in the European style. The houses have flat roofs, that command a fine view of the sea; they vary from two to three stories in height, and have a quadrangle in their centre, into which the windows uniformly open. The streets have, in consequence, a gloomy appearance; and they are farther darkened by the successive stories of the houses projecting over each other, and by

their being frequently propped up by timbers across from one to another. The "islands" whence Algiers derives its name, are two rocky ledges opposite its N. E. quarter, which have been united, strongly fortified, and connected with the main land by a mole; another mole, stretching S. W. from these islands, and furnished with two tiers of cannon, incloses the harbour, which is rather small, and incapable of accommodating any vessel larger than a middle-sized frigate. A light-house is erected on one of the islands at the junction of the two moles. The *Kasba* or citadel is surrounded by strong walls, and its fortifications have been repaired and strengthened by the French. It is, in fact, a little town in itself. It was here that the French found the treasure belonging to the dey referred to in the previous article. The mosques are octagon buildings, with a dome and minarets, often elegant, and adorned with marble colonnades. There are numerous public and private fountains, and baths of all kinds; for though formerly destitute of water, Algiers is now well supplied with that important element, which is brought to the town by aqueducts constructed in the last century, and which, previously to the French occupation, were kept in repair by funds set apart for that purpose. Many shops have been opened by Europeans; they consist of recesses in the sides of the houses, about 7 ft. by 4; but business is mostly transacted in the bazars, which, with barbers' shops and cafés, are the chief places of resort for the natives. Algiers is now the residence of the governor-general of the French possessions in Africa, and of the principal government functionaries and courts of justice. It was created the seat of a bishopric in 1838; is strongly garrisoned; and has a regular intercourse by steam packets with Marseilles. The manufactures are chiefly those of silk stuffs, girdles, purses, clocks, jewellery, woollen cloths, *kaiks*, *bermouss*, sandals, harness, carpets, junk, bronze utensils, &c. The markets are well provided with meat, vegetables, and fruit; provisions generally cheap, excepting bread, which is dear: there were no ovens, and only handmills for grinding corn, before the occupation by the French. European manners, habits, and dresses are common; as many hats are seen as turbans; cigars replace pipes, shops bazars; grand hotels, cafés, billiard tables, eating houses, *cabinets littéraires* have been set up, and a circus, cosmorama, and opera established. The streets have all received French names. In 1837 there were at Algiers 223 fine days, 63 on which it rained, and 69 during which the sky was covered with clouds. There arrived at Algiers in 1837, 905 vessels of the burden of 74,762 tons. Of these 29 vessels, tonnage 6,363, were from England; and 25 vessels, tonnage 4,581, from British possessions in the Mediterranean. The environs of Algiers are very beautiful, and for some miles round interspersed with great numbers of elegant villas. There are 2 small suburbs, those of Bah-el-Oued and Bab-a-Zoun; the former to the N., the latter to the S. of the city. About a mile S. of the *Kasba* is the *Sultan Kalesse*, or fort of the emperor, an irregular polygon without fosse or counterscarp, about $\frac{1}{2}$ m. in circumference. It stands on the spot where Charles V. encamped, A. D. 1541, and completely commands the town; but is itself commanded by Mount Boujereah. The ancient city of Rustonium, the capital of Juba, was situated not far from Algiers, to the W. of Torretta Cica; some ruins of this city still exist. Algiers was founded A. D. 935. For some notice of its history, see the previous article. (See *Tableau de*

la Situation, &c.; Rozet, iii. pp. 14—88.; *Show's Travels*, pp. 33—35.)

ALGOA BAY. See PORT ELIZABETH.

ALHAMBRA. See GRANADA.

ALHANDRA, a town of Portugal, prov. Estremadura, on the Tagus, 18 m. N. N. E. Lisbon. Pop. 1,500. ALICANT, (an. *Lucuntum*), a sea-port town of Spain in Valencia, cap. prov. same name, on the Mediterranean, lat. $39^{\circ} 20' 41''$ N., long. $0^{\circ} 30' 30''$ W. Pop. about 14,000, having declined from 21,500 in 1810. It is situated between mountains at the bottom of a spacious bay, having Cape la Huerta at its N. E. extremity, and Isla Plana on the S. Large vessels anchor from $\frac{1}{2}$ to 1 m. from shore, and small craft lie alongside the pier, which, though incomplete, is about 320 yards in length. Alicante is defended by a castle on a rock about 400 feet high. Streets narrow and crooked; but when visited by Mr. Townsend they were well paved and clean. None of its churches, convents, or other public buildings deserves notice. It has a school of navigation, and has, or at all events had, an institution for providing for orphans, deserted children, and the sons of soldiers. We are not aware whether the "House of Mercy," founded in 1786, and intended to assist in the suppression of mendicancy, still exists. (Townsend, iii. p. 184.) The trade of Alicante, though still considerable, has fallen much off, partly in consequence of the emancipation of America, but more through the influence of oppressive duties and the disturbed state of the country. Its exports consist principally of wine, almonds (10,000 cwt.), barilla (50,000 to 60,000 cwt.), olives and olive oil, brandy, figs, salt, esparto-rush, wool, silk, linen, &c. The imports consist principally of linens, salted-fish, corn, cotton and cotton stuffs, colonial produce, timber, &c. (Resides Townsend, see *Inglish's Spain*, ii. 204.; *Communications from British Consul*, &c.)

ALICATA, or LICATA, a sea-port town on the S. coast of Sicily, Val di Gerigenti, at the mouth of the Salso, lat. $37^{\circ} 4' 25''$ N., long. $13^{\circ} 55' 40''$ E. Pop. 13,465. It is built partly on the beach and partly on the slope of some hills. Its walls have gone to decay, and neither of its two castles is of any considerable strength. It is a poor-looking place, but exports considerable quantities of corn, with sulphur and soda, pistachio nuts, almonds, macaroni, &c. The port is shallow, so that large vessels must load in the offing, or road, about a mile S. W. of the town, where they are exposed to the southerly winds. (Seymour's *Two Sicilies*, li. p. 297, 4th ed.; *Smyth's Sicily*, p. 159.) ALICATA, the most W. of the Lipari islands, 56 m. E. N. E. Palermo. Pop. 260. It is about 6 m. in circ., rises abruptly from the sea, with irregular ravines and precipitous hills. It is cultivated, wherever there is any soil, with singular and laborious industry, and produces most excellent wheat, barilla, flax, capers, &c. The people are said to be exceedingly healthy; it has only two unsafe landing-places, and is rarely visited by strangers. (Smyth's *Sicily*, p. 277.)

ALIGHUR, a strong fort of Hindostan, in the district of the same name, between the Ganj and the Junna, 32 m. N. Agra, lat. $27^{\circ} 56'$ N., long. $77^{\circ} 59'$ E. It was taken by storm in 1803; and was soon after made the head-quarters of a civil establishment for the collection of the revenue, and the administration of justice. The N. portion of the district of Alighur is a desolate tract, overgrown with low jungle; but the S. portion is fertile and highly cultivated. The natives, though turbulent, are superior to the Bengalese, and other tribes more to the East.

ALKMAAR, a town of N. Holland, cap. arrond. and cant., on the great ship canal from Amsterdam to the Helder, 20 m. N. N. W. the former, lat. $52^{\circ} 38'$ N., long. $4^{\circ} 44' 45''$ E. Pop. 9,500. It is strongly fortified and well built; there are many fine canals, shaded with trees, and the whole town has a strikingly clean and comfortable appearance. The *Hôtel de Ville* and the arsenal are the only public buildings that deserve notice. It is the seat of a court of primary jurisdiction, and has a college, physical society, theatre, concert hall, &c. Vast quantities of excellent butter and cheese are produced in the surrounding meadows. Exclusive of butter, about 40,000 tons of cheese are said to be annually disposed of in its markets. It also manufactures canvass, and has a considerable trade in cattle, corn, tulips, &c. Its commerce has been materially facilitated by the construction of the great canal. Without the town is a fine promenade, similar to those at the Hague and at Haarlem. In 1873, Alkmaar was invested by the Spaniards; but having been repulsed with great loss, in an attempt to take the town by storm, they abandoned the siege. In 1799, the Anglo-Russian army, under the Duke of York, advanced from the Helder as far as Alkmaar. (Dict. *Géographique*; *Murray's Hand-book*, &c.)

ALLAHABAD, an extensive and populous prov. or soubah of Hindostan proper, between the 24th and 36th deg. N. lat., and 79th and 83d E. long. It is bounded on the N. by Oude and Agra, S. by Gundwana, E. by Bahar

and Gwadwana, and W. by Malwah and Agra. It is about 270 m. in length by about 120 in breadth.

It is divided into the following *zillahs* or districts, viz.: 1. Allahabad; 2. Benares; 3. Mirzapoor; 4. Junpore; 5. The Rewah territory; 6. Bundelcund; 7. Cawnpore; 8. Manipure territory. It is watered by the Ganges, Jumna, and other great rivers. Adjacent to the former, the country is flat and very productive, but in the S. W. in the Bundelcund district, it forms an elevated tableland, diversified with high hills containing the celebrated diamond mines of Poonah. The flat country is extremely sultry, and subject to the hot winds, from which the more elevated region is exempted. In the hilly country, where the rivers are less numerous than in the plains, the periodical rains and well-water are chiefly relied on for agricultural purposes. On the whole, however, Allahabad is one of the richest provinces of Hindostan. The principal articles of export, are sugar, cotton, indigo, cotton cloths, opium, saltpetre, diamonds, &c.; and, in addition, it produces all kinds of grain and a vast variety of fruits.

The chief towns are Allahabad, Benares, Callinger, Chatterpore, Chunar, Ghazypore, Junpore, and Mirzapore. The whole of this extensive province is now subject to the British government; the Benares district having been ceded in 1775; Allahabad and the adjacent territory in 1801; and the districts of Bundelcund in 1803. Seven-eighths of the inhabitants are supposed to be Hindoos, the remainder Mohammedans.

ALLAHABAD, an ancient city of Hindostan, cap. of the above prov. and district, near the confluence of the Ganges and Jumna, being by the course of the river 80 m. from the sea, but the distance in a direct line from Calcutta is only 475 m.; from Benares, 75 m.; and from Agra, 280 m., lat. $25^{\circ} 27' N.$, long. $81^{\circ} 50' E.$ At a short distance from the city, at the junction of the rivers, is situated the fortress, founded by the emperor Acbar, in 1583; but much improved since it came into the possession of the British. It is lofty and extensive, completely commanding the navigation of both rivers. On the sea side it is defended by the old walls; but on the land side it is regularly and strongly fortified. It could not be taken by a European army, except by a regular siege; and to a native army it would be all but impregnable; and hence it has been selected as the grand military depot of the upper provinces.

Being situated at the point of union of two great navigable rivers, Allahabad would seem to be in one of the finest positions in India for being the seat of an extensive commerce. And if we suppose with D'Anville and Dr. Robertson, that it occupies the site of the ancient Palibothra, it certainly ranked among the first commercial cities of antiquity.* But in modern times it does not appear to have ever attained to the magnitude or importance that might have been anticipated. Formerly, however, it was both more populous and flourishing than at present. A considerable cotton manufacture is said to have been driven from the town, by the exactions of the native officers of the Oude government. According to Hamilton, the pop. amounted, in 1803, to about 20,000, exclusive of the military; and there is no room for thinking that it has been materially increased in the interval. The houses are of mud, raised on the foundations of more substantial brick edifices that have fallen into decay. Heber says, it has a desolate, ruinous appearance, and that it has obtained among the natives, the name of *Fakeerahabad*, (beggar abode!) It is the permanent station of a high court of justice. — *Suder Mofussil*, commissariat; and has a school formed, in 1825, for the education of the natives. Allahabad has been in possession of the British since 1765.

Besides the Ganges and Jumna, the Hindoos believe that another river, the Serawati, joins the other two from below ground. In consequence of this extraordinary junction, Allahabad is reckoned peculiarly holy, and is annually visited by many thousands of pilgrims, who come from all parts of Hindostan to bathe and purify themselves in the sacred stream: in some years their numbers have amounted to nearly 200,000, each of them paying a small tax to government: — "When," says Mr. Hamilton, "a pilgrim arrives, he sits down on the bank of the river, and has his head and body shaved, so that each hair may fall into the water, the sacred writings promising him one million of years' residence in heaven for every hair so deposited. After shaving, he bathes; and the same day, or the next, performs the obsequies of his deceased ancestors. The tax accruing to government for permission to bathe, is 3 rupees each person; but a much greater expense is incurred in charity and gifts to the Brahmens, who are seen sitting by the river-side. Many persons renounce life at this holy confluence, by going in a boat, after performance of certain solemnities, to the exact spot where the three rivers

unite, where the devotee plunges into the stream, with three pots of water tied to his body. Occasionally, also, some lose their lives by the eagerness of these devotees to rush in and bathe at the most sanctified spot, at a precise period of the moon, when the immersion possesses the highest efficacy. The Bengalese usually perform the pilgrimages of Gaya, Benares, and Allahabad in one journey, and thereby acquire great merit in the estimation of their countrymen." (*Hamilton's Gazetteer*; *Heber*, l. pp. 441–445.)

ALLAHABAD (DISTRICT OF), consists of the territory immediately adjacent to the city of Allahabad. In 1815, it contained 1,655,106 *begahs* of cultivated land, assessed at 279,324, a year of *jumma*, or land revenue. At the same time it contained 256,012 *begahs* of land, fit for cultivation, and 1,109,777 waste. It is watered by the great rivers Ganges and Jumna, and, when well cultivated, is remarkably fertile. Wheat is the principal crop; but the culture of cotton and indigo has greatly increased—and that of opium has also been introduced. A considerable quantity of cotton cloths, and chintzes, were formerly produced; but this branch of industry is now nearly annihilated in consequence of the native manufactures being undersold by the British. This district suffered considerably from the *jumma*, or land revenue, having been fixed at too high a rate, when the perpetual assessment was introduced. It has been the theatre of a considerable number of gang robberies; but these have been either wholly suppressed, or greatly diminished in consequence of the introduction of a more efficient police. (*Parl. Papers*, No. 753. li. Sess. 1832, p. 69, &c.; *Hamilton's Gazetteer*.)

ALLAN (BRIDGE OF), a neat village of Scotland, on the Allan, 3 m. N. W. Stirling. It is a good deal resorted to in summer by visitors, on account of a mineral spring in the vicinity.

ALLAUCH, a town of France, dep. *Bouches du Rhone*, 5 m. E. N. E. Marseilles. Pop. 3,869. It is built on the declivity of a hill, and is very ancient.

ALLEGHANY, or APPALACHIAN MOUNTAINS, a chain of mountains, in the U. States of N. America, running in a N. E. and S. W. direction from the N. parts of Alabama and Georgia, to the state of Maine, a distance of about 1,200 m. It consists of a number of ridges, having a mean breadth of about 100 m. and a mean elevation of from 2,500 to 3,000 feet. Their highest summits are in N. Hampshire, where they attain to an elevation of between 6,000 and 7,000 feet. They are almost every where clothed with forests and interspersed with delightful vallies. Their steepest side is towards the E., where granite, gneiss, and other primitive rocks are to be seen. On the W. they slope down by a gentle declivity continued to the Mississippi. Iron and lead are both met with, the former in great abundance, in various parts of the range; and the considerable quantities of gold that have been found in the streams in the upper parts of N. Carolina and Georgia, show that it also is among the products of the Alleghanies. But coal seems to be by far the most important of their mineral riches. Vast, and all but inexhaustible beds of bituminous and of anthracite stone coal, are found in different parts of the chain, and are already very extensively wrought. The quantities of anthracite brought to Philadelphia, partly for the supply of the city, and partly for shipment to other places, have wonderfully increased during the last dozen years. Salt springs are abundant all along the W. slope of the Alleghanies, and from some of them large supplies of salt are procured. This mountain system is crossed by the Hudson river, and is the only instance known, except that of the St. Lawrence, of the ocean tides passing through a primitive mountain chain, and carrying depth for the largest vessels. It is also crossed by several canals and railways. (*Darby's View of the United States*, passim; *Mason's Geology*, &c.)

ALLEN (BOG OF), the name usually given to the extensive tracts of morass situated in Kildare, and King's and Queen's counties, and the adjoining counties of Ireland. These do not however form, as is commonly supposed, one great morass, but a number of contiguous morasses separated by ridges of dry ground. Though flat the bog has a mean elevation of about 250 feet above the level of the sea, and gives birth to some of the principal Irish rivers, as the Barrow, flowing S., and the Boyne E.

ALLEN (LOUGH), a lake, co. Leitrim, Ireland, about 10 m. in length, and from 4 to 5 in width. This lake is generally supposed to be the source of the Shannon, and it has perhaps the best title to that distinction. It is elevated 144 feet above the level of high water-mark at Limerick; and the Shannon has been rendered navigable as far as the Lough.

ALLENDORF, a town of Hesse Cassel, on the Werra, 23 m. E. S. E. Cassel. Pop. 3,500. There is in the vicinity a considerable salt-work.

* Major Rennell denies this, and contends that Patna occupies the site of Palibothra. (*Narrative of a Map of Hindostan*, 5d ed. p. 49.) The site mentioned by Dr. Robertson, founded on the statements of

Strabo and Arrian, seem to prove conclusively the identity of Palibothra and Allahabad. (*Disquisition on Ancient India*, note xli.)

† A *begah* varies in size, but is generally about one-third of an acre.

ALLENSTEIN, a town in East Prussia, cap. circ., on the Alle, 27 m. S. S. W. Hellsberg. Pop. 3,000. It has a gymnasium, and fabrics of cloth and earthenware.

ALLESTAIR, a town in the peninsula of Malacca, which contained, in 1823, 2,000 houses.

ALLÈVÈRE, a town of France, dep. Isère, cap. cant., 21 m. N. E. Grenoble. Pop. 2,599. There are valuable iron and copper mines in its vicinity, and foundries where iron of an excellent description is prepared for conversion into steel, and also for being cast into cannon. In the neighbourhood are the ruins of the castle of Bayard, the birth-place of the famous knight of that name — the *chevalier sans peur et sans reproche*.

ALLIER, a dep. almost in the centre of France, so called from the river Allier, one of the principal affluents of the Loire, which traverses it from S. to N., between 45° 58', mid 46° 47' N. lat., and 2° 16' and 3° 57' E. long. Area, 723,981 hect., whereof about 468,000 are cultivated land, 70,000 meadows, 18,000 vineyards, 64,000 woods, 28,700 heaths, moors, &c. Pop. 309,270. Exclusive of the Allier, it is bounded E. by the Loire, and is traversed by the Cher, and other lesser rivers, &c. The ponds and smaller lakes are so numerous, that they are said to have an injurious influence over the climate. Surface undulating, and in parts hilly; soil generally fertile, producing a surplus of corn and wine, for exportation, with great numbers of cattle, sheep, and excellent horses. A good deal of the timber in the forests is oak, suitable for ship-building. Agriculture in this, as in many other departments of France, is in a very backward state. The peasantry are small proprietors, and wedded to the practices of their forefathers. *En vain leur indiquera-t-on de nouveaux procédés agricoles, ils cultiveront comme jadis, sans les prier.* *Une aveugle routine s'écrit de bornes à leur étroite intelligence.* There are valuable mines of coal, iron, and antimony; and quarries of marble and granite. Among the manufacturing establishments may be mentioned the glass-works of Sourignay and Commeny, which employ about 800 work-people; the iron works of Tronçais, which employ above 500 ditto, and furnish annually above 500,000 kilograms of iron; and there are also manufactures of cutlery, earthenware, cloth, and paper, with spinning-mills, and numerous breweries, rope-walks, &c. It is divided into 4 electoral arrond.; returns 4 m. to the Ch. of Deputies; and had, in 1838, 1,617 electors. Public revenue, in 1831, 6,444,045 fr. Chief towns, Moulins, Montluçon, Gannat, La Palisse, &c. (*Hugo, France Pittoresque, art. Allier, French Official Tables.*)

ALLOA, a sea-port and m. town of Scotland, co. Clackmannan, on the Forth, at the point where it ceases to be a river, and becomes a frith, 25 m. W. W. Edinburgh. Pop. of town, 4,417. of parish and town, 6,377. It is irregularly built; but has recently been much improved. A church, opened in 1819, has a spire 200 feet in height. The harbour is excellent; vessels of large burden lying close to the quays; there is also a dry dock and two yards for ship-building. The trade of the town is considerable, and it has nearly 8,000 tons of shipping. There are very extensive collieries, distilleries, and iron-works in the neighbourhood, the produce of which is principally shipped here; and in the town and its vicinity are extensive breweries, which produce ale rivaling that of Edinburgh, with an iron-foundry, two woollen manufactories, glass-works, tile and brick-works, &c. The justice of peace, and sheriff courts for the co. are held here. In a park adjoining the town, are the ruins of a seat of the Earl of Mar, part of which consists of a tower of the 13th century, 90 feet in height. (*Revised Atlas.*)

ALLOWAY KIRK: the church (Scottic Kirk) of a parish, on the coast of Ayrshire, long united with that of Ayr, near the mouth of the Doon, on the road from Ayr to Maybole, about 3 m. S. from the former. The Kirk has been for a lengthened period in ruins, but being recently brought forward in Burns's lamentable tale of Tam O'Shanter, and having in its immediate vicinity, the poet's birth-place, and the monument erected to his memory, it has become an object of great interest. Though roofless, the walls are in pretty good preservation; and the feelings with which they are now associated, will protect them from depredation. The church-yard, which is still used as a burying-ground, contains the graves of Burns's father and mother; and, such is the prestige with which it has been invested, that latterly it has become a favourite place of interment. Between Alloway Kirk and Ayr, but much nearer the former than the latter, is the cottage in which Burns was born (on the 25th of February, 1759), a one-story house, of humble appearance, with a thatched roof, and long used as an inn. About 1 m. on the other side of the Kirk, are the "Auld brig o' Doon," and the new bridge — the latter about 100 yards below the former, and built since the time of Burns; and on the summit of the acclivity of the E. bank of the river, about half way between the old and new bridges, is the monument of the poet. This elegant structure was

finished in 1823, at an expense of about 2,000*l*. It is built in imitation of the monument of Lycabettus at Athens, and consists of a triangular basement, on which rises a peristyle of 6 Corinthian columns, 30 feet in height, supporting a cupola, surmounted by a gilt tripod. It is above 60 feet in height; is built of fine white freestone, and has a chaste, classical appearance. Independently of the peculiar associations connected with the place, the scenery around is equal in richness and variety to any in Scotland. The celebrated statues of Tam O' Shanter and Souther Johnnie are appropriately placed in a grotto within the grounds attached to the monument. (*New Statistical Account of Scotland, art. Ayr; Chambers's Land of Burns, &c.*)

ALMAIDA, a town of Portugal, prov. Estremadura, on the Tagus, opposite to Lisbon. Pop. 4,060. There is an old castle on a rock, an hospital, a Latin school, with large magazines for wine.

ALMAIDEN, a town of Spain, prov. La Mancha, in the Sierra Morena, 57 miles W. S. W. Ciudad Real. Within a very few miles of this town is a famous mine of cinabar, whence mercury used to be obtained, to the extent of from 12,000 to 15,000 quintals a year, for the supply of the silver mines of Mexico. This mine is very ancient, and is believed, indeed, to have been wrought by the Romans. But the statements of Pliny (*Hist. Nat. Lib. 33*), apply distinctly to Nisapo in Bética, that is, to *Almadén de la Plata*, 27 m. N. N. W. Seville, where there is, also, a very productive mine. There are mines of the same port in other parts of Spain.

ALMAGRO, a town of Spain, prov. La Mancha, 12 m. E. S. E. Ciudad Real. Pop. 4,000. It has an important manufacture of blondes. The country round is celebrated for its mules and asses, of which there is annually a large fair.

ALMAZÁ, a town of Spain, prov. Murcia, 56 m. N. W. Alicante. Pop. 5,040. It is well built, has broad streets, linen factories, and a great annual fair, the neighbourhood of this town, on the 25th of April 1797, the French, under the Duke of Berwick, gained a complete victory over the allied forces in the interest of the archduke Charles. The latter lost 5,000 men killed on the field, and nearly 10,000 taken prisoners.

ALMAREZ, a town of Spain, prov. Estremadura, on the Tagus, 32 m. S. E. Plasencia. Pop. 1,000. Towards the middle of the 16th century, a fine bridge, in the Roman style, was carried over the river at this point. In 1810, an obstinate conflict took place near this town, between an Anglo-Spanish and French force.

ALMEIDA, a fortified town of Portugal, prov. Beira, 24 m. W. by N. Ciudad Rodrigo. Pop. 6,000. From its position on the frontier of the kingdom, it has always been deemed a military post of the greatest importance. In 1762, it was taken by the Spaniards, after a long siege. In 1810, it was taken by the French under Masséna: who abandoned it in the following year, after blowing up the fortifications.

ALMELO, a town of the Netherlands, prov. Overijssel, on the Vecht, 22 m. F. N. E. Deventer. Pop. 4,000. It has a college, a commission of agriculture and manufactures, and bleaches fine linen.

ALMERÍA, (an. *Mazra*), a sea-port town of Spain, Granada, near the mouth of the river, and at the bottom of the gulph of the same name, lat. 36° 51' 29" N., long. 2° 32' W. Pop. 19,000. It is the seat of a bishop, and has fabrics of soda and salt-petre, and of cordage and other articles made of the esparto-rush. The harbour is large, well sheltered, and is protected by a castle; the water is so deep, that large vessels anchor half a mile from shore, in from 9 to 14 fathoms, and smaller vessels anchor close in shore, in from 5 to 9 fathoms. The ancient sovereigns of Granada considered this as the most important town of their dominions, as well on account of the fertility of the surrounding country, as of its manufactures and commerce. But it is now almost fallen off.

ALMODÓVAR DEL CAMPO, a town of Spain, with a castle, prov. La Mancha, 18 m. S. S. W. Ciudad Real. Pop. 3,000.

ALMONBURY, a pa. and township of England, W. R. co. York, wap. of Agbrigg, divided by the Colne from the pa. of Huddersfield. The pa. is very extensive, containing 30,140 acres, with a pop. of 30,800. It contains several villages, of which Almonbury is the principal. Pop. of Almonbury township 7,068, mostly engaged in the manufacture of woollens and cottons, especially the former. (*See Huddersfield.*)

ALMORA, a town of Hindostan, cap. Kumaon, in the N. E. part of India, 90 m. N. by E. Bareilly; lat. 29° 25' N., long. 79° 40' E. It stands on a ridge 5,337 feet above the level of the sea, and is compactly built. The houses of stone, and slated, are generally two and some three stories high; the ground-floor being occupied as shops. The old Gorkha citadel stands on a commanding point of the ridge at the E. extremity of the town, and several martello towers have been erected on peaks to the eastward. This place was acquired by the British in 1816.

The surrounding country is remarkably bleak and naked. (*Hampton's E. I. Gazetteer.*)

ALMUNECAR, a sea-port town of Spain, Granada, lat. 36° 7' 50" N., long. 3° 51' W. Pop. 2,100. The surrounding country produces cotton and sugar. The anchorage is fit only for small vessels, and should not be used by them except in cases of emergency, as the E. winds common on this coast are dangerous.

ALMUNIA, a town of Spain, Arragon, 18 m. N. E. Calatayud. Pop. 3,000.

ALMURRAIDIEL, a town of Spain, in La Mancha, 8 leagues from Manzanares.

ALNMOUTH, a village of England, in Northumberland, at the mouth of the Alne, $\frac{1}{2}$ m. E. S. E. Alnwick. It exports considerable quantities of corn and other produce.

ALNWICK, a m. town of England, cap. co. Northumberland, on a declivity near the river Alne, 275 m. N. by W. London. Pop. 6,748. There is a spacious square where a weekly market is held, and a large town-house, where the co. courts meet, and the members for the co. are elected; the assizes, however, are not held here, but at Newcastle. Alnwick was formerly fortified, and vestiges of its walls and gates still remain. At the N. entrance to the town stands Alnwick Castle, once a principal stronghold of the kingdom on the side of Scotland, and now a magnificent baronial residence of the Dukes of Northumberland. It underwent, not many years ago, a complete repair and renovation, executed in good taste. At the entrance to the town, a column is erected in honour of one of the Dukes of Northumberland. A cross, called Malcolm's Cross, stands on the spot where Malcolm III. king of Scotland, is said to have been killed, in 1092, by a soldier, who is said to offer him the keys of the castle on the point of a spear. (See *Haile's Annals of Scotland*, anno 1093, and *Dr. Percy's note* on the same subject.)

ALOST (Flem. *Alost*), a town of Belgium, prov. East Flanders, on the Dender, about half way between Brussels and Ghent. Pop. 14,907. It is surrounded by walls, and is clean and well built; the parish church, the largest in the country, is not finished; it has a college, and several other educational establishments; a town-house, remarkable for its antiquity, with manufactures of linen, cotton, lace, hats, &c., print-works and dye-works, breweries and distilleries, tanneries, soap-works, iron and copper foundries, and potteries. Vessels of small size come up to town by the river; and it has a considerable commerce in the produce of its manufactures, and in hope of an excellent quality, grown in the neighbourhood, rape oil, &c. At Alost is the tomb of the celebrated Thierry Martens, the friend of Erasmus, who introduced the art of printing into Belgium. (*Vander Maelen, Dict. Geog. Flandre Orientale*, p. 3.)

ALPHEN, a town of the Netherlands, prov. S. Holland, cap. cant. on the Rhine, $\frac{1}{4}$ m. E. Leyden. Pop. 2,200. It has manufactures of earthenware and pipes.

ALPNACH, a village of Switzerland, cant. Unterwald, on the S. W. arm of the lake of Lucerne. Pop. 1,300. A very singular road, called the *Silide of Alpnach*, is constructed in the immediate vicinity of this town, for conveying trees from Mount Pilatus to the lake, from which they are forwarded to Holland, &c. (See *App. to Ingli's Switzerland*.)

ALPS (THE), constitute (Caucasus excepted) the most extensive and at the same time the highest mountain system of Europe. They extend from the banks of the Rhone in France on the W., to the rivers Verbas and Naranta on the E.; of which the former falls into the Save, a confluent of the Danube, and the latter into the Adriatic. Hence they occupy the whole space between the 5th and 18th degree E. long., forming a vast semicircular bulwark which encompasses, on the N., Italy and the Adriatic Sea. The extremities of this semicircle approach 43° N. lat., but the great body of the range occupies the space between the 46th and 48th degrees N. lat.

The Alps are closely united to two other mountain ranges; on the W. to the Apennines, which traverse Italy in its whole length; and on the E. to the Balkhan, which covers Turkey and Greece with its numerous ramifications. The boundary line between the Apennines and the Alps is difficult to determine. It seems to be most expedient to suppose that the Alps begin on the W. side of the great road over the Bochetta pass (2,550 ft. above the level of the

sea), which leads from Genoa to Novi in Piedmont. That portion of the range which begins at this road and extends E. to the sources of the Tinea, a tributary of the Var, is called the *Maritime Alps*, and does not contain any very high summits; but it is extremely steep, and is traversed only by one road practicable for carriages. This road connects the town of Nice with the town of Coni in Piedmont, and traverses three ridges by the cols or mountain passes of Brous, Brovis, and de Tande. The last col is in the main ridge of the range, and rises to 5,981 feet above the level of the sea.

Between the plain of the Po and the valley of the Rhone, the mountain mass lies in its greatest extent S. and N., reaching from the shore of the Mediterranean, or from nearly 43°, to the lake of Geneva, or to nearly 46° 50' N. lat. Its length is here, consequently, about 230 m., and its width averages about 100 m. The watershed between the rivers falling into the Po, and those emptying themselves into the Rhone, does not traverse the middle of the mountain region, but is found at about 30 miles from its E. border. On it rise some very high summits. The most remarkable are, Mount Viso, 13,853 feet above the sea, and on whose E. declivities the Po takes its origin; Mount Genevre attains 11,784, Mount Cenis 11,795, and Mount Iseran 13,286 ft. above the sea. Farther N. is the immense mass of rocks that constitute Mont Blanc, whose highest point, the *Bosse de Dromedaire*, is in lat. 45° 50' N., long. 6° 51' E., 15,748 ft. above the sea, is the highest elevation to which the Alps attain. The valleys, both to the E. and W., branch off at right angles from the watershed. Those to the east are short, straight, and deep, and terminate in the plain of the Po; those to the west are of much greater length, and rather winding. On this side, especially in the dep. *des Hautes Alpes*, between the upper branches of the rivers Isere and Durance, are placed a considerable number of very high summits; Mont Loueyra attains 14,451 ft., Mont Loupilla 14,144 ft., Mont Peloux de Val-louise 14,119 feet, and at least twelve others rise above 11,000 feet. The peculiar disposition of the valleys in this portion of the Alps has rendered the communication between France and Italy comparatively easy. The roads follow the valleys up to the watershed, and have then only to traverse one high ridge. Three great carriage roads lead over it. The farthest to the S. is the road of Mount Genevre, which ascends from the banks of the Rhone along the valley of the Durance to Briançon, and traverses the ridge N. of Mount Genevre, where it attains 6,197 ft. above the sea; whence it descends in the valley of the river Dora to Susa. The second is the road of Mount Cenis, which on the side of France may be said to begin at Grenoble. It ascends first the valley of the Isere, and afterwards of the Arc, a tributary of the former, and traverses the ridge N. of Mount Cenis, where it is 6,784 ft. above the sea. Hence it descends into the valley of the Dora to Susa. The latter is by far the most used of all the roads over the Alps; and it is stated that annually from 16,000 to 17,000 carriages of all kinds, and from 45,000 to 50,000 horses and mules, pass along it. The third carriage road is that of the Little S. Bernhard, which ascends the valley of the Isere, passes the ridge between Mount Iseran and Mont Blanc, and descends in the valley of the Dora Baltea to Aosta. It attains in its highest point to an elevation of 7,200 ft. above the sea; and it is most commonly supposed that it was by it that Hannibal penetrated into Italy. This portion

of the Alps comprehends what commonly are called the Cottian, Graian, and partly the Pennine Alps, together with those of Dauphiné and Savoy.

At Mont Blanc the direction of the range is changed. It runs hence E. N. E., and the N. ridges continue in that direction to their termination in the neighbourhood of Vienna. With the change of direction a change in the disposition of the valleys is observed. The range is divided into two or more ridges, running nearly parallel, and including extensive longitudinal valleys. From the ridges enclosing these longitudinal valleys short transverse valleys descend S. and N. to the plains which bound the mountain range. This disposition of the ranges renders the communication between Italy on one side, and Switzerland and Germany on the other, much more difficult than the communication between Italy and France; for the roads must either traverse two or more ridges, or great deflections must be made to avoid one of them.

E. of Mont Blanc the range is divided into two high ridges, which enclose the valley of Valais, and unite about 8° of E. long., at the sources of the Rhone. The southernmost of these ranges, which is immediately connected with Mont Blanc, contains nearly in its middle Mount Rosa, the second highest summit of the Alps, being 15,170 ft. above the sea. W. of it stands Mount Cervin, or Matterhorn, the third highest summit, rising to 14,778 ft. Then follow Mount Combin, which has 14,136 ft., and Mount Velan, which attains 11,030 ft. E. of Mount Rosa, and near it is the Cima de Saci, 13,740 ft. high. This chain comprises the greater part of the Pennine and a portion of the Lepontine Alps, but is commonly called the Alps of Valais. In the chain which encloses the valley of Valais on the N. the greatest European glacier is found, not far W. of the source of the Rhone. Here a great part of the chain rises above the line of congelation, and is always covered with ice. It is stated to have an area of 200 sq. m. Many high summits rise out of it in the form of pyramids; and as the snow does not adhere to their steep sides, they form a sublime contrast with the sea of ice that surrounds them. The most famous of these summits are the Finsteraarhorn, 14,085 ft.; the Monch (Monk), 13,507 ft.; the Jungfrau (Virgin), 13,713 ft.; the Schrekhorn, 13,454 ft.; the Vischerhörner in Grindelwald, 13,333 ft.; and the Eiger, 13,032 ft. high. The glaciers of Grindelwald and Lauterbrunnen, which attract so many travellers, are only small detached portions of this immense glacier. W. of the great glacier the chain still contains many summits rising to 11,000, and even to 12,000 ft. of elevation; as the Alets, the Blümlisalp, and others. It may be considered as terminating on the W. with the Diablerets, or Teufels-hörner, which attains about 10,000 ft. of elevation. W. of them the mountains are of moderate height, and towards the lake of Geneva they sink into elevated hills. This chain goes commonly by the name of Alps of Bern (Bernier Alpen).

The depression of this chain at its western extremity has afforded an opportunity of establishing a carriage communication between Geneva and Bern in Switzerland, and Milan in Lombardy. The road runs along the shores of the lake of Geneva, and enters at its eastern extremity the valley of the Rhone or of Valais. It then ascends the valley as far as the town of Brigg, and passes thence over the S. range by the

pass of the Simplon to Domo d'Ossola and the shores of the Lago Maggiore. The highest point of this road is 6,585 ft., the town of Brigg 2,325, and Domo d'Ossola 1,003 ft. above the sea. This road, made by order of Napoleon, partly at the expense of France, and partly of the then kingdom of Italy, is a noble work. It is about 26½ ft. wide, rising 14 inch each yard. In some places it is tunnelled to a considerable distance through the solid rock. It is the only carriage road over this range; but another road, used only by mules, has obtained celebrity by Napoleon having passed it in 1800, previously to his famous Italian campaign. This is the road of the Great S. Bernhard; it begins at Martigny on the Rhone, ascends the vale of the small river Drance to its source, where it passes over the chain near the celebrated Hospice at an elevation of 8,051 ft. above the sea, and descends hence to Aosta on the Dora Baltea.

E. of the sources of the Rhone is the only place in the Alps running W. and E. where the range is not divided by longitudinal valleys, but is intersected by the two transverse valleys of the Reuss and Tessino. Hence there has existed time immemorial a line of communication in this point between Switzerland and Italy. This is the road of the S. Gothard, uniting Zurich and Lucerne with Milan, running first along the shores of the lake of the four cantons (or of Lucerne) to Altorf, and afterwards in the valley of the upper Reuss to Andermatt. It passes the ridge at an elevation of 6,850 ft., descends to Aiviole on the Tessino in Val Leventina, and runs in this valley to the Lago Maggiore, and thence to Milan. This much frequented road has only in modern times been rendered practicable for carriages, on account of the poverty of the small cantons which it traverses.

That portion of the mountain system which lies between Mont Blanc and the road of the S. Gothard is less broad than any other part. It probably does not measure more than 80 m. across in a straight line; but its valleys, both to the S. and the N., but especially the latter, known by the name of Highlands of Bern (Bernier Oberland), are considered as exhibiting the richest mountain scenery in the Alps.

E. of the road over the S. Gothard pass, the mountain system widens considerably; so that between 9° and 13° E. long., its average breadth may be estimated at between 120 and 130 miles. But at the same time the high summits are less numerous, a few only attaining 12,000 ft., though a great number still exceed 10,000 ft., and pass the line of congelation. The height of the mountain passes shows evidently that the elevation of the whole mountain mass has rather increased than decreased, at least W. of the pass over the Brenner.

That portion of the range which approaches the pass of the S. Gothard is called the Rhaetian Alps, or the Alps of the Grisons. It is divided into four ridges, which enclose three longitudinal valleys; those of the Upper Rhine, of the Inn and Mera, and of the Adda. The central valley is divided by a high transverse ridge into two, of which the W. or shorter, called the Vale of Bregaglia, is drained by the river Mera, which runs W., and falls into the lake of Como, or rather of Mesola; and the E. and much longer by the Inn, which falls into the Danube. The valley of the Upper Rhine, extending first E. N. E., turns afterwards suddenly N., and affords two openings towards the low country; one to the lake of Constance, and the other to

the lake of Wallstadt. Thus the town of Chur or Coire, situated where the Rhine turns N., has an easy communication both with Germany and Switzerland. Though a small place, by far the greater part of the commercial intercourse between Bavaria, Wirtemberg, Baden, and Switzerland on one side, and Italy on the other, is carried on by the road passing through it. The canton of the Grisons; sensible of the advantage accruing from this commercial intercourse, has constructed three excellent roads over the range, which divides the affluents of the Rhine from those descending into the plain of the Po. A road runs from Coire along the Rhine to the place where the Vorder Rhein and Hinter Rhein join, and thence ascends in the valley of the latter to the village of Splüghen in the Rheinwald. At this place the road divides in two. One continues to ascend the valley of the Hinter Rhein to a village called also Hinterrhein, and passes thence over the high mountain ridge to S. Bernardino; it is called the road of S. Bernardino. From this village it descends in the Val Misocco or Miso along the river Moosa, which opens near Bellinzona into the small plain surrounding the N. extremity of the Lago Maggiore. This road, which rises to 6,390 ft. above the sea, has been made in modern times to avoid the heavy duties which the Austrian government laid on the foreign commodities passing through its territories; for from Bellinzona they now can pass to Turin and Genoa without traversing any portion of the Austrian dominions. The other road leaves the Rheinwald at the village of Splüghen, and directly passes over the mountain ridge to Val Giacomo, which opens into Val Bregaglia near Chiavenna. The highest part of this road between Splüghen and Isola is 6,580 ft. above the sea. Another road runs from Coire nearly directly S. over some mountains of moderate height, till it enters the valley of Oberhalbstein, which it ascends nearly to its upper extremity, where it divides into two branches, of which the E. passes Mount Julier at an elevation of 7,285 ft.; it leads to the valley of Engadinen, and is not a commercial line of communication. The W. road passes over the Maloga and descends into Val Bregaglia, where it continues to the town of Chiavenna. It rises to 8,250 ft. above the sea, and though practicable only for small carts, is much used.

The next road farther E. is rather a military than a commercial line, and was recently made by the Austrian government to open a carriage communication between the newly acquired Valteline and Tyrol. It begins at Innsbruck, ascends along the Inn as far as Fjinstermünz, near the boundary line between Tyrol and Switzerland; turns then southward, and passes the watershed of the Alps between Nanders and Reshen, where its highest point is about 4,500 ft. above the sea. Then it descends along the valley of the Adige to Glurns; but a few miles S. of this it leaves the valley, and turning S.W. traverses a very lofty lateral chain of the Alps, which at the place where it is crossed by the road is called Monte Stelvio. It then rises to the height of 8,960 ft., being the highest elevation of any carriage road in Europe. From this point it descends rapidly into the valley of the Adda to Bormio and Sondrio, and thence to Milan. It is commonly 16 ft. wide, and has been made at a vast expense, and with great skill.

This road encircles on three sides an extensive mountain region, filled up by snow mountains and glaciers, occupying the greater part of the

country between Innsbruck and Glurns, and displaying the wildest scenery of the Alps. Eternal snow covers here a space not much less in extent than that which surrounds the Finsteraarhorn and Virgin, and it is likewise overtopped by numerous steep summits of a pyramidal form, many of them rising to more than 10,000 ft. above the sea; as the Gebach Ferner 12,288 ft., the Wildspitz Ferner 12,364 ft., the Glockthurm 11,284 ft., and others. Where the road traverses Monte Stelvio it passes near another mountain group, less in extent, but rising to a greater elevation. In it is Mount Orteler or Orteler, the highest summit in Tyrol, 12,823 ft. above the sea; and near the latter Mount Hoch Ischernowald 12,422 ft., and Mount Zebru 12,281 ft. high.

To the E., but at some distance from these mountain masses, is the road over the Brenner, which may be considered as the E. boundary line of the Rhaetian Alps. This road begins at Innsbruck, ascends the valley of the small river Sill, and passes thence over the watershed between the Inn and the Adige, where, N. of Störzing, it attains the elevation of 4,643 ft. It then descends in the valley of the Eisack from Brixen to Bolzano or Botzen, and thence to Roveredo and Verona. It is one of the most frequented commercial roads over the Alps.

This road may be considered as separating the W. from the E. Alps. The latter are distinguished from the former by being more distinctly divided by longitudinal valleys running W. and E.; by the greater number of separate ridges; their greater width and lesser elevation; the number of snow-topped mountains being comparatively few, and none of them occurring E. of 14° E. long. The northern half of this mountain region is known by the name of the Noric Alps; and the southern by those of Carinthian, Crainian or Julian, and Dinarian Alps.

Not far distant from, and nearly parallel with, the N. border of this mountain region, extends a very long longitudinal valley from 11° to 15° E. long.; but it is divided by two transverse ridges into three valleys, in which flow the rivers Inn, the Upper Salzach and the Upper Enns, all of them running E. To the S. of the valley of the Salzach is placed the highest part of the Noric Alps. Many summits rise above the snow line, and between them are many extensive glaciers. The highest summits are the Gross Glockner, 12,567 ft.; the Gross Wiesbach or Krummhorn, 11,844; and the Ankogel, 11,873 ft. above the sea. The longitudinal valley south of this range is divided by a transverse ridge into two valleys, of which the W. is drained by the Eisach, which runs W. and falls into the Adige. The E. valley is drained by the Drave, running E., and one of the largest tributaries of the Danube. The mountain chain dividing these from the plain of Lombardy is much less elevated, rising only in a few summits to above 8,000 ft., and none of them exceeding 9,000 ft. above the sea. Only the Terglou, which rises near 14° E. long., at the sources of the Save, attains a height of 9,884 ft., and is by many considered as the most E. snow mountain of the S. range of the Alps.

E. of 14° E. long. the Alps are divided into 5 ridges by 4 longitudinal valleys, all of them opening to the E. These valleys are traversed by the rivers Enns, Muhr, Drave, and Save. The Muhr suddenly turns S., and running through a wide and open transverse valley empties itself into the Drave. The ranges enclosing these valleys on their N. and S. sides gradually decrease in height as they advance towards the

E.; so that when arrived at 16° they may rather be termed hills than mountains, except the ridge which divides the valley of the Drave from that of the Save, which preserves its mountainous aspect beyond 18° E. long.; where, at the confluence of the Drave with the Danube, it sinks into low hills, but rises again into mountains towards the confluence of the Danube and of the Save, where it takes the name of Sirmian Mountains, or Fruška Gora. This latter group may be considered as the most E. offset of the Alps, but rises hardly to more than 3,000 ft.

The range which divides the valleys of the Muhr and of the Ens turns S., and continues for a distance in that direction, forming the E. boundary of the transverse valley of the Muhr; but on the boundary line between Styria and Hungary, it subsides into low hills, which are followed by flat high ground, connecting the Alps with the forest of Bakony. This name is given to a low mountain range which separates the two plains of Hungary from one another, terminating where the Danube suddenly turns southward, and which may also be considered as one of the E. offsets of the Alps.

The most N. ridge of the Noric Alps, which skirts the valleys of the Salzach and Ens on the N., is broken through by these rivers where they turn N. to run to their recipient, the Danube. This ridge may be considered to terminate with the Schnieberg, near Neustadt, rising 6,882 ft. above the sea. This ridge sends numerous lateral branches to the N., which terminate close to, or at a short distance from, the Danube, between Linz and Vienna. But they rarely attain the height of 4,000 or 5,000 ft.

Through this part of the Alps lie the roads by which the towns of Linz and Vienna communicate with Italy and Trieste and Fiume. There are especially two great roads, with different branches; having, as central points, the towns of Villach on the Drave in Carinthia, and of Laybach on the Save in Carniola. The first, uniting Linz on the Danube with Italy and Trieste, runs in the beginning mostly along the banks of the river Traun, in a W. S. W. direction, to the town of Salzburg on the Salzach: it then follows the valley of the last-mentioned river up to the place where it is divided by a transverse ridge from that of the Ens, and then passes over that ridge to Radstadt. Hence it directly ascends the elevated range which separates the valley of the Ens from that of the Muhr, and is known by the name of the Tanern. The highest point of this road, at Hirschwand, rises to 5,290 ft. above the sea. From S. Michael, in the valley of the Muhr, the road ascends again to pass over the third range, which divides the valley of the Muhr from that of the Drave. This chain, however, is much lower. The road leads to Spital on the Drave, and thence follows the banks of the river to Villach. From Villach it ascends the valley of the Gail, a tributary of the Drave, to Tarvis, where the roads leading to Italy and Trieste separate. The road to Italy turns W., traverses the most S. ridge by the pass of Ponteba, 2,572 ft. above the sea, and descends through the valley of the Tella to Treviso and Venice. The road to Trieste runs from Tarvis S., attains its highest point at the pass of Predil (3,840 feet high), and descends thence in the valley of the Isonzo to Gorz or Gorizia, whence it turns S. to Veith and Trieste. This road is connected with that over the Brenner by a transverse road, uniting the valley of the Drave with that of the Eisach. It ascends along the Drave from Villach to Spital and Lienz, passes over the transverse

bridge separating the valleys by the pass of Innich, and descends the Eisach in the wide valley of Puster to Brixen, where it joins the road over the Brenner.

The road between Vienna and the towns on the Adriatic runs in the beginning along the E. skirts of the Alps to Neustadt on the Leitha, whence it ascends the ridge called the Sommering, on whose summit it is 3,337 ft. above the sea. Hence it descends along the small river Mürz to Bruck on the Muhr. Along the last-named river it passes through Grätz to Marburg on the Drave. It then traverses the range separating the Drave and Save, passing through Wendisch, Teistritz, Cilli, and the Trojan pass to Laybach. Between this place and Trieste is the mountainous country called the Adelsberg and Karst. Near Adelsberg the road rises 2,271 ft. above the sea; it thence descends to Senosetsh, and passing over the Karst arrives at Trieste. From the pass of Adelsberg a road branches off to Fiume.

Two carriage roads unite this road with that which connects Linz with Italy. The most N. runs in the valley of the Muhr westward, beginning at Bruck, and traversing Leoben, Idenburg, and Muran; at St. Michael it joins the other road. The S. runs in the valley of the Drave, between Marburg and Villach, and traverses Klagenfurt.

The Dinarian Alps, which may be considered as the link connecting the mountain system with the Balkhan mountains, occupy the country between the Gulph of Quarnero or Fiume and the rivers Verbas or Verbriza and Narenta in Turkey, and have obtained their name from Mount Dinara, their highest summit (near 44° N. lat.), which rises to 6,046 ft. above the sea. The principal ridge runs nearly parallel to the Adriatic, at a distance of about 30 miles more or less, and forms at the same time the watershed between the rivers falling into the Adriatic or joining the Save. Lower ridges, mostly parallel to the principal ridge, fill the country between it and the sea; but those branching off towards the Save run nearly S. and N. Opposite the Gulph of Quarnero, the higher mountains cover only a space of less than 80 miles from W. to E.; and as here the fertile plains of Hungary approach nearest the sea, the Austrian government, desirous of devising some means by which the abundant produce of that country could be brought to the markets of the commercial world, made in the last century two roads over the numerous ridges which traverse the country. They are known by the names of the Caroline and Josephine roads; the former rising at one point to 4,576 ft. above the sea. But the lines were not judiciously chosen. They run over a succession of steep acclivities and declivities; and as they traverse a country destitute of water, they could only be used by light carriages and mules. But in the beginning of this century a company of private individuals constructed another and very superior road, on which all steep slopes have been avoided; so that it is practicable for carriages conveying the most bulky commodities from the interior of Hungary to the coast. This road begins on the coast at Fiume, ascends directly the mountains, passes through Kumenjak and Skerbuteryak, and terminates at Carlsstadt on the Culpa, where this river begins to be navigable.

On three sides the Alps are surrounded by plains. On the S. by that of Lombardy, on the N. by those of Switzerland and Bavaria, and on the E. by the great plain of Hungary. The plain of Lombardy is less elevated than those of Switzerland and Bavaria; for the Lago Mag-

glaciers only 805 ft., and the lake of Como 697 ft.; whilst the lakes of Geneva, Zurich, and Constance are respectively 1,307, 1,310, 1,304 ft. above the sea. The highest ranges of the mountains are much nearer to the plain of Lombardy than to the plains on the N.; and their descent is much steeper towards Italy than towards Switzerland or Germany. The mean elevation of the great plain of Hungary is only 900 ft. above the sea; and in it terminate the E. extremities of the ranges, which no where rise to a great height.

The central ridges of the Alps are composed of primitive rocks, especially of granite and gneiss, and are distinguished by their pointed peaks. On the N. side of this formation extends a slate formation of considerable width. This does not appear to accompany the range on the S., except along the E. Alps, where it has been observed to extend from Brixen on the Eisach to Marburg on the Drave, skirting that river on the S. Beyond the slate formation, the chalk occupies a considerable space. It is found to occupy the greatest extent on the S. E. of the mountain system, the whole Julian Alps being composed of it. On the opposite or N. W. side, the sandstone formation extends from the lake of Geneva as far as the S. boundary of Bavaria. The chalk formation is distinguished by its summits, which do not rise in pointed peaks, but form either cones or cupolas.

All those parts of the numerous ridges which rise above the line of congelation are of course covered with snow all the year round. In many places the snow occupies a considerable space on the upper parts and summits of the rocky masses, and from these "eternal reservoirs" of snow the glaciers are derived. The sides of the rocky mass are usually furrowed by long narrow valleys; and in these masses of snow, descending from the upper parts under the form of ice, extend the farther downward the greater the mass and height of the snow from which they are derived. These accumulations of snow and ice form glaciers, many of which are from 15 to 20 m. long. Near the upper part, or at their origin, they are generally narrow, sometimes not much more than 100 yards across; but as the valleys grow wider as they proceed downward, the glaciers also extend in width, taking the shape of a fan, and in some places are 2 miles across. The thickness of the ice masses varies from 100 to, perhaps, 600 feet. Though the snow line in the Alps is found at an elevation of about 8,000 ft. above the level of the sea, some of the glaciers descend so far downward that their lower extremity is not more than 3,500 ft. above it. The ice of the glaciers does not resemble that, wit. which our rivers are covered in winter. It consists of a great number of crystals measuring from half an inch to 2 inches in length, and somewhat less in width, united by having been pressed strongly together. It is difficult to remove one of these crystals without breaking it; but when the first has been removed, the others may be easily taken up. The surface of the glaciers is very various, and depends on the degree of inclination with which the valley descends. Where the descent is gradual, the surface of the glacier is nearly level, and offers few crevices; but where the declivity is rapid and uneven, the glacier is rent with numerous chasms, and covered with elevations, rising from 100 to 200 feet, having the aspect of a sea agitated by a hurricane. The chasms are frequently many feet wide, and more than 100 deep. Their formation, which never takes place in winter, but is frequent during summer, is accompanied with a loud noise resembling thunder, and a shock

which makes the adjacent mountains tremble. These chasms are subject to change every day, and almost every hour, and it is this circumstance that renders the ascent of the glaciers so dangerous to travellers. Sometimes there are found in the glaciers pyramids of ice of a considerable elevation and a regular form, on the tops of which are placed large pieces of rocks. At the lower extremity of the glaciers is an excavation in the form of a grotto, frequently 100 feet high and from 60 to 80 wide, whence issues a small river, bringing down a bluish water. Though every single crystal of the ice of the glaciers seems perfectly white, the whole mass is of a blue colour, passing through every shade from the most feeble sky-blue to that of the lapis lazuli; it is most pure and beautiful in the lower parts of the chasms. The glaciers impart one of the greatest charms to the scenery of the Alps, by the beauty of their colour, and their contrast with the surrounding country, their lower extremities being commonly contiguous to meadows covered with the finest grass and the most beautiful flowers, and the declivities of the mountains which enclose them exhibiting large tracts clothed with magnificent trees, especially firs.

Avalanches are more frequent in the Alps than in most other mountains, because of the steepness of their declivities. The most common consist of masses of snow, which, commencing their descent at the higher parts of the mountains, and increasing in magnitude and velocity as they roll down to the valleys, overwhelm, in their headlong career, men and cattle, destroy villages and forests, and dam up and obstruct the course of rivers. Four kinds of avalanches may, however, be distinguished. 1. The *drift avalanche* takes place when the upper parts of the mountains have been covered by a heavy fall of snow during a calm, followed by a strong wind before the mass has acquired consistency. An immense mass of loose snow is then suddenly brought by the wind into the valleys, where it frequently covers villages; but in general these avalanches do not occasion much damage, unless when they cause a compression of the air. This sort of avalanche usually occurs in the beginning of winter. 2. The *rolling avalanches*: these bring down great masses of compact snow, especially towards the end of the winter, when it begins to thaw. In their progress, they are increased by all the snow they meet in their descent; their impetus and mass being frequently such as to overwhelm and beat down every thing, rocks not even excepted, that may interrupt their course. These, the most destructive of the avalanches, cause great loss of life and property. 3. The *sliding avalanches* are masses of snow descending slowly along the surface of a not very steep declivity. They take place in spring, when a long thaw has dissolved that portion of the snow which lies immediately on the rocks, and thus loosened the bond with which the whole mass is united to its base. They carry before them every thing that is too weak to withstand their pressure. They sometimes occasion considerable loss, but not frequently. 4. The *ice or glacier avalanches* are formed by larger or smaller pieces of ice, detached from a glacier by the summer's heat. They are precipitated downwards with a noise like thunder. When seen from a distance, they resemble the cataract of a powerful river. As they generally descend into uninhabited places, they seldom do much damage.

The rolling and sliding avalanches expose travellers to the greatest dangers they have to incur in traversing the Alps. There are, in fact,

certain localities on the most frequented roads to which they descend annually, and which are consequently very dangerous. To obviate the risk of accidents from this cause, in the construction of new roads, as of those of the Simplon and over Monte Stelvio, care has been taken at such places to excavate the mountain to a certain depth, and to cover over the road with strongly built arches, which effectually provide for the safety of the traveller. A few places on the roads are also rendered unsafe by less or greater pieces of rock which descend with fearful velocity from the steep declivities of the mountains. This usually happens when, after some days' continued rain, a strong wind arises and shakes the higher portion of the mountains. Luckily, however, such places are not frequent. Travellers on the glaciers run the risk of falling into chasms, or of finding the ice under their feet suddenly opening in the progress of the formation of a new chasm.

The scenery of the Alps owes a part of its numerous charms to the great number of extensive lakes, of which nearly every one is distinguished by some peculiar beauties. Most of them have an easy access, being situated on or near the outskirts of the range, as the lakes of Geneva, Constance, and Zurich; or partly within and partly without the range, as the lake of the Four Cantons, and the Lago Maggiore and that of Como, and the beautiful lakes in Austria. Innumerable are the small lakes which occur on or near the summits of the high ridges and glaciers. Most of the rivers and torrents have their sources in such lakes.

The chalk formation of the Julian Alps offers the most interesting natural phenomena. It consists of a fine-grained, much-decomposed primitive chalk, which is rent by a great number of transverse crevices and precipices, and frequently forms deep depressions in the fashion of funnels. In it occur numerous caverns and subterraneous galleries of great extent, in which everywhere the finest and most fantastic stalactites are formed. More than a thousand such caverns are already known, and many have never been visited. The most remarkable are those of Adelsberg (which see), Magdalen in its neighbourhood, Zirknitz, &c. Numerous too are the rivers and torrents which suddenly disappear underground, precipitating themselves into a large chasm, and re-appearing after a subterraneous course of many miles. Here are also many intermittent wells, which, at certain seasons, emit large quantities of water, and at others are dry. Several of them feed the lake of Zirknitz, which has acquired celebrity for being for several months quite dry, and for several others filled with water; so that it serves each year successively for tillage, pasturage, hunting, and fishing!

The Alps are not rich in metals, except iron. Some mines of gold and silver occur on the S. as well as on the N. declivity, especially in the Austrian dominions; but their produce is inconsiderable. Others of copper and lead are more productive; but they too are comparatively poor, except the Bleiberg (lead mountain) of Carinthia, which furnishes some of the best lead in Europe. The quicksilver mines of Idria, N. N. E. of Trieste, are reckoned among the richest of the globe. The iron mines of Styria, Carinthia, and Carniola are very productive, and their produce hardly inferior to any of Europe. Rock-salt occurs only in a very few places in the W. Alps; but on the N. side of the E. Alps are very rich layers of that mineral, running, as it seems, in a continuous line from the banks of the Inn at Halle to those of the Enns in Austria.

They are worked with great industry at different places.

Vegetation covers the greater part of the Alps. The larger valleys, none of which rise to 5,000 ft. above the sea, contain some tracts fit for agricultural purposes. They consist generally of uneven ground, extending on both sides a river. Behind it the mountains rise with a steep and commonly inaccessible ascent; which is covered with high trees: in the lower parts with oak, beech, elm, &c.; and in the upper region with fir, pine, larch, and the *Pinus Cembra*. Near the region of the pastures the trees dwindle down to low bushes. The pasture region, which occupies the next place, offers commonly a plain strongly inclined towards the valley, and is in general of considerable width. It is called in Switzerland the *Alps*. Here are found the huts or *senes* of the herdsmen, inhabited only in summer, when the cattle are brought to these pastures. The upper part of the range is occupied by bare rocks, many of which rise above the line of congelation. This line occurs in the Alps between 8,000 and 9,000 ft. above the sea, and is lower on the N. than on the S. declivity.

Corn is grown on the N. side, not above 3,800 or 4,000 ft.; but on the S. it succeeds 1,500 ft. higher. The highest place at which barley ripens is Skala in the Engadin, 5,950 ft. above the sea. High trees are found in some places not above 4,500 ft., at others they ascend the declivities even to 7,000 ft. and more. Oak is found up to 4,000 ft., elm to 4,300, ash somewhat higher, beech to 5,000, fir to 5,300, mountain ash to 5,600, birch to 5,700, pines to 6,500, and larch to 7,000 or 7,300 ft. above the sea. Where the high trees begin to cease, the mountains are covered with bushes and the Alpine rose (*Rhododendron ferrugineum* and *hiruntum*).

The inhabitants of those ranges of the Alps which extend from the Mediterranean to the lake of Geneva are mostly of French origin, speaking a corrupt dialect of the French language. In the remainder of the mountain system the population is of Teutonic origin, only a few of the more open valleys terminating in the plain of Lombardy, speaking a dialect of the Italian language. The most E. extremity of the whole range, between the rivers Muhr and Save and the Julian Alps, is partly inhabited by a population of Slavonian origin, called the Wendes or Slovenzi. As the tracts of land fit for agricultural purposes are of comparatively small extent, the rearing of cattle and the making of butter and cheese constitute the principal employment. Many of the inhabitants migrate, at certain seasons, to the neighbouring countries in search of work. Some of them return annually, some after the lapse of some years. Besides the dairy, the mines give employment to a number of inhabitants; but this is only the case in the E. Alps of Styria, Carinthia, and Carniola, where rich mines of iron and extensive layers of salt are found. In these districts, also, are some manufactures of hardware and iron utensils. In the other parts of the range manufacturing industry is almost unknown; but near its outskirts on the N. side it has in later times become so diffused, that it hardly yields to any other part of the continent. The inhabitants of the mountains are distinguished by their love of liberty, their opposition to every kind of oppression, the frankness of their behaviour, their adherence to their old manners and dress, and their fidelity and honesty.

The Alps did not become well known till the reign of Augustus. That emperor finally

subdued the numerous and savage clans which inhabited the Alpine valleys, and cleared the passes of the banditti by which they were infested. He improved the old roads, constructed new ones, and succeeded in establishing free and easy communications across the mountains. The chain was then divided into separate portions, which have preserved their boundaries and denominations nearly to the present day.

Travellers will find much useful and interesting information with respect to the Alps in *Elbel's Manuel du Voyageur en Suisse*, 1817.

ALPS (LOWER), Basce Alpes, a frontier dep. in the S. E. of France, having E. the Sardinian states, S. the dep. of the Var, W. dep. Vauchuse, and N. the dep. Drome and Hautes Alpes. Area, 682,643 hectares. Pop. 159,045. This dep. derives its name from its being principally occupied by the W. slope of the Alps. Its aspect is highly varied and picturesque: presenting a succession of high rugged mountains, crowned with eternal snow, vast sombre forests, and low, rich, smiling valleys. The mountains, hills, &c., occupy about half the surface, and the woods about a sixth part: the extent of cultivated land is estimated at 185,000 hect. of meadows at nearly 18,000, and vineyards at 14,000 do. The principal river is that of the Durance, which traverses the dep. from N. to S.; it is also in part intersected, and in part bounded by the Verdon, and is watered by many mountain streams, the inundations of which often occasion great mischief. The climate varies, of course, with the elevation and exposure of the soil. There is a good deal of spade husbandry; and mules and asses are used in preference to either horses or oxen. Produce of corn crops insufficient for the consumption. Potatoes extensively cultivated. Olive, fig, and mulberry trees are all cultivated in the lower and warmer districts, and dried and other fruits make a considerable article of export. The lower mountains afford excellent sheep pasture. They belong partly to individuals, and partly to communes; and besides the stationary sheep, or those that belong to the dep., about 400,000 head are annually brought from the adjoining dep. of the Var and the *Bouches du Rhone*, to be depastured for about 4 months in summer on the mountains referred to. They pay at the rate of from 1 fr. to 1 fr. 25 cent. per head; and both their size, and the quality of their flesh and wool, are said to be materially improved by the change. The shepherds never quit their charge either by night or by day. Besides the sheep belonging to the dep., the breed of which has been materially improved, it has a great number of goats; and the rearing of bees is also much attended to. There are mines, but not very productive, of iron, lead, copper, and coal. Manufactures have not made much progress; but there are several silk filatures and silk looms, with manufactures of cloth, hats, earthenware, tanneries, &c. Great numbers of the poorer classes leave their homes for a portion of the year, to seek employment in the neighbouring dep. It has two electoral colleges, which return 2 m. to the Ch. of Deputies; and had, in 1838, 837 electors. Public revenue in 1837, 2,628,917 fr. Principal towns, Digne, Sisteron, Barcelonnette, in the picturesque valley of the same name, Forcalquier, &c.

ALPS (UPPER), Hautes Alpes, a frontier dep. in the S. E. of France, on the N. side of the dep. of the *Basces Alpes*, and having on the E. the Sardinian States. Area, 553,264 hect. Pop. 131,162. This dep. differs in few respects from that just described, except that it is more mountainous and less fruitful. Some of the mountains rank, in fact, among the highest in the immense chain of which they form part. Mont Pelicou, the most elevated, rises 14,120 ft. above the level of the sea, and Mont Olan 13,461 do. The mean elevation of the mountains may be taken at about 9,000 feet; and the elevation of the highest cols or passes from one valley to another sometimes exceeds 7,000 feet. There are several glaciers in the N. part of the dep. Agriculture similar to that of the *Basces Alpes*. Only 97,500 hect. of surface is cultivated; 77,000, hect. are occupied by woods and forests, and about 24,000 by meadows, the irrigation of which is an object of great importance. The valleys principally lie alongside the rivers Durance, Bruch, Drac, &c. Inhabitants poor and laborious; it is even said, that women are sometimes seen yoked, *avec des aues*, to the plough! *Greniers d'abondance* are es-

tablished in different communes, which make loans of seed and necessities to poor families. There are mines of iron, lead, &c. Manufactures principally confined to coarse cloth, linen, stockings, hats, &c., required for the use of the inhabitants. The cheese and butter of the Briançonnais are highly esteemed. Bread made of potatoes is extensively used. Families using rye bread commonly bake it only once a year; it keeps for 15 or 16 months; is hard, and has to be broken to pieces by a hatchet. Between 4,000 and 5,000 of the peasants leave the dep. every year in the beginning of October, and return early in June. It is estimated that at an average about a fifth part of those that emigrate never return, and that those who do, bring back with them about 200 fr. a piece; the emigrants principally take to the trades of pedlars, showmen, &c. It has 2 electoral colleges, which return 2 m. to the Ch. of Deputies; and had, in 1838, 412 electors. Public revenue, in 1831, 2,307,152 fr. Principal towns Gap, Briançon, and Embrun. (For this and the prev. dep. see *Hugo*, arts. *Basces et Hautes Alpes*; the authorities there referred to; and the *French Official Tables*.)

ALRESFORD, a market town and two parishes of England; co. Hants, hund. Alton. The town is situated on the Itchen, at no great distance from its source, 57½ m. S. W. by W. London. It was formerly a place of much more importance than at present, and sent a member to the II. of C. Pop. of town and parishes, 1896.

ALSACE, a ci-devant prov. of France, forming the depts. of the Upper and Lower Rhine.

ALSEN, a Danish island in the Baltic, separated by a very narrow channel from Sleswick, and by the Little Belt from Funen. Shape irregular, being about 20 m. long, and from 3 to 8 in breadth. Pop. 15,200. Surface pleasantly diversified with wood and open fields. All the country houses are surrounded by fruit-trees, and large quantities of fruit are annually exported. Principal towns, Nørborg and Sønderborg. Christian II., deposed by the states of Denmark in 1523, was confined for nearly 17 years in a tower (since demolished) in the castle of Sønderborg.

ALSFELD, a walled town of Hesse Darmstadt, cap. bailiwick, on its N. frontier on the Schwalm. Pop. 3,019. It has manufactures of ratens, flannels, and linen, with considerable bleach-fields and print-works.

ALSLEBEN, a walled town and castle of Prussian Saxony, reg. Merseburg, on the Saale. Pop. 1,700. The castle is the property of the Duke of Anhalt Dessau, to whom the town belongs.

ALTAI MOUNTAINS (THE), a very extensive mountain range in Asia, extending from the eastern banks of the Irtysh, a tributary of the Ob, (60° E. long.), to the shores of the Pacific, at the S. extremity of the Sea of Okhotsk, opposite the island of Tarakai (142° E. long.). Its length, therefore, is little short of 2,500 m. The several chains which compose this mountain system are chiefly found between 46° and 52° N. lat., but some detached ridges advance to 49° and 57° N. lat. The breadth of the whole system is probably nowhere less than 450 m. and at some places it widens to 700 m. and upwards. It is, however, not possible to determine it with any degree of exactness, since only the S. declivities of the range have been visited by travellers, the S. declivities lying within the territories of the Chinese empire being inaccessible to Europeans.

The most westerly portion of the system, between the river Irtysh and the river Tashlyshman, the upper branch of the Ob, is properly called the Altai Mountains, which name has been afterwards used to indicate the whole system. This portion bears also the name of the Ore Altai, because it contains numerous veins of the precious metals. It consists of several ridges, which mostly run W.N.W. and E.S.E. These ridges advance their W. extremities close to the banks of the Irtysh, where they are 500 or 600 ft. high, but at a distance of about 15 or 20 miles from the river they attain from 3,000 to 5,000 ft., which elevation may be considered as the mean height of the greatest part of the ranges; only where they approach the lake Telctzkoi and the river Tashlyshman they rise still higher, even to 10,000 ft., and the river is always covered with snow. It is called *Altai Biehi*, and is, so far as is known, the highest portion of the system.

Between the Tashlyshman and the great lake of Baikal, the mountains appear to form two great chains, running E. and W.; of which the S., which falls within the Chinese empire, and is called the Tangu Oola, or Tangu Shan, seems to be the principal range. It is divided from the N. chain by a long valley, in which run the Kentschick from W. to E., and the Ta-kem from E. to W.; after their junction the river is called Yenesei, and breaks through the N. chain. The portion of the latter situated W. of the Yenesei river is called the Sayanian range, but the E. chain bears the name of Ergik Targak Taiga. Both chains unite about 100° E. long., at a considerable distance W. of the lake Baikal, at the sources of the Selenga, the most considerable

river which empties itself into the lake. The united chain is here called Gourd Uliden Dzang, which name it preserves to 108° E. long., running in general E. On the E. side of the meridian of 108° E. long. and the river Selenga, the direction of the mountain chains composing the Altai system is changed; they run N.E., and form a very extensive mountain region E. of the lake Baikal. This region is called the Balkalian or Daurian Mountains; but the highest chain belonging to it, and lying within the Chinese empire, bears the name of the Great Khing-Khan. The most easterly portion of the Altai Mountains, between 123° and 142° E. long., lies again nearly due W. and E.; but here it advances to 56° N. lat., and is called by the Russians the *alabolon Kherbet*, and by the Chinese Khing-Khan Tugurik.

The Aldan Mountains may be considered as a continuation of this latter chain. They separate from it at the sources of the river Aldan, a tributary of the Lena, enclose the valley in which it runs on either side, and continue on the E. side along the shores of the Sea of Okhotsk up to the bay of Pershina, the most northerly corner of that sea. From this bay one branch runs N.E., and terminates at Behring's Strait with the East Cape and the Cape of Tshukotskhol-Nosa. Another branch turns abruptly S., and traverses the peninsula of Kamtschatka, terminating at Cape Lopatka. The highest summit of the Aldan Mountains, adjacent to the road connecting Yakutsk with Okhotsk, was found by Erman to be 4,055 ft. above the sea. But the chain traversing the peninsula of Kamtschatka contains several volcanoes, some of which rise to a great elevation. Erman measured three of them. The highest peak of the volcano of Shivelutsk (50° 40' 32" N. lat.) rises to 10,591 ft., the volcano of Klutshuvsk (56° 4' N. lat.) 15,825 ft., and that of Tolhatshinsk 3,346 feet above the sea. If the Aldan Mountains and the range traversing Kamtschatka be considered as a continuation of the Altai chain, more than 1,500 miles must be added to its length.

The country extending N. of the Altai Mountains to the shores of the Polar Sea is one continuous plain, sometimes of an undulating surface, but mostly exhibiting immense flat lowlands, called, as others of a similar description, *stepes*. This plain, at the foot of the range, is hardly more than 500 ft. above the sea, to which it gradually slopes down. On the other hand, the countries lying S. of the Altai Mountains constitute a portion of the great elevated table-land of Upper Asia. Their surface is much more uneven, being traversed in many parts by ridges of rocks and hills, whilst others present themselves as immense plains covered with sand. The mean elevation of these countries seems to be from 2,000 to 3,000 ft. above the level of the sea.

Roads.—Two roads lead over the Altai, and one over the Aldan Mountains. That most to the W. is the great road of Kiachta, by which the commerce between Russia and China is carried on. It begins at Irkutsk, the capital of East Siberia, situated on the Lower Angara, not far from the point where it issues from the lake Baikal. From this town, which is 1,440 ft. above the sea level, goods are carried in summer by water, and in winter over the ice of the lake, to Udinsk, and hence to Seleginsk, where they are landed, and transported to Kiachta, the Russian commercial establishment, and exchanged with the goods brought by the Chinese to Maimatshin. The Chinese bring the goods to Urga, the provincial capital of the adjacent country; and in advancing farther S. they attain the highest point of the range S. of Urga, on the mountain Dshirgalanta. S. of the river Toia, where it rises to 5,055 feet above the sea. They afterwards descend to the table-land, and traverse the great desert of Gobi, or rather Gobi and sometimes called Shamo. The other great road leads from Udinsk, on the river Selenga, to the mining district of Nertshtinsk. From Udinsk it runs E. in the valley of the river Uda, a tributary of the Selenga, somewhat more than 250 m.; then it traverses the highest part of the range near 112° E. long., and descends into the valley of the Ingoda, in which it continues to Goroditskshen, where the Ingoda unites with the Onon, and forms the Shilka river. On the banks of the last-mentioned river it continues to Nertshtinsk. The great road over the Aldan Mountains connects Yakutsk with Okhotsk. Yakutsk is only 287 feet above the level of the Polar Sea. Between this place and the river Aldan the road rises gradually, and attains at Nokhinsk on the heights forming the W. bank of the Aldan river 751 feet. In the valley of the Aldan it descends to 424 feet above the sea. E. of this river the road rises to 1,531 feet at Garnastakh, and in the mountain pass six miles W. from Khoimia to 2,619. It continues nearly on this level for several miles, and then descends with a rather steep declivity towards the Sea at Okhotsk. This latter place is only 13 feet above the sea.

Mines.—The Altai Mountains are rather rich in metals, especially in silver, gold, copper, and lead. The mines from which these metals are extracted have been worked on a large scale at some unknown period, and by an

unknown nation. In the middle of last century the Russians, following the traces of the ancient mines, began to work them; but only at the W. extremity of the mountain system, between the Irish and the Oby, and again on the banks of the Shilka river, east of the lake Baikal. The first mines are comprehended in the mining district of Barnaul, and the second in that of Nertshtinsk.

The mining district of Barnaul, called by the Russians that of Kolyvano-Woskresensk, comprises the mines in the Altai Ore Mountains, where at present the richest mines are found in the valleys by which the W. declivity of the mountains sloping towards the Irish is furrowed. Here are the mines of Syryanovsk, in the valley of the Bukhtarma, about 40 m. from the Irish, and at no great distance from the boundary of the Chinese empire; they are productive of silver and lead. Farther to the N.W. are the mines of Iliderak and Krukow, in the valley of the small river Ulba, which also produce silver and lead, and are at present considered as the richest in this district. In the valley of the Uba, N.W. of Shamanaicho, are the mines of Semenoff, which produce silver and copper, but are not rich. In the valleys forming the N. declivity of the range are the mines of Schlengenberg, famous for the great quantity of silver extracted from them during the last century; but at present they are less considerable, and begin to be exhausted. W. of them are the mines of Loktewsk, producing great quantities of copper. To the E. of the Schlengenberg are the mines of Woskresensk, which furnish copper, but at present are not worked. The ores from these mines were formerly carried to Barnaul on the Oby, where they were smelted; but smelting houses are now erected in the neighbourhood of the most considerable mines. They are all worked on the account and for the benefit of the Russian government; and an Imperial ukase directs that every year 350 pounds (34,200 lbs.) of gold and silver shall be sent to Petersburg from this district. Of this amount 920 pounds are silver, and 25 pounds gold extracted from the silver. The quantity of copper and lead annually furnished by them is not stated. The former is partly coined in Siberia in the mint of Susansk. At Kolyvano-Woskresensk are extensive polishing works, where granite, porphyry, jasper, agate, and marble are worked into tables, vases, chimney-pieces, basins, columns, &c. The material is brought from the river Korgon, and 300 workmen are employed in them at the expense of government. The mining district of Nertshtinsk on the Shilka, a tributary of the Amur, is much less important. The number of mines is stated to amount to upwards of 80, but many of them have been abandoned. The ore is smelted in several large smelting establishments, of which that of Nertshtinsk is the most considerable. The silver is extracted from galena ore, a cwt. of which contains from $\frac{1}{4}$ to 2 ounces of silver. The annual produce is stated to be only 235 pounds, or 16,500 marks of silver; consequently less than a fourth part of the annual produce of the mines of Barnaul. The country though poor, is very abundant; but the want of fire-wood and coal in the neighbourhood of the mines prevents the increase of their annual produce. (See *Pallas, Humboldt, Ledebur, Von Bunge, and Erman*.)

ALTAMURA, a town of Naples, prov. Terra di Bari, at the foot of the Appennines, 29 m. S. W. Bari. Pop. 16,000. It is surrounded by walls, has a magnificent cathedral founded by Frederic II., an hospital and a lyceum, and is one of the handsomest best built towns in the province. Having taken part with the republican party in 1799, it was taken by the royalists, and given up to military execution; but it has since recovered its former prosperity. Altamura is supposed to be founded on or near the site of the ancient *Lapazia*.

ALTAVILLA, a town of Naples, prov. Principato Ultra, cap. cant., 7 m. N. Avellino. Pop. 2,600. This also is the name of a town in the prov. Principato Citra, S. Campagna. Pop. 2,400.

ALTDORF, a town of the grand duchy of Baden; on the great road from Bale to Frankfort. Pop. 1,200. It is the property of Baron Turkheim, who has here a fine castle, and a valuable botanical garden.

ALTRON, a town of Bavaria, circ. Rezat, 13 m. S. E. Nuremberg. Pop. 2,000. All sorts of wooden toys are manufactured here, and are exported to all parts of Europe and to S. America. There are also considerable breweries. The surrounding country is beautiful and fertile.

ALTEA, a town of Spain, Valencia, near the sea, 30 m. N. E. Alicante. Pop. 4,800. It has glass-works; and, the contiguous territory produces cotton, wine, flax, silk, and honey.

ALTEA, a town of Prussian Westphalia, cap. circ. same name, on the Senne. Pop. 4,000, principally employed in wire-drawing and in the manufacture of needles, pins, thimbles, &c.

ALTENAU, a mining town of Hanover, prov. Grubenhagen, Harz mountains, about 1,500 feet above the level

of the sea. Pop. 1,300. There are in the vicinity mines of silver, copper, and iron.

ALTENBERG, a town of the kingdom of Saxony in the Erzgebirge mountains, 25 m. S. Dresden. Pop. 1,460. It manufactures lace, the surrounding mountains abound in tin, and are covered with forests.

ALTENBRUCK, a town of Hanover, on the Werne, near where it falls into the estuary of the Elbe, a little above Cuxhaven. Pop. 2,400. It has some trade in corn and cattle.

ALTENBURG, a principality in the duchy of Saxe-Gotha, divided into two principal parts by the lordship of Gera, and possessing several detached portions in other states. Area, 498 sq. m. Pop. in 1832, 113,677. The W. part, watered by the Saale, is hilly and woody; while the E. part, watered by the Pleisse, is flat and fertile. The inhab. who are descendants of the Wendes, are industrious and are almost all Lutherans.

ALTENBURG, the cap. of the above principality, 24 m. S. S. E. Leipzig, near the Pleisse. Lat. 50° 50' N., long. 20° 27' E. Pop. 12,625. It is well built; has a gymnasium with a considerable library, a foundation for noble ladies, an orphan asylum, and a theatre; with manufactures of wool, tobacco, sealing-wax, gloves, and an extensive trade in wood, corn and cattle.

ALTENBURG, a town of Hungary, 29 m. S. S. E. Knokiusburg, in an island of the Fritha, at the point where it unites with the right arm of the Danube. It has a gymnasium, and an old castle, now used as a corn magazine. It was burnt by the Turks in 1683.

ALTENKIRCHEN, a town of the Prussian States, prov. Rhine, cap. circ., on the Wied, 16 m. N. Coblenz. Pop. 1,150. It has some fabrics of linen and cotton, and a forge. The vicinity of this town, was, in 1796, the theatre of some obstinate conflicts between the French and Austrians; in one of which, on the 21st September, the brave General Marceau was killed.

Brief, brave, and glorious was his young career;
His mourners were two hosts, his friends and foes.—BRYAN.

ALTENSTEIG, a town of Württemberg, circ. Black Forest, 5 m. W. N. W. Nagold. Pop. 1,700. It is built on the declivity of a steep hill, at the summit of which is an old castle.

ALTER-DO-CHAO, a town of Portugal, prov. Alentejo, on the Avis, 14 m. W. S. W. Portalgale. Pop. 2,000. It is surrounded by walls.

ALTKIRCH, a town of France, dep. Haut Rhin, cap. arrond., 34 m. S. Colmar. Pop. 3,028. It is situated on a hill, at the bottom of which is the Ill; has some tanneries, and a cattle fair once a month.

AL TOMONTI, a town of Naples, prov. Calabria Citra, 24 m. N. N. W. Cosenza. Pop. 2,100. It is situated on an eminence, has good air, with mines of iron and silver, and a brine spring in the vicinity.

ALTON, a town of the U. States, Illinois, on the Mississippi, a little above its confluence with the Missouri. This town was founded so late as 1818, and in 1832 it contained only two or three dozen houses. But the public attention having been then directed to its advantageous situation for commerce and navigation, it has since advanced with extraordinary rapidity; and at present (1838) it has probably from 2,500 to 4,000 inhab. ! There can be little doubt that it is destined to become an important commercial emporium. (*Illinois in 1837*, p. 113.)

ALTON, a m. town and parish of England, co. Hants, hund. Alton, on the Wye, 47 m. S. W. by S. London. It is a neat town, with manufactures of druggets and worsteds. Pop. 2,742.

ALTONA, or **ALSTENA**, a considerable city of Denmark, in Holstein, on the Elbe, 2 m. W. Hamburg. Pop. 26,400. It is well built, is a free port, and enjoys various privileges: it having been a favourite object with the Danish government to attract to it some portion of the wealth and commerce of Hamburg. But in this they have had but little success. Altona has, however, a good deal of trade; ship-building is also carried on to a considerable extent; and there are manufactures of cotton, silk, leather articles, &c., with sugar-houses, breweries, and distilleries. There is here a superior academy or college, a public library, a mint, an orphan-house, with numerous churches, &c. The inhabitants are mostly Lutherans. Altona was burned by the Swedes in 1713, under circumstances of great barbarity.

ALTORF, or **ALTDORF**, a town of Switzerland, cap. cant. Uri, delightfully situated in a narrow valley surrounded by lofty mountains, near the S. E. extremity of the lake of Lucerne, at the N. extremity of the pass over Mount St. Gothard, lat. 46° 55' 10" N., long. 8° 37' 47" E. Pop. circa 1700. It suffered severely from a fire in 1799, but has since been rebuilt on an improved plan. It has a handsome parish church, a town-house, and a Capuchin convent, with a library attached. Altorf is intimately associated with the true or fabulous history of William Tell. He is said to have been born in Burglen,

a village close by; and an old tower, in the town of Altorf, covered with paintings in honour of Tell, is said to mark the spot whence he shot the apple off his son's head. (*Ébel, Manuel de Voyageur en Suisse; Ingli's Switzerland*, p. 105, &c.)

ALTRINGHAM, a town of England, co. Chester, 8 m. Manchester. Pop. 2,708. It is a neat thriving town, with factories for the spinning of cotton, linen yarn, &c.

ALTSÖHL, a free town of Hungary, at the confluence of the Sztatna with the Gran, lat. 48° 34' 55" N., long. 19° 7' 20" E. Pop. 2,000. It is old, and is entirely occupied by Slavonians. On a hill in the neighbourhood are the ruins of a castle, said to have been a favourite residence of Mathias I.

ALTSTETTEN, a town of Switzerland, cant. St. Gall, 9 m. S. from the embouchure of the Rhine in the Lake of Constance. Pop. 4,800. It is situated on the declivity of a mountain in a beautiful country, surrounded with corn-fields and vineyards; has a fine church which serves both for Catholics and Protestants, a public library, a muslin manufactory, and three fairs annually.

ALTURA, a town of Spain, Valencia, 3 m. N. W. Segorbe. Pop. 3,000. It has distilleries, potteries, and a paper-mill. The country round produces a great deal of wine.

ALVA, a village and parish of Scotland, co. Stirling, 7 m. N. E. Stirling. Pop. 1,300. The Devon iron company has considerable works here.

ALVARADO, a small town of Mexico, near the mouth of the river of the same name, 40 m. S. S. E. Vera Cruz, lat. 18° 34' 18" N., long. 65° 39' 15" W. The bar at the mouth of the river, about 1½ m. below the town, renders it inaccessible for vessels drawing above 10 or 12 feet water; large ships being in consequence obliged to anchor in the roads, exposed to all the fury of the N. winds, which often blow with much violence. During the period that the castle of St. Juan D'Ulloa continued in possession of the Spaniards, after Vera Cruz had thrown off their yoke, the trade of the latter was principally carried on through Alvarado; but upon the reduction of the castle by the patriots, it speedily reverted to its old channel.

ALVINCZ, a town of Transylvania, on the Maros, opposite Roberick, 7 m. S. W. Karlsburg. Pop. 3,300, almost all Magyars and Bulgarians.

ALVITO, a town of Naples, prov. Terra-di-Lavore, 6 m. S. E. Sorso. Pop. 2,800. It is built on the declivity of a hill, in a hilly situation; has an hospital, and several *monte-de-piété* for the marriage of young girls.

ALWUL, a large town of Hindostan, prov. Delhi, cap. dominions of the Macherri Raja, 90 m. S. S. W. Delhi, lat. 27° 44' N., long. 76° 32' E. It is situated at the base of a steep hill, and is strongly fortified. On the summit of the hill, about 1200 feet high, is a fortress containing several tanks.

ALYTH, a town and parish of Scotland, co. Perth, 12 m. W. Forfar. Pop. 2,888. The soil is fertile, and the town, which is finely situated, carries on some branches of the linen manufacture.

ALZEY, a walled town of Hesse Darmstadt, on the Selz, 18 m. S. S. W. Mayence. Pop. 2,200. It has manufactures of linen and stockings, and tanneries.

ALZIRA. See **ALCIRA**.

ALZONNE, a town of France, dep. Aude, at the confluence of the Lampy and the Fresquel, near the canal of Languedoc, 12 miles W. N. W. Carcassonne. Pop. 1,644. It has manufactures of fine cloth caps, &c.

AMAK, a small Danish island, on which a part of Copenhagen is built. It is principally laid out in gardens and pleasure-grounds.

AMALFI, a city and sea-port of Naples, 9 m. W. S. W. Salerno. Pop. 3,500.* This city attained during the early part of the middle ages to great distinction as an independent maritime republic; and was the first Italian state that traded with Egypt and the shores of the Mediterranean. In the zenith of her prosperity, in the 11th century, Amalfi is said to have contained 50,000 citizens; and her wealth, and the skill and intrepidity of her mariners were then unequalled. But after being reduced by the Normans, she was taken and sacked by the Pisans, in 1130; and from this period she rapidly declined, and not long after fell into obscurity. A unique copy of Justinian's Pandects, said to have been found by the Pisans among the spoils of this city, was believed, though, as Savigny has shown, without much foundation, to have led to the revival of the study of the civil law; and Amalfi is also famous for having been the birth-place of Flavio Gioja, supposed by some to have been the inventor of the mariner's compass, but who it is certain was only its improver. (*Gibbon's Decline and Fall*, cap. 56. *Rampoldi, Cronografia dell' Italia*.)

AMAND-LES-EAUX (ST.), a town of France, dep.

* Rampoldi says 11,000; but we have no doubt that this is very far beyond the mark. Most authors set down the population at from 2,500 to 3,500; and the amount given to us by Rampoldi seems quite inconsistent with the accounts as to the decay of the place.

du Nord, cap. cant., on the Scarpe, 74 m. N. W. Valenciennes. Pop. 8,566. This town is celebrated for its mineral waters, whence its name; it is very ancient, has a communal college, and the ruins of a celebrated abbey, destroyed at the revolution. It is situated in a rich well cultivated country, where the flax is produced (*lin ramé*) of which the finest laces are made. These are manufactured in the town, with woollen stockings, cotton coverlets, soap, linseed oil, chicory, &c. It has also distilleries, tanneries, and a great fair held on the 31st May.

AMAND-MONT-ROND (ST.), a town of France, dep. Cher, cap. arrond., at the confluence of the Marmande with the Cher, and at one of the extremities of the canal, joining the Cher and Loire. Pop. 7,392. It is well built, has a *tribunal de première instance*, a commercial college, and a theatre. It manufactures wooden clogs and leather; and there are forges, cannon foundries, and porcelain manufactures in the neighbourhood. It is the most commercial town of the dep.; the exports consist principally of the produce of the surrounding country, viz., timber, staves, iron, wine, chessnuts, rattle, lather, hemp, wool, goatskins, &c.

AMAND (ST.), the name of several small villages in different parts of France.

AMANTEA, a sea-port town of Naples, prov. Calabria Citra, cap. cant., 14 m. S.W. Cosenza. Pop. 7,000. It is encircled by walls; has an old castle, 4 parish churches, some convents, and a school for *belles-lettres*. There are hot springs in its vicinity; and its territory has the appearance of a continued olive wood. It is supposed to occupy the site of the ancient *Nepesina*. It was taken by the French in 1806, after an obstinate defence.

AMANTEPE, an ancient town of Portugal, prov. Minho, on the Tanaga, 35 miles N. E. Oporto. Pop. 5,600. It is situated in an agreeable valley, is well built, has a fine bridge, an hospital, an hospicio, two churches, and a Latin school.

AMARUPURA (vulg. *Ummrapura*), a city, and formerly the cap. of the Birman empire, on a peninsula between the Iravadi on the one hand, and a deep and extensive lake on the other, 6 m. N.E. Ava, lat. 21° 55' N., long. 96° 7' E. In 1800, the pop. was estimated by Captain Cox at 175,000; but the seat of government having been transferred to Ava in 1819, it has since rapidly declined, and is now an inconceivable place. It has a fort, which the Birman look upon as impregnable; but which a well-served battery would breach in a few hours. The circumstance of most of the houses consisting of wood and bamboos, accounts for the rapid decay of the place since 1819. Near the city is a temple, much frequented by devotees, containing the celebrated bronze statue of Gnahna, brought from Arracan in 1784. (*Hamilton's E. I. Gazetteer*; *Crawford's Ava*, p. 274.)

AMASIEII (an. *Amasia*), an ancient city of Asiatic Turkey, cap. sanjak of same name, in the E. part of Naticolia, on the *dekil Ernak*, lat. 40° 35' N., long. 36° 26' E. The situation is peculiar, being difficult of access, and having a citadel on a sharp-pointed rock, connected with the hills whereon the town stands. Outside the walls are some curious caverns; and in the upper part of the town, are to be seen the ruins of a temple, a fountain, and aqueducts, mentioned by Strabo. Most of the houses are of wood, but many are of stone, and all are covered with tiles. Streets narrow and filthy. The mosque of Sultan Bayazid is a fine edifice, with two lofty minarets of hewn stone. Great quantities of silk and wine are produced in the surrounding country, and some branches of the silk manufacture are carried on in the town, which has a considerable trade. There is a great discrepancy in the accounts of the population. According to Fontanier, it has 10,000 houses; whence the population might be estimated at 50,000 or 60,000; but others do not estimate it nearly so high. Strabo, the most celebrated geographer of antiquity, belonged to Amasia, and has left a very minute description of this his native city.

AMASIEII, a sea-port town of Asiatic Turkey, Naticolia, on the Black Sea, lat. 41° 45' 27" N., long. 32° 21' E. It is built on the declivity of a hill, on a peninsula between two works; but its proper roadstead is on the E. side of the isthmus, at a short distance from land, in 3 or 4 fathoms. Its commerce is inconsiderable. There are in the town the ruins of a temple of Neptune, and some other antiquities.

AMATRICE, a town of Naples, prov. Abruzzo Ultra II., cap. cant., on a pleasant hill, near the source of the Tronto, 22 m. N. Aquila. Pop. 5,000. It has 5 parish churches, 2 *monts-de-piété*, a school of *belles-lettres*, and a manufacture of counterpanes.

AMAXICHI, a sea-port town, cap. Santa Maura, one of the Ionian islands, near its N. E. extremity, on a bay of the narrow strait separating the island from the opposite coast of Albania, lat. (castle) 36° 50' 15" N., long. 20° 43' E. Pop. 6,000? The access to the town by sea is defended on the N. by the strong castle of Santa Maura, and about 14 m., and on the S. by Fort Alexander, on

the narrowest part of the strait. The town is meanly built. Owing, probably, to the prevalence of earthquake, most part of the houses are of wood, and only one story high; but those in the principal street are somewhat superior. It is the residence of the governor, and of a Greek bishop. Extensive salt marshes, or rather lagoons, lie between the town and the castle of Santa Maura, the communication with the latter being kept up by a causeway supported on low arches. The harbour, though improved by the construction of an extensive mole, is fit only for small craft. In summer, the town, owing to the neighbouring marshes, is unhealthy.

AMAZON, MARANON, or ORELLANA, the principal river of S. America, and perhaps the largest in the world. It is formed by the united waters of the Tunguragua and Ucayale; it being doubtful which of these should be considered as the main stream, though the precedence has generally been given to the first. The Tunguragua takes its rise from the lake of Llauricocha, in Peru, in 10° 30' S. lat., within 60 m. of the Pacific Ocean, while the Ucayale is formed by the junction of the Apurimac and Taro, the source of the former being near Arequipa, in about the 16th deg. of S. lat. Both rivers follow at first a northerly course, inclining to the W. the Tunguragua till it reaches Jam, in about 54° S. lat. and 78° W. long., and the Ucayale till it unites with the other at St. Miguel Yarnapa, in about 44° S. lat., and 72½° W. long. The course of the river is therefore generally from W. to E. till it falls into the Atlantic, almost under the equator, in about 51° W. long. Taking the Apurimac for its source, and following its windings, its course may be stated at above 4,700 m. It is studded with innumerable islands, many of which are from 10 to 15 m. in circ., and some much more. Its mouth, which is 180 m. in width, has the large island of Cayana in its centre, and marking its extreme limit. The rise and fall of the tide is distinctly felt at Obidos, 400 m. inland. At its mouth, two days before and after full moon, the phenomenon of the *bore* occurs in a very formidable shape; the water from the ocean rushing into the river, with a prodigious force and noise, in two, three, and sometimes four successive waves, each presenting a perpendicular front, from 10 to 15 feet in height! No small vessel can encounter it without certain destruction.

Of the rivers which fall into the Amazon, after the junction of its two great branches from the N., those most important are, the Napo, Putumayo, Yapura, and Rio Negro, the latter having a course of from 1,400 to 1,500 m. To the S. the principal tributaries are the Yavari, Yntay or Yotan, Yuma, Madeira, Topajos, and Xingu. Of these the Madeira is by far the largest, and would any where, except in America, be reckoned a river of the first magnitude. Its course may be estimated at about 1800 m.

The Amazon, and its tributaries, afford perhaps the greatest extent of inland navigation of any river system in the world. Its amount may be moderately estimated at from 40,000 to 50,000 m. The Amazon itself is navigable to the E. part of the Andes, 2,000 m. in a direct line from the sea. The navigation to the Pongo de Manseriche, in about 76½° W. long., is not interrupted by a single cataract or rapid. Its channel is deep; and it may be navigated by vessels of almost any burden, up to the junction of its two great arms. During the swell in the rainy season the current is rapid; but at other times it may be stemmed not by steam only, but by the aid of the E. breeze which blows perennially against the current. At Jam, in 78° W. long., the level of the stream is only 1,240 feet above that of its estuary at Cayana, so that its descent is not at an average rate of a foot every 2 m.; and during the latter part of its course it is much less.

At present the vast and fertile country traversed by the Amazon, and its affluents, is nearly in a state of nature, being mostly covered with immense forests, affording cover to wild beasts, and all descriptions of reptiles. During the period of the inundation, a great extent of the low country, on both sides the river, is laid under water. There can, however, be little doubt that, at some future period, all its immense basis, comprising above 2,400,000 sq. m. will be occupied by civilised nations. The Amazon will then be one of the most important and valuable, as well as extensive channels of communication in the world.

A communication exists between the waters of the Amazon, and those of the Orinoco. In fact, Humboldt passed by water from the Rio Negro, the principal N. affluent of the former, into the Casiquari, an affluent of the latter, and thence into the main stream of the Orinoco.

The mouth of the Amazon was discovered in 1500, by Vincent Yancz Pincon, but very little was known respecting the river, till 1539, when Francis D'Orellana, a Spanish adventurer, having embarked on the Rio Napo, one of its remote tributaries, and following the current, was carried down the stream to its embouchure. Orellana having reported that armed women were met with

on its banks, it thence obtained its popular name of Amazon, though it be still sometimes called Orellana from its explorer. The origin of the town Marañon is not certainly known. According to Condamine, it is the name of a Spanish officer, who visited the river previously to Orellana; but this is very doubtful, and the more probable opinion seems to be, that it is derived from an Indian nation of that name, which had inhabited some part of its banks. The Amazon was first accurately described by M. de la Condamine, who having embarked upon it, in 1743, near Jaen, and followed its current to its mouth, gave an interesting account of the expedition, with a map of the river, in his *Voyage de la Rivière des Amazones*, Paris, 1745. See also Humboldt's *Travels*; *Journal of Geographical Society*, ii. p. 650.; *Encyc. Britannica*, art. *America*, &c.

AMBAZAC, a town of France, dep. Haute Vienne, cap. cant., 12 m. N. N. W. Limoges. Pop. 2,736

AMBEER, a town of Hindostan, the ancient cap. of the Jeypoor territory, 5 m. N. by E. Jeypoor, lat. 26° 57' N., long. 75° 40' E. The town, romantically situated on the margin of a lake, is now in ruins. In its vicinity is a fine old fortified palace, and a large castle. The former has a noble hall of audience, and some beautiful apartments, enjoying from their windows, balconies, &c. one of the most striking prospects that can be conceived, (*Heber*, ii. p. 416.)

AMBELAKIA, a town of Turkey in Europe, sanjak Tricala, or Thessaly, on the W. declivity of Mount Ossa, near the Peneus, 15 m. N.N.E. Larissa. This place was distinguished, during the latter part of the last and the first part of the present century, by the industry of its inhabitants, and the skill and success with which they carried on the business of spinning and dyeing cotton yarn. The townspeople, who were wholly Greeks, formed a sort of independent community, and either defended themselves from the exaction of the Turks, or were neglected by the latter. At first individuals carried on business on their own account, on the principle of free competition; but thinking that their profits would be increased by carrying it on in common, they formed themselves into an association on a joint stock principle. For a while this succeeded perfectly well; but, in the end, the parties quarrelled among themselves, and the fruits of their industry were swallowed up in expensive and protracted litigation. At length the staple trade of the place was totally annihilated by the importation of cheaper yarn from England; the produce of our spinning mills having not merely superseded the hand-spun yarn of Ambelaki in foreign markets, but in those of Turkey itself. The town and surrounding country have since become comparatively poor and depopulated. In the acme of its prosperity it might have 7,000 inhab. (*Urquhart's Spirit of the East*, ii. p. 14, &c.)

AMBERG, a town of Bavaria, circ. Regen, on the Vile, by which it is intersected, 31 m. N. N. W. Ratibon. Pop. 8,000. It was formerly the capital of the Upper Palatinate; streets wide and clean; and though the houses be mostly of wood, it is a pretty well built. It is encircled by a double wall, flanked with numerous towers. Principal public buildings the electoral, now royal castle, arsenal, mint, salt-warehouse, town-house, church of St. Martin, &c. It has a lyceum, a gymnasium, a seminary for the education of teachers, some well endowed hospitals, a convent for noble ladies, a public library, theatre, and house of correction. It is an entrepôt for salt, and has manufactures of fire-arms, tobacco, earthenware, &c. There are mines of coal, and iron, with iron-works, forges, &c. and the principal glass-works in Bavaria in its vicinity. Its territory is also very productive of hops. It is the seat of a tribunal of appeal, a commissariat of police, a president and a chamber of finances.

AMBERIEU, a town of France, dep. Ain, cap. cant. Pop. 2,800.

AMBERT, a town of France, dep. Puy de Dome, cap. arrond., on the Dore, 36 m. S. E. Clermont. Pop. 8,016. The town is pretty well built; but the streets are narrow and crooked, and the houses, being principally constructed of granite, from the adjoining mountains, have a gloomy, dismal-looking appearance. Ambert, and the arrondissement of which it is the capital, are distinguished by their industry. The town is especially celebrated for its paper for printing and engraving, in the manufacture of which it employed, in 1834, 102 machines (*cuers*), each of which required the assistance of 10 persons, and consumed annually about 23,000 kilog. of rags, and produced 11,000 kilog. of paper. Workmen employed in the paper trade, earn about 1 fr. 60 cent. a day, and women from 50 to 55 cent. a combination has existed among the work-people in this trade since the 15th century, and they are said sometimes to give the law to their masters. There are also in the town very extensive manufactures of ribands, lace, woollen cloths for the marines, called *écarlates à pavillon*, serge, linens, pins, &c. The value of the linen annually produced in the arrondisse-

ment is reckoned at 900,000 fr.; 2,350 work-people are employed in the manufacture of lace, besides those in the riband and other trades. The trade of the town is very considerable. It is the principal market for the famous cheese *dites d'Auvergne*. (*Hugo, France Pittoresque*, tom. ii. p. 8.)

AMBLETEUSE, a small decayed sea-port town of France, dep. *Pas de Calais*, 6 m. N. Boulogne. Pop. 581. It was formerly a sea-port of considerable importance; and both Louis XIV. and Napoleon endeavoured, by improving its harbour, to regain for it some portion of its ancient consequence. But, owing to the accumulation of sand, their efforts have had no permanent influence, and the town is almost deserted. James II. landed here after his abdication of the English throne, in 1689.

AMBOISE, (an *Ambacia*), a town and castle of France, dep. Indre et Loire, cap. cant., on the left bank of the Loire, 15 m. E. Tours. Pop. 4,695. The castle occupies the summit of a rock, about 90 feet in height. The town *singulièrement triste et laide*, lies principally between the bottom of the castle rock and the river; but it has suburbs on an island in the river, and on its right bank. The castle, which is of vast extent, was commenced under Hugh Capet, and finished under Charles VII.; it was a favourite residence of Louis XI., and in it Charles VIII. was born in 1470, and expired in 1498. It is also famous in French history as the birth-place of the conspiracy, *dite d'Amboise*, against the Guises, concerted in 1560. It suffered much during the religious wars, and was partly demolished during the revolutionary phrenzy. The remaining portion is now converted into a dépôt for the flints for the use of the French army, brought from the quarry of Meuse, near St. Aignan. The views from its towers and battlements are superb.

A manufacture of files, grates, and cemented steel, established at Amboise in 1780, continues to flourish, and employed, in 1835, about 160 workmen. It consumes annually above 200,000 kilog. of fine steel, its products being estimated at 200,000 packets of files, *dites d'Allemagne*, 50,000 dozens do. after the English fashion, 2,000 packets do., *dites de Nuremberg*, and 6,000 *carreaux*. The manufacture is under the able direction of M. St. Bris. There is also in the town a manufacture of arms, with tanneries, &c. A handsome wooden bridge, with stone piers, erected in 1822, connects the town with its suburb on the opposite side of the river. (*Hugo, France Pittoresque*, ii. p. 104, &c.)

AMBOOR, a town of Hindostan, in the Carnatic, district S. Arcot, 108 m. W. S. W. Madras, lat. 12° 50' N., long. 78° 46' E. It is neat and regularly built; the inhab., who are industrious, prepare a considerable quantity of castor oil for exportation. To the left of the town is a lofty isolated mountain, that was formerly surmounted by an all but impregnable fort; but its upper works have been destroyed since it came into the possession of the British, and the tower is used as a place of confinement for malefactors.

AMBOYNA (*Ambun*, Malay), an island of the E. Archipelago, in its third or E. division (*Crawford*), belonging to the Dutch. It lies in 3° 40' S. lat.; between 128° and 129° E. long. S. W. of Ceram, is 32 m. in length, and 10 in breadth; area 424 sq. m., pop. 45,000 (*Cannabich*, 1837). Its shape is irregular, being indented by a long bay (Binnen), which divides it into two very unequal portions, connected by a narrow isthmus. Surface mountainous. It is watered by numerous rivers, and overgrown everywhere by trees and underwood, interspersed with clove plantations; its soil, a rich red loam, is of a darker colour in the valleys, and sometimes mixed with sand; climate healthy, the average heat of the year 82° Fah., the lowest temperature 72° F. The monsoons occur regularly, but their effects are quite the reverse of those experienced in Borneo, and the W. division of this Archipelago; the E. monsoon bringing rains, and tempests, and the W. dry weather. The Dutch appropriated this island to the culture of the clove, for the production of which it is especially calculated; and to secure to it a monopoly of this valuable product, barbarously compelled the destruction of the trees in the other islands subject to their power. The clove (*gomode*, Tidor lang.) thrives best in a dark loamy soil, but not very near the sea, on hills, on sandy or hard clay soil, or on sedge grounds, and requires much care in its culture. The plant resembles a large pear tree, from 20 to 40 feet in height. In the Moluccas it bears at 7 or 8 years, in Amboyna not till 10 or 12 years old; about one-third of the trees are infertile, the rest may continue to bear fruit for 70 years. The crops are gathered in Oct. and Nov., they are very unequal in different years, but the produce of each tree may average from 2 or 3 to 5 lbs.; the total annual produce is said formerly to have been 650,000 lbs. (*Hamilton*.) Sago forms the chief nourishment of the inhabitants, and very superior igidjo, but inferior coffee, are also grown. Sago trees are 7 years in arriving at full growth, and last

N. America is more indented than any other of the great divisions of the globe, with immense gulphs and arms of the sea. One of the principal of these, in the N. E. part of the continent, consists of what Balbu has not unaptly called the sea of the Esquimaux, from its coasts being every where occupied with tribes belonging to that peculiar race. It consists of two great divisions, Davis's Straits and Baffin's Bay, separating Greenland from the rest of the continent; and Hudson's Bay, lying more to the S. and W., but connected with the former by numerous channels, some of which have only been recently discovered. The navigation of these seas and inlets, even at the most favourable seasons, is extremely difficult, from their being constantly encumbered with ice; and it is only during a short period of the year that it can be attempted. The next great inlet of the sea on the American coast is the Gulph of St. Lawrence, so called from the great river of that name which falls into its S. W. extremity. Passing over the numerous inlets and noble bays on the coast of the United States, we come to the Gulph of Mexico and the Carribean Sea.

This vast mediterranean is separated from the Atlantic by the peninsula of Florida, and the Greater and Lesser Antilles, or the West Indian islands. The latter are, as it were, a continuation of Florida; and are, it is probable, the only remaining points of what was once a broad belt of land, which has been broken to pieces and partly submerged in some of those tremendous convulsions to which the earth has been subject. But, however this may be, this great inland sea is divided into two portions by the peninsula of Yucatan and Cape St. Antonio, at the W. extremity of the island of Cuba, which approach within a comparatively short distance of each other; that to the N. being called the Gulph of Mexico, and that to the S. the Carribean Sea, or the sea of the Antilles. The Isthmus of Panama is at the extreme S. limit of the latter, in about the 8th deg. of N. lat. It is believed that it would be by no means difficult to cut a canal across this isthmus, and consequently to unite the Atlantic and Pacific oceans. The Gulph of California, separating the peninsula of that name from the main land, is the most important inlet of the sea on the W. coast of N. America.

S. America bears a striking resemblance in the form of its coasts to Africa. It is much more compact than N. America, and is comparatively little indented by arms of the sea. The great rivers, Amazon, La Plata, Para, Orinoco, &c., may, however, be looked upon as a species of inland seas; and are, in some respects, more serviceable than the latter. The W. coast of America, from the proximity of the Andes, has but few gulphs; and is, in great part, all but destitute of harbours. The S. extremity of S. America, or the country of Tierra del Fuego, is properly an archipelago, being separated from the continent by the narrow and winding strait of Magellan, or Magalhaens.

Mountains.—Humboldt has shown that all the high elevations of the New World belong to that great chain which, under different denominations, extends from one of its extremities to the other, along its western coast, over a space of no less than 10,000 m. The American mountains may, however, be divided into *eight* systems, or principal groups, three of which belong to S., and three to N. America; and one each to the West Indian and Arctic archipelagos.

1st. Of these systems, that of the Andes, or Peruvian system, from the highest mountains being in the country formerly known by the name of Peru, is by far the most gigantic. This vast chain of mountains commences at Cape Horn, in about the 56th deg. of S. lat., and following pretty closely the line of the W. coast of the continent, to which it forms as it were a huge bulwark, stretches N. to the Bay of Panama, in about the 9th deg. of N. lat. But at Popayan, in about 21° N. lat., the chain is divided into three great ridges, of which the most westerly takes the direction above mentioned, while that farthest to the E. follows a N. E. direction, terminating a little to the E. of lake Maracaybo. The name *cordillera*, sometimes given to the entire chain, belongs properly only to the highest ridge. In parts the chain consists of only one ridge, and in others of 2 or 3, enclosing Alpine valleys of a vast height and sometimes of great extent. It has, next to the Himalaya chain, the highest summits known to exist; and its mean elevation may be taken at from 10,000 to 12,000 ft. Chimborazo, near Quito, 21,400 ft. above the level of the sea, was formerly supposed to be the highest summit of the Andes; but the researches of Mr. Pentland have shown that it is far surpassed in

altitude by Zorata and Ilamani, near lake Titicaca, which respectively rise to the prodigious elevation of 25,250 ft. (nearly 10,000 ft. higher than Mont Blanc) and 24,000 ft. (See *ANDES*).—2d. The system of La Parime, or Gnyana, embraces the mountains scattered over the immense island formed by the Orinoco, Cassiquari, Rio Negro, and Amazon. It consists of an irregular group of mountains, separated from each other by plains, savannas, and immense forests. The Sierra de Parime may be regarded as its principal chain. The Peak of Duida, 8,312 ft. in height, is the culminating point of the chain and of the whole system. 3d. The Brazilian system, embracing the mountains that lie between the Amazon, Paraguay, and Rio de la Plata. The Sierra de Espinhazo is its most elevated chain. It traverses, under different denominations, the provinces of Bahia, Minas-Geraes, Rio de Janeiro, San Paulo, and the northern extremity of the province of San Pedro. Its culminating points are Itambe and the Sierra da Piedade, nearly 6,000 ft. high, in the province of Minas-Geraes.—4th. In N. America, the principal mountain system is that of the Mexican Alps, and Rocky Mountains, which may be regarded as a continuation of the Andes. In Mexico, it is divided into three distinct ridges; within which, between the parallels of 19° and 24° N. lat., are immense plateaus elevated to the height of between 6,000 and 9,000 ft. The central cordillera of Mexico stretches N. 10° W. from the 25th to the 38th deg. lat., separating the waters of the Rio del Norte, flowing S. E. from those of the Colorado, flowing S. W. The highest peaks in the ridge in Mexico, are the volcanoes of Popocatepetl, 17,000 ft., and Orosaba, 16,365 ft. From about the 38th deg. the ridge, which then begins to be called the Rocky Mountains, stretches N. 28° W., till it terminates near the mouth of the Mackenzie River, on the Arctic Sea, in about the 69th deg. of lat. and 138th deg. of W. long. Some peaks in this chain, between 52° and 53°, are said to be nearly 16,000 ft. above the level of the sea; and others between 37° and 39°, have been ascertained to be from 10,000 to 12,000 ft. in height. We have no accurate information respecting the height of the passes of the Rocky Mountains, nor of the altitude of their base above the sea; but on their E. side is a very extensive tract, dry, sandy, and almost a desert. 5th. Parallel to the Rocky Mountains, and at no great distance from the sea, a chain of mountains runs N. from the peninsula of California, till it is lost in Russian America. This chain, which has been called by Humboldt the Californian Maritime Alps, increases in altitude as it gets further N. Mount Hood, near the 45th deg., on the S. side of the Columbia or Oregon river, is said to be about 16,000 ft. high; and Mount St. Helen's, about a degree further N. on the N. side of the Columbia, has an elevation of 14,000 ft. Mount Fairweather, in the 59th deg., is also 14,000 ft. high, and Mount St. Elias, the loftiest in the chain, attains to an elevation of about 17,000 ft. The last two are volcanoes. Between the Rocky Mountains and the Maritime Alps, is an extensive prairie tract, 700 m. in length, by from 100 to 200 m. in breadth. The Rocky Mountains and the Maritime Alps are connected by a ridge in about the 42d deg. lat., dividing the waters which flow N. to the Columbia from those which flow S. to the Colorado.—6th. The mountains E. of the Mississippi do not at all approach the Rocky Mountains in magnitude. They are included in what is called the Alleghany or Appalachian system, extending in a N. E. by N. direction

from Alabama, on the N. confines of Georgia, to the banks of the St. Lawrence, being about 1,200 m. in length, with a mean breadth of 100 m. The White Mountains of New Hampshire, 7,300 feet above the level of the sea, are the highest in this range, which is crossed by the tidal waters of the Hudson river. The immense valley of the Mississippi lies between the Rocky and the Alleghany chains. — 7th. Balbi proposes to embrace, under the denomination of Arctic system, all the mountains that are already, or that may hereafter be discovered within the Arctic archipelago. The culminating points of that system, in so far as they are at present known, are the Corn du Cerf, in Greenland, the height of which has been much exaggerated, but which is probably above 8,000 ft., and the Aeraefi Taekull, in Iceland, 6,649 ft. — 8th. The system of the Antilles embraces the mountains in the archipelago of that name. Its culminating points are, the Anton-Sepo, in Hayti, nearly 9,600 ft. in height; and the Sierra de Cobre, in Cuba, the most elevated summits of which attain about the same height.

Plateaus. — America has a great variety of plateaus, some remarkable for their prodigious elevation, and others for their immense extent. Under the former are included the plateau of Titicaca, divided between Bolivia and Peru, comprising an area of about 18,000 sq. m., with a mean elevation of above 13,000 ft. The populous and well cultivated plateau of Quito is elevated about 9,600 ft.; and the extensive plateau or table land of Anahuac, in Mexico, from 6,000 to 9,000 ft. Among the latter, or those principally remarkable for their extent, may be mentioned the central plateau of S. America, embracing the vast province of Matto Grosso, with parts of Goyaz and San Paulo, in Brazil, the whole of Paraguay, Chaco in the confederation of the Rio de la Plata, and a part of the lands of the Chiquitos and Moxes in Bolivia. Its elevation varies from about 750 to 1280 feet.

Volcanoes. — America has a great number of volcanoes, and some of the most elevated volcanic mountains in the world. The departments of the Equator and of Cauca in Columbia, the states of Nicaragua, San Salvador, and Guatemala in central America, Chili, Russian America, and Iceland in Danish America, contain a great number of volcanoes. The most remarkable volcanic mountains are, Cotopaxi, Sangway, and Pichincha in the Columbian department of the Equator; Pasto, Sotara, and Purace, in that of Cauca; Guagua-Pilitina, or the volcano of Arequipa, and Sehama in Peru; the volcanoes of Copiapo, Chilan, Antoco, and Peteroa, in Chili; those of Socomusco, Guatemala, or Puego, Agna, Pacaya, San Salvador, Granada, and Telica, near St. Leon, of Nicaragua, in central America; Popocatepetl, or the volcano of Puebla, Citlatepetl, or the volcano of Orizaba, the volcano of Colima, and that of Xorullo, in the Mexican confederation; St. Elias, and Fairweather, in the Californian Alps; the two volcanoes of the peninsula of Alaska, and those of the Aleutian islands; with Hekla, and others in Iceland.

Plains. — In no other part of the world are the plains so vast. The immense space from the outlet of the Mackenzie River to the Delta of the Mississippi, and between the central chain of the Mexican system and Rocky Mountains, and the Alleghany, forms the largest plain, not of America only, but of the world; it embraces the basins of the Mississippi, the St. Lawrence, Churchill or Nelson, almost the whole basin of the Missouri, nearly the whole basins of the Suskatchewan

and Mackenzie River, and the entire basin of the Coppermine River. Four fifths of that portion of this vast plain, which lies beyond the 50th deg. of lat., is a bleak and barren waste over-spread with innumerable lakes, and bearing a striking resemblance to N. Asia; but its more southerly portion, or that lying W. of the Alleghany chain, and N. from the Gulph of Mexico, differs widely in character from the other, being well wooded and fertile on the E. side, bare but not infertile in the middle, and becoming almost a desert in the extreme W. The second great plain of the New Continent is that of the Amazon: it embraces the whole central part of S. America, comprising more than half Brazil, with south west Columbia, the eastern part of the republic of Peru, and the northern part of Bolivia; its limits are nearly identical with those of the middle and lower parts of the immense basin of the Amazon and Tocantim. The plain of the Rio de la Plata extends between the Andes and their principal branches, and the mountains of Brazil, to the Atlantic Ocean and the Straits of Magellan. It embraces the south-west part of Brazil, Paraguay, the country of the Chiquitos, Chaco, with the greater part of the confederation of the Rio de la Plata, the state of Uruguay, and Patagonia. A large portion of it is known by the name of the *Pampas* of Buenos Ayres, or Rio de la Plata. The plain of the Orinoco, embracing the Llanos of New Granada and Venezuela in Columbia, extends from Caqueta to the mouth of the Orinoco, along the Guaviare, Meta, and lower Orinoco. In some of the flat parts of America large tracts of territory are met with, which, in respect of aridity of soil, and of the sand by which they are covered, may be compared to the deserts of Asia and Africa. The most remarkable and most extensive of these tracts, are the Desert of Pernambuco, occupying a great part of the N. E. plateau of Brazil; the desert of Atacama, extending with some interruptions along the coast of the Pacific from Tarapaca in Peru, to Copiapo in Chili; and the Desert of Nuttal, at the E. foot of the Rocky mountains, between the Upper Arkansas and Paduka, forming part of the central plain of N. America.

The *Rivers of America* are on a much larger scale than those of any other portion of the globe, affording facilities of internal communication of vast importance, and quite unequalled any where else. The principal are the Amazon, Mississippi, Plata, St. Lawrence, and Orinoco. The Amazon flows E. through the broadest part of S. America, having its *embouchure* under the equator. Its entire course is estimated at about 4,700 m., and it has several tributaries, larger than the Wolga or the Danube. Uninterrupted by either rocks or shallows, it is navigable for vessels of considerable burden to the E. foot of the Andes, a distance, in a direct line, of above 2,000 m. from the sea; and though civilisation has as yet made little or no progress in the vast and fertile regions through which it flows, there can be no doubt that it is destined to become as it were a great highway for many powerful nations; and to have its banks thickly set with populous towns and emporiums.

The Mississippi, taken in connexion with the Missouri, the largest and most important stream, flows from N. to S., falling into the Gulph of Mexico, about 100 m. below New Orleans. Its course, including windings, exceeds 4,200 m.; many of its tributaries, as the Arkansas, Red River, Ohio, &c., are of great magnitude; and it drains one of the largest and finest basins

in the world. It is navigable for about 1,700 m. In a direct line from its mouth; and though civilisation has only begun to strike its roots and scatter its seeds in the wide regions through which it flows, it is already a well frequented channel of communication. But the boldest flights of imagination can hardly figure what the Mississippi will be, when the rich and fruitful countries on its banks, and those of its affluents, are all fully peopled, and making use of its waters to send abroad their surplus products, and to import those of other countries and climates.

The Plata, which runs S. with a slight inclination to the E., is the grand channel of communication to a very large portion of S. America. Its course may be estimated at about 2,500 m.; and its basin is inferior only to that of the Amazon or the Mississippi.

The St. Lawrence, with its connected lakes, or rather great inland seas, is the grand outlet of the largest freshwater system in the world. Including the lakes, its course exceeds 2,000 m. It is remarkable for the equality of its current, which is nearly uniform throughout the year.

The Orinoco has a course of about 1,800 m., and carries to the sea an immense body of water. There is a water communication between one of its affluents, the Cassiquari, and the Rio Negro, an affluent of the Amazon.

Owing to the circumstance of the Andes, and of their prolongation in N. America, being generally within a comparatively short distance of the W. coast, there is not, in most parts, room in the intervening space for the formation of any very great river. Hence, notwithstanding the prodigious length of the W. coast, it only receives two large rivers, and these not of the first class; the Rio Colorado, falling into the bottom of the Gulph of California, and the Columbia or Oregon. Their course may be estimated at about 1,100 m. each.

The Mackenzie is the only great river flowing into the Arctic sea. It has a N.N.W. course; it is connected by a series of lakes and tributary streams with lake Superior, and consequently with the St. Lawrence.

Lakes.—No part of the world has so many lakes as N. America, especially that portion between 42° and 67° lat., which might be justly called the lake region. It presents not only the greatest masses of fresh water on the surface of the globe, but so many smaller lakes and morasses, that their enumeration is almost impossible. These lakes form a most important feature in the physical geography of the new world. In the rainy season, several of them overflow their banks; and temporary communications are then established between rivers whose embouchures are frequently at immense distances from each other. Some of these communications are permanent; as, for instance, that of the Mississippi or Churchill with the Mackenzie River. The great lakes of N. America are, Lake Superior, Michigan, Huron, St. Clair, Erie, and Ontario. These, which are all connected together, discharge their superfluous waters by the St. Lawrence, and form that vast reservoir of fresh water, sometimes called the sea of Canada. (See the titles for a full description of these lakes.) The next in size and importance are Lakes Winnipeg, Athabasco, Great Slave Lake, and Great Bear Lake, stretching N.N.W. from Lake Superior to near the mouth of the Mackenzie River, and forming as it were a continuation of the Canadian lakes. There are some considerable lakes in the Mexican states; and the comparatively small

lakes of Tezeaco, Xochimilco, &c., in the valley of Mexico, are remarkable for their elevated situation, their vicinity to the capital, and the superb works undertaken to prevent the damage caused by their frequent overflowing. Lake Nicaragua, in central America, is remarkable for its size, the beauty of its scenery, its volcanoes, and from its forming the basis of the works projected for uniting the Atlantic and Pacific oceans. The limited size of the principal lakes of S. America, strikingly contrasts with the dimensions of those of N. America. The lake of Titicaca, the largest and most celebrated of the S. American lakes, is situated near the N.W. frontier of Bolivia, or Upper Peru, in an Alpine valley surrounded by ridges of the Andes. It covers an area of above 4,000 sq. m., and is elevated 12,795 feet above the level of the sea! Manco Capac made his first appearance on the banks of this lake. The basins of the Rio Colorado, or Mendoza, and Rio Negro, present several very extensive lakes; but these are really rather vast morasses, than lakes properly so called.

Islands.—A multitude of islands belong to America. We shall briefly notice the principal, in the order of the seas in which they are situated. In the Atlantic Ocean are, the archipelago of St. Lawrence or of Newfoundland, at the mouth of the Gulph of St. Lawrence: its principal islands are Newfoundland, Anticosti, Prince Edward's Island, and Cape Breton. The great Columbian archipelago, or Antilles, commonly called the West Indies, comprises a great number of islands and secondary groups, lying between the peninsula of Florida and the delta of the Orinoco. Its chief islands are, Cuba, Hayti, or St. Domingo, Jamaica, and Porto-Rico, called the greater Antilles; St. Cruz, Antigua, Guadalupe, Martinico, St. Lucia, Barbadoes, St. Vincent, Tobago, Trinidad, and several others, called the smaller Antilles. The Lucayos, or Bahama Islands, a vast secondary group, are situated to the N. of Cuba. Towards the southern extremity of the New Continent, are the Falkland or Malouine Islands, which have no fixed inhabitants; in the southern ocean is the archipelago of Magellan and Tierra del Fuego, the most southerly inhabited part of the world. By its position, at the extremity of America, it belongs as much to the ocean, to which we have assigned it, as to either the Atlantic or Pacific Ocean.

The Antarctic archipelago, or Antarctic lands, under which denomination we include all the islands situated beyond 56° S. lat., next claims attention. The greater part of these islands have been recently discovered; they are all uninhabited, are mostly covered with ice, and are important only to whale and seal fishers. The most remarkable islands and groups are, the Island of St. Peter, called by Cook, S. Georgia; the archipelago of Sandwich, the Orkneys, S. Shetland, Trinity Island, the small islands of Alexander I. and Peter I.; being at present the most southerly of the known parts of the world. The Pacific Ocean has also a multitude of islands, lying in groups, of which we can only notice the following: the archipelago of Madre de Dios, on the W. coast of Patagonia; the Campana and Madre de Dios are the largest of these islands: the archipelago of Chiloe, situated to the S. of Chili, to which it belongs, and of which Chiloe Island is the largest: the archipelago of Galapagos, situated under the equator, about 500 m. W. from the coast of Columbia, but which has no stationary inhabitants: the archipelago of Quadra and Vancouver, comprising a

great number of islands, and that of King George III., on the N. W. coast of N. America, with the Aleutian Archipelago in Russian America. In Behring's sea, are the group of Pribylof and Nou-nivok, belonging to Russia. The Arctic Ocean presents a vast number of islands, the majority of which, previously to the late voyage of discovery, were regarded as parts of the American continent. Balbi proposes to give to these islands the general denomination of Arctic lands or Arctic archipelago, and to subdivide them as follows: E. or Danish Arctic lands, comprising the great group of Greenland and Iceland, belonging to Denmark, and Jan Mayen's Island, without stationary inhabitants; the W. or English Arctic lands, extending to the W. and N. of Baffin's and Hudson's bays, the principal groups of which are, N. Devon, N. Georgia, with the islands Cornwallis, Melville, &c.; and the archipelago of Baffin—Parry, with the islands Cockburn, Southampton, New Galloway, &c.

The Climate of America is nearly as celebrated for the predominance of cold, as that of Africa for the predominance of heat. With the exception of the limited space along its W. shore, between the Andes in the S., and the Maritime Alps in the N., the temperature of the New World, in the same latitude, is every where inferior to that of the old. Countries which, from their geographical position, we should suppose would be mild and temperate, are exposed to long and severe winters, during which they are wholly covered with snow; and in point of fact, the entire continent of N. America above the 50th degree of lat. is all but uninhabitable. Even in the 45th parallel, on the N. side of the Canadian lakes, frost is continuous for more than six months. Occasional frosts occur as low down the Atlantic coast as the confines of Florida, near the 30th deg. of lat., in the parallel of Morocco, Cairo, and Suez. This predominance of cold is no doubt ascribable to a great variety of causes; among the most prominent of which may be placed the extraordinary elevation of the soil. Not only is the continent traversed from one extremity to the other by immense chains of mountains covered with perpetual snow, but in many parts, as in Mexico and Columbia, very extensive plains are found at an elevation of from 6,000 to 10,000 feet above the level of the sea! Thus the plain of Quito, immediately under the equator, has an elevation of above 9,600 feet, and its mean temperature is said not to exceed 53° Fahr. In some parts, where the plateaus rise rapidly, there is often, within a few leagues, an extraordinary change of temperature. At Vera Cruz and Guayaquil, for example, on the borders of the plains of Mexico and Quito, and nearly on a level with the sea, the heat is often quite oppressive. These different climates have different vegetable productions. "Hence the traveller journeying down the deep descent of one of these magnificent ravines (leading from the plateau of Mexico), through forests of birches, oaks, and pines, finds himself suddenly on the level shores of the Rio Alvarado, surrounded by palms, and has an opportunity of seeing the animal products of the N. and S. of the Alpine regions and tropics, nay of the E. and W. hemispheres, mingled together. Wolves of northern aspect dwelling in the vicinity of monkeys; humming birds returning periodically from the borders of the frozen zone, with the N. bunting and soft-feathered titmouse, to nestle near parrots; and our common European whistling ducks and teal, swimming in lakes which swarm with sirens

and Brazilian parrots and boatbills." — (See Richardson's *Zoology of N. America*, in the *Sixth Report of the Irish Association*, p. 135.)

In addition to its vast mountain chains, and the prodigious elevation of many of its plateaus, the lower temperature of America may be partly ascribed to the great indentation of the sea between N. and S. America, and the want of extensive sandy deserts in the tropical regions, easily impregnated with heat. The place of the latter in the African continent is here occupied by vast forests, traversed in all directions by immense rivers. The forests, however, are not confined to the tropical regions; they extend over the greater portion of the continent, powerfully diminishing the influence of the solar rays upon the earth, and greatly increasing its moisture. A strong and abundant vegetation, the result of its greater humidity, is, in fact, the distinguishing characteristic of the New World.

We may add, with respect to N. America, that while but a very small portion of it is within the torrid zone, it reaches far within the Arctic circle, where it also attains to a great breadth. The N. W. wind prevails during winter. This wind, sweeping over a desolate country, over-spread with marshes, forests, frozen lakes, and mountains, buried under eternal snows, contracts an intense degree of cold, and in its progress southward, passing over a wilderness, where the ground is shaded by forests from the solar rays, its original character is in no respect changed. It slowly yields to the dominion of the climate, and retains its temperature long after it has penetrated into the regions of heat. Throughout N. America the N. wind is accordingly felt to be keen and piercing. It increases the rigour of the seasons in the more northerly regions, and extends the influence of winter far into those latitudes, which, in the other hemisphere, are blessed with perpetual spring. The countries lying within the tropics are exposed to the inroads of the northern blasts; and the great heats felt at Vera Cruz and Havannah are often suddenly reduced by strata of cold air brought by the N. winds from Hudson's Bay. These winds blow from October to March, frequently bursting forth in tremendous hurricanes, and cooling the air to such a degree, that at Havannah the centigrade thermometer falls to 0, or 32° Fahr., and at Vera Cruz it falls to 16°, or to 60° Fahr. At Zacatecas, within the tropic of Cancer, it frequently froze hard in the winter of 1825; and in the city of Mexico the thermometer has been known, though rarely, from the same cause, to fall below the freezing point. To the prevalence of these N. winds, therefore, combined with the extraordinary elevation of the ground, and the uncultivated state of the country, overspread with vast forests, the greater cold of N. America seems chiefly ascribable. In S. America nearly the same causes operate. The country is even more desolate; the climate is more inclined to moisture; and liable beyond the 40th parallel, to dreadful tempests; while immense mountain ranges, rising far above the limit of perpetual snow, aid these effects, and greatly increase the rigour of the seasons. To these causes may be added the form of the American continent, which being greatly contracted in breadth as it approaches the S., is, in consequence, exposed on every side, except towards the N., to the surrounding oceanic winds. To the S. of Cape Horn is the great Antarctic Ocean, where cold prevails even to a much greater degree than in the N., so that the winds coming from those inhospitable seas bring to

the American continent all the unmitigated rigour of the polar regions. The Andes and maritime Alps protect the strip of territory between them and the Pacific Ocean from the freezing influence of the N. W. wind; and to this its greater mildness is partly, at least, if not wholly, owing.

Minerals.—The mineral riches of America are probably superior to those of any of the other great divisions of the globe. The discovery of the mines of Mexico and Peru effected an entire revolution in the value of the precious metals; and they have since continued to be the grand sources whence supplies of gold and silver have principally been derived. The produce of the American mines at the commencement of the present century, was estimated by M. Humboldt as follows:—

Annual Produce of the Mines of America at the Commencement of the Nineteenth Century.

Political divisions.	Gold.		Silver.		Value of both gold and silver in dollars.
	Marcas of Castille.	Kilogs.	Marcas of Castille.	Kilogs.	
Vice-royalty of New Spain	7,000	1,600	2,538,220	557,512	25,000,000.
Vice-royalty of Peru	3,400	782	611,090	140,478	6,240,000.
Captain general-ship of Chili	12,212	2,807	29,700	6,827	2,060,000.
Vice-royalty of Buenos Ayres	2,200	506	481,830	110,764	4,850,000.
Vice-royalty of New Grenada	20,505	4,714	- - -	- - -	8,990,000.
Brazil	29,900	6,873	- - -	- - -	4,360,000.
Total	75,217	17,291	3,460,840	795,581	45,500,000.

This sum of 45,500,000 dollars, at 4s. and 3d. a dollar, amounts to 9,243,750*l*.

Mr. Jacob, author of the *Historical Inquiry into the Consumption of the Precious Metals*, estimated the annual average produce of the American mines, from 1800, to 1810 at 47,061,000 dollars. But the revolutionary struggles which began, in 1810, to disturb Peru, Mexico, and the rest of Spanish America, by causing the expulsion of most of the great capitalists, by whom the mines were principally carried on, speedily caused some of the most productive amongst them to be entirely abandoned, and occasioned an extraordinary falling off in the supply of the precious metals previously obtained from the New World. Mr. Jacob estimates the average annual produce of the American mines, from 1810 to 1829, at only 4,036,000*l*., being less considerably than half their produce at the beginning of the century; and though this estimate has been suspected of being somewhat undervalued, there are pretty good grounds for thinking that it is not far from accurate. (*Jacob*, ii. 267.) The failure of the companies formed in this country in 1825, for working the American mines, the instability of the revolutionary governments, and the continued anarchy and insecurity that has prevailed down to the present time in Mexico, and in all the old provinces of Spanish America, have hitherto prevented any very material additions being made to the supply of bullion from the American mines, which at this moment (1838) is certainly under 5,000,000*l*.

The causes of this extraordinary decline being thus explained, it is plain that there are no grounds for supposing that it will be perpetual. It is believed, indeed, that some of the richest of the mines known to exist in Mexico have not yet been wrought; and it is more than probable that many mines will yet be discovered. The instability and weakness of the governments, and the consequent indisposition to embark capital

in industrious undertakings, are the only obstacles that hinder the American mines from yielding greater supplies at present than at any former period.

Exclusive of the mines, the gold and silver washings of Brazil, and other parts of S. America and of the U. States, are considerably productive. Besides gold and silver, most other metals are found in less or greater abundance in America. Chili and Cuba have some of the richest copper mines in the world; lead is found in different parts of the U. States, particularly in Illinois, and in Mexico, &c.; iron is most abundant in the U. States, and in many other parts of the continent; salt also is very widely diffused; and coal, including anthracite, is found in vast deposits in different parts of the U. States, in British America, and in Chili. Europe may now be said to be wholly dependent on Brazil for supplies of diamonds, which seem to be more abundant there, than anywhere else.

Vegetation.—Stretching, as America does, from the eternal snows of the Arctic to those of the Antarctic circle, and possessing soils of every elevation and quality, her vegetable products are necessarily of the most diversified description. Owing to the prevalent humidity and coolness of the climate, and the richness of the soil, her forests and pastures are unrivalled for extent, luxuriance, and magnificence. The forests consist generally of very heavy timber, including many species of pines and larches unknown in Europe, with an endless variety of oaks, maples, cypresses, tulip trees, mahogany trees, logwood, Brazil-wood, &c. &c. The Old World is indebted to the New for some of its most useful and widely diffused vegetable productions. Potatoes, though probably not introduced into Europe for more than a century after the discovery of America, already form a most important part of the food of most European nations; and tobacco, though it also be of American origin, has been diffused from one extremity of the Old World to the other, and is, perhaps, the most universally esteemed of all luxuries. We also owe to America maize, or Indian corn, millet, cocoa, vanilla, pimento, copiba, cinchona or bark, so important in medicine, jalap, sassafras, nux vomica, &c. The *Cactus cochiquilfer*, which furnishes the cochineal, is also peculiar to America. On the other hand, America is indebted to the Old World for a great variety of cereal grasses, trees, and fruits. At the head of the former may be placed wheat, barley, oats, and rice, all of which succeed admirably well in large portions of America. It seems pretty well established that the sugar-cane is indigenous to some of the W. Indian islands; but it is abundantly certain, not merely that the art of making sugar, but that the cane, now most generally cultivated in the islands and in continental America, was brought to them either from the E. Indies or from Madeira. America is also indebted to the Old World for the coffee-plant, now one of her staple products; and for oranges, lemons, peaches, and most descriptions of fruit-trees. New York apples, though now very superior to any produced in this country, are derived from plants carried from England. The vine has been raised in America; but either the soil or climate is not suitable for it, or, which is perhaps most probable, sufficient care has not been bestowed on the manufacture of the wine. The tea-plant has been tried in Brazil; but, owing to the dearth of labour, there is no chance of its being profitably cultivated there, or any where else in America.

The Zoology of America differs in many im-

portant respects from that of the Old World. Of about 1,350 mammals that have been described and classified, America possesses about 540; but, with few exceptions, she is singularly ill provided with the useful animals. As already stated, neither the horse, ox, sheep, nor hog, were found in America on her discovery by Columbus; and the want of them must, no doubt, have been a considerable obstacle to the advancement of the natives in the career of civilisation. The elephant and the camel are also unknown in America; but she was not entirely destitute of useful animals. In Peru they had the llama, guanaco, paco, and vicuña, animals that bear a considerable resemblance to each other, if they be not of the same species. The first has a considerable analogy to the camel, though it be neither so large nor strong, and wants the hump. It was, and still is, employed to carry loads, and being docile and sure-footed, makes its way over the most dangerous paths. Its pace is slow, seldom exceeding 12 or 15 m. a day, and it usually carries about 80 lbs. Its wool, or rather hair, which is generally, but not always, white, is spun and made into articles of clothing. The guanacos and pacos are not so serviceable as beasts of burden as the llamas, and are comparatively little used. The vicuña, the smallest of them all, inhabits the least accessible parts of the Andes; it is chiefly prized on account of its wool, which is of a very superior quality. The flesh of these animals, though dry and coarse, is used as food. They are almost the only animals that the native inhabitants of America had been able to subdue, and to render subservient to their purposes. The bison, or American ox (*Bos americanus*), the largest native quadruped of the New World, is principally found on the prairie lands of the Rocky Mountains in N. America. It is rarely, if ever, seen to the S. of the Mississippi; and it is doubtful whether it was ever found on the Atlantic coast. The *Bos moschatus*, or musk ox, is found only in the most N. parts of America to the W. of Hudson's Bay, from 66° to 73° N. lat. Its horns, which cover all the forehead, are often of great weight. The Rocky Mountain goat, remarkable for the fineness of its wool, inhabits the Rocky Mountains from Mexico to the extremity of the range. Several species of deer are found both in N. and S. America. The rein-deer is the most northerly ruminating animal, being found in Greenland and the remotest of the Arctic islands. On the W. coast it descends as low as the Colombia river.

America possesses several peculiar species of the genus *Canis*, or dog. The physiognomy of the American wolf, when contrasted with that of its European namesake, is very distinct. There is a great variety of foxes. The fur of the *Canis lagopus*, or arctic fox, and of some other varieties of the same genus, is of considerable value. The best known variety of the American dog is the *Canis familiaris*, found in Newfoundland. This animal is now very common in England, and is deservedly a great favourite. It is strong and active, has long fine glossy hair, a curved bushy tail, and webbed toes, by means of which it swims admirably well. The colour of the back and sides is generally black, with a white belly and legs, and frequently a white spot at the tip of the tail. It is naturally fitted, by its thick covering of hair, for a cold climate, and is more active and in better health in this country in winter than in summer.

The beaver (*Castor*) is more abundant perhaps in the N. W. parts of N. America than in any other part of the world. But the great demand

for, and high price of its fur, has led to a great diminution of its numbers, and to its nearly total extirpation in the more accessible parts of the country. The coypou, known in commerce by the name of neutra, and the chinchilla, are found in S. America. They yield a highly esteemed fur, and immense quantities of their skins are now imported.

America has but few beasts of prey. The most formidable, the *Felis onca*, or jaguar, is found only in S. America. It is larger and stronger than the panther; but is inferior in size and ferocity to the Bengal tiger, with which it is generally compared. The *Felis discolor*, or puma, is found in both S. and N. America: though denominated the American lion, it is neither so large nor fierce as the jaguar. A number of bears, some of them of the largest and most formidable description, are found in Arctic America: two are peculiar to it.

Tropical America has a great variety of apes, but none of them approach so nearly to the human form as the orang outang, or chimpanzee, and none of them have the ferocity of the baboon. Many, however, have prehensile tails, endowed with so great delicacy of touch that they have been compared to the trunk of the elephant. This fits them admirably for travelling from tree to tree.

The vampire bat, frequent in S. America, is very dangerous. It attacks the larger animals, and even man himself, when asleep; and as its bite is not sufficiently painful to awaken the victim, the bleeding it occasions sometimes proves fatal.

America is infested by an immense number of reptiles. Of these pests the rattle-snake is one of the most common, and also the most dangerous: but there are others little less venomous. The true *boa constrictor* is found of an enormous size in the marshes and swamps of tropical America. Centipeds, sometimes a yard in length, with enormous spiders, scorpions, &c., abound in these regions. According to Humboldt, the white ants and termites are even more destructive here than their congeners in the Old World.

The birds of America are exceedingly numerous. The condor, which inhabits the most inaccessible parts of the Andes, though of less dimensions than was formerly supposed, is the largest and most powerful of all the feathered tribes. There are also a great many eagles, vultures, falcons, and other birds of prey. A species of ostrich, but smaller than the African, inhabits the Pampas; and the woods of both Americas are the resort of vast flocks of wild turkeys, pigeons, &c.

The waters of America are well supplied with fish; and the rivers in the tropical regions produce also enormous lizards and alligators. In the lakes of the Caraccas is found the electric eel.

Nothing, however, is so worthy of remark, in relation to the zoology of America, as the wonderful increase of the horses and cattle carried there from Europe. Had we not been fully aware of all the circumstances in regard to their immigration, it would certainly have been supposed that they were indigenous to America, and that it, in fact, was their native country. They here rove about in immense herds in a state of pristine freedom; and so numerous have they become that the slaughter of oxen, not for the carcass, but merely for the hide, is the principal business of many extensive provinces. (See PAMPAS.) In a single year above 800,000 hides have been exported from Brazil only, exclusive

of those exported from Buenos Ayres, Montevideo, and other ports! In consequence, too, of the extraordinary increase of horses, the mode of existence of the natives in several parts has been wholly changed; they have become expert horsemen, and pass a considerable part of their time on horseback, approaching in this respect to the Tartars and Arabs of the ancient world. Sheep have not succeeded so well in America as cattle and horses; and their wool, in most parts, is generally of an inferior description.

Races of Men. — The native inhabitants of America differ in physical form, in language, and perhaps in intellectual character, from every other variety of the human race. Probably, however, the general agreement which exists among themselves is even more remarkable than their disagreement from other races. The *Red* men, as the Americans call themselves, in contradistinction to the European and African races, (that is, to the *Whites* and *Blacks*, the only two they have any knowledge of,) exhibit surprisingly little difference, although extending over 70° on the N. side, and 54° on the S. side, of the equator. Heat or cold, drought or moisture, elevation or depression of surface, have certainly no effect in the production, even of the small variations occasionally discoverable among them. "The Indians of New Spain," says Humboldt, "bear a close resemblance to those who inhabit Canada, Florida, Peru, and Brazil. Over 1,500,000 sq. leagues, from Cape Horn to St. Laurence and Behring's Straits, we are struck at the first glance with the general resemblance in the features of the inhabitants. We think we perceive them all to be descended from the same stock, notwithstanding the prodigious diversity of their languages. In the portrait drawn by Volney of the Canadian Indians, we recognise the tribes scattered over the savannahs of the Apure and the Carony. The same style of features exists in both Americas." The general physical form is as follows:—Skin dark, having more or less of a red tinge, usually called copper-colour, but thought to be more correctly characterised by that of cinnamon; hair of the head black, coarse, lank, shining, long, but not very abundant; hair on other parts of the body very deficient. The beard is seldom altogether wanting, but it is so uniformly scanty, as often to present the appearance of its being so. Forehead long; eyes deep sunk, small, and black. Face broad across the cheeks, which are round and prominent; nose well raised, and round at the apex; mouth large, and lips thick; chest high, thighs massy, legs arched, feet large, hands and wrists small. The height is nearly the mean stature of the European race, but the body is usually more squat and thick set. The countenance is hard-favoured, and the look stern, yet with a certain sweetness in the expression of the mouth which is a contrast to the rest of the features. It will appear, from this statement, that the races which the American most nearly resembles, are the Mongul, Malayan, and Indo-Chinese. The features of the face are, however, more amply chiselled than in any of these; the frontal bone is more flattened than in any of them, and the stature is greater than it is, at least, in the Malayan race. Although in the tropical regions of America there are no black men, as in Africa or Asia, nor in its temperate regions, any whites, as in Europe, still varieties do exist in an inferior degree; which may be compared to those which exist among Europeans, and among Negroes. The most striking of these are found in the short, squat, and tallow-coloured Esquimaux, about the

polar regions of the N., and the tall Patagonians towards the S., extremity of the continent. The first of these differ in no respect, as far as physical form is concerned, from the people of the same name in Asia and Europe. The Patagonians or Puelches, inhabiting the S. E. coast of the southern extremity of America, may be considered, after rejecting the exaggerations of early, and the contradictions of later travellers, as the tallest people in the world. If with us the medium height of the male sex may be estimated at 5 feet 8 inches, that of the Patagonians may be taken at six feet. Other races, remarkable for their great stature, also exist among the Americans; as the Caribees and Cherokees. But there are also races remarkable for their shortness, as the Peruvians, who are between the mean European standard and the Chaymas, whose average height, according to Humboldt, is five feet two inches, which makes them a full inch shorter than the Malayan race, yet much taller than the Esquimaux. Upon the whole, it may be remarked that the American race exhibits a wider difference in stature than any other family of mankind, while this difference, at the same time, would not seem to be productive of any essential variation in physical or intellectual capacity. In point of colour there exists also considerable variety; the brownish-red tinge for the most part prevails; but in some cases its intensity approaches to black, and in others to the fairness of a southern European. The probability is, after all, that the number of distinct races of men in America is at least as great as in other portions of the world, although their smaller numbers, and obscurity of the tribes make it more difficult to distinguish and class them. In this matter, languages, so useful a guide in Europe and Asia, have not, in America, on account of their multiplicity and intricacy, afforded as yet much assistance. The exceeding, and perhaps insurmountable difficulty of this branch of the inquiry may, indeed, be judged of when it is known that the number of distinct languages spoken by men whose numbers are not supposed to exceed 10,000,000 has been reckoned at no less than 438, and their dialects at 2,000! The intellectual powers of the American family, must, at first view at least, be considered as ranking it below all the other principal races of mankind. The Americans, when left undisturbed to the exercise of their native energies, had not tamed any of the useful animals, whether for food or labour, the llama and vicuña by one tribe excepted. The Peruvians used gold, found in its native state, and they appear, also, to have been able to smelt and harden copper—the utmost stretch of their ingenuity; but they knew nothing of the use of iron. The agriculture of the most civilised of the American tribes was of a rudeness and imperfection of which there can hardly be said to have been an example in the Old World. The Quichua, the most improved of their languages, had no words to express abstract or universal ideas, as *space*, *time*, *being*, *matter*, *substance*, &c., or even such as *justice*, *honour*, *gratitude*, *freedom*, &c. They had invented no species of writing, and the contrivances by which they attempted to depict and record their ideas are more rude than any thing handed down in the traditions of European and Asiatic nations. In all the respects now mentioned, the Americans evinced their inferiority to the nations of Europe and Asia, and, in all but the invention of a rude sort of hieroglyphics, to even the Negro nations of Africa. Nature had not, indeed, in many respects, been propi-

tious to them : she had denied them nearly all the domestic animals which have conduced materially to the civilisation of the inhabitants of the Old World ; as the horse, ass, ox, camel, sheep, goat, hog, and most of our domestic poultry. But their want of ingenuity is sufficiently shown by their not availing themselves of such as they possessed ; as the rein-deer, goose, duck, turkey, and other poultry, soon domesticated by the European settlers. For their want of ingenuity in not discovering the art of smelting iron, no plea can be shown ; and, indeed, it might rationally be supposed that the paucity of useful animals for domestication would rather have had the effect of directing and concentrating their efforts in other quarters. Mere handfuls of Europeans, in comparatively rude ages, subdued the most numerous and warlike tribes of America, and these handfuls have now grown into the majority of the population.

Of the origin of the American race we are totally ignorant. Neither the evidence of physical form nor of arbitrary customs and institutions, which could spring only from a common source, or the testimony of language, connect them with any other race of men. The testimony of language on this subject is particularly clear. For example, incontestable evidence of a connection exists among the great majority of those insular languages which extend over at least 60° of latitude, and between Madagascar and Easter Island, over 200° of longitude ; but the moment we quit the last named island, which is but 45° from the coast of America, all further trace of a Polynesian language ceases. We are not, indeed, unaware that the comparison of a great number of American with a great number of Asiatic languages has exhibited a small number of resemblances ; but these we are disposed to consider as forced, fanciful, or accidental.

The moral character of the native Americans has been depicted under very different colours ; but there can, we apprehend, be very little doubt that the bad features in it very decidedly predominate. Their capacity of enduring hardships and privations of all sorts, and even the most excruciating tortures without murmur or complaint, is well known ; and is owing as much, perhaps, to physical causes, as to the training they undergo. They cannot be accused of ingratitude, or of a want of hospitality, but they are in the last degree vindictive, cruel, and treacherous. When not engaged in war, or hunting, or drinking, they sink into a state of torpor and apathy from which nothing can rouse them. They have all, or mostly all, an irrepressible rage for spirituous liquors ; to obtain which they will sacrifice every thing, and which has been too readily ministered to by Europeans. The state in which we find women may generally be taken as pretty indicative of the character of a people ; and tried by this test, the American Indians will be found to be almost at the bottom of the scale of civilisation. From the one end of the continent to the other, woman, with very few exceptions, is a slave ; she has to perform all the laborious occupations of the tribe, and is, in fact, degraded almost to the level of a beast of burden. Polygamy is very generally practised ; and it is only in some rare cases that chastity is held in any estimation. Their religion is a rude species of idolatry or féticism. Cannibalism has undoubtedly prevailed over the whole continent ; and is not yet entirely extinct. The Mexicana, the most advanced of the native nations, delighted in blood, and were accustomed, when invaded

by the Spaniards, annually to offer up thousands of human victims on the altars of their gods ! Even the Peruvians, the least sanguinary of all the Americans, though Sabians, or worshippers of the heavenly bodies, did not scruple, on the death of their monarchs, to immolate hundreds of human victims on their tombs !

The natural inferiority of the native Americans, and their incapacity to attain to anything like real civilisation, are strikingly evinced by the result of the continued efforts of the Jesuits in Paraguay for their improvement. So long as the Jesuits resided among them, and could direct their efforts, and compel them to be industrious, all went on very well, and the golden age seemed to be restored. But the entire system was forced and factitious. The moment the Jesuits withdrew, the fabric that had cost them so much pains and labour to raise, fell to pieces. Civilisation had taken no real root among the Americans ; and they relapsed forthwith into the indolence, improvidence, and idolatry, that seem natural to the race.

"From the moment," says an able writer, "that the Europeans landed in the New World, benevolence has been at work to instruct some portions of these tribes in religion and the arts, and flattering accounts have been published from time to time of the success of those humane persons who dedicated their lives to the task. But, after three centuries of incessant exertion, what is the result ? Is there one tribe that exhibits the steady industry, the provident habits, the spirit of improvement, and the rational views of religion, which are to be found in any parish of England ? We cannot find that there is. Many tribes, living near the whites, have adopted their habits and ideas to a certain extent, but merely under the influence of imitation. While missionaries and teachers are among them, every thing wears a favourable aspect ; but their civilisation is never self-sustained. It is created by the agency of men of higher natural endowments, and when they are removed it moulders away, because it has no foundation in their character. Many parties of Indians, remnants of tribes once powerful, have lived peaceably, on reserves of land, inclosed amidst the population of the United States, for more than a century. No situation can be imagined better fitted to promote their improvement ; but in no one instance, so far as we know, have they melted into the mass of the white population, or risen to any thing near their level in knowledge and the useful arts. They live in huts in no material degree better than the wigwags of their wandering brethren. They are generally honest, but drunken, indolent, and ignorant, though teachers and missionaries are employed by the government to instruct them. Basket-making is almost the only trade they ply, and in their habits and character they may be aptly compared to the gypsies of Europe who exist in the midst of civilisation, without partaking of its spirit or its benefits. It should be observed that there is not the same reluctance in the whites to mingle their blood with the red men as with the blacks. Much has been recently said of the progress made by the Cherokees ; but we suspect that what is witnessed there is but a flimsy veil of improvement, spread over habits which are essentially savage. We are convinced, in short, that the Indian is truly the man of the woods ; and that, like the wild animals he lives upon, he is destined to disappear before the advancing tide of civilisation, which falls upon him like a blight, because it supplies new food to nourish his vices,

while it demands intellectual and moral faculties in which he is deficient, and renders useless those qualities which predominate in his character. We would not discourage the attempt to meliorate the lot of the Indians; but this will succeed best when it is grounded on a true knowledge of their natural capacities. Some of them are much more susceptible of moral and religious improvement than others; but to instruct and reclaim them effectually, our belief is that the system of the Jesuits is the only one that holds out a chance of success. They must not merely be taught and preached to, but they must be retained in a state of pupilage, trained to their duties, controlled and directed in all their proceedings by intellects superior to their own; and there are many tribes too ferocious and intractable for even this method of tuition. We do not maintain that the character of the Indian nations is indelible; but to effect any considerable change in it, the lapse of a longer period would be required than the existence of these tribes is likely to extend to. Neither do we think that there is any thing in the extinction of these people by natural means which humanity should mourn over. In every state of life man has but a brief span of existence allotted to him. Successive generations fall like the leaves of the forest; and it should be remembered that the extinction of a race of men by natural causes, means merely its non-renewal or the suspension of those circumstances which enabled it to continue its existence." (*Encyc. Britannica*, ii. p. 631.)

Population. — Besides the original inhabitants, vast numbers of Europeans, of all nations, have emigrated to America since its discovery by Columbus, tempted originally, for the most part, by the *auri sacra fames*. It was this same passion, taking it in its most literal and degrading sense, that has made them fill the Antilles, and part also of the continent, with millions of negroes brought from Africa, and reduced, with their descendants, to a state of slavery. But at a later period America furnished an asylum for the victims of political and religious persecution in the Old World; and for these many years she has offered an all but inexhaustible field for the profitable employment of its redundant capital, skill, and labour; and thousands upon thousands,

who could hardly contrive to exist on this side the Atlantic, have attained, if not to opulence, at least to comfort and independence, in America. Hence she has long been, and still continues to be, the promised land of the poor but industrious man; and a city of refuge to all who happen to be discontented with the policy, or who have given offence to the rulers of the Old World.

The estimates of the population of America at different periods have differed very widely, in consequence of the vague and defective nature of our information with respect to it. Humboldt estimated the population of America, including the Antilles, at about 35,000,000. Balbi estimated it, for 1827, at 39,000,000; but we incline to think that this was below the mark even for the epoch to which it refers; and the population of the United States, British America, and Brazil, but especially the first two, has since increased prodigiously. At present we are well convinced that the population of America is not under, if it be not rather above, 47,000,000.

Political Divisions. — It would be useless to attempt giving any detailed outline of the existing divisions between the different states among which America is at present parcelled out: for the chances are that they will be materially altered in the course of a few months. In fact, ever since the commencement of the revolutionary struggles in 1810, down to the present moment, every thing has been, in the greater part of America, in a state of transition. States have been formed, split into portions, and again consolidated. Hitherto, however, none of the new States formed out of the Old Spanish provinces, seem to have acquired any considerable portion of stability, or to be in a condition successfully to oppose foreign invasion or domestic insurrection. No doubt a better order of things, and one more calculated to promote the improvement of those naturally fine countries, will be established; but, in the meantime, very little importance need be attached to the subsisting territorial arrangements.

The following account of the different American States, and of their extent and population in 1838, is partly taken from the Weimar Almanac; but we have altered and we hope improved it in several particulars: —

Estimate of the Area and Population of the American States in 1838.

States.	Area in Eng. sq. m.	Total pop. 1838.	Whites and Europ. Creoles.	Indians and Free-coloured races.	Blacks and Indian slaves.
North America:					
Havyl	28,302	935,000	28,000	490,000	495,000
Mexico	?	7,500,000	1,200,000 (1835)	5,800,000	
Central America	208,561	1,900,000	475,000	1,425,000	
United States	2,446,759	(16,580,000)	10,555,552 (according to the census of 1830).	591,576	2,009,050
Texas	?	100,000	?	?	
South America:					
Araucania	28,000	450,000	-	450,000	
Argentine Republic	1,050,000	1,000,000	?	?	?
Bolivia	318,000	1,400,000	800,000	900,000	
Brazil	2,740,000	6,000,000	845,000	3,130,000	2,085,666
Chili	101,000	602,000	130,000	472,000	
Colombia:					
a. Ecuador	?	550,000	?	?	
b. N. Granada	?	1,685,000	?	?	
c. Venezuela	?	829,000	?	?	
Paraguay	146,555	600,000	60,000	540,000	
N. Peru	954,000	851,000 }	136,311	729,515	284,773
N. Peru	494,000	175,000 }	20,000	155,000	
Uruguay	223,978				
Unsettled States:					
Petagonia	441,309	150,000	-	150,000	
Mosquito	124,595	300,000	-	300,000	
European Colonies:					
1. British	565,000	2,300,000	1,480,000 (whites)	820,000	38,000
2. Danish	170	46,000	6,000	5,000	184,866
3. French	125,112	280,000	95,000		72,800
4. Dutch	10,666	85,000	5,800	7,000	
5. Russian	490,350	80,000	870	49,130	
6. Swedish	43	8,000	1,992	580	5,438
7. Spanish	58,206	1,090,000	400,000	80,000	540,000
Independent Indians	2,000,000	1,300,000		1,300,000	
		46,851,000			

Diseases of America.—The Anglo-American population is subject to the same diseases as the people of England; but suffers more from intermittent and remittent fevers. Yellow fever sometimes prevails epidemically as far north as New York and Philadelphia. Of 122,591 deaths occurring in New York in the 31 years 1805-35, 7,563 were ascribed to fevers of every type; 327 to intermittents; 1,480 to remittent and bilious fevers; 477 to yellow fever; not less than 3,368 deaths to dysentery; 1,606 to diarrhoea; 5,183 to cholera; and 4,670 to cholera infantum, a malady more prevalent in America than England. The mean duration of life in the English race has been considerably affected by the climate of America. We have calculated the mortality of the cities of New York and Philadelphia, and it will be found to differ little from the mortality of English cities of the same extent.

The population of New York increased from 75,770 to 270,089 in the 30 years from 1805 to 1835; the mean population deduced from 7 quinquennial enumerations was 147,108; the total deaths in the 31 years 1805—1835 amounted to 122,501, exclusive of 6,925 still born. * The mean annual rate of mortality in New York was therefore 2.686 per cent., nearly 1 in 37.

The population of the city and suburbs of Philadelphia was 119,325 in 1820, and 167,811 in 1830; the deaths in the 10 years, 1821-30 amounted to 40,506, exclusive of 2,692 still-born. The mean annual rate of mortality was 2.663, nearly 1 in 38.†

Deadly epidemics decimate the Havannah, Vera Cruz, and other cities in tropical America. The yellow fever begins to prevail epidemically at Vera Cruz in May, when the mean temperature rises to 75°·2 of Fahrenheit's thermometer; it attains its maximum force in September and October. The disease is fatal to strangers, particularly to the inhabitants of the temperate and cold climates. In the intendency of Vera Cruz, the yellow fever, which rages in the capital, has never been able to ascend above the farm of Eucero, which Humboldt found to be 3,044 feet above the level of the sea; and as the Mexican oaks do not flourish below this limit, it shows that the constant average temperature is of a true tropical character.‡ Humboldt also observes, that, while yellow fever rages at La Guayra, it never crosses the Cumbre and the Cerro de Avila.

The condition of the mothers, and the training of the children, exercise an influence upon the health and diseases of the native American tribes which cannot be overlooked. The women, though doomed to severe labour, are spared during the period of pregnancy. They seldom marry till they are about 20. Accouchements take place in private cabins, and the mother, after washing herself in cold water, returns in a few days to her usual employments. Sir W. Penn was assured, and correctly, that the American Indians plunge their infants into cold streams as soon as born, in all seasons of the year. This practice, which destroys the weaker bodies, and strengthens the survivors, has been generally adopted by the savages of cold and temperate climates. It was common in Greece; and Virgil makes one of the early Italians say in the *Æneid*:—

*Durum a stirpe genus: natos ad flumina primum,
Deferimus, sævoque gelu duramus et undis.*

The Dorians and Pelasgians exposed their children; and Lycurgus regulated the practice by enacting that none but the infirm and diseased

should be abandoned after a public examination. There are no deformed Indians or idiots; they are sacrificed, says an apologist of savages, by the severity of the Indian manners. To facilitate their transport from place to place, the children are tied to a board, where they lie upon their backs for 6, 10 or 18 months. By some tribes the heads are flattened by pressure. The child generally sucks its mother till it is 2 years old, and sometimes longer. The circulation of the blood is more languid in the Indians than in persons who are in the constant exercise of the habits of civilised life. Out of 8 North American Indians, whose pulses Rush examined at the wrists, he did not meet with one in whom the artery beat more than 60 strokes in a minute.

The diseases of the Indians vary with the climate and locality. In the north, however, fevers constitute the most striking diseases. Pleurisies, peripneumonies, and rheumatisms are common. Dysentery is an Indian disease. Great numbers perish of famine, and the innumerable diseases generated by famine. In the temperate zone, ague, remitting and malignant fevers assail them in the endless forests, and in the marshes, and effluvial atmosphere of the lakes and rivers. In the tropics, Humboldt says, they are exempt at Vera Cruz from the ravages of yellow fever, which proves so fatal on the coast and in the West Indies to Europeans. But thousands have been carried off in repeated epidemics, by a disease not very different from yellow fever, called *Matlazahuelt*. Small-pox, which is believed to have been introduced amongst them by the Spaniards, sometimes destroys half the heads of a tribe. Montezuma died of small-pox. It has been a generally received opinion that *lues venerea* was acquired from the inhabitants of Hispaniola (Hayti), and conveyed by the equipage of Columbus to Europe. The son of Columbus relates in his narrative that the islanders had a cutaneous affection, called *caxacaracoh*, which resembled a tetter (Tenia): the historian, Ferdinand Oviedo de Valdes affirms that the Spaniards were infected with it by the Indian women, and communicated the disease to the Neapolitans in the expedition of Gonzalvo de Cordova. He ascribes its importation to the second expedition of Columbus. Various cutaneous affections had been described by earlier medical writers, confounded with leprosy, and attributed to impure intercourse; but, in 1493, syphilis appeared, with its striking and appalling symptoms, almost simultaneously all over Europe. Columbus disembarked from his first voyage, March 15., at Palos, and arrived at Seville in April. In the beginning of the summer, the disease was observed at Auvergne, in Lombardy, in the rest of Italy, and in Brunswick. ¶ Could *lues venerea* have travelled at this telegraphic rate? A learned Spaniard justly remarks, that neither the classical writers, nor the satirists of the 14th century, alluded to the effects of syphilis: in the words of the licentiate of Villalobos, it was, taken in its entire character, *jamás vista en metrio, ni en prosa, ni en ciencia, ni istoria*. It still, however, remains a problem whether the outbreak of the malady merely coincided with the return of Columbus, or was conveyed from America. Rush affirms that the disease called by the English, morbus Gallicus; by the French, mal de Naples; by the Portuguese, Spanish disease; by the Spaniards, Indian disease:—was communicated to the northern tribes of America by Europeans.

¶ Sprengel, *Hist. de la Médecine*, tom. II. p. 499.

Violent deaths are common among the Indians. Their occupations expose them to accidents. They are engaged in an almost perpetual warfare; and entire tribes are sometimes exterminated. Their connexion with the European population has made them acquainted with spirituous liquors; and this has proved another prolific source of disorder.

Celsus says, *Medicina nunquam non est*; and this holds among the American Indians. Their medical treatment, for the infirmities to which they are subject, is simple, and often instructive. In fevers, they abstract all kinds of stimulating food; and allow their patients to drink plentifully of cold water. Sweating is a common remedy. The Indian mode of procuring this evacuation is as follows:—the patient is confined in a close tent, or wigwam, over a hole in the earth, in which a red hot stone is placed; a quantity of water is thrown upon this stone, which instantly involves the patient in a cloud of vapour and sweat; in this situation he rushes out and plunges himself into a river, from whence he retires to bed. If the remedy has been used with success, he rises from his bed in four and twenty hours perfectly recovered from his indisposition. This bath is used not only to cure fevers, but to remove that uneasiness which arises from fatigue of body; and used for this purpose it is an excellent remedy. They purge and vomit: ipecacuanha is one of the many roots they employ for the latter purpose. They confine bleeding to the parts affected. A piece of rotten wood is burnt upon the skin for the same purposes as the moxa. They attempt to staunch the flow of blood from wounds by plunging in cold water, and endeavour to restore drowned people by suspending them by the heels. They have a great many specifics of uncertain value. The Indians attend to the sick for a certain season, but abandon them if the disease be protracted. When the northern Indian is unable, from sickness, to continue his journey, he is left behind by his companions, and covered over with deer skins; he is supplied with water, food, fuel, if the place will afford it, and informed of the track which his companions intend to pursue. (*Hearne.*)

Some of the most important drugs in the *Materia Medica* are derived from America. Guaiacum was introduced, at an early period, as a specific for syphilis in the place of mercury, which it superseded for several years. It is now fallen into disuse. Not so the root of the American sarsaparilla, which is consumed in great quantities, although it is exceedingly expensive. It is found in the hedges and swamps of Virginia. There are several species; the best, according to Humboldt, grows on the borders of a lake, two days' journey from Esmeralda. The calumba root, jalap, copaiba, and ipecacuanha are derived from America. We are also indebted to the New World for Peruvian bark. These remedies are invaluable; they contributed, in the 17th century, with the introduction of syphilis, to destroy the blind adoration of Galen, and led to a revolution in medicine.

Discovery of America.—This is the most striking event in modern times, and has perhaps made the most important change in the condition of mankind. There is no rational ground for supposing that the ancients had the slightest idea of the existence of the American continent. The form of their vessels, flat-bottomed and impelled by oars, and their ignorance of the compass,

allowed them to move only at a short distance from land. Their voyages, therefore, though in some instances extensive, were always along the coast of the great continents; nor is there the faintest record of any one having turned his daring keel into the vast abysses of ocean. Nothing could be less probable, than that tempest or accident should drive any of the few vessels which then navigated the exterior seas of Europe to so immense a distance, or, if driven, that they could ever have returned.*

But if we listen to some learned moderns, America would appear the general refuge of all who felt themselves straitened in the old world. The Trojans, Syrians, Carthaginians, Canaanites, but above all the Jews, have been represented as the undoubted ancestors of its present people. These speculations proceed upon a total oblivion of the fact, that man has every where many things in common with his fellows. The division into tribes and respect for chiefs, the lamentations over dead relations, the love of ornament, are considered as habits which the Americans must have learned from the Jews. Garcia, observing that most of them honoured their parents, and considered theft and murder as crimes, thinks it clearly proved that they received the ten commandments from Moses. Others were obstinate, unbelieving, and ungrateful; sure signs of their belonging to the stiff-necked posterity of Abraham.* Attempts have been made to trace a similarity between the languages of the old world and of America, but certainly with most slender success. Barton has collected 55 similar sounds, which Professor Vater has raised to 104, and Malte-Brun to 120; but to produce this, it has been necessary to search through sixty languages in each world. These few, too, if we except the natural infantile sounds *Ata, Baba, Papa, &c.* are by no means striking; and it seems even singular, that chance should not have produced more coincidences. Attempts have been lately made to identify the style of Mexican architecture with that of ancient Egypt; but we can see no ground for this, unless in the dimensions of the former, and some forms which a regard for beauty or convenience might suggest to both.†

The Welsh have put in a claim to the discovery of America. In 1170, Madoc, a prince of North Wales, sailed in quest of maritime adventure, and, after a long voyage, reached a "faire and large country" filled with wonderful objects: he then returned and took with him ten vassals and a larger party. Thus far seems tolerably attested; but though affording a sufficient foundation for Mr. Southey's poem, the idea of the region arrived at being really America seems scarcely to merit refutation. The intimation, that he left Ireland far to the north, makes it not improbable that he might have reached some part of Spain, no inconsiderable achievement in that age for a Cymric chieftain.‡

The claim of discovery by the Northmen from Iceland has been much more generally received. The Scandinavian writers have supported it as a point of national honour; and the learned in the rest of Europe have generally acquiesced in their authority. They would not, we think, have done so had they perused the original narratives in Torfæus, and the *Heimskringla*, or *Saga*, of King Olaf Tryggesson. Biorn, an Icelander, in sailing across to Greenland, was overtaken by a tempest, and after being tossed about for

several days, came in view of an unknown land. After navigating several days along the coast the wind became favourable, and in four days he reached his destination in Greenland. Can any one seriously suppose, that in this short passage he could have been driven upon Newfoundland, upwards of a thousand miles out of his way, or if driven, could thus directly and rapidly have retraced his course? Numerous voyages to and from this new country, named Vinland, are then related, with no mention of particular difficulty or danger. One of them is stated, without any surprise, to have been performed in *twenty-four hours*; a manifest impossibility under the Newfoundland supposition. As to the term *Vin-land*, very inappropriate even to Newfoundland, the Northmen probably, who could not be great connoisseurs on this subject, mistook for the grape one of those delicate berries which abound on the Arctic border. We are convinced then that Vinland was merely a southern part of Greenland; for the modern hypothesis, which places the colonies on the western coast, is by no means supported by good early authorities.*

Another alleged discovery of much celebrity stands on the report of the Zeni, Venetian noblemen of distinction. Towards the end of the fourteenth century, they visited and spent a considerable time in Friesland, an insular country in the north of Europe, which Forster has shown to agree not ill with Orkney, Shetland, and the Ferö islands. They there learned, that four fishing boats being driven more than a thousand miles to the westward, had reached a coast named by them East-out-land, where they found cultivation, large cities, castles, and a Latin library in possession of the king. Thence they sailed to a more southern country, named Drogio, inhabited by a rude people, ignorant of iron, waging furious wars, and devouring each other. Reports were then made of a more civilised people to the south-west, who abounded in gold and silver, and had splendid temples, in which human sacrifices were offered. Forster, Malte-Brun, and for some time geographers in general, considered that these countries were undoubtedly Newfoundland, New England, and Mexico. Mr. Murray was, we believe, the first to observe, that even the distance of 1000 miles by no means corresponded; that the castles, libraries, and populous cities on the savage coast of Newfoundland, were the reverse of credible, and that accounts of Mexico were little likely to have reached the Friesland fishermen. He argued therefore that, supposing the northern voyage correct, interpolation must have been practised in what related to America. This has been corroborated by the research of Mr. Biddle, who, on comparing different posthumous editions of Ramusio's work, found that the narrative had been altered in accordance with successive and corrected accounts of the new continent. He therefore rejects the whole as a forgery; we rather incline to think that the northern voyage may be genuine, while all that relates to America is undoubtedly interpolated.†

In the maps constructed during the fifteenth century, some curious features appear, which have been referred to a western world. In 1436, one formed at Venice by Andrea Bianco has in the north-west Atlantic, not very remote from Newfoundland, the word *Stoka fixa* (Stock fish). But it is to be observed that Iceland and the adjacent seas were then the seat of a great fish-

ery, and the term may have been merely used to express the abundance of its finny tribes. Another remarkable object in this map, as well as in one long prior, and in a subsequent one by Martin Behaim, is a long range of territory west of the Canaries, named Antilia. It seems impossible to trace with certainty the origin of this term, which we strongly suspect to be a corruption of the Atlantis of Plato, and to have no other origin. The inhabitants of those islands are said to have confirmed the impression, by asserting that, in certain states of the atmosphere, they saw in mysterious distance a great unknown land; the work either of imagination or of some optical deception.‡ These ideas, however, rested on no solid basis, and the sound judgment of Columbus appears to have been in no degree influenced by them; it was not to Antilia, but to other regions, that he directed his voyage.

Perhaps no individual ever stood so much alone as this navigator, in making a discovery that changed the face of the world. He conceived the design, and struggling against the opposition made by his age, singly achieved it. Yet, like every other great revolution, it was doubtless prepared by previous circumstances. The progress of navigation and commerce, the enthusiasm excited by maritime discovery, its wide range along Africa and towards India, all tended to give this direction to his spirit of lofty and daring adventure. The invention of the compass, and improved celestial observations, rendered it no longer impossible to steer through an unknown ocean. Sound reasoning, aided by some errors, made him hope, by sailing westward, to reach, even at no very great distance, the coasts of Eastern Asia. Ptolemy, whose works were then the chief modern light, had, from errors of graduation, and exaggerated itineraries, carried Serica or China much too far east. Again, Cathay and Mangi, described in such splendid colours by Marco Polo, not being recognised as the same country, were supposed to be still further east than Serica; as was also, on better grounds, his Xipangu, or Japan. This last, therefore, seemed likely to be at no immense distance from the western coast of Europe.

Columbus, being firmly impressed with this opinion, and being supported by the judgment of learned friends, made the first offer to Genoa, his native country; but the citizens, unused to oceanic expeditions, at once rejected it. He then applied to Portugal with seemingly every chance of better success; and king John accordingly referred it successively to a special commission, and to the council of state. There was then, however, a powerful party opposed to maritime enterprises altogether, as wasting the national resources; while their opponents merely defended a prosecution of the sure and successful career, by which they had nearly rounded the southern point of Africa. The proposal was rejected, while John was persuaded to take the mean step of secretly sending a vessel on his own account, which, however, returned without any success. Columbus next repaired to Spain, then under the able sway of Ferdinand and Isabella. Here, however, cosmographical knowledge was much less advanced; the globular form of the earth was doubted by many, and even represented as against the authority of scripture and the fathers. Financial difficulties, caused by the war with the Moors, and the lofty demands of Columbus to have the offices of viceroy and high admiral made hereditary in his family, ope-

‡ Maritime and Inland Discovery (Cab. Cyclop.), t. 1, 237, &c.

rated against him: and five years' solicitation was vainly employed. Proposals were then made by his brother Bartholomew to Henry VII. of England, who received them more favourably; but as Columbus was on the point of setting out for this country, Isabella was persuaded to recall him, and, after some further difficulties, she engaged in the undertaking with the utmost ardour, and even pledged part of her jewels to raise the necessary funds.

The expedition after all consisted but of three small vessels, and cost only 4,000*l*. Columbus sailed from the port of Palos on the 3d of August, 1492, and went by way of the Canaries. He encountered innumerable obstacles arising chiefly from the timid and mutinous temper of his seamen, and after exhausting every resource furnished by his extraordinary address and perseverance, had been obliged to promise to return in a few days, if still unsuccessful. Signs of land, however, became frequent, and on the night of the 11th of October a light was observed at some distance, and the joyful sound of land! land! burst from the ships. But having been often deceived before, they spent the night in a state of the utmost anxiety. As soon, however, as morning dawned, their doubts and fears were dispelled; and the natives of the Old and the New Worlds found themselves, for the first time, in sight of each other! The land on which Columbus made his descent, and which had a pleasant delightful aspect, was one of the Bahama Islands, called by the natives Guanahani, and by the Spaniards San Salvador. Having landed, and taken formal possession of the country for the crown of Spain, Columbus became satisfied, from the poverty of the natives, that this was not the rich country of which he was in search. He therefore immediately set sail, and, shaping his course a little more to the S., successively discovered the great islands of Cuba, and Hayti or Hispaniola. After various transactions with the natives of the latter, he erected a fort, and leaving there a detachment of his men, set out on his return to Spain, arriving, after being obliged to take refuge in the Azores, and in the Tagus, at Palos, on the 15th of March, 1493, having spent 7 months and 11 days in his memorable voyage. He brought with him pieces of gold, a party of natives, and specimens of the vegetable and animal productions of this new world. His arrival was hailed with an enthusiasm of wonder and admiration in Spain and in Europe, and he made his entrance into Barcelona almost in regal pomp.

Columbus found no longer any difficulty in equipping a new armament, to which volunteers flocked from every quarter. In September he set sail with 17 vessels, several of large burden, and having 1,500 persons on board. Though he found his colony involved in many troubles, he was not deterred from pushing his enterprises to the westward. Having fallen in with Cuba, he sailed along its southern coast, then steering to the left, lighted upon Jamaica. He was delighted with the rich verdure and picturesque aspect of these fine islands, which he firmly believed to be parts of the Asiatic continent. Having returned to Spain, he set out, in 1498, on a third voyage. Having first proceeded southward to the Cape de Verd Islands, and steering thence across the Atlantic, he came in view of the lofty mountains of Trinidad. Rounding that island into the Gulph of Paria, he saw the Orinoco rolling by many mouths its mighty stream into the ocean. This discovery highly gratified him, and was, indeed, the first time that any part of the S. Ame-

rican continent had been visited by Europeans. He sailed along the coast as far as Margarita, and thence to Hayti. In 1502 he undertook a fourth voyage, seeking to push westward till he should arrive at regions belonging to India. In this course he struck against the coast of Honduras; where, instead of turning to the right, which would have led him to Mexico, he took the left, or N. W. course, as most promising for his object. He reached the Gulph of Darien, but without seemingly gaining any intelligence of the south sea. He then returned to Spain, where, weighed down by hardships, and disgusted by the ingratitude of Ferdinand, he closed, in 1506, his unrivalled career.*

America had, in the interval, been explored from a different quarter. John Caboto, or Cabot, a Venetian, who had settled at Bristol, presented to Henry VII. a plan of western discovery. That monarch, who had nearly earned the glory of Columbus's voyage, gave his full sanction to the undertaking. The adventurer, it appears, was willing to defray the whole expense; but whatever regions might be discovered, he and his family were to rule them as lieutenants, and to enjoy the exclusive trade, paying, however, to the king 1-5th part of the profits. The patent was granted in 1495, but circumstances prevented him from sailing till 1497. Then proceeding due west, he arrived, on the 24th of June, at a land with an island adjacent, which appears to be Labrador and Newfoundland. This was the first discovery of the continent, since it was not till 1498 that Columbus reached the mouth of the Orinoco. Cabot brought home several of the natives, and, though the aspect of the coast was not very inviting, Henry was so much gratified that he next year granted a fresh patent, allowing him to take up any 6 ships within the realm, equip them at the royal expense, and receive on board any number of English subjects who might be pleased to accompany him. John, from some unknown cause, did not go out in person; but the expedition was led by his son Sebastian, who, though a youth, showed already the talents of a great navigator. According to the very imperfect accounts of his voyage, he had with him 300 men, and sailing by way of Iceland, reached the coast of Labrador in about lat. 68°. Discouraged by its bleak appearance he steered to the south, and continued in that direction till lat. 38°. There are reports of his having attempted to establish a colony, but without success.†

Meantime, in another quarter important discoveries were proceeding. Vincent Yanez Pinçon, in crossing the Atlantic from the Cape de Verd Islands, was assailed by a tempest, which drove him to the southward of the equator; and, after being bewildered for some time amid unknown seas, he came in January 1499, to the view of an unknown coast, which was that of Brazil, near Cape St. Augustin. Thence he coasted northward to the mouth of the Amazons, and viewed with astonishment the immense body of water poured by it into the ocean, justly inferring that it must have rolled through a continent of vast extent. Three months after, Alvarez Cabral, despatched to India to follow in the footsteps of Vasco de Gama, came upon a more southern part of the same coast, which he named Santa Cruz, and took possession of it in name of the king of Portugal.‡

America had thus been reached in three dif-

‡ Maritime and Inland Discovery, ii. 51, 52.

ferent and distant quarters, on a scale which conveyed a high idea of its greatness, but without at all ascertaining its outline and limits. There was still ample unexplored coast to leave room for the passage to India, which continued to be the grand object in the discoveries that immediately followed. We shall begin with those most important ones, made by way of the Gulph of Mexico. Even before the fourth voyage of Columbus, Alonso de Ojeda, on learning the results of the third, set out from Spain in 1499, and following up the career of his predecessor, explored the coast from Margarita to Cape de Vela. He was accompanied as pilot by Amerigo Vespucci, a skilful navigator, who, returning to Europe, published a narrative of the voyage, representing himself as the first discoverer of the continent. The relation was read with extraordinary interest, and the public adopted the name of America, yielding him an honour undoubtedly due to Columbus. In 1500, Rodrigo de Bastidas explored the coast from Cape Vela to the point reached by Columbus in his fourth voyage, thus connecting a vast extent of continent. Ojeda and Nicuesa obtained grants of different portions; but their colonies, conducted rashly and violently, were almost entirely destroyed. A remnant was assembled at Darien by Vasco Nunez de Balboa, an officer of great enterprise, who, penetrating across the isthmus, came in view of the great southern ocean. Vast prospects were thus opened: but the court of Spain ungenerously transferred the chief command to Pedrarias Davila, who, actuated by mean jealousy, persecuted and put to death his predecessor, without himself achieving any thing of importance.

The discovery of the northern coast of the Gulph was begun by Ponce de Leon. This officer, while in command at Porto Rico, was misled by the illusory report of a fountain, in which whoever bathed was restored from the most decrepit old age to all the bloom and vigour of youth. In pursuit of this chimerica, he beat about from coast to coast, plunging into every pool, of course without success. In the course of his search, he came in view of an unknown coast, which he named Florida. Sailing along to a considerable extent, and turning the southern point, he ascertained it to be part of the continent, and the Spaniards long continued thus to name and to claim as their own the whole territory to Canada inclusive, though they were ultimately unable to maintain more than this southern extremity.

The main direction was still towards the west. In 1517, Cordoba from Cuba sailed along the coast of Yucatan, and collected some intelligence of the wealth and civilization of Mexico. He was followed next year by Juan de Grizalva, who, in the same direction, traced the entire coast of Mexico as far as Panuco. The fertile shores, well built towns, and abundance of gold, inspired the most flattering ideas of this coast, which was immediately dignified with the title of New Spain. In 1519, Garay, governor of Jamaica, sent four ships under Pineda, who, beginning at Florida, traversed the whole coast as far as Vera Cruz. The entire survey of the Gulph of Mexico was thus completed.*

Velasquez, governor of Cuba, on receiving the flattering accounts brought by Grizalva, determined to lose no time in fitting out an armament for the conquest of New Spain. Jealousy, however, deterred him from employ-

ing the original discoverer; and he gave the command to Hernan Cortes, a personal favourite, but who possessed every quality fitting him for such an undertaking. In March, 1519, he landed at Vera Cruz, and having burned his ships, marched into the interior with about 500 men. With this small force, seconded by his own superior sagacity and daring, Cortes subverted the empire of Mexico, put its sovereigns to death, and annexed it to the Spanish crown. Having reached the South Sea, he employed Alvarado to march along its coasts, which he did for the space of 400 miles, till he reached Guatemala. Nunez de Guzman afterwards penetrated the northern provinces to New Galicia, now Guadalajara and Zacatecas. Cortes himself, having equipped a fleet in 1536, discovered the peninsula of California, with its deep gulph, commonly named in that age the Vermilion Sea. †

The discovery by Balboa of the South Sea remained long without any result, through the weakness or disunion of the officers employed. The most tempting accounts were however received of the wealth of Peru, and the abundance of its precious metals. In 1531, Pizarro, a daring adventurer, who had sailed with Ojeda, after one unsuccessful attempt, succeeded in assembling a band of brave and fierce followers, with whom he sailed to attack that great country. By a union of boldness and treachery, he seized the empire and treasure of the Incas; and Peru became an appendage of the Spanish crown. Almagro, the companion and rival of Pizarro, pushed southward into Chili, but he met there with great difficulties, and was recalled by the affairs of Peru. Pedro de Valdivia, however, having the government of that country conferred upon him, marched to the southern border of its fertile territory, as far as 40° S. Lat. Vadillo, in 1537, made a march from Darien to Peru, through the fine countries of New Granada and Quito. Expeditions to conquer the latter were undertaken by Balacazar and Alvarado, who, after contending for its possession, agreed to divide it between them. In 1540, Gonzalez Pizarro, brother to the conqueror, undertook an expedition through the Andes to the west of Quito, in hopes of discovering a country said to abound in fine cinnamon. After numberless hardships, he came to the banks of the great river Amazon. Having followed its course for some distance, he employed Orellana, one of his officers, to descend the stream in a light bark to search for provisions. Orellana, inspired by a spirit of adventure, continued his voyage, and traced the whole of its immense course down to the ocean.

While the above-mentioned events were in progress, discovery proceeded, though in a less brilliant train, along the eastern coast. In 1514, Juan Diaz de Solis, a skilful mariner, was sent to sail round America, and reach the opposite side of the isthmus of Darien. Solis, beginning with St. Augustine, the limit of Pinçon's discovery, surveyed the whole coast of Brazil, and then came to the grand opening of the Rio de la Plata. But, having incautiously ventured on shore with a small party, he was surprised by the natives, and, with several of his party, experienced the dreadful fate which awaits those captured by the cannibal tribes of this continent. The remaining crews, on witnessing this catastrophe, were struck with dismay, and immediately returned home. Three years after, Fernando Magalhaens, or Magellan, a Portuguese, discontented with his treatment in his

* Oviedo. Robertson. Mart. and Inal. Discov. B. iv. ch. iii. iv.; Bancroft's Hist. United States, ch. ii.

† Cortes Relations, Ramulo III. Robertson.

native country, offered his services to Charles V. The immediate object was to reach the Moluccas from the west, and thus, according to the papal grant, establish a claim to those islands, which were then much valued. A fleet of five sail being equipped, he sailed in September 1519, and having proceeded along the coast of Brazil, reached Port St. Julian, where he wintered. In October 1520, he entered the strait bearing his name, and after a few weeks' navigation, saw the great Pacific opening before him. He stretched directly across, and came to the Philippines, where he was killed in a contest with the natives; but his vessel had the honour of being the first that circumnavigated the globe. In 1526, Sebastian Cabot was sent out to the La Plata, where he ascended the Parana and the Paraguay, and, notwithstanding the opposition of the Portuguese, established two or three forts. In 1535, Juan de Mendoza, an opulent Spaniard, founded the city of Buenos Ayres, and in 1537 Juan de Ayolas penetrated across the Andes to Peru. Thus the great outlines of Southern America were traced in every direction.*

Discovery in the north did not proceed with the same rapid steps. We have already noticed the important voyages made by the Cabots. This excited the rivalry of the Portuguese, and in 1500 Gaspar de Cortereal, a nobleman of that nation, set sail and surveyed a considerable extent of the coast of Labrador. He carried off about 50 of the natives, to employ them as slaves; but the enmity of the people, thus justly roused, probably led to the fatal result of his next voyage, from which he never returned. His brother Michael, sailing in search of him in the following year, met the same fate, which was shared also by another expedition sent in 1503.

The reign of Henry VIII. was unfavourable to nautical enterprise. The discovery of the Cabots was not followed up, and Sebastian sought the service of Spain. He was sent out, however, in 1517, as pilot to an expedition commanded by Sir Thomas Pert, which, it appears, actually entered Hudson's Bay; but the commander then lost courage and returned, to Cabot's great indignation. This discovery attracted little notice, and was soon forgotten.

France now entered on the career of American discovery. In 1524 Francis I. employed Giovanni Verazzano, a Florentine navigator, who sailed along and described the coast from Carolina to Newfoundland. Unhappily, in a subsequent voyage, he fell into the hands of the natives, and suffered a cruel death. Ten years after Jacques Cartier, a seaman of St. Malo, performed several voyages, in which he entered the Gulf of St. Lawrence, and ascended the river as high as Montreal. Attempts were then made to colonize these countries, for some time without success: however, in 1604, De Montz founded the colony of Acadia, and Champlain, in 1608, that of Canada. The latter, engaging in warlike expeditions, penetrated southward to the lake bearing his name, and westward beyond Lake Huron.†

The Spaniards, meantime, as already observed, had, under the title of Florida, claimed nearly all North America; nor were they wanting in vigorous efforts to make good their title. In 1520, Lucas Vasquez de Ayllon discovered and attempted to form a settlement on South Carolina; but having begun by entrapping and carrying off a number of the inhabitants, he excited such

a fierce enmity that many of the settlers were killed, and the rest returned to Hispaniola. In 1524, Estevan Gomez sailed as far as the latitude of New York, whence he brought off a cargo of slaves. A more important expedition was undertaken in 1528 by Narvaez, the rival of Cortes, and sent to supersede him, but who had been vanquished and made prisoner. He now sought to indemnify himself by a kingdom in Florida. He landed with a force of about 600 men, and advanced about 800 miles into the interior, baffling all attempts to oppose his progress. The natives, however, irritated by his violent and domineering conduct, posted themselves in the woods, and harassed him by constant attacks and surprises. The Spaniards, completely exhausted, and in extreme want, were obliged to seek the nearest coast. Unable to reach their ships, they constructed frail barks, which, on coming out to the open sea, were wrecked, and almost the whole number perished. Alvaro Nugnez the treasurer being cast ashore, contrived, by conciliating the Indians, acting as a merchant and physician, and even pretending to work miracles, to make his way to Mexico, after a seven years' pilgrimage. The land route was thus traced between that country and Florida.

This catastrophe did not prevent another attempt. Fernando di Soto had been an associate of Pizarro in the conquest of Peru, where he distinguished himself by the capture of Cuzco, and other exploits. He returned to Spain with a high name and a princely fortune; but instead of sitting down to enjoy these, he resolved to make them instruments for conquering an empire for himself. His reputation attracted many of the most distinguished Spanish youths as volunteers; and in May 1528 he landed in Florida, with a more powerful armament than those which had conquered Mexico and Peru. The exploits of Soto surpassed, in daring valour and brilliant achievement, those of Cortes and Pizarro; but his fortune was far different. There was here no great empire, no central point to strike at. He struggled on amid a succession of fierce and petty tribes, whom he always vanquished, but who rose around and behind him, and never left to his troops more than the ground which they covered. He was lured on by reports and specimens of the gold formation of North Carolina; but arriving there, in a most exhausted state, and finding only ridges of naked hills, he turned back. He afterwards pushed far to the westward, crossed the Mississippi in about lat. 35°, and proceeded northward to near the present site of New Madrid. Finding no report of gold, or rich kingdoms, he made a dash at the extreme west, passed the heads of the White River, then descended the Washita and Red River to the Mississippi. Here, overpowered by fatigue and disappointment, he sunk into the grave. The miserable remnant of his men, anxious to conceal his death from the Indians, carried the body at dead of night into the middle of the river, and sunk it beneath the waters, afterwards, putting together some rude barks, they made their escape to Mexico.‡

The wanderings of Alvaro had attracted the attention of the Spaniards to the regions immediately north of Mexico. A friar, Marco di Nizza, set out with a party to explore them, returned with a romantic account of a city, named Cevola, having 20,000 splendid houses, and its most common utensils of gold, silver,

* Herrera, Robertson, Marit. and Int. Dis., R. IV. ch. vi. vii.

† Bannister, III. Mem. Cabot, ch. xiii. Champlain, Voyages.

and the richest jewels. Mendoza, the viceroy, hoping to emulate the glory of Cortes, fitted out two large expeditions, one to proceed by land under Vasquez Coronado, the other by sea under Fernando Alarcon. Coronado, after a most arduous march through rugged and desolate mountains, reached the plain of Cevola, and, notwithstanding a most desperate resistance, forced an entry, but found a mere village of 400 houses, with nothing at all splendid; the jewels were only pebbles and rock-crystal. In hopes of achieving something, he marched 300 leagues to the coast, where he found a city of somewhat greater consequence, named Quivira, which cannot now be identified. Alarcon, unable even to join his associate, returned equally disappointed. Cabrillo, a Portuguese seaman, was then employed by Mendoza to explore the coast. He reached as high as 44° N. lat. but brought back a gloomy account of the aspect of the region, and the difficulties of navigating this northern sea.*

The zeal of Spain now slackened; but, in 1579, Drake, in his expedition round the world, traced the north-western coast as high as lat. 48°. There is a narrative by a Spaniard named Juan de Fuca, who boasts that, in 1596, he reached a similar latitude; and his report, long discredited, has been confirmed, in a great measure, by the discovery of a strait closely answering his description, and now bearing his name. In 1596 and 1602 the Conde de Monterey employed Sebastian Viscaya, who did not, however, reach so far as Cabrillo. There is also a narrative by De Fonte, who boasted that, in 1640, he had reached the latitude of 53°, where he found numerous islands separated by narrow straits, which he named the Archipelago of St. Lazare, and within them a large lake named Belle. This account is generally branded as fictitious; yet we cannot but observe, that it strikingly agrees with the numerous chain of islands found by Vancouver in the same latitude, while Lake Belle may be the interior sea between them and the main.†

The power of Spain having declined, she was unable to maintain the vast pretensions she had advanced in relation to Florida. Britain, now become a much more formidable maritime power, established colonies in Virginia and New England in defiance of Spain. In doing so, although there was not room for great discoveries, she acquired a far more accurate knowledge of this long range of coast. The expectation was still entertained, that some of its openings might lead into the South Sea, and this was even viewed by the Virginia company as one of their leading objects. But the laborious survey of Chesapeake Bay, by Smith, in 1608, nearly put an end to these hopes.

The British, however, made indefatigable efforts to discover a passage to India by the north. Sir Martin Frobisher, in 1576, found means to equip 2 slender barks of 25 tons for this arduous attempt. Passing the southern extremity of Greenland, he reached the coast north of Hudson's Strait; but, after sailing about for some time without perceiving any opening, and the season being advanced, he returned. One of the party brought home a shining black stone, which some ignorant persons pronounced an ore of gold. The utmost enthusiasm was thus kindled, and a larger expedition was easily fitted out next year. Frobisher then discovered the straits bearing his

name, leading into Hudson's Bay; but he was arrested in them by the ice; he carried home, however, a store of the black stone. The hopes of the nation were higher than ever, and the queen sent him back with 15 ships, a strong fort in frame-work, and 100 men to form a colony. In approaching the place, however, he was attacked by so furious a tempest, with islands of ice driving against the vessels, that he had the utmost difficulty in saving and bringing them home. These disasters, and the discovery that the appearances of gold were illusory, caused a suspension of this series of enterprise.

In 1585, a number of leading merchants fitted out 2 vessels under John Davis. Steering farther N. than Frobisher, he crossed from Greenland the straits bearing his name, and came upon the American land in about 66° N. He sailed somewhat farther N., and surveyed different parts of the coast, but was obliged by the lateness of the season to return. His report, however, being favourable, he was sent out again next year. Though much retarded by the encounter of a huge field of ice, he reached his former station, and steered thence S. E. till he came to Labrador, having passed numerous islands, as appeared to him, but probably the coasts bordering on the sounds and inlets leading into Hudson's Bay. Being assailed by tempests, he returned to England, still giving such favourable hopes that, though many of the adventurers held back, Mr. Sanderson, his zealous patron, procured for him a smaller armament. He pushed to the yet unattained point of 72° 12' N., on West Greenland; thence he steered 40 leagues across, but was arrested by the fixed field of ice in the middle of the bay. He vainly attempted to round it, and was pushed southward to his former station on the American coast. He penetrated 60 leagues up Cumberland Strait; then being obliged to return, he observed, without entering, the entrance of Hudson's Bay. He returned home as sanguine as ever, but the perseverance of the merchants was exhausted.‡

The Muscovy and Levant companies, in 1602, sent out John Weymouth; but the mutinous spirit of his crew prevented his achieving any thing. They employed, in 1606, John Knight, who was surprised and killed in Labrador by the natives. In 1607, Sir Dudley Digges, Sir John Westenholme, and other gentlemen fitted out Henry Hudson, a celebrated navigator, who had already made three arctic voyages. Though furnished only with one ship of 55 tons, he penetrated, after many difficulties, into the bay, or rather inland sea, which bears his name. He surveyed a considerable extent of its eastern shore; but as November had arrived, was obliged to winter there. Much hardship being endured till spring, a mutiny arose among his crew, who exposed Hudson and his friends to perish on this inhospitable shore, and, with thinned numbers, made their way to Ireland.

Notwithstanding these melancholy circumstances, a great opening had thus been traced, and, in 1612, the Company sent out Sir Thomas Button, accompanied by Bylot, one of Hudson's companions. Sir Thomas having entered the bay, steered directly across through such an extent of open sea, as made him hope that he was now in the Pacific; when he suddenly saw himself arrested by a long line of coast, to which he gave the name of Hope checked. He wintered in Nelson's River, sailed up Roe's Welcome, surveyed various points on Southampton Island, and returned to England. After a fruitless attempt by Gibbons, Bylot and Baffin were sent,

* Ramusio, vol. iii. p. 297, &c. Venegas Californica.

† Torquemada, Monarquia Indiana, book v. Murray, Discov.

N. Amer. vol. i. p. 87, &c.

‡ Hackluyt, iii. 54-114.

in 1615; but they were arrested by the eastern coast of Southampton Island. In 1616, they went to try the more patent route of Davis's Straits. They made then the complete circuit of that great inland sea, which has since been named Baffin's Bay; but returned with the conviction that it was enclosed by land on every side, and afforded no hope of a passage. The search in this direction was discontinued; but, in 1631, Fox was sent out by the king, and James by the Bristol merchants, to try again the route of Hudson's Bay. Fox, after vainly attempting a western route, sailed up the channel bearing his name, the most direct route to the strait of the Fury and Hecla, but stopped much short of that point. James stood to the southward, and being entangled in the eastern coasts of the gulph, was obliged to winter there, when his crew suffered the utmost extremity of cold.*

The north-western coast of America, notwithstanding the Spanish discoveries, remained still almost unknown. But after Russia had overrun Siberia, and reached the shores of the eastern ocean, her active rulers felt an interest respecting the opposite continent. It was even doubted, whether it was separated from that of Asia; but this, in 1728, was nearly ascertained by Behring, who reached the eastern extremity of the latter continent, on the straits which bear his name. He saw the land thence stretching N. W., but did not discover any part of America. A few years after, Krnischel, a Kossac, from Kamschatka, de-eried, and sailed along it for two days. In 1741, Behring and Tchirikoff were sent thither to make a careful survey. They were separated: the former reached the coast, and landed about the latitude of 58°. He could not accomplish his object of surveying it to 65°, and being obliged to winter on one of the Aleutian islands, suffered severe hardships, to which he fell a sacrifice. Tchirikoff came in view of it in about lat 55°; but being unable to land, and having lost two boats in attempting to communicate with the natives, he returned to Kamschatka. On this voyage the Russians found their claims to the American coast N. of 55°; and their traders soon established along it a chain of settlements with a view to collecting furs and skins of the sea-otter. †

Capt. Cook employed his last voyage in examining the north-west boundaries of America, and in attempting to effect a north-west passage. He traced the coast from 50° northwards, till he came to Cape Prince of Wales, the western limit of the continent: then steered north-east till, in about 70°, he was arrested by an unbroken chain of ice islands. He returned, naming the adjacent promontory Icy Cape; and King and Clerke next season in vain attempted to penetrate further. The information obtained in this voyage induced many English ships to resort to this coast with a view to the capture of the sea-otter, for whose rich skin there is a regular demand in the China market. Dixon and Meares, in this pursuit, explored Nootka and the adjacent coasts. The Spaniards attempted to oppose this trade, and even captured the Argonaut, a British vessel; but were obliged to withdraw their opposition. They now sent several expeditions, particularly one under Ayala and Maurelle; but these could make no discovery which had not been anticipated. In 1791-2, Vancouver was employed in making a careful survey of these coasts, in the hope of finding a passage into the Atlantic, through one of their numerous bays; but this

he proved to be impracticable. Broughton, under his direction, ascended the Columbia for about 90 miles. Capt. Gray, employed by the United States, had before been at its mouth, and given it its name; but he is said never to have entered the actual channel of the river.

Meantime some straggling attempts after the passage were made from the Atlantic. In 1668, the Hudson's Bay Company was formed, and undertook to make exertions for this object. There is however no record of any till 1721, when Knight, governor of one of their forts, prevailed on them to supply him with the materials for a voyage. Unfortunately, being obliged to winter on Marble Island, he and his whole crew fell a sacrifice to sickness and famine. In 1741, Mr. Dobbs, a gentleman of influence, and imbued with the the most ardent zeal on this subject, prevailed on the Admiralty to send out Capt. Middleton with the Furnace bomb-ketch. That officer, in 1742, sailed to the head of Sir Thomas Roe's Welcome, where he found on one side Repulse Bay, on the other a frozen strait between Southampton Island and the mainland. Having also looked up Wager inlet, he pronounced a passage in this direction impossible. Dobbs and others loudly accused him of carelessness and even treachery, and kindled such a spirit that 10,000*l.* was raised by subscription, and parliament voted a bounty of 20,000*l.* to the subscribers in the event of their success. Two vessels were sent out under Captains Morr and Smith, who however merely examined the Wager inlet, ascertaining that there was no passage, and then returned.

Maritime expeditions were now suspended, but some important discoveries were made by land. Ever since Baffin's last voyage, the impression had prevailed that North America stretched indefinitely towards the pole. But in 1769, Mr. Hearne, sent by the Hudson's Bay Company, descended Coppermine River, and found it to terminate in a sea at about 65° N. lat. In 1789, Sir Alexander Mackenzie, an agent of the North West Fur Company, descended, much farther westward, the great river bearing his name, and came to what he termed a lake, but which, from its having tides and containing whales, was very decidedly judged to be also a sea. There was thus found great room to suppose that, in a latitude between 60° and 70°, America was bounded by a great Arctic ocean: while from these observations combined with those of Cook, the estimate of its breadth was greatly enlarged.

These considerations produced little influence, till, after the peace of 1815, when the energies called forth during the late war sought a different direction. Sir John Barrow proved that the impression against the existence of a passage, derived from former failures, rested on very slight grounds. Under his auspices, Capt. Ross was sent out in 1818, with the *Isabella* and *Alexander*, to make a more full trial in Baffin's Bay. He sailed entirely round it, but returned decidedly reporting that navigator's opinion to be correct, and that it afforded no western passage. Lieut. Parry of the *Alexander*, however, and other officers, were of opinion that the spacious opening of Lancaster Sound had been quitted without due examination, and afforded a favourable promise. He was therefore sent out next year, and though he did not reach the sound till August, found all his expectations fulfilled. The ships, during the first day after

* Purchas, iii. 596, 716. Narratives of Fox and James Barrow's Arctic Voyages.

† Muller, Cox. Burney.

entering the sound, had an unobstructed run of upwards of a hundred miles. After sailing a little farther, he was arrested by ice, and obliged to turn southward along the eastern shore of Prince Regent's Inlet. Being arrested there, he returned northwards, and was gratified to find the passage to the west become quite clear. He run along it to beyond 110° W. long., thus entitling the crew to a royal bounty of 5,000*l*. He was then obliged to make arrangements for spending the winter, during which, notwithstanding the most rigorous cold, the health and spirits of the crew were surprisingly preserved. He was defeated in his attempt next year to penetrate farther west, and obliged to return.

Capt. Parry was again sent out the following year; but it was now resolved to try the channel by the northern head of Hudson's Bay, which Middleton was considered as having by no means completely explored. He found no reason to doubt the accuracy of that navigator; but by pushing up the Fox Channel, he arrived at a strait, named after his vessels the *Fury* and *Hecla*, which was ascertained to afford a passage into the Polar sea. It was so blocked up with ice, however, that his utmost efforts, during two successive seasons, could not force a passage. Having returned to England, he was sent out a third time, in 1824, to endeavour to penetrate through Prince Regent's Inlet into the open sea, of which he had now fully ascertained the existence. The season however being peculiarly rigorous, it was not till next summer that he reached the western coast; and the *Fury*, being then squeezed between two masses of ice, sustained so severe an injury, that it became necessary to abandon her, and give up all attempts to proceed farther.

Other means were at the same time resorted to for exploring the northern boundary of America. Lieut. Franklin and Dr. Richardson undertook to proceed to the mouth of the Coppermine River, and thence attempt to trace the whole coast, from the strait of the *Fury* and *Hecla* to the *Icy Cape* of Cook. They sailed from England in May, 1820; were obliged to winter on the *Athabasca Lake*, and in July, 1821, embarked on the *Arctic Ocean*. They turned to the eastward, but were forced to take a very circuitous course through deep sounds and inlets, particularly the great one named *Coronation Gulph*. Hence on reaching *Point Turnagain* in $109^{\circ} 25'$ W. long., though the sea continued open, they found it necessary to return, from the exhausted state of the equipment. The party, being obliged to travel by land over a range of naked territory broken by lakes and rivers, endured the utmost extremes of human misery, and several perished before they could reach *Fort Enterprise* on the *Coppermine*. They returned, however, with unbroken spirits and determination, and government liberally furnished the means of renewing their efforts. At the same time, Capt. Beechey was sent by way of the *Pacific Ocean* to follow in the steps of Cook, and meet them from the westward. Franklin's new expedition set sail in 1825, wintered on *Great Bear Lake*, and early next year were at the mouth of the *Mackenzie*, whence they now proposed to begin their survey. From this point Capt. Franklin proceeded W.; Dr. Richardson E. The former explored a considerable extent of coast bordered by ranges of the *Rocky Mountains*; but, after passing *Foggy Island*, in long. 147° W., the obstacles became so serious as made it necessary to turn back. Meantime, however, Capt. Beechey had passed

Behring's Straits; and, though the ship could not be navigated beyond the *Icy Cape* of Cook, Mr. Elson, in a boat, reached $156^{\circ} 21'$ W. long., where a cape stretched into lat. $71^{\circ} 23'$ N. The expeditions were thus within 9 short deg. of long. from each other; of which had they been aware, they would at every cost have pushed through. Dr. Richardson succeeded in exploring the whole coast between the *Mackenzie* and the *Coppermine*, connecting his discoveries with those of the former voyage, and leaving unknown only two comparatively small portions between Franklin's extreme points and those reached by Beechey on one side, and Parry on the other.

Capt. Ross, regretting the mistake by which he had failed to discover the entrance into the *Polar Sea*, anxiously sought the means of retrieving this error. These were furnished by a public-spirited friend, Sir Felix Booth, and the resources of steam navigation were called forth. They were not of much avail; but Capt. Ross, through many difficulties, made his way into Prince Regent's Inlet, and reached considerably farther than Parry on its eastern limit. He thrice wintered there, and explored a great extent of the adjacent coasts. He found himself on what appeared a peninsula, named *Boothia*, reaching to 74° N. lat., and connected with the continent by a narrow isthmus. A considerable extent of the American coast to the westward was also explored, but without reaching Franklin's *Turnagain*. Commander Ross is considered as having ascertained the site of the magnetic pole on the western coast of *Boothia*. Capt. Ross, in attempting to reach home, was obliged to spend another winter near the northern point of the peninsula. His arrival, in 1833, occasioned a joyful surprise, as the most melancholy forebodings had prevailed as to his fate.

During the alarm felt at his long absence, an expedition to discover and release him was fitted out, partly by government and partly by private subscription. It was entrusted to Capt. Back, a companion of Franklin, with the hope that he might also make some further discoveries. Having left England in February, 1833, he wintered at the eastern end of *Great Slave Lake*, and next summer descended a river named the *Thlew-ee-chop*. It terminated in a spacious bay, at the end of which the coasts appeared to stretch, one S.E., the other due W. From *Cape Ogle*, where this last direction began, was seen on the E. an apparently boundless expanse of sea. By the observations then made it appeared probable, that *Boothia* did not form part of the American continent; but was connected with a more southerly peninsula which, along with it, formed one great island.

In 1838, the public were surprised by the intelligence, that one of the blanks still left in American geography had been filled up. The *Hudson's Bay Company*, now certainly an active and liberal body, determined to explore what was yet unknown in their own territory. Under the intelligent direction of Mr. Simpson, the resident governor, Messrs. Dease and Simpson, in the summer of 1837, went over the intermediate space between the points reached by Franklin and Beechey. It was found to run in a nearly direct line, presenting no remarkable feature except the efflux of two large rivers. The same gentlemen were employed, in 1838, to explore from *Cape Turnagain* to the strait of the *Fury* and *Hecla*; a more difficult task.

The first important steps in the discovery of

the interior of N. America, were made by the French from Canada, under the government of Count Frontenac. Under his auspices, Ioylet and Father Marquette, in two Indian bark canoes, undertook to explore the vast regions on the Mississippi. Lake Michigan then formed the extreme boundary of European knowledge. From it, ascending the Fox river and descending the Oniscassin, they reached the central stream, and were astonished at its grandeur, and the majestic forests on its banks. In proceeding downwards, the first people they met were the Illinois, who received them hospitably. Afterwards they were struck by the influx of the mighty stream, deeply tinged with mud, of the Missouri (named by them Peketanani). Under the name of Ouabiskgou, they describe the united stream of the Wabash and Ohio. They came next to the Akamseas (at the mouth of the Arkansas), but perceiving now that the river must terminate, not, as had been supposed, in the Gulph of California, but in that of Mexico, they were afraid of the Spaniards, and returned.

When the two travellers arrived at Quebec, there happened to be in that city an enterprising young Frenchman, of some birth and fortune, named *Sieur de la Salle*, who conceived an enthusiastic desire to prosecute this career of discovery. Through influence at court, he procured ample means. After some time spent in erecting forts upon the lakes, he reached the Mississippi by a new route, ascending the Miami and descending the Illinois. On reaching the Arkansas, he hesitated not to prosecute his voyage, and passed along the territory of the Taencas, Natches, and Quinipissas. Soon after, by the vast breadth to which the waters expanded, their brackish taste, and the shells on the shore, he discovered, with exultation, that he was at the mouth of the Mississippi. He hastened back by the same route to Canada, and thence to France, where he was received with the highest distinction, created governor of the region he had traversed, and sent out with four ships and 280 men. He went by the W. Indies; but unfortunately he could not distinguish the entrance of the river, and, while searching for it, a mutiny arose among his men, in which he was killed.

About this time Hennepin also attempted to reach the source of the Mississippi; but, after passing the Falls of St. Anthony, he was taken prisoner by the Indians, detained long in captivity, and thought himself happy in making his escape. Some time after, Baron Lahontan reported his having ascended a great tributary, which he calls Long, but which appears to be the St. Peter's. He met some members of a distant tribe, who described a chain of high mountains lying to the westward, beyond which was a great salt lake, a term which the Indians often apply to the sea. These correct statements seem to absolve the baron's reports from the suspicion of fiction, which has been sometimes attached to them.

The English colonies on the Atlantic had made a great advance in population and wealth, before they attempted to penetrate across the Alleghany. An opinion had indeed long prevailed, that this range formed an insurmountable barrier. In 1714, however, Spottiswoode, governor of Virginia, sent a party, who made their way into the western territory. It was still some time before the colonists made any attempts to settle there, and when they did, they were vigorously opposed by the French, who, in virtue of the

settlement of Canada and the discovery of the Mississippi, claimed the whole region. They drove out a company who attempted an establishment on the Ohio, and erected, on the present site of Pittsburg, Fort Duquesne, which struck a general alarm through the provinces. The conquest of Canada, and the peace of Paris, in 1763, removed this opposition. Still the settlement was made, not by any combined or official movement, but by Boone, and other daring adventurers, who maintained a series of bloody struggles with the natives, by whom the English were kept in perpetual alarm. It was not till some years after the war of independence, that Kentucky was received into the union, and that the great tide of emigration began, which has covered the valley of the Mississippi with so many populous and flourishing states.*

The Americans having in 1804 purchased Louisiana from Napoleon, claimed under that vague title the whole region to and beyond the Mississippi, and commenced operations for exploring that vast territory. An expedition was arranged by Mr. Jefferson, then president, and was led by Captains Lewis and Clarke, the former of whom was his private secretary. On the 16th May, 1804, they began their voyage on the Missouri. They passed its great tributary the Osage, inhabited by a numerous people of that name; then the Kansas, more than half its own breadth; lastly, the large and rapid stream of the Platte. Having ascended 1600 miles, and reached the foot of the Rocky Mountains, they found the season too far advanced for crossing that great chain. They, therefore, built a fort named Mandan, where they spent the winter. Early in April, they were again in movement, and in nineteen days came to the influx of the Yellowstone, almost equal to the main stream. They next reached two great branches or forks, without knowing very well which to take, but chose the southern and largest, and were assured of being right when they saw the great falls of which they had been apprised, and which formed a most magnificent spectacle. They ascended, till they could bestride this mighty river, and found the spring head whence it welled, about 3,000 m. above its confluence with the Mississippi.

Having now reached the crest of the great rocky chain, the travellers descended rapidly, though not without difficulties, from the ruggedness of the road and the want of provisions. They at length, however, embarked on the southern branch of the Columbia, which they named Lewis, and after passing its falls saw it spread into a wide channel, and ultimately open into a bay, where they exultingly heard the sound of breakers from the Pacific. They wintered at the mouth of the river, and hastened back by the same route in the following spring. They were not, however, the first who had crossed the entire breadth of the continent. This had been effected in 1792 by Sir Alexander McKenzie, in a more northerly quarter; and in 1803, the agents of the Montreal Company had crossed the mountains, and formed trading posts on the northern branches of the Columbia.†

The American government sent, in 1805, another expedition under Major Pike, to trace the yet unknown head of the Mississippi. It was found in a direction almost due north, not rising from any great natural range, but in a flat marshy region, and passing through a number of little lakes, the chief of which, named Leech and Red Cedar, contend for the honour

* Flint, *Indian Wars of the West. Cinch.*, 1833.

† See Journal of D. W. Harmon (*Andover*, 1820).

of giving birth to this leading American water. Its length proved to be at the mutual junction little less than half the Missouri, which therefore ought properly to rank as the main stream. Pike, on his return, was sent to explore the course and origin of the Arkansas and Red Rivers. The former he found very broad, flowing through a country richly stocked with game, and having its source in the Rocky Mountains. He first conveyed an idea of the loftiness of that chain, which he compared, though with exaggeration, to the Cordilleras. He attempted then to descend the Red River, but entered by mistake on the Rio del Norte, and proceeding into the Mexican territory was made prisoner by the Spaniards, but well treated and soon released. About the same time, Mr. Dunbar and Dr. Hunter, from Natchez, sailed to a considerable height up the Red River and its tributary the Washita, surveying the fertile country on their banks.

After a long suspension, the American government, in 1819, recommenced this career. Major Long and Dr. James were sent to explore more precisely the western territory, southward of the Missouri. They discovered with regret that a great sandy desert extends for a breadth of about 400 miles eastward from the rocky mountains. That chain was carefully examined, and its highest peak found not much to exceed 12,000 feet. Seeking to descend the Red River, by a fresh fatality they mistook for it the Canadian, the longest tributary of the Arkansas, by whose channel they regained the Mississippi. Meantime General Cass was employed in a more careful examination of this last river, tracing in his way the southern shore of Lake Superior. Major Long, on his return, ascended St. Peter's River, already visited by Larhontan and Carver. He found, rising from continerminous sources, the northern Red River, which flows into the British territory, and ends in Lake Winnipeg. These successive expeditions conveyed to the United States government a pretty correct idea of the interior of their vast territory, including those parts of the continent which had hitherto been most imperfectly known.

AMERKOTE, a town and fort. of India, territory of Sind, in the desert, 88 m. E. Hyderabad, lat. 25° 20' N., long. 68° 49' E. The emperor Akbar was born here in 1541.

AMERSFORT, a town of the Netherlands, prov. Utrecht, on the Kem, which becomes navigable at this point, 12 m. E. N. E. Utrecht. Pop., in 1830, 11,782. It is well built and well fortified; has a court of original jurisdiction, a college, a commission of agriculture, with manufactures of fustians, dimities, bombazeens, &c. It is the mart for the corn and tobacco cultivated in the contiguous territory; and has a considerable transit trade in produce from Germany, embarked here in flat-bottomed boats from Amsterdam. The distinguished statesman and grand pensionary, Barneveldt, sacrificed in 1617 to the fanaticism of the people and the hatred of Prince Maurice, was a native of Amersfort.

AMERSHAM, a bor. and pa. of England, co. Buckingham, near the Colne, 26 m. W. N. W. London. Pop. of parish, 2,816. The town consists of one long street crossed by a shorter one, having the church at the point of intersection. The living is a rectory and one of the best in the county. There is a free-school, to which are attached three exhibitions at Corpus Christi college, Oxford, with almshouses, and three charities. A good deal of black lace is manufactured, and the market is well attended. Previously to the Reform Act, by which it was disfranchised, this borough sent 2 members to the H. of C., the right of voting being in the inhabitants paying *scot and lot*; but these being all tenants of the lord of the manor, it was in fact a nomination borough.

AMESBURY, or AMBRESBURY, a m. town and par. of England, co. Wilts. The town is situated on the Avon, 74 m. N. Salisbury. Though inconsiderable, it is noted for the ruins of an abbey, the vicinity of Stonehenge, and for having been the birth-place of Addison. The parish comprises 6,060 acres, with a pop. of 944.

AMHARA, a division of Abyssinia, which see.

AMHERST, a sea-port town of the Brit. prov. of Martaban, India beyond the Ganges, and the chief British military and commercial station in the provinces E. the Than-tsweng river, on a point of land in the N. E. angle of the Gulph of Martaban, facing the mouth of the Than-tsweng and the lake of Balu to the N. Lat. 16° 4' 40" N., long. 97° 30' 24" E. Pop. in 1827, 1,600; now (1838) probably 5,000. It was founded in 1825, after the restoration of the town of Martaban to the Birmanes, in the view of serving as a military post, and a commercial establishment, and as an asylum for such refugees as might choose to emigrate from the Birmanes dominions. The apex of the promontory, which is the highest spot in the town, is occupied by the church, governor's house, court of justice, fortifications and other public buildings; on the higher ground around it are the European and Chinese quarters; and the lowest are by choice inhabited by the natives. The military cantonments are about 14 m. distant, in a dry, level, and elevated spot. The harbour is spacious and secure, with 3 fath. water at low neap tides; rise and fall about 19 ft., with a flow of 6 m. an hour, and perfectly still for 2 hours both before and after high water. Ships may lie within 100 yards of the shore. Mangrove and a kind of oak are abundant here, and there are teak forests at no great distance. Good water is found everywhere 6 feet below the surface. (*Hamilton, E. J. Gazetteer*, p. 47.)

AMHERST, a town of the U. States, Hampshire, co. Massachusetts, 82 m. W. Boston. Pop. 2, 631. A college was established here in 1821, which, in 1836 had 9 professors and 252 students. The expenses of a student are reckoned at from 90 to 120 dollars a year, including board and college fees. Amherst is the name of some other places in the U. States.

AMHERSTBURGH, a town of Upper Canada, on Detroit R., 3 m. above its embouchure in Lake Erie, and 14 m. below Detroit. It was founded during the administration of Lord Amherst, and was named after his lordship.

AMIENS (an. *Samarobriva*), a city of France, cap. dep. Somme, on the river of that name, 72 m. N. Paris, lat. 49° 53' 41" N., long. 2° 18' 11" E. Pop. 32,391. Amiens has a citadel constructed by Henry IV. It is well built; streets for the most part straight and clean; and it has some fine squares and promenades. The old Gothic cathedral, in excellent preservation, is one of the finest in Europe. It is 366 feet in length and 132 in height. Among the other public buildings may be specified, the Royal College, theatre, Hôtel de Ville, corn-market, courts of justice, barracks, seminary of St. Achel, château d'En, &c. It is the seat of a bishop, has a *cour royale*, a court of assizes, a commercial tribunal, a custom-house, a public library containing above 40,000 vols., an academy, an academy of sciences and belles-lettres, a free school of design, a botanical garden, &c.: manufactures very considerable. They consist principally of kerseymeres, casimires, merinos, &c. made partly of home, and partly of German and Spanish wool. The linen trade is also considerable; but it is now surpassed by that of cotton. There are annually produced about 60,000 pieces of cotton velvet, the aggregate value of which is estimated at about 5,000,000 fr. and about 70 looms are occupied in the production of velvets, *dites d'Utrecht*. There are also several mills for the spinning of cotton and flax; with dye and bleach-works; manufactures of machinery, beet-root sugar, and chemical products; tanneries, soap-works, paper-mills, &c. The *patés de Canard* made here, are highly esteemed. Flat-bottomed vessels, drawing from 40 to 50 tons, come up the river to the town, which is the centre of a very considerable trade, as well in its own productions as in those of the surrounding country. Amiens is very ancient, being supposed to have existed anterior to the invasion of Belgium by the Romans. It is known in diplomatic history from the circumstance of a definitive treaty of peace between England and the French republic having been signed in it on the 25th March, 1802. It is the birth-place of Peter the Hermit, the apostle of the first crusade; of Ducange, author of the *Glossarium ad Scriptores medie et infime Latinitatis*, a work of wonderful research and labour; and of Delambre, the late learned author of the most accurate though not the most eloquent history of astronomy. (*Hugo, France Pittoresque*, art. *Somme*, &c.)

AMJIRA, a town in Malwa.

AMLWCH, a sea-port town of N. Wales, N. shore of the island of Anglesea, which has risen from the state of an inconsiderable fishing village, in consequence of the discovery of the famous copper mines in the adjoining Pary's Mountain, in 1768, to be a town with about 6,000 inhab. It has a pretty good port, excavated from the solid rock. During the flourishing period of the mines, they produced above 3,000 tons a year of pure metal; but they have been gradually declining for these several years past, and do not now produce above 700 tons a year. It is not therefore probable that Amwlch, which depended

almost entirely upon the mines, is destined to make much further progress. It is united with Beaurmar, Holyhead, and Llangefni in returning a m. to the H. of C. Pop. of parish, 6,285.

AMMAN, (the *Rabbat* of the Scriptures, and *Philadelpia* of the Greeks), a city of Syria E. of the Jordan, deserted and in ruins; lat. $32^{\circ} 8' N.$, long. $36^{\circ} 8' E.$; 25 m. N. E. Dead Sea, and 30 m. E. Richa (an. *Jericho*).

The remains of Amman are very extensive, but none of them seem to be older than the era of the Greek power in Syria. They consist of theatres, temples, and colonnades, of great beauty and high finish, some of them being in very perfect preservation. A great number of private houses still remain, but there is not a single inhabitant.

This is one of the most ancient cities mentioned in Jewish history. It was the capital of the Ammonites, a people undisturbed by the Israelitish settlement in Palestine, and with whom the Jews lived in a state of suspicious truce till the era of Jephthah, about 1161 B. C. Thenceforward the two nations were in almost constant hostility, generally to the disadvantage of the Ammonites; and in 1035, B. C., David took their capital. But notwithstanding this noteworthy event, and the unsuccessful war they waged against Jehosaphat (B. C. 896), and Jotham (B. C. 760), they continued to be a powerful people, and about 600 years B. C. supplied Nebuchadnezzar with a strong auxiliary force to assist in the destruction of their old enemies. Amman was subsequently included in the Assyrian and Persian empires; and after the battle of Issus (B. C. 333), it passed, with the rest of Syria and Palestine, into the hands of the Greeks. In 218 B. C. Palestine was the scene of war between Antiochus the great and Ptolemy Philopater; the former of whom utterly destroyed Amman. Having been rebuilt by Ptolemy Philadelphus, it received from him its Greek appellation of Philadelphia. It became a Roman town in the last century B. C., and remained such till the conquest of Palestine by the Saracens, A. D. 638. Under the Christian emperors of the East, Amman appears to have been a bishop's see, but it was declining before its capture by the Arabs, and Abul-Feda, in the early part of the 14th century, describes it as already deserted.

The ruins of Amman stand on the banks of a brook, which issuing from a large pond at the S.W. corner of the town, flows (partly under ground) over a flinty bed into the Zerka (an. *Jabbok*) an affluent of the Jordan. The water of this stream is excellent, a circumstance which renders the spot a desirable halting-place for caravans, the drivers of which use the ancient temples and buildings as shelter for their beasts, literally fulfilling the denunciation of Ezekiel, "I will make Rabbah of the Ammonites a stable for camels and a couching place for flocks." (*Numbers to Chronicles, passim*; *Polychron. lib. v. cap. 5*; *Robinson, ii. 172-175*.)

AMMERSCHWILR, a town of France, dep. Haut Rhin, 4 m. N. W. Colmar, pop. 2,136.

AMOL, a city of Persia, prov. Mazanderan, on the Heraz, about 12 m. above where it falls into the southern part of the Caspian Sea, lat. $36^{\circ} 30' N.$, long. $52^{\circ} 25' E.$ Pop. differs at different seasons; but in winter, when greatest, is estimated, by Mr. Fraser, at from 35,000 to 40,000. The principal object worth notice is a mausoleum erected by Shah Abbas over the remains of a former distinguished sovereign of Saree and Amol, who died in 1378. This magnificent structure has however been injured by an earthquake, and is rapidly decaying. There is a bridge of 12 arches over the Heraz, and there are in the vicinity of the town many mounds and other remains of Persian antiquities. The bazars are extensive, and well supplied with certain articles; but it has little trade or industry. Mr. Fraser could not find tea either here or at Balfooshi, and the inhabitants had never heard of coffee. *Chilaw* and *mas*, that is plain lotted rice and sour curds, is the common food of the people, some of whom season it with a little salt fish. (*Fraser's Southern Banks of the Caspian Sea*, &c. p. 101.)

AMOOK, or **AMUR**, a large river of E. Asia which has its sources in Mongolia. It is formed by the junction of two great rivers, the Onon or Chilkha, which rises nearly under the 110 deg. of E. long. and the 50 deg. of N. lat., and the Kerlon or Argoun, which rises nearly under the same meridian, but about 24 deg. more to the S. The latter river traverses the great lake of Koulou, and, issuing from it, and pursuing a N. E. course, forms, for a considerable distance, the line of demarcation between the Russian and Chinese empires. The Kerlon and Onon unite near the fort of Ruklanova, in about the 120th deg. E. long. The combined river having taken the name of Amoor, flows E. and S. E., till, at its most S. point, it is joined by its large tributary, the Songari, flowing N. E.; the Amoor, having suddenly taken the same direction, preserves it during the remainder of its course, till it falls into the arm of the sea opposite the N. end of the island of Saghalien, or Tekouka, in about the 53d deg. of lat. and the 140th deg. of long. The entire course of the river, to the source

of either of its principal branches, may be estimated, inclusive of its windings, at about 2,400 m.; but the distance in a direct line from its sources to its embouchure does not exceed 1,400 m. In the lower part of its course it flows through a comparatively rich well cultivated country; but the country round its sources, and the upper part of its course W. of the Kinsau Yalo mountains, being contiguous to the great desert of Shamo or Gobi, has the same characteristics. The Russian fort of Nertschinsk stands on the Nerstcha, near where it falls into the Chilkha. (*Ritter's Erdkunde Von Asien*; *Arrowsmith's Map of Asia*; *Cochrane's Travels*.)

AMORBACH, a town of Bavaria, 24 m. S. Aschaffenburg, with a castle, formerly a very rich abbey.

AMORGO (an. *Amorgos*), an island of the Grecian Archipelago, about 36 m. in circumference, lying S. E. from Naxia, in about $36^{\circ} 50' N.$ lat., and under the 26th deg. of E. long. Pop. estimated at between 2,000 and 3,000. It is in part mountainous and rocky; but, in antiquity, it was noted for its fertility, and it is said by Tournefort to be well cultivated, and to produce more corn and wine than the inhabitants can consume. It contains a town of the same name. Port St. Anna, on the N. shore of the island, is an excellent harbour, with good anchoring ground in from 18 to 20 fathoms. Simonides, famous in antiquity for his imbecies, was a native of Amorgos. (*Tournefort, Voyage au Levant*, i. p. 232.)

AMORGO POULO, an uninhabited islet, 6 in. W. Amorgos.

AMOUR (ST), a town of France, dep. Jura, cap. cant. 9 m. S. W. Lons-le-Saulnier, pop. 2,631. It has a forge, a nailwork, a considerable marble work, tanneries, &c.

AMOY, a sea-port town of China, prov. Fokien, with a commodious and secure harbour, lat. $24^{\circ} 10' N.$, long. $118^{\circ} 10' E.$ Though situated in one of the least fertile districts of the empire, the merchants of Amoy carry on a very extensive intercourse with Formosa, whence they import provisions, with the other Chinese ports to the N. and S., and with Siam, Java, Singapore, the Sooloo islands, &c. This port was open to Europeans till 1734, when all trade with them was suppressed. It was visited by the ship *Amherst*, in 1832; but the authorities prevented that commercial intercourse from taking place to which the people seemed to be extremely well disposed. (See *Report of the Voyage of the Ship Amherst*.)

AMPFING, a village of Bavaria, 6 m. W. by N. Muhlendorf. A great battle was fought in the vicinity of this village, on the 28th September 1322, between Louis Duke of Bavaria, emperor of Germany, and Frederick archduke of Austria, when the latter was entirely defeated and made prisoner. (Pfeffel, anno 1322.) It was from this point also that Moreau commenced his famous retreat in 1800.

AMPLEFUIS, a town of France, dep. Rhone, 19 m. W. S. W. Villefranche, pop. 4,881. It has manufactures of linen and cotton, particularly the latter.

AMPTHILL, a m. town and p. of England, co. Bedford, h. Redbornstoke, 4½ m. N. W. London, pop. 1,688. It is nearly built, has a charity school for 13 poor children, and an hospital for 10 poor men and women. Amptill Park, a magnificent mansion, the property of Lord Holland, is situated a little to the W. of the town.

AMPURIAS, a town and castle of Spain, N. E. part of Catalonia, on the Llobregat, near the sea, 24 m. N. E. Gerona, pop. 2,200.

AMRAN, a walled city of Arabia, in the Deshebel, or mountain land of Yemen, being the chief town of a district of the same name, lat. $15^{\circ} 32' N.$, long. $43^{\circ} 38' E.$, 25 m. N. W. Sanaa, and 104 N. E. Hodeida. Pop. unknown, but may probably amount to from 1,500 to 2,000. It stands near a mountain, in a fertile country, in the centre of the coffee lands, the dep. to which it gives name being a part of Haschid-u-Bekel, one of the most noted divisions of Yemen for the growth of coffee. Amran is not, however, politically united with the state of Haschid-u-Bekel, but is under the government of the Imam of Yemen Proper. (*Niebuhr, Des. de l'Ar. par. ii. pp. 127-220*.)

AMRETSIR or **UMRITSIR** (*Pool of Immortality*), a town of India, the holy city of the Sikh nation, 44 m. E. Lahore, lat. $31^{\circ} 28' N.$, long. $74^{\circ} 48' E.$ Pop. not stated. It is an open town, about 8 m. in circ.; streets narrow; houses lofty, and built of burnt bricks, but the apartments are small. Manufactures inconsiderable; but being situated on the high road between Cabool and Delhi, and Cachmere and the Deccan, it enjoys an extensive trade, and is the residence of several rich merchants and bankers. It is defended by a fort built by the present Sikh ruler, Runjeet Singh, who has also united it to the Ruwee by a canal 34 m. in length.*

The town derives its entire celebrity from its being the

* This is Hamilton's statement. Captain Burnes says, it was made by one of the emperors of Hindostan, and that it is 80 m. in length. (*Travels to Bokhara*, &c. vol. i. p. 150. 12mo. ed.)

principal seat of the Sikh religion. Amretsar, or the Pool of Immortality, is a basin 135 paces square, built of brick, in the midst of which is a temple, covered with "burnished gold" (*Burnes*), dedicated to the warrior saint, Gooroo Govind Singh, the principal founder of the religion and power of the Sikhs. Within this temple is preserved, under a silken canopy, the *Grantha Sahib*, or sacred book of the Sikhs, being a code of laws and ordinances, principally compiled by the above saint. The temple is attended by a numerous body of priests, who are supported by the voluntary offerings of the devotees, by whom it is frequented. Immersion in the sacred pool is believed by the Sikhs, and many tribes of Hindoos, to purify from all sin. (*Hamilton's East India Gazetteer*; *Burnes*, &c.)

AMSTERDAM, or AMSTELDAMME (dam of the Amstel), a famous marit. and commercial city of Holland, cap. prov. N. Holland, and of a district and cant. of the same name, on the S. bank of the Y., an inlet or arm of the Zuyder Zee, where it is joined by the Amstel, lat. $52^{\circ} 22' 7''$ N., long. $4^{\circ} 53' 15''$ E. Being situated in a marsh, its buildings are all founded on piles driven from 40 to 50 feet into a soil consisting of alluvial deposits, peat, clay, and sand. The canals by which it is everywhere intersected, and along which all heavy burdens are conveyed, are said to divide it into 90 islands, and are crossed by about 290 bridges, partly wood and partly stone. Its form is that of a crescent or half moon, the horns on either side projecting into the Y, and inclosing the port. On the land side it is surrounded by walls having 26 bastions and a wide ditch; but its ramparts have been planted with trees, and converted into public walks and boulevards; the only defence of the town consisting in the facility with which the surrounding country might be laid under water. It is from 8 to 9 m. in cir., and covers a space of about 900 acres. The Amstel, which runs through the city, divides it into two nearly equal portions; that to the E. of the river being termed the old, and that to the W. the new city. In the centre and oldest portion of the city, on both sides the Amstel, is a cluster of irregular streets and canals; but the streets and canals round this central nucleus are mostly regular, and parallel to each other. Three of these streets, the Hoeren, Keyzers, and Prinzen Gracht, are not easily to be matched in any other city of Europe for their length, width, and the grandeur and elegance of their buildings. They are each about 2 m. long, about 220 feet broad; and following the direction of the outer wall of the city, which is that of a polygonal crescent, have all the lines perfectly straight between the angular points. The houses are large and well built; a canal, crossed by numerous stone bridges and bordered with trees, runs down the middle of each of these streets, the spaces on both sides being well paved and lighted, as is indeed the case with all the other streets. The principal shops are in the Kalvers Straat, the Nieuwendyk, and the Warmois Straat. The quarter occupied by the Jews is the dirtiest part of the town. Many artisans and others belonging to the poorer classes inhabit cellars under the houses of the more opulent; and a great many reside constantly on the water, in comfortable apartments built on the upper decks of their trading vessels, more particularly those employed in inland navigation. The houses, which are all of brick, are generally 4 or 5 stories high, and have their gables to the street. Many of them are constructed in an elegant style; and some of them are splendidly fitted up.

Of the public buildings, the palace, formerly the stadth-house (town-house), is the most magnificent. It stands in an open space or square called the Dam. This fine structure, re-

garded by the Dutch as the eighth wonder of the world, is erected on a foundation of 13,659 piles; it is 282 feet in length, 235 in depth, and 116 high, exclusive of the cupola, which is 41 feet higher, and from the top of which there is an excellent view of this singular city. With the exception of the ground floor, which is of brick, it is built of freestone. The ball-room, represented as one of the finest in Europe, is said to be 120 feet long, 55 in width, and 90 in height. The foundations of the stadth-house were laid in 1648, and it was finished in the short space of 7 years. Among the other public buildings are, the exchange, founded in 1608, and capable of accommodating 4,500 persons; the *hôtel de ville*, formerly the admiralty; the museum, containing an excellent collection of about 500 pictures, including several master-pieces, principally of the Dutch and Flemish schools; the arsenal, built on the island of Kattenburg; the buildings of the society of *Felix Meritis*, having a superb concert hall, &c. Of the churches, that most worthy of attention, the New Church, was begun in 1408. It contains some fine monuments, particularly one in honour of the brave admiral De Ruyter. The painted glass windows of the Old Church, dedicated to St. Nicholas, are amongst the finest in Europe. There are in all about 50 places of worship, among which are several synagogues, the Jews being supposed to amount to about 16,000. The principal bridge over the Amstel, near where it enters the city, is 610 feet in length by 64 in breadth, with 11 arches, through which large ships pass. The barracks, built by the French, three weigh-houses, and two ancient towers, called herring towers, deserve to be noticed. In 1822 the warehouses originally built for the East India Company, being heavily laden with corn, their foundations gave way, and they sunk half way down in the earth.

Among the literary institutions is the Athenæum, or college, with 10 or 12 professors, a good library, an anatomical theatre, and a botanical garden. In 1836 it had 33 students of law, 25 of theology, 25 of medicine, &c. There are here also a school of navigation; a royal academy of the fine arts, founded in 1817, with 6 professors; the Amsterdam Institute, or Society of *Felix Meritis*; a society of Public Utility, founded on an extensive scale, in 1787, &c. Schools of the best description, for the gratuitous education of the poor, are found in every part of the town; and instruction may be said to be universally diffused. There are three theatres. The workhouses, hospitals, infirmaries, the house of correction or rasp-house, the orphan-house, the establishment for widows, the lunatic asylum, with the numerous other charitable establishments, may be cited as models of good order, cleanliness, and economy. The hospital for the old and indigent of both sexes on the quay of the Amstel, is admirably contrived for the comfort and convenience of its inmates. The building is 260 feet long, by 230 deep, and 3 stories high. It has galleries and a garden where its occupants enjoy the fresh air. There is here, and in other Dutch towns, a class of provident institutions or asylums, which admit aged persons of both sexes on payment of a comparatively small sum. Masters and mistresses frequently reward old and faithful servants, by paying for their admission into one of these excellent institutions.

The mouths of the canals opening into the Y and of the Amstel are provided with strong floodgates; and on the side of the town nearest the sea a new dyke has recently been constructed to guard against inundations. The harbour is

spacious and secure; the largest ships coming close to the quays and warehouses. It has recently been much improved by the formation of docks and basins. At the point where the Y joins the Zuyder Zee there is a bar, called the Pampus, which cannot be crossed by large ships unless previously lightened. To obviate the inconveniences arising from this circumstance, and the dangers and delays occasioned by the shallowness and difficulty of navigating the Zuyder Zee, a ship canal has been constructed from Amsterdam to the IJelder. This noble work is about 50½ m. in length; and being 20 feet 9 inches deep, admits large ships. Its level is that of the highest tides, the only locks it requires being one at each end; but it has too sluices in the intermediate space. It was begun in 1819, and finished in 1825, at an expense of about 1,000,000*l*. The dues are moderate; and it has been of the greatest service to Amsterdam, by giving it, as it were, a deep-water harbour on the most accessible part of the Dutch coast.

The manufactures of Amsterdam, besides various branches of those of wool, linen, cotton, and silk, comprise sail-cloth, refineries of sugar, borax, sal-ammoniac, sulphur, &c.; with distilleries and breweries, tanneries, tobacco manufactories, iron-foundries, rope-walks, smaltz-works, gas-works, soap-works, oil mills, &c. Ship-building is extensively carried on. The art of cutting diamonds and other stones for the lapidaries has here attained to great perfection: there are at present (1838) 5 principal, besides several smaller establishments devoted to this business, being mostly carried on by Jews. Jewellery, gold lace, &c. are also largely produced. But Amsterdam is far more distinguished as a trading than as a manufacturing city. Throughout the 17th century, and the first half of the 18th, she was what London is at present, the metropolis of the commercial world. Gradually, however, partly in consequence of the oppressiveness of the public burdens, but more, perhaps, of the growth of commerce and navigation in England and other countries, she lost the greater part of the carrying trade, which she had nearly engrossed, at the same time that her fisheries and foreign trade progressively fell off. During the subjugation of Holland by France, her colonies fell into the hands of England, her ships disappeared from the sea, and the trade of Amsterdam was almost annihilated. But notwithstanding these untoward events, and the exactions to which she was repeatedly subjected, she preserved her industry and a vast amount of capital; and no sooner had peace been restored and Holland had recovered a portion of her colonies, than the commerce of Amsterdam began rapidly to increase; and though still far short of its ancient importance, it is now of very considerable extent and value.

The imports principally consist of sugar, coffee, spices, tobacco, cotton, tea, indigo, cochineal, wine and brandy, wool, grain of all sorts, timber, pitch and tar, hemp and flax, iron, hides, linen, cotton and woollen stuffs, hardware, rock-salt, tin plates, coal, dried fish, &c. The exports consist partly of the produce of Holland, partly of the produce of her possessions in the East and West Indies and other tropical countries, and partly of commodities brought to Amsterdam as to a convenient *entrepôt* from different parts of Europe. Of the first class are cheese and butter (very important articles); madder; clover, rape, hemp and flax seeds; rape and linseed oils, Dutch linen, &c. Geneva is principally exported from Schiedam and Rotterdam; oak bark

principally from the latter. Of the second class are spices; Mocha and Java coffee; sugar of Java, Brazil, and Cuba; cochineal, indigo, cotton, tea, tobacco, and all sorts of eastern and colonial products. And of the third class, all kinds of grain; linens from Germany; timber and all sorts of Baltic produce; Spanish, German, and English wools; French, Rhenish, and Hungarian wines, brandy, &c. The trade of Amsterdam may, indeed, be said to comprise every article that enters into the commerce of Europe. The total value of the imports and exports are respectively estimated at about 3,500,000*l*. or 4,000,000*l*. From 220 to 230 large ships belong to Amsterdam, employed in the trade to the E. and W. Indies, the Baltic, &c. There is little coasting trade; the communication with most other Dutch towns being principally kept up by canals. The total number of ships of all sorts entering the port amounts, at an average, to about 2,200 a year.

The merchants of Amsterdam were formerly most extensive dealers in bills of exchange, and in all sorts of funded property and government securities; but London is now, in this respect, far superior to her old rival: the latter, however, still enjoys a large share of the exchange business of the Continent, and many of her capitalists are large holders of foreign securities.

The old bank of Amsterdam, founded in 1609, and so celebrated among the monied institutions of the 18th century, ceased to exist in 1796, on the invasion of Holland by the French. The present bank of the Netherlands was established in 1811. Insurance business is extensively carried on.

The city is supposed to contain above 26,000 houses. In 1785 the pop. is said to have amounted to 235,000. It had declined in 1814, the epoch of its greatest depression, to 180,000; and at present it amounts to about 207,000. Notwithstanding the city is surrounded on all sides with water, and that the greatest care and attention are required to prevent its being submerged, it labours under a total want of spring water. The water in the river and canals being filthy, brackish, and totally unfit for use, the inhabitants are partly supplied by rain water carefully collected in tanks, and partly by water brought in a peculiar description of barges from the Vecht, 6 or 7 m. distant. It is curious that despite this want of good potable water, the humidity of the atmosphere, and the effluvia generated in warm weather from the water of the canals, the town is free from epidemic disorders, and the inhabitants healthy and robust. Most probably this is owing in a considerable degree to the comfortable mode of living of the bulk of the people; the prevalence of cleanliness, in which the Dutch are superior to all other nations; and the absence of extreme poverty and destitution.

The toleration that prevails at Amsterdam, does equal honour to the people and the government. There is here every variety of sects; but they are distinguished by nothing so much as by their abstinence from theological discussions, and by their apparent respect for the opinions of others. "It must not, however, be inferred that the toleration existing here and in the rest of Holland—a toleration perfect in *fact* as well as in law—has its origin in any degree of apathy with respect to religion, or in any irreligious tendencies on the part of the people; such a conclusion would be utterly erroneous. Generally speaking, the Hollanders, whatever may be their particular religious profession, are firm believers, and devoted to the practice of piety. This virtue

pervades all classes of society in Amsterdam." Hence, notwithstanding the defects of its climate and situation, Amsterdam is a most desirable place to many persons. For ages it has been a "city of refuge" to the oppressed and persecuted of all nations; and therein lies one of the main causes of its wealth and prosperity.

The city police is well regulated, and robbery and housebreaking are of rare occurrence. A drunk person, or one in rags, is a very unusual sight. No loose women are permitted to infest the streets; which are, also, quite free from beggars. The disgusting dens of profligacy, known by the name of *spiel* houses or *musicos*, still exist; but they are frequented by few, except the dregs of the populace.

In every part of Holland, but no where more than at Amsterdam, do we find proofs of the astonishing power of ingenuity, industry, and perseverance. This great city is not merely built in a marsh, but is constantly exposed to the risk of being overwhelmed by the influence of high tides and storms. But this danger has been effectually provided against; and the waters by which the city is all but surrounded, and which penetrate every one of its streets, are under complete controul, and made to contribute to the comfort and accommodation of the inhabitants. The works necessary for the public safety and protection require, however, to be watched over with unceasing vigilance; and a large annual expenditure is incurred in keeping them in good repair, and in dredging and clearing the port and canals.

It is a curious fact, that notwithstanding the superabundance of water, there is not, owing to the flatness of the soil, a single water mill in Holland. There are, however, immense numbers of wind mills, employed frequently to pump up water from the low grounds, as well as to grind corn, crush seeds, &c. There is a large wind mill on every one of the bastions by which Amsterdam is surrounded.

Amsterdam has been sometimes called the Venice of the North; and in respect of situation, number of canals, and the magnificence of the public and private edifices, it certainly bears a very striking resemblance to the Venice of the South. But each of these great cities has, notwithstanding, a perfectly original and distinctive character.

In the 12th century, Amsterdam was only a small fishing village; in 1482, it was fortified. At the outset of the revolutionary struggle with Spain, the Duke of Alva having expelled the Protestants from the city, and committed the government to zealous Catholics, it supported for a lengthened period the cause of the Spaniards; and it was not till 1578 that it joined the confederation. From this epoch it began rapidly to increase. The most complete toleration being granted to all sects, it became an asylum for those driven by persecution from the other towns of the Low Countries and elsewhere. The closing up of the Scheldt, in 1648, transferred the greater part of the trade of Antwerp to Amsterdam, and raised the latter to the highest pitch of prosperity. (*Dict. Géographique, art. Amsterdam; Balbi, 2d ed.; Barrow's Family Tour through S. Holland, &c. pp. 92-133; Murray's Handbook for N. Europe; Mculloch's Commercial Dictionary; Chamber's Edinburgh Journal for 1338, &c.*)

AMSTERDAM ISLAND, a small but remarkable island in the S. Indian Ocean, lat. 37° 47' S., long. 76° 54' E., being 4½ m. in length, by 2½ in breadth, and 700 feet high. It is obviously of volcanic formation. A large portion is occupied by what has undoubtedly been a mag-

nificent crater; but the sea having made an irruption into one of its sides, it is now converted into a circular harbour, the only accessible one in the island. The surface is every where light and spongy, and in parts burning hot. There are several hot springs, having temperatures varying from 80° F. to the boiling point; with the exception of a single chalybeate spring, having a temperature of 112°, all the springs in the island are brackish. Some of the hot springs are so near the water's edge, that it is no exaggeration to affirm that fish taken with the one hand may be boiled with the other! The surrounding sea swarms with various species of fish, particularly with crayfish. No trees or other fruit-bearing plant, nor quadrupeds, nor land-birds, are found on this island; but it is resorted to by vast numbers of sea-birds. Seals and sea lions abound on its shores and in the adjoining sea, which makes it be occasionally visited by ships engaged in the seal fishery. It was discovered by a Dutch navigator, Van Vlanning, in 1696, and was visited by Mr. Barrow in 1793. (See the *Voyage of the latter to Cochin China; and the Philosophical Transactions*, vol. xx.)

AMSTERDAM, NEW, a town and harbour of S. America, English Guiana, near the m. of the Berbice river. Pop. 1,600. Being founded by the Dutch, it is built in their fashion, and intersected by numerous canals. The private houses are mostly of wood, covered with bamboo leaves, but the government offices are of brick, and handsomely built. The entrance to the river, in lat. 6° 24' N., long. 57° 11' W., is defended by three forts. There are only 7 feet water on the bar at low ebb. The canals being filled and emptied by the flow and ebb of the tide, all impurities are swept off, and the health of the town is preserved notwithstanding the heat of the climate. (*American Coast Pilot.*)

AMTZELL, a village of Wirtemberg, circ. Danube. Pop. 2,130.

ANACAPRI, a town in the N.W. corner of the island of Capri, in the Gulf of Naples, on the N. side of Mount Solaro, nearly 2,000 feet above the level of the sea. Pop. 1,800. The ascent to it is very steep, and is effected by a stair of 552 steps, called *la scalinata*. It has a church, a convent, and a castle in the neighbourhood: there are also two ancient towers, and the remains of some edifices, ascribed to Tiberius. The prospect from the castle is extensive, and singularly rich and beautiful, commanding the Tyrrhenian sea, the Gulf of Naples, Vesuvius, &c. The inhabitants are said to be much attached to the situation; and some, it is affirmed, have never descended *la scalinata*.

ANAGNI, a town of the Papal States, 38 m. E. by S. Rome. Pop. 5,500. It stands on a hill, and has a very fine prospect; but its interior is mean and miserable. It is the seat of a bishoprick, founded in 487.

ANAM or AN-NAM (Burmese), a country of Asia, occupying the E. portion of the great E. peninsula of S. Asia, or India beyond the Ganges, comprising Cochín China and Tonquin (to which only the name of Au-nam properly belongs), with the E. and S. part of Cambodia, and many small islands in the Chinese Sea. It lies between 8° 45' and 23° 22' N. lat., and 105° to 109° E. long.; having N. the Chinese provinces of Quang-tung, Quang-si, and Yün-nan; W. Laos and Siam, and in the rest of its extent, the ocean. It is 965 m. in length, varying in width from 415 m. to 60 m. Area, probably about 98,000 sq. m. (*Crawford.*) Pop. variously estimated at from 5 to 15 or 20 millions! The lowest estimate, which is that of Mr. Crawford, is probably the most accurate.

The country is subdivided as follows:—

1. *Cochin China* (called Dang-traoing, or Central country).

Provinces.	Chief cities.
Bue-thuen, Nha-trang, Phu-yen, Qui-nhon, Quang-ai, Quang-nam, Hue,	Hue, the capital (pop. 60,000), <i>Crawford</i> ; Turin, <i>Fau-si</i> .

2. *Tonquin*. (Dong-kiuh, External country).

Ke-cho, Ting-long, Wai-tak, Sang-sa, Kien-pai, Sing-kwang, Hung-wa, Kio-king, Leang-sun, Chung-wa, La-nam 1st, La-nam 2nd, Hai-yang, Aw-kwong, Man-nung-chao.	Ke-cho (Cachao), 160,000 inhabitants. Hue, 20,000 inhabitants.
---	---

3. *Cambodia* (called Ko-men by the natives).

Ya-teng, Ping-fang, Fo nan, Win-cheng, Ho-an, Teng-chong.	Sai-gon, 180,000.
---	-------------------

(*Crawford, Journal of an Embassy, &c., 4to. Lond. 1828, p. 456. 458. 464; Chapman's Voyage, &c. in the Asiatic Journal, 1825, 1826; Balbi, Adriatic, Abrégé de Géographie, 3 edit. 8vo. Paris, 1837, &c. p. 768, 769.*)

Mountains.—The principal chain, an offset from the Himalaya range, runs through the central and southern parts of the country, forming the W. boundary of Cochín China, and the E. of Laos and Cambodia, and terminating at Cape St. James, in lat. 10° 16' N. Between this range and the sea, Cochín China consists of a succession of others, gradually decreasing in height as they approach

the shore, and inclosing a great number of fertile valleys. These mountains have not been measured by Europeans. The summits of the principal chain are acuminate, sterile, and most probably granitic; but their steep sides are clothed with extensive forests, and the inferior ranges are often cultivated nearly to their tops. (*White's Voyage to Cochin China*, p. 72.; *Finlayson's Mission to Siam and Hué*, p. 325.)

Plains.—Tonquin and Cambodia are both immense alluvial basins of great fertility, and traversed by large rivers; in addition to these, there are a few small flats around the mouths of the rivers in the central provinces. The plain from the mouth of the Oubouquenne to Cape St. James is but little above the level of the sea, and subject to inundation at every spring tide.

Rivers.—The Menam-kong, or river of Cambodia, is one of the largest in Asia; it rises in the Chinese province of Yun-nan, is joined by some large streams from Tibet, and, running nearly due S. through the centre of Laos and Cambodia, forms, for some distance, the W. boundary of the Annamese dominions, and discharges itself in lat. $9^{\circ} 35'$ and $10^{\circ} 15'$ by two principal mouths (the farthest N. being called the Japanese river, the S. one the Oubouquenne), and by many smaller ones. The Sang-koï (*Bulbi*) or river of Tonquin, has a shorter course; it rises in the mountains of Yun-nan, runs mostly S. E. through Tonquin, passing by Ke-cho, and falls into the Gulf of Tonquin by two principal mouths, between 20° and 21° N. lat. Both these rivers, as well as that of Sai-gon (which is $\frac{1}{2}$ of a mile in width near that city), have deltas at their mouths: they are navigable generally for large ships; but owing to sand banks at both its mouths, it is reported that the Tonquin river is available to none above 200 tons burthen, though Crawford doubts this statement as respects the N. mouth. (*Crawford, Journ. Nat. Hist.*, &c., pp. 459–462.) There are several other considerable rivers in Tonquin; as the Li-Sing-Kiang: along the Cochinchinese coast they are all much smaller, and with a shorter course; the river of Hué (on which the capital is situated) is one of the most considerable, has a fine estuary, and is navigable by vessels of 200 tons burthen. (*White, Voyage*, p. 185–231.)

Lakes.—Harbours.—Europeans have described no lakes of any magnitude; but the shores of Cochinchina abound with some of the finest harbours in the world. From Cape St. James to the Bay of Turon, there are no less than nine of these, safe and accessible with every wind: that of Turon, in the opinion of Mr. Crawford and others (though not in that of M. de Bougainville), is not surpassed by any in the East.

Coast and Shores.—The coast here is generally bold, and presents many promontories, like that of C. St. James, which is 300 feet in height; the precipices occasionally alternating with a narrow sandy beach. The anchorages are every where good; but at no great distance from the shores, sand-banks and rocky islands are often very prevalent.

Geology and Minerals.—The primitive rocks, of which the principal mountain chain is almost wholly composed, are granite and syenite; the lower hills contain quartz, marble, and mountain limestone. In the S. provinces, the granite is seamed in every direction; on the rounded sides of the hills it alternates with syenite, and both rocks are penetrated by veins of iron ore: near Hué, all the hills are granite, and their peaks in the highest degree sharp, rugged, and uncovered. There is a great diversity of upper soils in the valleys; some being dry, friable, and sandy; others of a stiff clay. The soils of the central provinces are however mostly sandy: those of Tonquin and Cambodia are, as already stated, alluvial. Around their shores there are extensive and fertile mud-flats.

Tonquin is the only part of the empire rich in metals; it produces large quantities of gold, silver, copper, and iron: with the latter it supplies all the country except the most S. part. Its mines are worked by Chinese, and about 100 piculs (or 17,800 lbs. Troy) of silver are produced yearly. Cochinchina has no metallic wealth: silver only is said to be found at Cape Avarella; in Cambodia is poor in metals. It produces iron, but in inadequate quantity for its own use, and it is therefore imported from the neighbouring countries to the W. of it: the central provinces yield salt. (See *Crawford*, p. 472.; *Finlayson*, pp. 294–359–351.; *Asiatic Journal*, vol. xix. p. 194.)

Climate.—Is generally fine and healthy, the heat being tempered in the maritime districts by the sea breezes; in the winter it is even cool in Cochinchina, but in Tonquin the heats of summer are excessive, and the cold of winter proportionally severe. At Hué, M. Chaigneau, who resided there for some time, reports that the greatest heat of summer was 103° , and of the cold of winter 57° F. During the wet season of August, Mr. Crawford found that the thermometer in the shade ranged in one day from 79° to 82° F. at Sai-gon. In the S. the seasons follow the same order as in Malabar, Bengal, and Siam; viz. the

rains prevail with the S. W. monsoon from May or the beginning of June, to September: the same takes place in Tonquin. But in Cochinchina, between 11° and 18° N. lat., the rains set in with the N. E. monsoon, and last from October till March; the high mountain range protecting this country from wet weather by intercepting the clouds at the converse season of the year. The general height of the barometer at Hué is $29.85''$. Immense inundations last sometimes for 3 or 4 days at a time: Tonquin is subject to heavy floods and violent hurricanes. (See *Crawford*, p. 470.; *Chapman's Voyage*, in the *Asiatic Journal*, vol. iv. p. 125.)

Vegetable Products.—The forests of Cochinchina produce a variety of scented woods, as sandal, rose, eagle-wood, &c. The true cinnamon (*Laurus cinnamomum*) is indigenous to this country, and valued by the Chinese more than that produced in any other; it is found wild chiefly in dry and sandy soils. The banks of the Sai-gon, and the other large rivers are thickly covered with jungle; amongst which are teak, iron-wood (*Syzygium*), a kind of Calophyllum, as straight as a Norway fir, well adapted for ships' masts, mangrove, &c. In the forests of Cochinchina, cedars, walnut, peltry, cocoa, areca, betel, bamboo, rattan, ebony, and most of the products of British India. Cambodia yields gamboge, the finest cardamoms, aniseed, areca, indigo, &c.; the central provinces, pepper and two sorts of sugar cane; Tonquin, many kinds of varnish trees, areca palms, &c. Cotton, rice, and the mulberry tree are almost universal. Amongst the fruit are oranges of a blood-red pulp and delicious flavour, bananas, figs, pomegranates, pine-apples, guavas, mangoes, shaddockes, lemons, limes, plantain, yam, &c. Ginger, and spices of various sorts, are also indigenous. An inferior sort of tea, with a leaf twice or thrice as large as that of Hohea, grows wild in the hilly parts of Quang-ai, and is sold at from 6 to 20 quans (300 to 1,000 cents.) the picul (133½ lbs.). (*Crawford, Journ.*, pp. 474–478.; *Barron, Voyage*, &c., pp. 341–346.; *Asiatic Journ.*, xix. pp. 123, 124.; *White, Voyage*, p. 150, 209, 210.)

The cocoa-nut tree, next to the bamboo, is the most useful of any. The trunk is used for house and ship building; the husk produces cordage and cables superior to any other; the leaves are used for roofing, and for making paper, and wicker work; the oil for lamps and painting; the shell for cups, &c.; and the nut furnishes both food and drink.

Scenery.—The interior of Cambodia has been little explored by Europeans, but its surface is believed to be covered, in great part, with extensive forests. The banks of the river Sai-gon are covered with mangrove trees, and no cultivation appears until within from 20 to 30 m. of that city. *Bien-huon*, the most S. prov. of Cochinchina, extends to about 12° N. lat., and is most remarkable for its aloes. *Nha-trung*, which succeeds it, is an elevated and ill-cultivated region, but produces silk. *Phu-yen*, which reaches as far as lat. 14° , is the richest and the most highly cultivated and peopled province of all: it is full of fruitful valleys and gently undulating hills, on which rice is grown in terraces, almost to their summits, and bounded W. by lofty mountains, crowned with towers and pagodas, or having their pinnacles enveloped in fleecy clouds. *Qui-nhon*, is a province of great extent, and well cultivated: *Quang-ai* and *Quang-nam*, extending from 14° N. to nearly 17° , are almost exclusively the countries of the sugar cane and the tea tree. The banks of the river Hué, though beautifully and more indebted to art than to nature; they abound in ornamental gardens, laid out amongst graves of cocoa, areca, banana, and bamboo, and rows of hibiscus. At Turon, and in most of the N. of Cochinchina, there is a degree of sterility not met with in the S.; but the whole country is apparently inferior in fertility to that of Siam. Tonquin has been very imperfectly examined by Europeans, but is the most populous province; therefore, most probably, of superior fertility and cultivation. (*Crawford, Journ.*, pp. 460, 461.; *Finlayson*, pp. 299, 349.; *White, Voyage*, p. 74.; *Arrowsmith's London Atlas*.)

Animals.—The elephant, rhinoceros, tiger, leopard, buffalo, bear, horse, goat, &c., are natives of Annam. There are no jackals nor foxes, nor hares, but a profusion of other kinds of game. Great numbers of monkeys and baboons are found in the woods: one large and powerful species seems to be peculiar to Cochinchina; the dog and cat, which are also natives, are domesticated: elephants are used in war. Peacocks, parrots, and a variety of birds of the richest plumage, inhabit the forests; curlews, plovers, &c. the shores; and aquatic birds of all descriptions, the rivers. Alligators inhabit the larger rivers; the *cobra-de-capello*, and several other large and venomous serpents, infest the country. The seas abound with an inexhaustible supply of fish, and afford subsistence to a large portion of the population; amongst the species are, the flying fish, scorpion fish (remarkably and beautifully variegated), mango fish of Bengal, &c., with soles, mullets, and many

others familiar to us: shrimps and crawfish are very fine; and molluscs, in large quantities, are taken for food. Mosquitoes and other insects abound in great quantities. (*Crawford, Journ.*, pp. 478, 479; *Barrow, Voyage*, p. 312.; *Finlayson*, p. 411.; *White, Voyage*, pp. 63-191, 257-311.; *M. de Bougainville, Journal de la Navigation autour la Globe*, 3 vols. 4to., Paris, 1837, vol. i. p. 263.)

The People consist of several races: — 1. the *Cochin Chinese*, and *Tonquinese*, who are similar in person, and most of their habits and customs, to the Chinese; 2. the *Cambodjans*, in physical qualities, manners, &c., more resembling the Siamese; 3. the *Mot race*, inhabiting the mountainous country between Cochina China and Cambodja; believed by some to have been the aborigines, said to be black like the Caffres, and in a savage state. Besides the native races, there are 25,000 Chinese, who work the mines and trade in metals in Tonquin, and many others who are settled in the commercial towns, but mostly in the N. provinces; the other strangers are chiefly Malays, about 5,000 in the S. parts of Cambodja, and Portuguese. (See *Crawford*, pp. 464-470.; *Asiatic Journ.*, iv. 340.)

Physical Qualities. — According to Mr. Finlayson, the majority of the inhabitants are of Malay origin.* He observes, "that the men average 5 feet $\frac{3}{4}$ inches in height, which is below the ordinary standard of the Malays and Siamese; they are less bulky and clumsy than the latter, but of a somewhat squat figure. Their upper extremities are long, their lower ones short and stout; they are not fat; their muscular system is large and well developed. Head and face both nearly round; the longitudinal and transverse diameters of each being nearly equal; forehead short and broad, cheek-bones wide, but not particularly salient, chin large and broad; but the coronoid process of the lower jaw has not the fulness apparent in the Malays and Siamese, and the affinity in this respect to the Tartar race is still less. Eyes rounder and smaller than those of the Chinese and Siamese, more lively and intensely black; lips moderately thick; hair on the scalp copious, black, and coarse; heard grisly and thin, and no hair on the cheeks. The colour of the skin is olive, and very often, especially in the females (who are sometimes really handsome), the complexion is no darker than that of the inhabitants of the S. of Europe." (See *Finlayson*, pp. 294, 374-378.) They are intelligent — without much originality, or invention; but exhibiting a very great aptitude for imitation. Of their disposition, such conflicting statements have been made by those who have experienced either a handsome or an unhandsome reception from them, that it is difficult to come to any conclusion. They are sprightly, animated, good-humoured, and altogether destitute of the solemn reserve of the Chinese; always laughing and chattering, volatile, capricious and changeable, vain, and imbued with considerable national pride. *Crawford* and *Finlayson* say that they are mild, docile, and inoffensive; (no travellers have accused them of ferocity); affable, kind, and attentive to strangers; and the lower orders not rapacious, although a despotic, illiberal, and avaricious government has unquestionably made all within the influence of the court the most arrant thieves. In their manners and behaviour, the Anamese are polite and graceful; but punctilious and ceremonious. (*Ibid.* pp. 296-299, 374, 383, 384.; *Crawford*, pp. 481, 488, 489.; *White, Voyage*, p. 269.; *Barrow, Voyage*, p. 297.)

Occupations, &c. — Agriculture — Rice. — Rice, which is here the "staff of life," forms the main article of culture. There are six different sorts grown; two on the uplands, used for confectionery, and yielding only one crop annually; the other sorts yield from two to five crops a year; but generally two, one in April, and another in October; or three, where the inundations have been profuse. Maize, cotton, yams, sweet potatoes, pulse, and fruit, are the other articles of general culture.

Sugar. — The sugar-cane is cultivated by the Cochin Chinese only, and a very inferior, dark, clayey produce obtained. Most of the cinnamon that is exported is cultivated; tobacco, capsicum, pepper of a very good quality in the central provinces, are other useful objects of culture: no coffee is grown, except in a few gardens near Hué.

Silk. — Raw silk is produced in large quantities in Tonquin and Cochin China. The ground is but indifferently tilled; near Sai-gon, it is in many small patches of about half an acre, the rice grounds being bounded by ditches. Agricultural labour is almost wholly performed by women; they guide the plough, which is drawn by a buffalo, plant the rice, build and repair the cottages, &c., and are entrusted with all the household concerns. Their pay, as well as that of labourers of the other sex, is 1 mae a day with food, or 2 mae without it. (*Barrow*, pp. 301, 315, 316.; *White*,

* Mr. Finlayson was a surgeon, who accompanied Mr. *Crawford* in his embassy in 1822, and, as an anatomist, his opinion is deserving of the greatest attention.

Voyage, p. 198-202.; *Crawford*, pp. 474-476, 522.; *Finlayson*, p. 384-395.)

Cattle Breeding. The buffalo is domesticated, and is useful in agriculture; the ox is of a small reddish-brown kind, but not used as food, beef not being commonly eaten; a small species of goat is kept; but sheep are very rare and extremely inferior. The hog is a very favourite animal; the breed is the Chinese, and remarkably fine; at Hué, hogs are always stall-fed, and seldom suffered to roam at large. The horse, of an inferior breed, is used only for riding, being unfit for cavalry service; there are neither asses nor mules.

Poultry. — Poultry, in large numbers, are kept every where; those at Sai-gon are said to be amongst the finest in India; geese are not so common as ducks or fowls; the game cocks are trained for fighting. (See *Crawford*, pp. 478, 479.; *Barrow*, p. 310.; *White*, pp. 260-256.)

Food, &c. — The diet of the people is to European ideas often gross and disgusting in a high degree. Rice, legumes, and fish, form the chief part of their food; but dogs and alligators' flesh, rats, mice, worms, frogs, and other reptiles, maggots, entrails, and putrid meats, are among their favourite dishes. Pork, boiled ducks, and fowls, boiled and stewed yams, and sweet potatoes, sugar-cane, fruit, and much confectionery, compose great part of the rest, and tea, and rice-whisky (of which a great deal is drunk), compose their usual beverages; fish-pickle is their favourite condiment, into which nearly every morsel they eat is plunged; elephants' flesh is eaten only by the sovereign and nobility. Milk is not used at all, and eggs are not valued until they are rotten, or nearly hatched. They take two meals a day; one at 9 or 10 o'clock in the morning, the other at sunset. These they take in the open air, generally in front of their houses, and eat with chop-sticks tipped with ivory or metal, porcupine quills, and a pottery spoon.

Habits. — The tobacco that is grown is all used in the country; all the men smoke, and, as well as the women, chew betel and areca, which either they or their attendants (if rich) always carry with them in boxes or large purses for the express purpose. In their persons they are extremely dirty, notwithstanding their frequent ablution: their under garments are never washed nor changed until they drop to pieces; their nails are never cut; their length being an indication of rank.

Diseases. — The country they inhabit is healthy enough; but their habits engender leprosy, scurvy, syphilis, and scrofula, the diseases owing to the climate are mostly of a febrile and intermittent character. (See *Barrow*, pp. 297-316.; *White*, p. 266-227, 295.; *Finlayson*, p. 300.; *Crawford*, pp. 487, 488.; *White*, pp. 38, 64-86, 300.; *Bougainville*, vol. i. pp. 261, 262.)

Arts and Manufactures — House-building. — The inferior dwellings consist of mud walls, thatched or covered with bamboo leaves; the better sort of houses are of wood or brick, and tiled, but the bricks are only baked in the sun, and glazed windows are unknown. The huts of the secondary near Sai-gon consist of wadded floors, raised about 3 or 4 feet above the ground, and contain two or three compartments, one of which is a common room; in the others the family sleep on mats on a kind of raised platform, ranged around the walls. A superior residence, visited by Mr. White, was 30 feet in length by 25 feet broad, consisting of one story, the sides of wood and bamboo frame-work. The roof of bamboo leaves projected 10 feet, and screens of matting were attached to the eaves. Under this verandah was the general parlour; inside the walls a corridor ran all round the building, enclosing a stack of dormitories in the centre; at one extremity of the house was a large kitchen, furnished with a huge wooden pestle and mortar for grinding rice, several small fire-places of rough stones, and a small platform where meals were taken. The ordinary furniture of a cottage consists of a coloured matting for the floor, an earthen stove, an iron rice-pot, and some very rude porcelain and other earthenware articles. (See *Barrow*, pp. 310-316.; *White*, pp. 177-223.; *Finlayson*, pp. 300-350.)

Ship-building. — The art in which, above all others, the Cochin-Chinese excel is that of ship-building. Their vessels, the construction of which were it not for their rude materials, would not disgrace Europe, are built of from 5 to 100 tons burthen, but mostly between 16 and 30 tons; sharp at either end, and the deck 1-3d longer than the keel. Their bottoms mostly consist of wicker work, covered on the outside by a coating, $\frac{1}{2}$ inch thick, of galgal, a close and durable mixture of pitch, oil, lime, &c. The sides and deck are bound together with cross-bulk heads, and as the larger vessels usually belong to a joint-stock company of merchants, there are as many separate holds as owners. The fishing boats and others, 40 feet in length, are made of 5 long planks extending from stem to stern, their edges mortised, tightened with wooden pins, and bound together by twisted bamboo fibres: at each end they are raised much higher, and painted, gilded, and ornamented with figures of dragons and serpents. They

often carry a covered cabin, built like a house upon the deck; from one to three sails of matting, which in the N. provinces are often square and more like those of Europe; a wooden anchor with one fluke, shrouds and cables of rattan, and cordage of *coir*. During the unfavourable monsoon, the boats are taken to pieces, and the larger vessels drawn up on shore to some distance. The mode of rowing, is by pushing, and not pulling, the oars against the water (*White*, p. 293.); when there are many rowers, they push in regular succession, beginning with the one at the stern. The government rowers, who are selected from the army, are paid but 1 quan per month; the boats that ply for hire are chiefly conducted by women; but the very unfair and ungallant custom prevails, that the men pay no fare, they being all supposed on government service. They have no wheeled carriages; but people of distinction are carried in a palanquin, formed of a cotton net hammock, with a mattress and pillows inside, covered by a large varnished canopy, in form like a tortoise-shell; the whole stung upon a long pole, and carried on the shoulders of two, four, or six men. (See *White*, pp. 213-255. 319.; *Barrow*, p. 317.; *Finlayson*, p. 316-409.)

In most manufactures, the Anamese are very far behind, and are superseded by the Chinese, from whom they derive most of their useful articles. Sword-handles with very good flagee work, boxes of lacquered ware, inlaid with pearl or gold, purses, matting, baskets, coarse silk, and very durable cotton stuffs, bells, cannon, iron nails, scissors of a rude kind, varnish, &c., they can make; but they cannot temper iron or steel, print calico, or make a matchlock, and depend for all their arms on European nations. (*Crawford*, p. 482.; *Finlayson*, *Mission*; *White*, p. 261.; *Barrow*, p. 317.)

Trade.—The Chinese are the butchers, tailors, confectioners, bankers, money-changers, and pedlars of the empire, and are met with in all the towns with an elastic pole across their shoulder, and at either end, a basket containing their wares. In the bazars, gilt paper, fans, porcelain, drugs, and other China produce, tools, necessities of life, and the other articles yielded by the country, are sold. Provisions are cheap. Mr. White found that, at Sai-gon, pork was 3 cents per lb.; beef, 4 c. (America); fowls, 50 cents per dozen; a fine deer, 15 dollars; rice, 3 dollars a picul (133 lbs. Eng.); shaddocks and lemons, 50 c. per hundred; oranges, 30 c. per hund. Tea of Hué is sold in boats on the rivers, as well as varnish, which, with other combustible matters, is not allowed to be kept on shore, and the varnish merchants live constantly in their covered houses, built on bamboo rafts. The foreign trade is comparatively trifling, and almost wholly with the Chinese; very little with the Siamese or Europeans. (*Finlayson*, p. 371.; *White*, pp. 212-227. 259-261.; *Crawford*, p. 510.)

Exports.—From 20,000 to 60,000 piculs of sugar; 250,000 to 300,000 lbs. of true cinnamon not freed from its epidemics, at 80 to 60 quans per picul; 3,000 piculs of aniseed from Cambodia; raw silk at 34 to 35 quans the catty (24 lb.), 200 piculs from Fai-fu, 60 p. from Hué, and 1,000 p. from Cachao annually; cottons superior to those of Bengal; areca, spices, cardamoms from Cambodia, hogs' lard, scented woods, rice, edible birds' nests, and molluscs, and the precious metals, are exported to China; gamboge, red dying wood from Tonquin, ivory, pearl, horns, hides, gum-lac, gold-dust, and other metals in smaller quantities to other parts of the world. When Barrow wrote, sugar at Turon fetched 3 dollars, pepper of Cochín China, 6 to 8 doll., and rice half a dollar the picul of 133 lbs. British manufactures then sold usually at 20 to 30 per cent. profit, and were paid in silver ingots. Ke-cho was formerly the centre of the Eastern trade, and at the end of the 17th century the English and Dutch had factories there, whence they exported largely.

Imports.—The imports are chiefly manufactured silks, porcelain, drugs, a great quantity of gilt paper, and fine teas for the upper classes, with household, &c. utensils from China; spices, sandal-wood, tin from Malay; opium (which is however prohibited from India, 150 chests annually, 2-3ds of which are consumed in Tonquin; cottons from Canton and Singapore (but none of a variety of colours in the same piece, nor chintzes); British woollens, chiefly scarlet, some yellow or green, and all coarse; a few serges, and camlets, iron and arms from Europe; but altogether amounting to very little. The China trade is chiefly in Ke-cho, Sai-gon, Hué, and Fai-fu, but the whole scarcely amounts to 20,000 tons annually, being little more than half the Chinese trade with the single city of Bangkok in Siam.

Canals.—The transport of goods between Ke-cho and Hué is facilitated by a canal, 180 miles in length, 20 yards in breadth, and almost straight; said to be constructed by the reigning monarch in 1812: near Hué it is used for irrigation as well as conveyance. (*Crawford*, pp. 473-477.; *Asiatic Journal*, xix. (1825), pp. 124-126.; *Barrow*, p. 340.; *Finlayson*, p. 404.; *White*, p. 510.)

Weights, &c.—The picul is about 133½ lbs. Eng., and divides into 100 catties, each equal to 1 and 1-3d lb. Eng. A bag of rice weighs 50 catties.

Money.—The current coin is the sepeck, cast at Ke-cho, of a compound brittle metal, called *tu-teng-ke*, the base of which is zinc. It is about the size of a shilling, and pierced with a square hole; by which they are strung in numbers together, and as they are the only coin used, they form a very bulky and inconvenient medium. Accounts are thus reckoned:—60 sepecks = 1 mass (5 cents), 10 mas = 1 quan (50 cents), the two latter units are imaginary. A Spanish dollar is valued at 1½ quan; an ingot of silver, at from 27 to 28 quans; there are also gold ingots of the same and of double value, but the currency is subject to very capricious and roguish changes. (See *White*, *Voyage*, pp. 257-259.; *Crawford*; *Chapman's Voyage in Asiatic Journal*, iii. (1817), 543.)

Public Revenues are derived from, 1. a capitation tax of 1 and 1-10th quan, paid by every male above 15 years of age; 2. a land-tax; 3. the crown lands, which are farmed by different villages; 4. various contributions, imposts on foreign trade, &c. These imposts are small, and there is none on exported sugar: those in the service of the government are exempted from them. The king has monopolies of gold dust, ivory, and rhinoceros' horns. (See *Crawford*, p. 490.; *White*, pp. 250-257.)

Government is an hereditary military despotism, in which, however, primogeniture is more attended to than legitimacy. The sovereign has the title of Emperor. The central administration under him is conducted by six Mandarins, ministers who have charge of the archives, religion, justice, war, finance, and woods and forests. Besides these, the viceroys of Tonquin and Cambodia, and the *Mandarins of Elephants*, who is prime minister, and minister of foreign affairs, have seats in the supreme council. Each province is divided into 3 departments, called *Hu-yen*; each dep. into 3 or 4 districts, called *Tou*. The provincial governments are under a viceroy of the 1st class of Mandarins (or military class), who has 2 civil Mandarins under him; each *Hu-yen* is governed by 2, and each *tou* by one civil Mandarin: the villages are governed by officers elected by the peasantry, who are answerable for the taxes of their constituents.

Ranks, &c.—All rank is official, and, although in part hereditary, descends a step in each succeeding generation. Each functionary has power to inflict punishment on all inferior to him in rank, and unlimited obedience to this power is displayed amongst all classes. (See *Crawford*, p. 490.; *Finlayson*, p. 381.; *White*, pp. 264-279.; *Asiatic Journal*, xix., p. 126.)

Army.—The royal guard consists of 30,000 men and 800 elephants, besides the provincial troops, the number of which varies. All males are liable to serve, and 1 out of 3 is generally a soldier. There is continually a levy of those between 17 and 30; and those who are obliged to serve, cannot leave the army till age or infirmity compel them. They are in active service for three successive years, and then have leave of absence for the three next, which they spend with their families, employing themselves in the tillage of a small allotment of land, granted by government to each. The standing army was formerly 150,000 men; but when Crawford visited the country, it was only between 40,000 and 50,000 men. *Finlayson* says, "they are robust, smart-looking troops, clothed in British scarlet woollens, sometimes turned up with blue or yellow, and wear a conical helmet of basket-work, lacquered and gilt: their other arms are swords, muskets with bayonets, shields, and long spears, decorated with a tuft of red horse hair. Their cartouche boxes, and other accoutrements, bear a similarity to those of Europe, the defensive arts of which, discipline, &c., were introduced by the French during the last century, who once supplied them with 10,000 stand of arms. Much progress was made in military affairs by the Cochín Chinese, and the late king cast a number of cannon. Hué, Sai-gon, and some other cities, are strongly fortified. (*Crawford*, pp. 491, 492, &c.; *Finlayson*, p. 343, 344.; *White*, p. 269.)

Navy.—consists of about 200 gun-boats, carrying from 16 to 22 guns, 100 large galleys of from 50 to 70 oars, with several small swivel pieces, and a 12 or 24 pounder at the prow, and 500 smaller galleys somewhat similarly armed. The seamen are classed in regiments the same as land troops, 6 of which are on duty at the capital, and 1 at each of the other principal forts. (*Crawford*, p. 492.)

Religion.—of the mass of the people is a species of Buddhism: the upper orders follow the religion of Confucius. Christianity was introduced in 1624 by the Portuguese Jesuits; and there are about 425,000 Christians in the empire (*Crawford*), viz.: 300,000 in Tonquin, 100,000 in Cochín-China, and about 25,000 in Cambodia; but they are the most abject of the population, and possess no political weight whatever. The religion of the Anamese does not affect their morals or mode of life. Its ceremonies seem to consist in offering first fruits, scented

woods, &c., to idols, in burning great quantities of gilt paper at certain times, sticking inscriptions on posts, trees, and houses, and carrying about phylacteries, and other sacred objects. The Cochín Chinese are very superstitious, and endeavour to appease the evil spirit more than they venerate the beneficent one. They have pagodas, and a *pantheon*; but their idols and temples are most commonly an image of the Chinese god Fo, inclosed in a small house of wicker work, hung up in a tree, or elevated on four long posts, and approached by a ladder. Their priests are few, and but little respected by a people who treat many of their gods with contempt. In Chiampa (*Tsiampa*), the S. part of Cochín China, Indian and not Chinese gods are the objects of worship. (*Barrow*, pp. 228—231.; *Crawford*, pp. 467—469, 499.; *Finlayson*, p. 280.; *White*, pp. 50, 212, 275—277.)

Morals.—Mr. White observes, that theft is universal, and murders not uncommon. All travellers agree in the want of chastity amongst unmarried females; their open prostitution neither degrades them in public opinion, nor prevents their becoming married, after which, however, a strict watch is kept over them. (*White*, p. 281, 282.; *Finlayson*, p. 300.)

Jurisprudence.—The police of the villages and the laws are administered by the village chiefs already spoken of; in the towns, one of the principal inhabitants of each street is chosen by the rest as *head of the street*, and is answerable for the good behaviour of all the rest over whom he is an arbitrator. In capital cases, judgment rests with the governors of the *hu-yen*, or there may be appeal from them to those of the province, and ultimately to the royal council; where all the evidence is scrupulously re-added. The judges write and seal their individual opinions separately, and the emperor himself determines on the case. No distinction is made between natives and foreigners, the latter being under the protection of the minister of strangers. The several chiefs give audience, and receive petitions every day; but presents to each are necessary to obtain a hearing. (*See Crawford*, p. 498.; *White*, p. 282.)

Punishments.—The bamboo is constantly at work, and the *cauque*, or yoke, for other minor crimes, which is composed of two pieces of wood 10 feet long, fastened across by two others, and worn sometimes tightly round the neck. All capital crimes, as murder, robbery, sometimes corruption (excepting adultery), are punished by decapitation: the criminals are brought into the bazar, or public place, and placed in rows, each opposite a placard, declaring the nature of his crime; then, with one blow of a two-handed satire, their heads are successively struck off. Parties convicted of adultery are tied together and thrown into the sea. (*See White*, pp. 44, 281.; *Crawford*, p. 498.)

Customs, &c.—Polygamy is allowed; the first wife is the chief, the others being mostly of inferior rank; the children of all are, however, equally legitimate. The richer classes marry at 15, the poorer at 20 or 30 years of age, or when they can afford to buy a woman from her friends; but women cannot be married against their own consent. Marriage is but a verbal contract, ratified by exchanging presents before witnesses, and dissolved as readily by merely breaking a pair of chop-sticks, or porcupine quills, before a third party. The remains of the dead are often laid out with much pomp under a pavilion covered with silks, and surrounded with tables of the choicest fruits, area, &c., and a band of music for 15 days. White garments are worn, and much gilt paper is burnt at these times. No native nor foreigner, if married there, is allowed to quit the country. (*Crawford*, pp. 463—520.; *White*, pp. 282—300.; *Asiatic Journal*, iv. p. 15.)

Amusements, Public Taste, &c.—The Anamese are very fond of dramatic representations, which are performed in pavilions for several days together with little intermission, and to which no entrance-money is required, the actors depending on voluntary contributions. The plays consist of historical operatic pieces, or of a light and comic dialogue, interspersed with cheerful airs, each concluding with a common chorus. Their dancing and music is in exact time, the latter not destitute of melody, nor unlike some Scotch airs. The instruments in use are gongs, drums, violins, flutes, guitars, and trumpets sufficiently harsh and grating; but the applause is always in proportion to the noise made. They have some notion of sculpture, the best specimens of which are seen on tombs. They are fond of shuttlecock and football, cock and quail fighting, the tricks of jugglers, &c.; and the upper ranks of elephant, tiger, or buffalo hunting, and fireworks, cards, dice, &c., without, however, being addicted to gambling. (*See Barrow*, pp. 298—300.; *White*, pp. 301, 302, 390.)

Dress.—Is the same as that of the Chinese before the Tartar conquest, consisting of loose trousers, tied round the waist with a sash; several loose frocks of different lengths, the upper one the shortest, and having long loose sleeves, a small close collar, and 5 buttons and loops; a broad

basket-work hat, or a turban of crape; slippers by which the feet are not cramped like those of the Chinese; hair long, and turned up in a knot on the top of the head. The dress of both sexes is alike, only in that of the women the frocks are longer, and they wear bracelets and armlets of pearl or ivory, earrings, and other ornaments. Dress is an object of great attention with all classes. (*Crawford*, p. 415.; *Barrow*, pp. 301—309.; *White*, p. 298.; *Finlayson*, p. 378.)

Language.—The language of the Cochín Chinese, like their dress, &c., has been derived from that of China; it is monosyllabic, destitute of inflexions, its written character like the former, although it possesses several elements, as the B, D, and R, which the Chinese are unable to pronounce. The Cambodjans speak a different language, and the people of Tsiampa another distinct from both. Literature is confined to Chinese books, chiefly on medicine, and the works of Confucius. (*Crawford*, p. 464, 467, 484.; *Barrow*, p. 326.)

History.—In 234 A.C., this country was conquered by the Chinese, who held it till A.D. 263. In 1406 it was re-conquered by the Chinese, who abandoned it again in 1428. In 1471, Cochín China was completely subjected by Tongkin; but in 1553, the throne of the yoke, and, till 1748, was governed by both a nominal and real sovereign, the latter of whom was a military commander and regent. The nominal sovereigns then obtained the mastery, and ruled in the midst of anarchy till 1774, when, in the reign of Camng-shung, the revolution of N'ac (*Yingac*) and his brothers overturned their power. Bishop Adran, a French missionary, the tutor of the late king's son, obtained for him the alliance of Louis XVI., and, with the aid of a few of his countrymen, was the main cause of the restoration of his pupil Gia-long to the throne of his ancestors, on which he was firmly seated in 1809. Adran reformed the jurisprudence, commenced public works, surveyed the coasts, promoted trade, established naval arsenals, and new disciplined the king's army; but dying soon after, many of his wholesome reforms sank into disuse. Gia-long died in 1819, and was succeeded by an illegitimate son, who was invested, in 1821, by the court of Peking with the empire of Tongkin and Cochín China. (*Crawford*, pp. 505—510.; *White*, pp. 84—94.)

ANAPA, a sea-port town and fortress of European Russia, (Circassia, on the N.E. coast of the Black Sea, 47 m. S. E. Yenikale, lat. 44° 54' 52" N., long. 37° 16' 21" E. Pop. ex. of military, 3,000. The fortress, constructed by the Turks in 1784, was taken by the Russians in 1791, and in 1807, and finally in 1828, since which it has been definitively ceded to them. The houses are mostly mere cabins, built of wood and mud. The inhabitants consist of Circassians, Turks, Tartars, Greeks, Jews, Armenians, Russians, &c. The port, or rather road, is nearly open, with bad holding ground, and so shallow as to admit only ships of small burden. Anapa is at present principally important as a military post; but were tranquillity restored in Circassia, it would most likely become the seat of a considerable commerce. The exports are grain, tallow, and butter, hides, peltries, wax, &c. (*Klaproth, Tableau du Caucase*, p. 160.; *Spencer's Circassia*, i. 286.)

ANCENIS, a town of France, dep. Loire Inférieure, on the Loire, 21 m. E. N. E. Nantes. Pop. 3,667. It is well built, has a handsome college, an hospital, and barracks. There are coal and iron mines in the neighbourhood; and it has a good deal of trade in wine, vinegar, brandy, timber, &c. Its port serves as an entrepôt and station for the vessels navigating the Loire. The town is commanded by a Gothic castle placed on a steep hill.

ANCEVILLE, a town of France, dep. Meuse, 11 m. S. S. W. Bar-le-Duc. Pop. 2,211.

ANCHOLME (ISLE OF), see LINCOLNSHIRE.

ANCIAONS, a town of Portugal, prov. Trás-os-Montes, 12 m. W. Torre de Moncorvo. Pop. 1,900. It is encircled by walls, and has a castle and mineral springs.

ANCONA, a marit. city of Italy, the third in the Papal States, cap. leg. same name, on the Adriatic, 174 m. S. E. Sinigaglia, lat. 15 m. N. W. Loreto, and 188 m. S. E. Rome, lat. 43° 37' 42" N., long. 13° 30' 38" E. Pop. 34,000, of whom many are Jews, Greeks, and Mohammedans. It is the seat of a civil tribunal, of a tribunal of original jurisdiction, and of a bishopric; is built amphitheatre-wise, on a sloping ground, declining to the sea, between two hills, on one of which stands its cathedral, on the other its citadel; streets narrow, dirty, and irregular; but many houses spacious and elegant; quay, fine; port formed by a mole 2,000 ft. in length, 100 do. in breadth, and 66 above the sea, having at its extremity a lighthouse, with a handsome revolving light. The mole being hooked at the extremity, vessels may lie immediately within the harbour in from 7 to 8 fathoms, but it should anchor within a short distance of the entry. There is good anchorage ground about 4 m. without the mole, in 10 and 12 fathoms. On the mole stands a noble ancient triumphal arch, in honour of the

Emperor Trajan, who improved and embellished the town and port; it is formed of large blocks of white marble; and it has also another arch in honour of Pope Benedict XIV. The cathedral, situated on a bold promontory on the site of an ancient temple of Venus, has a curious porch, supported by two lions of Egyptian granite; a very ancient altar, and many fine marble pillars. There are 10 other churches, containing many good paintings; 15 convents, a college, and two hospitals. The palace of the delegate, the exchange, the town-house, and the fortifications, particularly the citadel, are also worthy of notice.

Its manufactures, chiefly in the hands of the Jews, consist principally of wax, tallow, silk hats, and paper. The harbour is well adapted for building and repairing ships, and is frequented by those of all nations. It was made a free port by Clement XII., and has a more considerable trade than any other town on the W. coast of the Adriatic, Venice excepted. Outside the harbour is a fine lazaretto, on an artificial island, communicating with the town by a bridge. The market-place is spacious, and the town is well furnished with cheap and good provisions. The women are said to be remarkable for their beauty. Thomson (*Two Journeys in Italy*, &c.) observes, "It was an amusing scene to pace along the wharfs, to listen to the strain of the tiny mandoline, or the deeper tones of the guitar, joined to the patriotic song of some poor Greek, or the more refined Italian ditty; while a motley group were sometimes seen collected in a Greek mystica, or an Italian feluca, dancing, whirling, and stamping to the music of some half dozen voices, or the tinkling of the Spanish guitar."

Ancona is said, by Strabo, to have been founded by a colony of Syracusans in the time of Dionysius. The Romans established themselves in it, B.C. 268. Being justly regarded as a naval station of great importance, Trajan expended large sums upon it, and built the mole. A.D. 592, it was occupied by the Lombards; in 839 it was sacked by the Mussulmans; and it afterwards formed an independent republic till 1532, when Bernardino Barba, under pretext of defending it against the Turks (having built the citadel which entirely commands the town), placed it in the hands of the Pope. In 1799 it was taken by the French, and in 1809 formed the chief city of the dep. of the Metauro. In 1814, it was restored to the Papal see. In Feb., 1832, a detachment of French troops landed unexpectedly, and took possession of the citadel; which the French government announced its resolution to retain so long as any Austrian troops remained within the Papal territories; the latter, however, having been withdrawn, the French evacuated the town in the course of 1833. (*Rampoldi's Geografia dell'Italia*, vol. 1. p. 80.; *Foray's Italy*, 1816.; *Thomson's Two Journeys in Italy*, &c. Lond. 1835, pp. 239 to 253.)

ANCY-LE-FRANC, a town of France, dep. Yonne, cap. cant. on the canal of Burgundy, 10 m. S.E. Tonnerre. Pop. 1,413. It is neat and well built, but is chiefly remarkable for the magnificent castle in its vicinity, built after the designs of Primaticcio, belonging to the descendants of Louvois, minister of Louis XIV. It is surrounded by a beautiful park, and has fine gardens. (*Hugo*, art. *Yonne*.)

ANDAD KHAN, a town of Independent Tartary, Khanat of Khokan, on the Sihoun (*Jaxartes*), 55 m. E. Khokan, lat. 41° 20' N., long. 71° 27' E. It is surrounded by gardens, and is a place of considerable size and antiquity.

ANDALUSIA, (so called, either from the Vandals who settled here in the fifth cent., or from an Arabic word, signifying *Land of the West*, the most S. division of Spain, comprising the four Moorish kingdoms of Seville, Cordova, Jaen, and Granada, between 36° 0' and 38° 30' N. lat., and 1° 37' and 7° 24' W. long., having N. Estremadura and La Mancha; E. Murcia; W. Portugal; and S. the Atlantic Ocean, the Str. of Gibraltar, and the Mediterranean; length, E. to W. about 350 m.; greatest breadth nearly 200 m.; area, 37,153 sq. m. Pop. about 2,400,000. It is at present divided into eight provinces, viz.—Seville, Cadiz, Cordova, Granada, Jaen, Malaga, Almeria, and Huelva. Its chief cities are Seville, Cadiz, Cordova, Jaen, Almeria, Granada, Malaga, Huelva, and Gibraltar. Two ranges of mountains traverse it from E. to W.: the most S. of these ranges is the loftiest, and has several points covered with perpetual snow; the highest, Mulahacen, being 11,678 ft. above the level of the sea. The Sierra Morena belongs to the N. chain, and forms part of the N. boundary of the district. Between these two ranges flows the Guadalquivir, by far the largest of the Andalusian rivers, and swelled by numerous streams from the lateral valleys opening into its basin. There are numerous small lakes. On the coast, the climate is hot and oppressive; but N. of the Sierra Nevada, the temperature is more equable, and cooler, although it never freezes. The primitive rocks of the high N. mountains are chiefly mica-slate, gneiss, and clay-slate, covered in some parts by black-transition

limestone, containing sulphuret of lead. Serpentine marble, and alabaster, are found in Granada; and there are numerous mines, that either produce, or have produced, gold, silver, copper, antimony, mercury, iron, lead, vitriol, coal, and sulphur; but with the exception of the lead mines of Adra, near Malaga, they are at present mostly in a neglected state. The vegetation partakes of the European and African characters: mastic, olive, myrtle, palms, bananas, &c., abound in the central parts of the country, but on the S. shores those common to Europe almost wholly disappear, and the sugar-cane and cotton are cultivated. Wheat, barley, fruits of all sorts, and wines, are abundantly produced; the chief wines are those of Xeres (sherry), Pajarote, Malaga, Montilla, &c.: silk is also an article of considerable culture. There are many rich pasture-lands, and the cattle and horses, especially the latter, are renowned as amongst the best in Spain. The wolf and boar are the only formidable wild animals; there is plenty of game, an abundance of fish, and none of the most venomous reptiles: the cochineal insect is successfully cultivated near Cadiz. Most part of the country is parcelled out into vast estates, belonging to grandees, the church, and corporations. Agriculture is in a very backward state. The greater part of the country is appropriated to pasture, the traveller often journeying many miles without seeing a single house, or any symptoms of cultivation; and, notwithstanding the fertility of the soil, there is annually a considerable importation of corn from the opposite coast of Africa, Sicily, and the Black Sea. The occupiers of the land mostly live together in towns and villages; their rents are usually paid on the *metayer* principle, and they are at once ignorant and poor; the inhabitants of the mountainous and less fertile districts are, as might be expected, the most industrious. The chief manufactures are those of woollens, silk, and leather; and but for oppressive customs laws, there would be a considerable trade both with other parts of Spain and foreign countries. Cadiz is the chief port.

The Andalusians are a mixed race, descended from Africans, Carthaginians, Romans, Goths, Vandals, and Moors. They retain much resemblance, both in person and manners, to the latter; although light hair, eyes and complexions, are by no means unfrequent. When they have any motive to exertion, they are not deficient in industry, and are intelligent and imaginative. Andalusia has produced many good poets and distinguished men in all ages:—Trajan, the Senecas, and Silius Italicus were natives of this prov. with Murillo, the painter, and some of the best lyric authors of modern Spain. (*Minano*, *Townsend's Spain*, ii. 238.; *Mallet-Brun*, &c. and *Spain*.)

ANDAMAN ISLANDS, a lengthened narrow group of islands, none of which are of any very considerable magnitude, in the E. part of the Bay of Bengal, stretching N. and S., between 10° 30' and 13° 40' N. lat., under about 92° 50' E. long. They are within the full sweep of the S. W. monsoon, and are washed for eight months a year by incessant rains. They produce many large trees, that might furnish timber and planks for the construction of ships, and for the finest cabinet work. The quadrupeds are but few, consisting principally of a diminutive breed of swine and rats. Among the birds is the swallow, that produces the edible nests so highly esteemed in China. Fish are generally plentiful, but occasionally scarce. The inhabitants, who are not supposed to exceed 2,500 or 3,000 in number, seem to be a peculiar race in the lowest state of barbarism. They seldom exceed 5 feet in height, have protuberant bellies, limbs disproportionally slender, skin a deep sooty black, hair woolly, nose flat, lips thick, eyes small and red, their countenances exhibiting the extreme of wretchedness—a mixture of famine and ferocity. They go quite naked, and are insensible to shame from exposure. They have made efforts to cultivate the ground, but are found only on the sea-coast, depending principally for subsistence on fishing. Their implements are of the rudest texture; but they use them with great dexterity, particularly in spearing and capturing fish. They have no utensil that will resist fire, and dress their food by throwing it on the live embers, and devouring it half broiled. Their habitations display little more ingenuity than the dens of wild beasts. Being much incommoded by insects, their first occupation in the morning is to plaster their bodies all over with mud, which, hardening in the sun, forms an impenetrable armour. They paint their woolly heads with red ochre and water, and, when completely dressed, have a most hideous appearance. They have an intense hatred of strangers, with whom they cannot be persuaded to hold any intercourse. They are supposed to worship the sun and moon; and during storms and tempests, endeavour to avert the wrath of the demon by whom they suppose them to be produced. Their language is peculiar, and is not known to have the slightest affinity to any spoken in India, or in any of

the Indian islands. They have been said to be *anthropophagists*, but this is doubtful. Some have supposed them to be a race of degenerate negroes; but this is a matter as to which it is impossible to arrive at any definite conclusion.

A British settlement was established at Port Cornwallis, on the largest of the islands, near the N. E. extremity of the group, in 1793. The harbour is excellent; and the settlement was designed for the reception of convicts from Bengal, and for the security of shipping during the moussoons; but the situation turned out so very unhealthy, as to occasion its abandonment in 1796. Since then they have been but seldom visited, except in 1824 and 1825, when some of the ships, on their way to Hangoon, touched at the islands. On one of these occasions, the natives attacked a party watering with the utmost fury; and were not repulsed without great loss on their side, and after they had killed one soldier, and wounded three others. (The above particulars have been selected from the excellent account of these islands, given by *Sydney, Embassy to Ava*, pp. 127—128, 4to. ed.; see also *Hamilton's Gazetteer*.)

ANDELYS (LES), two towns of France, within a very short distance of each other, dep. Eure, cap. arrond. one on the Seine, and the other a little inland, 10 or 11 m. E. Louviers. Pop. 5,085. The greater Andely is ill built, with narrow crooked streets; but it has a fine collegiate church. The lesser Andely has to boast of the magnificent ruins of the château Gaillard. There are manufactures of fine cloth, kerseymers, râteaux, cotton yarns, and paper, with tanneries, &c. Nicholas Poussin, the famous painter, was born in the hamlet of Villers, near the greater Andely, in 1594; and a monument has been erected to his memory in that town.

ANDENNES, a town of Belgium, prov. Namur on the Meuse, 13 m. E. N. E. Namur. Pop. 4,203. There are manufactures of earthenware and porcelain, and of pipes formed of the clay found in the neighbourhood.

ANDERLECHT, a neat well-built town of Belgium, near Brussels, of which it is in fact a suburb. (See *BAUSSELS*.)

ANDERNACH (the *Antunacum* of the Romans), a town of the Prussian prov. of Lower Rhine, on the left bank of the Rhine, 10 m. N. W. Coblenz. Pop. 3,600. It is situated in a volcanic country, its massive towers, turrets, and ruined walls, being admirably suited to the sombre scenery by which it is surrounded. Streets narrow and ill paved, and the houses gloomy, old, and out of repair. There is a fine old archway, supposed to be Roman, forming the gate of the town on the side next Coblenz; and below it, in a line towards the river, are the ruins of an extensive palace or castle, supposed to have been built by the Goths soon after the expulsion of the Romans. It exports two singular productions, viz. mill-stones made of porous lava, and large quantities of pounded *tuff*, denominated *trass*, a cement which, when mixed with water, becomes as hard as stone. The former are in great demand in most parts of Europe; the latter is principally used by the Dutch in the construction of their dykes, but is also exported to other countries. Immense rafts of timber from the German forests, destined for the Low Countries, are formed near Andernach. (*Barrow's Tour through Holland*, &c.; and *Schreiber's Rhine*.)

ANDES (THE), an immense mountain range, runs along the whole W. coast of S. America, covering with its chains, declivities, and valleys about a sixth part of that continent. The *Cordillera*, a name sometimes given to this chain, is properly applicable only to the innermost and highest ridge of the mass.

Cape Horn, on Cape Horn Island, in about 56° S. lat., may be considered as the S. extremity of the Andes. The most N. chain of the mountains is the *Parana* * de las Rosas, which extends to the E. of Lake Maracaybo, and terminates at about 9° N. lat. The whole system is thus found to extend lengthwise over 65 deg. of lat. Its width varies very much; in some parts it occupies only between 30 or 40 miles across, in others it covers with its branches and valleys a country extending 500 miles and upwards from E. to W.

Beginning our survey of this mountain system at its southern extremity, we find that it commences at the Cape of Good Success, on the W. shores of the Straits of Le Maire, in about 70° W. long. Even the high rocky mass which constitutes the island of Staaten Land, and extends more than a degree farther E., may be considered

as a continuation of this range, from which it is separated only by the Straits of Le Maire, between 30 and 40 m. across. From the Cape of Good Success the range runs W. along the S. shores of King Charles's Southland, the most extensive of the islands constituting the S. Archipelago of America, commonly called Tierra del Fuego. It covers about a third part of the surface of that island, as well as the whole of the islands lying S. of it, as Navarin, Hoste, Wollaston, Hermit, and Cape Horn. Towards the Straits of Le Maire, the range consists of rocky hills, of no great elevation; but farther W. they rise to an altitude of 2,000 or 3,000 ft. Cape Horn itself is a conspicuous rock, with a steep ascent, upwards of 3,000 ft. high. Mount Sarmiento, near Magdalen Channel, is the highest summit, and rises about 6,000 ft. above the sea.

In the W. part of King Charles's Southland, the range extends over the whole district S. and W. of Admiralty Bay. Farther W. it changes its direction, running in a N. W. direction as far as the Frith of Sinsalid (Ancon Sinsalida of the Spaniards), 52° S. lat., and 73° W. long. This part of the range, whose mean width may be about 100 or 120 miles, is longitudinally divided by that portion of the Strait of Magalhães which extends from Cape Froward to Cape Victoria. Two transverse channels divide the S. portion into two islands. The E. or Magdalen Channel, separates Clarence Island from King Charles's Southland; and the W. extends between Clarence Island and South Desolation; the latter bears the name of Barbara Channel. That part of the range which lies to the N. E. of the strait is intersected by two deep transverse inlets. The south-eastern, called Jerome Channel, terminates on the E. in two large lagoons, called Otway and Skrying Waters, which are both situated on the eastern side of the Andes in the plains of Patagonia. By this extensive Inlet, Brunswick Peninsula is divided from King William's Land. The N. W. transverse inlet bears the name of Smyth's Channel, and divides first King William's Land from Queen Adelaide's Archipelago, and afterwards joins the Frith of Sinsalid, which likewise penetrates through the whole chain of the Andes, and terminates with its numerous branches in the plains of Patagonia. South of this frith the mountains rise somewhat higher than on King Charles's Southland, but their mean elevation does not exceed 4000 ft. above the sea.

The mountain range south of the Frith of Sinsalid may be called the *Magalhães Andes*, extending principally on both sides the strait bearing that name. It consists of islands and peninsulas intersected by deep but narrow arms of the sea. The summits of the mountains are covered with eternal snow, the snow line occurring in these countries at about 3,500 feet above the sea. The lower parts of the mountains and the steep and rocky shores of the islands are partly covered with evergreen woods; except towards the ocean, where they present the aspect of bare black rocks.

At the Frith of Sinsalid begins the uninterrupted chain of the Andes. At this place it again changes its direction, running due N. with slight bends as far north as the Bight of Arica (18° S. lat.). It comprehends the Patagonian Andes between 52° and 42°, the southern Chilean Andes between 42° and 35°, and the northern Chilean and Atacamean Andes between 35° and 20° S. lat.

The Patagonian Andes extend from the Frith of Sinsalid to the N. corner of the Gulph of Ancud, opposite the island of Chiloe. They are only known from the side of the ocean, whence they rise to a considerable height with an extremely steep ascent. It would seem as if the range in this part had once occupied a much greater breadth, and that by some extraordinary convulsion the whole of the western declivity, with the summits of the range, had been broken down and buried in the ocean, so that only the eastern declivity has remained standing. The numerous and rocky islands which skirt this shore in all its extent, except at the protruded cape of Tres Montes, appear to support such a supposition. The eastern declivity of the range has not been examined; but what we know of it seems to be sufficient to warrant the supposition that in this part the Andes occupy a width of only from 30 to 40 miles. The mean height of the Patagonian Andes may be estimated at about 5,000 or 6,000 ft. None of its summits which have been measured exceed 9,000 ft. But snow mountains, and even glaciers, are stated to be frequent. The lower part of the declivity is covered with trees and shrubs, the upper part bare, as also those portions of the shore which are exposed to the immediate effects of the gales blowing from the Pacific.

The *Southern Chilean Andes* extend from the most

* *Parana*, rendered *desert* in the dictionaries, signifies in S. America a rather a desert nor a heath, but like the Peruvian word *puna* denotes a mountainous place covered with snowed trees, exposed to the winds, and in which a damp cold perpetually prevails. Under the torrid zone the *paranas* are generally from 10,000 to 12,000 feet high. They are, in fact, the lower summits of the *cordilleras*. Snow often falls in them, but it remains only a few hours. In this respect

they are distinguished from the *nevados*, which enter the limits of perpetual snow. The *paranas* are almost constantly enveloped in a transient fog; so that, when a thick small rain falls, accompanied with a depression of the temperature, they are at Hogs, or at Mexico, *as in parana*. Hence has been formed the provincial word *paranaruna*, to be as cold as if one were on a *parana*. (*Humboldt, Voy. Nat. li. p. 252; Modern Traveller, xxvii. p. 14*.)

N. corner of the Gulf of Ancud (48° S. lat.) to the high peak of Tupungato (near 33° S. lat.). Towards the N. extremity the Andes keep for some extent a distance of about 150 miles from the shores of the Pacific, the greatest which they attain in their whole course; but towards the N. they gradually approach it to within about 100 miles. Between the Andes and the shore are extensive plains, from 1,200 to 3,000 ft. above the sea; and from these plains the mountains rise with an extremely steep acclivity to the mean elevation of 13,000 or 14,000 ft. above the sea. Some summits attain 15,000, and even 15,500 ft. Though our knowledge respecting this part of the Andes be very scanty, it would seem that they form one extensive mass from 60 to 80 miles across, which, however, in its upper part is furrowed by a longitudinal valley, divided by short transverse ridges into several shorter valleys. This great mass of rocks is mostly clothed with forest trees and a rich vegetation; but in the interior it presents only bare rocks, nearly without plants of any description.

Three passes are known to traverse the Chilean Andes. That farthest S. skirts the high volcano of *Antuco*, between 37° and 36° S. lat., leading from the small town of *Tucapel* to the great plains E. of the Andes. It is also used by the aborigines inhabiting these plains, who bring to Chile salt and some commodities. The second road traverses the *Passi del Planchon*, which crosses the mountain ridges near 35° S. lat., beginning on the west at the village of *Curico* and leading to the territory of the *Pehuenches*, who occupy the E. declivity of the Andes, and thence to *Mendoza*. It is said to be the lowest of the mountain passes of the Andes, vegetation ascending up to the highest part of the road; it is farther stated to be more gentle in its ascents and descents. Yet it is little used, except by persons trading with the Indians in the Pampas. The third pass is that of *Portillo*, which at first runs along the river *Maypo*, S. of *Santiago*, the capital of Chile, and afterwards crosses the two ridges of the Andes which enclose the valley of *Tunuyán*. On the W. ridge the road rises to 14,362, on the E. to 13,210 feet above the level of the sea. From the latter it descends to the plains, and leads to *Mendoza*. It is the nearest way between the last-mentioned town and *Santiago*, the capital of Chile, and is therefore sometimes, but not frequently, used.

The high peak of *Tupungato* may be considered as forming the boundary between the S. and N. *Chilcan* Andes. N. of this summit the Andes, which farther S. form only one enormous mass of rocks, divide into two masses, which enclose long and wide valleys considerably lower than the surrounding ridges. The first valley of this description is that of *Uspallata*, which extends about 140 or 200 miles S. and N. It is traversed by two rivers; the *Rio de Mendoza*, which flows S.; and the *Rio de S. Juan*, which runs N. The watershed between them lies N. of 32° S. lat. This valley is about 15 miles in width, and presents an undulating surface. It is about 6,000 ft. above the level of the sea. The range E. of it, called the *Paramillo de Uspallata*, seems not to exceed 10,000 ft.; but the W. or principal range attains 14,000 ft. and upwards. The former is about 25, and the latter more than 70 miles across. The E. range has two narrow breaks, by which the two rivers of the valley find their way to the plains extending E.

Over these two ranges, and through the valley of *Uspallata*, lies the most frequented mountain road crossing the Andes. On the west it begins at the town of *Santa Rosa*, in the valley of the *Quitilota* river (2,614 ft. above the sea); it next follows the bed of that river for a great distance, and then crosses the high range nearly at equal distances from the mountain summits of *Tupungato* and *Acocagua* (between 33° and 32° S. lat.). The *Cumbre* or highest point is 12,454 feet above the Pacific. Hence the road descends along the *Rio de Mendoza* into the valley of *Uspallata*, passes the *Paramillo* range, and enters the plains near *Villa Viecosa*, whence it runs along the last-mentioned mountain chain to *Mendoza* (2,968 ft. above the sea); from *Mendoza* it leads over the *Pampas* to *Buenos Ayres*. Though much frequented, it cannot be passed by carriages, and only mules are used for the transport of commodities, and by passengers. In winter (from June to September) the passage is very dangerous, on account of the heavy falls of snow, which cause frequent losses of life and property. The pass is by some named that of the *Cumbre*, and by others of *Uspallata*.

N. of the valley of *Uspallata* the Andes continue to form two ranges, including extensive longitudinal valleys. The first in order is that of *Agualasta*, of which we know only that its soil is sterile, but its mountains rich in metallic ores. Then follows the valley of *Andalgalá*, which is entirely unknown. The latter extends to 23° S. lat. A great number of mountain passes are stated to exist over the W. range enclosing these valleys, which would indicate that the mean elevation of the Andes is here much less than in other parts. But none of these passes seems to be much used, nor has any of them been visited

by European travellers. It is, however, known that towards the Pacific this range does not descend with a short and rapid declivity, as in the S. Chilean Andes, but by table-lands in the form of terraces, which near the principal chain are 5,000 feet and more above the sea, but lower by degrees as they approach the ocean, where they still form a shore from 500 to 600 feet high. Being furrowed by deep water-courses, these table-lands, when seen from the banks of the rivers, appear frequently like mountains of considerable height.

From their farthest S. point as far as the N. point of the valley of *Uspallata*, the Andes do not send out lateral branches. But from the E. range, including the valleys of *Agualasta* and *Andalgalá*, several ranges branch off into the E. plains, and extend in a S. and E. direction to a distance of from 200 to 280 m. By these lateral chains the countries extending E. of the Andes, between 33° and 23° S. lat., are rendered hilly, and in some districts even mountainous. In the S. districts the height of the ranges is not considerable, but farther to the N. it increases greatly; and the chain, which branches off at the N. end of the valley of *Andalgalá*, and forms at present the boundary between the republics of *Buenos Ayres* and *Bolivia*, may attain a height of 10,000 ft. above the sea. It terminates at no great distance from the point where the *Rio Grande* enters the *Rio Vermejo*.

Between 23° and 20° S. lat. the principal range of the Andes seems to constitute a single chain, rising to a mean height of above 15,000 feet. In it stands the *Navado de Chorolque*, which is stated to rise 16,548 ft. above the sea; but it is probable that it is at least 1,000 ft. higher. From this chain several lower and narrow ridges run E. 120 or 150 m. The S. districts of *Bolivia* are in consequence rendered a succession of valleys and mountains. However, these ridges do not attain a great elevation over the plains on which they rise. A road traverses the principal chain; it begins on the coast of the Pacific at *Cobija*, or *Puerto de la Mar*, the principal harbour of *Bolivia*, passes over the high Andes of *Lipez* near the volcano of *Atacama*, and descends to *Tupiza*; hence it runs to *Potosí* and *Buquiasara*. This road is not much used, on account of the sterility of the surrounding country, and the difficulty of procuring provender for the mules and other animals of burden. In some parts water too is extremely scarce.

Near 20° S. lat. is the mountain knot of *Porco*. Here begin the *Bolivian Andes*, which extend to 14° S. lat., and may be considered as constituting the central portion of the whole mountain system. In no other part do the mountains attain an equal height, nor do they extend to such a considerable breadth. They present here one immense mass of rocks, extending in length over six deg. of lat., and measuring its breadth at the S. extremity more than 250, and at the N. about 200 m. The upper part of this enormous mass is between 13,000 and 14,000 feet above the level of the sea. On its edges are placed numerous mountain summits, which rise many thousand feet above the upper surface of the mass, so that the whole presents to the eye a plain surrounded everywhere by high ridges. The mountains enclosing the plain at its S. extremity rise to a great elevation, but not so high as those towards the N. The famous *Cerro de Potosí* is only 16,037 ft. high, and that of *Porco* 15,913 ft. In summer they have no snow upon them. The W. range contains summits of much greater elevation.

The volcano of *Gualatieri* (near 19° S. lat.) rises 22,000 ft., and the *Navado de Chuquibambá* (near 15° S. lat.) to 21,000 ft. above the sea. The E. range is still higher. Between the *Cerro de Potosí* and 16° 50' S. lat. none of its summits attain 17,000 feet of elevation, which here constitutes the snow line. But farther N. a great number of snow-topped peaks raise their heads above the clouds. At 16° 40' stands the *Navado de Illimani*, which attains 24,000 feet; and farther north the *Navado de Zorata*, which is about a thousand feet higher. The elevation of these two summits has been determined by Mr. Pentland; but he states that there are others which seem not much lower, especially the *Navado de Yari*, N. of *Mount Zorata*. These two high ranges run nearly parallel to one another; south of 17° S. lat. nearly due S. and N., but N. of that parallel S. E. and N. N. W. At their N. extremity (14° S. lat.) they are united by a transverse range, which extends N. E. and S. S. W., and is known by the name of *Andes of Vilcanota*. This latter range has several summits covered with perpetual snow, but their elevation has not been ascertained.

The country enclosed by these ranges forms an immense alpine valley, whose lowest parts are nearly 13,000 feet above the sea. It does not present a level plain; for those portions of it which are contiguous to the ranges are covered with mountains, or rather hills, rising several hundred and in many places even a thousand feet above their bases. But the internal districts preserve a sufficiently level surface to be called a plain. This is known under the name of the *Valley of Titicaca*, or of the *Desaguadero*. The first denomination is derived from

the lake of that name which occupies the N. portion of the valley, covering about 4,000 sq. m. It is famous in the history of Peru for the miraculous appearance of Manco Capac, the founder of the Inca dynasty. From its S. extremity issues a river, called the Desaguadero, which traverses the whole valley from 15° to 19° S. lat., where it is lost in a small lake. The length of the valley is upwards of 300 miles, but its width varies. In the parallel of Puno ($15^{\circ} 50'$ S.) it exceeds 60 miles, and in lat. $16^{\circ} 50'$ it is still wider; but from this point to its S. termination it gradually narrows, so as in the parallel of Oruro ($17^{\circ} 58'$) not to exceed 35 m. According to the statement of Mr. Pentland, the area of this valley, including the lake, exceeds 18,000 sq. m., of which the lake covers between a fourth and a fifth part. The surface of the lake is 12,795 ft. above the level of the sea.

The ranges enclosing the alpine valley of Titicaca are traversed by several mountain roads, of which the following are the most frequented:—That through the pass of Potosí, traversing the Puerto between the Cerro of Potosí and that of Huayna Potosí. It leads from Potosí to Oruro, and rises in its highest point to 14,320 feet. The road over the pass of *Condor Pachta*, between Oruro and Cochabamba, rises in its highest point to 13,950 ft. above the sea. The road through the pass of *Pucumani*, leading from La Paz to the countries east of the ridges, rises to 15,225 feet. The most used road is over the western range, and that through the pass of *Lus Guabilar*, leading from Arica on the coast, and Tacna, to La Paz, in the valley of Titicaca; it traverses the range at $17^{\circ} 50'$ S. lat., S. of the Nevado de Chilipuni, where it rises to 14,830 ft. Farther N. ($16^{\circ} 2'$ S. lat.) is another road, which connecting Arequipa with Puno, attains in the pass of *Altos de Toledo* an elevation of 15,528 feet above the sea.

Several lateral ridges run off from this great mass of rocks to the E.; but none of them seems to be distinguished by its height or extent, except the Sierra de Santa Cruz, which detaches itself from the principal range about $17^{\circ} 10'$ S. lat. and terminates near the banks of the Rio Guajal or Rio Grande, within a few leagues of the town of S. Cruz de la Sierra. It extends about 300 miles, and is of considerable elevation in its western part, where it forms the Nevado de Tiañica, near Cochabamba; farther east it becomes gradually lower.

The *Peruvian Andes* occupy the next place, extending from 14° to 6° S. lat. Between these latitudes they measure from 400 to 160 m. in width, and their area does not probably fall short of 200,000 sq. m. On their borders extend two ranges; of which the E., separating the mountain region from the great plains extending south of the Amazon, branches off from the E. extremity of the Andes of Vilcanota in a N. direction. It divides the affluents of the Ucayale from those of the Yavari, and terminates near 7° S. lat., about 160 m. from the Amazon. We know very little of this range, but it does not seem to rise any where to a great height; probably none of its summits exceed 10,000 ft. above the sea.

The W. range of the Peruvian Andes, which, with its W. declivities, approaches the Pacific Ocean to a distance of 50 miles or less, must be considered as the principal chain, on account of its height and breadth, and because it forms with the N. parts of the Andes an uninterrupted chain. It may be said to commence near the Nevado de Chuquibambá, where the Andes of Vilcanota join the W. range of the valley of Titicaca. It is remarkable that the Peruvian Andes seem to be rather a continuation of the Andes of Vilcanota than of the great W. chain; for near 16° S. lat. and between 71° and 75° W. long. the Peruvian Andes extend in a direction E. and W., whilst three degrees farther S. the Bolivian Andes run S. and N. In this portion of the Andes are some very high summits. Besides the Nevado de Chuquibambá, already noticed, are the Cerro de Huando and the Cerro de Parinacocha, whose elevation, however, has not been determined. Near 75° W. long. the principal chain of the Andes declines to N. W., and runs in that direction to the neighbourhood of Cape Parina, the most W. extremity of S. America. In the S. portion of this chain several summits rise above the snow line, but the elevation of none of them has been determined. The best known are, the Toldo de la Nieve, seen from Lima, to the S. E. of which it is situated; the Altuncagua, near 10° S. lat.; and the Nevado de Huayllillas, $10^{\circ} 50'$ S. lat. But between the last-named snow peak and Mount Chimborazo, in the Andes of Ecuador, or Equator (2° S. lat.), there is no summit which attains the snow line.

The country lying between the two outer ranges of the Peruvian Andes presents a continual succession of high ridges and long valleys, here and there intermixed with plains of moderate extent. It forms the best portion of the republic of Peru. The most remarkable district seems to be the plain of Bombon, near 11° S. lat., which is 13,500 feet above the level of the sea, and extends about 18 miles in width from E. to W., and 40 or 50 from S. to N. A great part of this elevated plain, which is

enclosed by two ridges of mountains, and on which the ariferous Cerro of Pasco is situated, is covered with swamps. The water running off from them, and from the elevated ground, which frequently is covered with snow, is collected in several lakes, of which three are especially noticed, as giving birth to three considerable rivers. The farthest N. is the Lake of Lauricocha, from which the Amazon rises; the farthest S. is called the Lake of Quilacocha, which gives birth to the Sanja or Maturo, one of the principal branches of the Ucayale. Between these lakes is that of Chiquicola, whence the Rio Huallaga issues. The plain of Bombon is farther to be considered as a mountain knot, from which different ranges branch off in different directions. Besides the principal range of the Peruvian Andes, which lies contiguous to it on the W., two mountain chains run off from it to the N., and one to the S. The most W. of the two N. chains runs nearly parallel to the principal range of the Peruvian Andes, and forms the E. boundary of the valley of the Marañon or Upper Amazon. It rises to a great elevation, but does not enter the snow line. One of its farthest N. branches extends close to the banks of the Amazon, where it forms the famous Pongo (cataract) of Manariclio. A lateral ridge of this chain branches off from it at about 7° , runs E., and terminates on the banks of the Rio Huallaga, where that river forms its great cataract, or pongo. The farthest E. of the N. chains separates the valley of the Huallaga from the *pampas* of S. Sacramento, traversed by the Rio Ucayale. It is towards its beginning in the mountain knot of Bombon of great height, but lowers considerably farther N., terminating between 6° and 7° S. lat. at the Pongo of the Huallaga. The S. chain, issuing from the plain of Bombon, runs S. E., nearly parallel to the principal range of the Andes, and encloses the rich valley of the Rio Sanja. It terminates in the most S. bend of that river, about 13° S. lat. and 74° W. long.; and nearly opposite another range of high mountains, which issue from the Andes of Vilcanota, and run N. separating the valley of the Rio Apurimac from that of the Rio Quilabamba or river of Cuzco. The valleys enclosed by these several chains of mountains seem to have a mean elevation of from 3,000 to 5,000 feet above the sea.

The roads traversing the Peruvian Andes are very imperfectly known. That most to the S. leads from Arequipa (near 16° S. lat.) on the coast to Cuzco in the valley of the Quilabamba, and traverses very high ranges of mountains. Another road leads from Lima to the town of Trarma, in the valley of the Sanja, and thence to Guancavelica, Huamanga, and Cuzco. It rises on the principal chain at the Portacuelo de Tucto to 15,760 feet above the sea. Farther north is the road passing over the plain of Bombon to the Cerro de Pasco. It traverses on the principal range two mountain passes, of which the W., called Alto de Tacabamba, attains an elevation of 15,135, and the E. or Alto de Lachagual, 15,480 feet above the sea. Another road connects the town of Truxillo with the valley of the Marañon. It traverses the great range near the Nevado de Guayllillas, and leads to Huamachucho and Caxamarquilla; but we are not acquainted with its particulars.

The *Andes of Ecuador*, or the *Equator*, extend to the N. of the Peruvian Andes. Their commencement may be fixed opposite the Punta de Aguija (6° S. lat.) and the place where the Marañon changes its N. N. W. course into a N. N. E. In the same parallel the chain also changes its direction. It runs between 6° S. lat. and the equator, nearly due north. This portion of the mountain system closely resembles the Chilean Andes. It constitutes one enormous mass of high ridges, of about 80 or 100 miles in width, overtopped longitudinally by a double series of very elevated summits, so that between them a succession of high valleys is formed. These Andes are also distinguished from those between 33° and 6° S. lat. by their not sending off to the E. lateral branches. Their eastern declivities are supported by short coniforms, which probably no where extend beyond 80 miles into the E. plains.

It is remarkable that the elevated valleys occupying the middle of the range rise in elevation as they advance to the N. That portion of the range which lies between 54° and 34° S. lat. is occupied by an extensive mountain knot, the Andes of Loxa, which, however, at no place attains the snow line. Then follows the longitudinal valley of Cuenca, which extends from 35° to 2° S. lat., and rises to about 7,800 feet above the sea. On this side no snow mountains occur. The mountains of Assiay, which form the N. boundary of the valley of Cuenca, extending between the two outer ranges, rise to 15,500 feet above the sea, and enter the snow line; but they are narrow, occupying only about 3 m. of lat. (between 25° and 2° S.). To the N. of them extends the longitudinal valley of Alameda, which attains its greatest elevation between 2° and $40'$ S. lat., and rises to about 7,980 feet above the sea. The summits of the ranges which enclose it on the E. and W. rise to a great elevation. On the

western range stands the famous Chimborazo, rising 21,420 ft. above the level of the sea. It was until lately considered as the highest summit of the Andes; but it is now known that the high peaks of the Bolivian Andes, the Nevado de Zorata and the Illimani, rise from 3,000 to 4,000 ft. higher. On the E. range stand the volcanoes of Sangay, Collanes, and Llanganate. On the N. the valley of Alausi and Hambato is bounded by a narrow transverse ridge, the Alto de Chislinche, which hardly rises 300 ft. above the adjacent level ground. But at its extremities, and especially on the lateral ranges, rise two very high summits; on the E. the volcano of Cotopaxi, attaining 18,980 ft.; and on the W. the Yllinza, attaining 17,376 ft. above the sea.

The valley of Quito extends from 40° S. lat. to 20° N. lat., and has an elevation of 9,600 ft. above the sea. It likewise is skirted by very high summits, on the E. by Antisana, which attains 19,136 ft., and by Cayambe Urcu, which attains 19,648 ft. above the sea. The summit of the latter mountain is traversed by the Equator. On the W. range the highest summits are the Fichincha, rising to 15,586 feet, and the Cotacachi, 16,448 ft. above the sea.

The three longitudinal valleys of Quito, Alausi, Hambato, and Cuenca, being only separated from each other by very narrow transverse ridges, may be considered as one valley, extending 240 miles in length, with a mean breadth of from 12 to 16 miles. They form the most populous and richest portion of the republic of Ecuador.

The northern boundary of the valley of Quito is formed by a transverse ridge between the Nevado of Cotacachi and the volcano of Imbabura (21° N. lat.). To the N. of it lie the *Andes de los Pastos*, an extensive mountain region, which extend to 10° 13' N. lat., and is crowned by several high summits and volcanoes; as the volcanoes of Cumbal, Chiles, and Pasto. The narrow valleys which lie between the different ridges by which it is traversed are, at a medium, 10,000 feet above the sea.

This portion of the Andes is directed from S. W. to N. E., and may be considered as the centre of the N. Andes, for it is here that the chain begins to divide into two principal branches: the western of which is called Cordillera de la Costa or de Sindagua, whilst the E. bears the name of Andes de los Pastos.

The Andes of Sindagua have a break at about 10° 30' N. lat., by which the Río de las Patías carries off the waters descending from the Andes de los Pastos and those which collect in the valley of Almaguer. This valley extends between 10° 13' and 10° 50' N. Its surface is very uneven, and its mean elevation may be about 6,900 feet above the sea. In the mountains which extend to the E. of it is a large alpine lake, the Ciénaga de Sebondoy, in which the Río Putumayo or Ica, a large tributary of the Amazon, takes its origin. This E. chain expands considerably to the N. of 10° 50' N. lat., so as to form a mountain knot, which receives the name of Paramo de las Papas. A little farther north (20° 5' N. lat.) the knot divides into two chains of mountains, which advancing N. enclose the valley of the Río Magdalena, as we shall see afterwards. From the mountain knot of the Paramo de las Papas a transverse ridge branches off westward, uniting the eastern chain of the Andes with the cordillera of Sindagua, and separating the valley of Almaguer from the great valley of the Cauca. Near the place where this transverse range leaves the mountain knot of los Pastos is the volcano de Puracé, 14,544 feet above the sea. This volcano may be considered as the most N. point of the Andes of Ecuador, comprising those of Quito and of los Pastos.

The countries lying on both declivities and at the foot of the Andes of the Equator are very thinly inhabited, and almost entirely by aboriginal nations, unacquainted with civilization and commerce. But the elevated valleys lying between the two ranges are comparatively well peopled, partly by the descendants of Europeans, and partly by Indians who have made some progress in civilization, and are acquainted with the advantages of commerce. Hence the great commercial road which traverses this portion of the Andes runs longitudinally over the internal valleys, beginning at the north at Popayan (20° 26' 13" N. lat.) in the valley of the Cauca, and terminating at Truxillo (8° 5' 40" S. lat.) on the Pacific. From Popayan (5,734 ft. above the sea) it ascends the Alto de Noble (6,176 ft.), and then the Alto de Quilquesa (6,416 ft.). Hence it descends to the Río de Guachicon (3,042 ft.), whence it rises again by degrees to the town of Almaguer (7,440 ft.) in the valley of Almaguer. It next enters the mountains of los Pastos, passing over the Paramo de Puruguy (9,408) to the village of Pasto (8,578 ft.). S. of this it descends to the Río de Guaitara (5,456 ft.), and again ascends a steep declivity to the village of Guachugal (10,320 ft.), whence it passes to the village of Tulcan (10,112 ft.). Having traversed the Paramo de Bolche (11,504 ft.), and the Alto de Pucara (10,400 ft.), it descends by a steep declivity to the river

Chota, which is passed at the Ponto de Chota (5,280 ft.), and hence it leads upward to the town of Quito (9,536 ft.).

From Quito the road runs over the plain to the Alto de Chislinche, which has a little more than 10,000 feet of elevation. It next passes through the valley by Hambato (8,864 ft.), Riobamba Nueva (5,472 ft.), Guamate (10,224 ft.), and Alausi (7,984 ft.). Between the last-mentioned place and the town of Cuenca is the famous and dangerous pass over the Paramo de Asuay, which in its highest point, the Ladera de Cadul, rises to 15,586 ft., and is above the snow line. More or fewer lives are annually lost on this *paramo*. Cuenca is 8,640 ft. above the sea. Leaving this town the road descends to the Río de Saraguru (7,376 ft.), and again rises to the Alto de Pulla (10,000 ft.), whence it passes to Loxa (6,768 ft.).

From Loxa the road passes to the W. declivity of the Andes, where it traverses Ayavaca (8,992 ft.) and Ollereros (4,708 ft.), whence it repasses the range by the Paramo de Guamani (10,960 ft.), and enters the valley of the Marañon. In this it traverses Guancabamba (6,360 ft.), Zulaca (4,352 ft.), the Paramo de Yumora (8,768 ft.), the Paso de Yucra (3,562 ft.), Montan (8,560), and Caxanagra (9,200 ft.). From the last-mentioned place it again passes the Andes to Guanguamara (8,000 ft.), and runs hence to Cascas (4,384 ft.) and Los Mokinos (608), terminating at Truxillo (200 ft. above the sea). Thus this long road runs continually over mountains in traversing 94° of lat.

From Guayaquil a road leads to Quito. From the first-mentioned place it runs through the low grounds skirting the Río de Guayaquil to Caracol, and then along the banks of the Río Ojiluar to Caluma, where the ascent of the mountains commences. The declivity is extremely steep between Caluma and Chimblo, which is situated on an elevated country S. of the Chimborazo. From Chimblo the road leads to Mocha and Lombato, where it joins the great mountain road.

There exists a road between Quito and the harbour of Carondelet over the Pass de Malbucha, but we are not acquainted with the particulars relating to it.

We observed above, that at about 10° 30' N. lat. the Andes of Sindagua branch off from the mountain knot of los Pastos. The E. range divides again at about 20° 5' N. lat. into two high mountain ranges. Thus we find N. of the latter parallel the Andes divided into three distinct chains, which enclose the valleys of the rivers Magdalena and Cauca. These chains are called the E., central, and W. Andes.

The *Eastern Andes* of New Granada run between 20° 5' and 50° 30' N. lat., nearly parallel with the central range N. N. E.; but N. of 50° 30' they incline farther E., running due N. E. Though none of its summits, except the Nevado de Chita (50° 50' N. lat.) and the Nevado de Mucuchies (48° 12') enter the line of perpetual congelation, its mean height is commonly above the region of trees; and the *paramos*, which extend on its summits, have a scanty vegetation, and rise to an elevation of between 12,000 and 14,000 ft. Las Rosas, the most N. of these *paramos*, terminates at 50° N. lat., and may be considered as the most N. extremity of the Andes; for the hilly country lying farther N. about the towns of Turuyo and Barquisimeto is not known to contain summits exceeding 4,000 or 5,000 ft. in elevation, and on that account alone cannot be considered as a continuation of the gigantic mountain system of the Andes.

The eastern declivity of this range is so precipitous that it affords no space for agriculture, and can only be ascended with great difficulty; but on its W. declivity recline several extensive table-lands, exhibiting a more or less level surface, and rising to an elevation of from 6,000 to 9,000 ft. above the sea. Such are the rich and fertile plains of Bogota, with those of Tunja, Socorro, Soğanazzo, and Pamplona. These table-lands terminate rather abruptly, and at a little distance from the banks of the Río Magdalena. The river Fuznza, or Río de Bogota, when issuing from the plain, precipitates itself at Tequendama, at two bounds, down a perpendicular height of 650 feet. In no other cataract is there so great a mass of water precipitated from so great a height; and the solitude of the place, the luxuriance of the vegetation, and the dreadful roar, present a scene of unrivalled sublimity.

The E. Andes are twice traversed by the road leading from Bogota to Carracas. From the capital of New Granada it runs over the table-land of Bogota and Tunja to the sources of the Teguia, a tributary of the Sogamozo, where it passes over the Paramo de Almodovar, on the summit of which it attains an elevation of 12,450 ft. above the sea. It then descends towards the E. plain; before attaining which, it again ascends the range to the town of Pamplona, which probably is not less than 9,000 ft. high. To the N. of this it traverses the upper part of the range, and passes to Rosario de Cucuta. From the last-mentioned place the road is made over the high grounds which skirt the N. W. declivity of the chain, passing through Merida, Mendoza, and Truxillo, to Tocuyo.

From Tocuyo it traverses the hilly region by which the Sierra de la Costa is united to the Andes, passing through Barquisimeto, S. Carlos, Valencia, and Victoria, to Caracas.

The *Central Andes* of New Granada run N., with a slight declination to the E., and form between their commencement and 5° 15' one great mass of rocks, about 40 or 50 miles in breadth, whose sides are only furrowed by ravines, but not intersected by valleys. Its mean height seems to be rather greater than that of the E. Andes, and it contains several summits which exceed the snow line. The most remarkable of them are from S. to N.; the Nevados de Huila, de Baraguan, de Tolima (which attains 18,336 ft.), and de Ilerveo. In the vicinity of the latter (5° 15') the range expands to about double its width, separating at the same time into several ridges, so as to form a mountain knot, with intervening valleys. This mountain region, known under the name of Sierra de Antioquia, forms in its upper valleys a high country, from 6,000 to 7,000 ft. above the sea, on which the ridges rise 2,000 ft. and more. It approaches very close to the Rio Cauca, so as to skirt its bed for about 150 miles. Opposite to the high banks formed by these ridges other mountains, belonging to the W. Andes, approach as near to the river, which runs for nearly 150 miles in an immense cleft, over a rocky and rugged bottom, and forms a series of cataracts and rapids between Salto de S. Antonio and Boca del Espíritu Santo. In all this space the river is quite unfit for navigation, and travelling by land is in this country very fatiguing, and not without danger. The ridges which issue from the mountain knot of the Sierra de Antioquia approach the Rio Magdalena to a distance of a few miles, and terminate not far from the place where that river joins the Rio Cauca, about 8° 30'.

That portion of the Central Andes which forms one undivided mass is crossed by two roads; one leading from Bogota to Popayan, and the other to Cartago. The first runs after descending from the elevated plain of Bogota to the banks of the Rio Magdalena, in the valley of this river to the S. as far as the town of La Plata, whence it turns W., and crosses the range over the Paramo de las Guanacas, on which it rises to 14,706 ft. above the sea. It then descends into the valley of the Cauca to the town of Popayan. The road between Bogota and Cartago descends from the plain of Bogota (8,736 ft.), crosses the Rio Magdalena at the pass de Guayaana (1,200 ft.), passes through the town of Ibague (4,480 ft.), and crosses the range by the famous mountain pass of Quindiu, between the Nevados de Baraguan and Tolima; at its highest point, the Garito del Paramo, it attains an elevation of 11,504 ft. above the level of the sea. It descends afterwards to the town of Cartago in the valley of the Cauca (3,152 feet).

The *W. Andes* of New Granada are the same range, which farther S. is called Sierra de la Costa or de Shindagua. It lowers considerably in advancing to the N., so that between 2° 20' and 5° N. lat. its mean elevation does not exceed 5,000 or 6,000 ft. above the sea, or from 2,000 to 3,000 ft. above the valley of the Cauca; nor is its breadth considerable, probably not more than from 15 to 20 miles, but it rises with a very precipitous declivity. N. of 5° the range is higher, and its breadth more considerable. Its highest summit is the Torra del Choco, S. E. of Novita, which, however, is far from attaining the snow line, and probably does not rise to much more than 10,000 feet. N. of this summit the range approaches close to the Rio Cauca, forming its high banks between the Salto de S. Antonio and the Boca del Espíritu Santo, and constituting with the opposite ranges of the Central Andes, as it were, one mountain knot. The Western Andes send from this point a range towards the Caribbean Sea, which skirts the Rio Cauca on the W., extending to the N. of 8° N. lat., and contains the Alto de Viento, a summit which attains more than 9,000 ft. of elevation.

From the W. Andes a ridge branches off near 6° N. lat. It runs to the W., and separates the sources of the Rio de S. Juan, which falls into the Pacific, from those of the Atrato, which runs to the Caribbean Sea. This range soon turns to the N. N. W., and advances in that direction between the Rio Atrato and the Pacific. Its elevation seems not to be considerable at the beginning, and it grows lower as it advances farther N. It seems to disappear entirely between 7° and 8°, opposite to the harbour of Cupica on the Pacific; for no mountain range is found on the isthmus of Panama, where it is narrowest.

Six roads are said to cross the W. Andes; but they can only be used with great difficulty, on account of the extreme steepness of the ridge. They are commonly impracticable for mules, and travellers as well as goods are brought over on the backs of Indians. The roads most used are that of Las Juntas, which leads from Cali in the valley of the Cauca to Buenaventura, a harbour on the Pacific; the road of S. Augustin, connecting

Cartago with Novita; and that of Verras, by which the town of Citara in the valley of the Atrato communicates with Antioquia on the banks of the Cauca.

The Geology of the Andes is very imperfectly known. Only a small portion of their immense extent has been visited by scientific travellers; and the information obtained from them teaches only a few isolated facts, which do not justify general conclusions. We are, however, informed, that the most frequent of the primitive rocks of the Alps—granite and gneiss—are by no means frequent in the Andes, which are composed mostly of porphyry and mica-slate. Porphyry is by far the most widely extended of the unstratified rocks of the Andes, and occurs through the whole range at all elevations, and frequently the highest summits are composed of it. Next to porphyry and mica-slate, trachyte and basalt are most frequently met with.

Volcanoes are frequent in certain portions of the range. Capt. B. Hall observed a phenomenon, which induced him to think that a volcano exists on one of the larger islands N. of Cape Horn, and that the observed phenomenon was produced by an eruption; but Capt. King, who surveyed these islands about 10 years ago, seems not to have found a volcano in Tierra del Fuego, nor in any other portion of the range south of 46° S. lat. But farther N. they occur in great numbers. Four volcanoes are visible from the island of Chiloe; they lie on the opposite coast, between 46° and 42° S. lat. Still more numerous are the volcanoes in the Chilean Andes, not less than 19 being known to be there in a state of activity. The most N. is that of Coquimbo, somewhat to the S. of 30° S. lat. But between this volcano and that of Atacama (between 21° and 22° S. lat.) no volcano is stated to exist, that of Copiapo, which appears on our maps, being unknown in the country. Farther N. the volcanic mountains occur only in the W. range of the Bolivian Andes; none of the high summits of the E. range having ever been known to have made an eruption, or emitted smoke. It is not known whether volcanoes exist in the Andes between 14° and 5° S. lat.; but it is certain that in this part of the range they are not numerous, as no mention of them has been made by travellers. That portion of the Andes in which volcanic agency is most active lies between 3½° S. lat. and 2° N. lat. The number of summits whose eruptions are recorded is here very considerable; and Humboldt is inclined to think that the valleys N. of the Pass of Assuay are to be considered as being placed on an extensive volcanic basis, and that most of the numerous summits surrounding them have once served, and may again serve, as channels for the subterranean fire communicating with the atmosphere. The farthest N. of these volcanoes is that of Puracé, in the neighbourhood of Popayan, where the Andes begin to divide into three ranges; which seem to be, in their present state, quite exempt from volcanic agency, none of their summits having ever made an eruption.

No portion of the globe is subject to such frequent and frightful earthquakes as the countries embosomed within the range of the Andes, and those lying between them and the Pacific Ocean. The towns of Bogota, Quito, Riobamba, Callao, Copiapo, Valparaiso, Concepcion, and others, have at different times been more or less destroyed by their agency; and some more than once.

Line of perpetual congelation.—The observations made by Humboldt in the Andes induced him to fix the snow line near the equator, at an elevation of 15,750 ft.; and he thought that, near

the tropic, it would be found at about 14,000 ft., or somewhat higher. But Mr. Pentland found it near 17° S. lat., at nearly 17,000 ft.; and later observations fix it near 12° S. lat., at about 16,400 ft. above the level of the sea. It is farther remarkable, that though a great number of summits rise above the snow line, glaciers are of rare occurrence in the Andes. This is partly to be attributed to the relative position of their summits which generally form a continuous line, without having other summits on their sides; and partly to the considerable distance which every where is found to intervene between two summits. It is only in the narrow ravines by which some of the sides of the giant summits are furrowed, that glaciers of small extent are met with.

Vegetation of the Andes.—The different plants and trees peculiar to the different regions of the globe appear in regular succession, as we ascend from the level of the ocean to the heights of the Andes. In the lower grounds, between the tropics, from the level of the sea to the height of from 3,000 to 5,000 feet, cassava, cacao, maize, plantains, indigo, sugar, cotton, and coffee are cultivated. Indigo and cacao, the plantain or the banana tree, and the cassava root require great heat to be brought to maturity, generally a climate of which the mean temperature is 75°. But cotton and coffee will grow at a considerable elevation, and sugar is cultivated with success in the temperate parts of Quito. Maize is cultivated in the same climate as the banana; but its cultivation extends over a much wider sphere, as it arrives at maturity at an elevation of 6,000 ft. above the sea. The low country within the tropics is also the region of oranges, pine-apples, and the most delicious fruits. Between the altitudes of 6,000 ft. and 9,000 ft. lies the climate best suited for the culture of all kinds of European grain. Wheat, under the equator, will seldom form an ear below an elevation of 4,500 ft., or ripen if above that of 10,000 ft. At the same time it must be observed, that the European colonists have not sufficiently varied their agricultural experiments to ascertain exactly the minimum of height at which European cerealia would come to maturity in the equinoctial regions of America. Humboldt mentions that in the Caraccas he saw fine harvests of wheat near Victoria, in the latitude of 10° 13' N., at the height of 1,640 and 1,900 ft., and at Cuba wheat flourishes at a still smaller elevation. Rye and barley, especially the latter, resist cold better than wheat; they are accordingly cultivated at a greater elevation. Barley yields abundant harvests at heights where the thermometer rarely keeps up during the day above 50° Fah. Within the limits in which European grain flourishes is to be found the oak, which from an elevation of 9,200 ft. never descends, near the equator, below that of 5,500 ft., though it is met with in the parallel of Mexico at the height of only 2,620 ft. Beyond the limit of 9,000 ft. large trees of every kind begin to disappear, though some dwarfish pines are to be found at the height of 13,000 ft., nearly 2,000 ft. from the line of perpetual snow. The grasses clothe the ground at an elevation of from 13,500 ft. to 15,100 ft.; and from this to the regions of ice and snow, the only plants visible are the lichen, which covers the face of the rocks, and seems even to penetrate under the snow.

In districts as elevated as the valley of Titicaca, agriculture is confined to potatoes, onions, and capsicum, and to the grain called *quinoa* (*Chenopodium quinoa*, L.in.); barley and rye are only cultivated as fodder. On the plain of

Bogota a farinaceous root, called *aracacha*, is cultivated, and lately some attempts have been made to introduce its culture in England. Trees are found to ascend to 12,000 ft. or 14,000 ft. on the declivities of the mountains; but their summits, which commonly form plains of some extent, are nearly bare of vegetation, nourishing only two or three kinds of low plants.

Among the vegetable productions of the Andes, none has obtained greater celebrity than the *cinchona*, or Jesuits' bark, which is now known to grow not only on different parts of the Andes, but also on the other high mountains of S. America. The best bark, however, is collected on the Andes between 5° N. lat. and 5° S. lat., where the trees grow at an elevation of from 10,000 to 14,000 ft. above the sea.

Zoology of the Andes.—This we are very imperfectly acquainted with. The most remarkable genus is that which comprehends the guanacos, llamas, and vicunas, of which the llamas are used as animals of burden; but they are slow, making only about 12 miles a day, and carrying about 70 lbs. of burthen. The vicunas give a very valuable kind of wool. Among birds, the *condors* have always attracted the attention of travellers, on account of their enormous size. They are a species of vulture.

Mineral Wealth.—If the high table-land of Anahuac in Mexico be excepted, no mountain range can vie with the Andes in mineral riches, especially in the precious metals. Many of the rivers descending from the Andes between the tropics contain small particles of gold in their sand. The particles of gold deposited in the alluvial soil skirting the beds of some of these rivers have attracted the attention of Europeans, and at some places the soil is carefully washed. The alluvial soils richest in gold are those lying to the W. of the Central Andes of New Granada, on both sides of the Rio Cauca; as also in the provinces of Barbacoas and Choco along the Pacific. In the latter districts platinum also occurs; and, till within these few years, when it has been found in the Ural mountains, these were considered as the only places in which it was to be met with. Alluvial soils rich in gold are also found along the rivers which descend from the range of the Bolivian Andes, between 14° and 17° S. lat.; and here too considerable quantities of gold are extracted. The annual produce of the *lavaderos* and gold mines of the Andes is stated by Humboldt to have amounted, in the beginning of the 19th century, to 283,429 oz.; equal, at 4*l.* per oz., to 1,133,716*l.*

Silver occurs in many places of the range between 33° and the equator; but it is commonly found at an elevation where vegetation nearly ceases, which renders the working of the mines very expensive, and frequently disappoints the otherwise well-founded expectations of the undertakers. The number of mines which have been worked and abandoned is very great; many of them, however, are still worked. The most celebrated silver mines are those of Potosi and Pasco. The former are in the Cerro de Potosi (19° 36' S. lat.), which rises to 16,037 ft. above the sea. This mountain is perforated in all directions; and it is said, though the statement be probably exaggerated, that there are no fewer than 5,000 excavations in it. The Cerro de Pasco is a hill, rising on the high plain of Bombon (about 11° S. lat.). It has been worked for more than two centuries, and may now be considered as the richest silver mine of America; unless, which is doubtful, it be sur-

passed by the silver mines discovered in N. Chili in 1830, about 30 or 40 m. S. of the town of Copiapo, where silver ore is said to be very abundant, and so rich as to yield 40 or even 70 ounces in each *cargo*. At the beginning of the present century, the annual produce of the silver mines of the Andes was stated by Humboldt to amount to 691,492 lbs. troy; which, if we take the silver at 5 shillings the ounce, gives a sum of 2,074,476*l*. It is not easy to estimate its amount at present; but probably it is not much fallen off.

Mercury or quicksilver occurs in many places N. of 14° S. lat., and S. of the equator; but since the destruction of the mines of Guancavelica, we are not sure whether it be any where worked. These, which were extremely rich, yielding from 4,000 to 6,000 cwt. a year, were unluckily ruined in 1789, through the ignorance and mismanagement of a superintendent.

Copper seems to occur very frequently S. of 14° S. lat. Large masses of nearly pure copper are stated to exist on the surface of the S. extremity of the valley of Titicaca, but the expense of bringing them down to the coast is at present so great that they cannot be turned to advantage. In the N. provinces of Chili several mines are worked with advantage. Miers estimated the quantity of copper exported from these countries in 1824 at 40,000 cwt.; in 1829, it rose to 60,000, and has since materially increased. It is mostly exported to China, India, and the U. States.

Ores of lead, tin, and iron are said to exist in various parts; but they are not worked.

Population of the Andes.—It is a characteristic feature of S. America, that its extensive plains, which comprise more than three fourths of its surface, are very thinly inhabited; nor does it appear likely that large portions of them should ever be brought to such a state of cultivation as to maintain a dense population. At present, far the greater number of the inhabitants are met with on the table lands, and in the valleys of the Andes. It has been doubted whether the whole population of S. America exceeds 12,000,000; but this, we have little doubt, is below the mark. We are inclined to think that the inhabitants of the Andes, including the coast of the Pacific, amount to more than 6,000,000. This coast is favoured with an excellent climate, and that portion of it which lies between 40° and 30° S. lat. has in general a good soil; but between 30° and 5° S. lat. it is a complete desert—a circumstance mainly attributable to the entire want of rain, a single drop never refreshing its arid soil. In this respect it forms a singular contrast with the coast extending between the equator and the Isthmus of Panama, where hardly a day passes without rain, and where at certain seasons it pours down in such abundance as to change all the lower lands into swamps, and to render the country extremely unhealthy. The whole coast along the Pacific does not probably contain 1½ million inhabitants; so that more than 4½ millions live within the mountain system.

The state of these countries seems to have been little different at the time when America was discovered. In the Andes only was found a government regularly arranged, and a nation which had made a considerable progress in civilisation, and which chiefly subsisted by the produce of its agriculture. Here only the Spaniards were able to conquer the country; in the other parts of America they established colonies, and tried by various means to subject the savage nations in their neighbourhood: these attempts succeeded in some instances, and in others not.

The population of the Andes is composed of the descendants, of the Spaniards, and of the ancient Peruvians. Negroes have also been introduced in the N. districts, and are pretty numerous in the valleys of the Rio Magdalena and Rio Cauca; they are also found on the coast in the provinces of Barbacoas and Choco, and, in small numbers, on the remainder of the coast as far S. as Arica. (13° S. lat.) The whites constitute the great bulk of the population in the valleys of the Rio Magdalena and Cauca; in the latter no aborigines are met with. But on the high valleys of *Æquator*, on the plain of Bombon, on the table land of Titicaca, and in the valleys which extend to the E. of the great chain of the Andes, the ancient Peruvians are by far the most numerous class of inhabitants, the whites being there probably much less than a fourth part of the population. The Peruvians belong to the copper-coloured race spread nearly over the whole American continent. They speak different languages; but the Quichua, sometimes called the language of the Incas, is understood or spoken by most of them. Travellers in general admit their frugality and industry in agriculture, working the mines, and some branches of manufacturing industry; but they are altogether deficient in that activity, spirit of enterprise, and desire to excel by which Europeans are distinguished.

Travelling in the Andes.—The improvement of the countries embosomed within the Andes is much retarded by the want of easy communication. Sometimes, the intercourse between places in the immediate vicinity of each other is interrupted by *quebradas*, or rents, generally narrow, sometimes of a vast depth, and with nearly perpendicular sides. The famous natural bridge of Icononzo, in Columbia, leads over a small *quebrada*; it is elevated about 312 feet above the torrent that flows in the bottom of the chasm. Most of the torrents that are passed in travelling over the Cordilleras are fordable; though their impetuosity is such when swollen by the rains as to detain travellers for several days. But when they are too deep to be forded, or the banks too inaccessible; suspension bridges are thrown over them, of a singular make; but which, notwithstanding their apparently dangerous and fragile construction, are found to answer the purposes required. Where the river is narrow, with high banks, they are constructed of wood, and consist of 4 long beams laid close together over the precipice, and forming a path of about a yard and a half in breadth, being just sufficient for a man to pass over on horseback. These bridges have become so familiar to the natives that they pass them without apprehension. Where the breadth of the river will not admit of a beam being laid across, ropes constructed of *beguros*, a species of thin elastic cane, of the length required are thrown over. Six of these ropes are stretched from one side of the river to the other; two, intended to serve as parapets, being considerably higher than the other four; and the latter being covered with sticks laid in a transverse direction, the bridge is passed by men, while the mules, being divested of their burdens, are made to swim across. All travellers have spoken of the extreme danger of passing these rope bridges, which look like ribands suspended above a crevice or impetuous torrent. But this danger, according to Humboldt, is not very great when a single person passes over the bridge as quickly as possible, with his body leaning forward. But the oscillations of the ropes become very great when the traveller is conducted by an Indian

who walks quicker than himself; or when, frightened by the view of the water seen through the interstices of the bamboos, he has the imprudence to stop in the middle of the bridge, and lay hold of the ropes that serve as a rail. Some of the rivers of the higher Andes are passed by means an invention or bridge denominated a *tarabita*. It conveys not only the passengers, but also their cattle and burdens; and is used to pass those torrents whose rapidity and the large stones continually rolling down, render it impossible for mules to swim across. It consists of a strong rope of bejuco, extended across the river, on each bank of which it is fastened to stout posts. On one side is a kind of wheel or winch to straiten or slack the rope to the degree required. From this rope hangs a kind of movable leathern hammock, capable of holding a man, to which a rope is fastened for drawing it to the side intended. For carrying over mules two ropes are necessary, and these much thicker and slacker. The creature being suspended from them, and secured by girths round the belly, neck, and legs, is shoved off, and dragged to the opposite bank. Some of these bejuco bridges are of great length, and elevated to a great height above the torrent.

A bridge of this sort was constructed by the 5th Inca over the Desaguadero, or river that issues from lake Titicaca, where it is more than 200 feet in width; and, on account of its utility, is still kept up. Sometimes, instead of being made of bejuocos or osiers, these suspension bridges are made of twisted strands or thongs of bullock's hide. Mr. Miers passed along one of this sort in Chili, 225 feet in length, by 6 feet wide! It conveyed over loaded mules, and was perfectly secure. (*Ulloa, Voyage en Amerique*, i. 358; *Miers, Chili*, i. 335; *Humboldt's Researches*, ii. 72.)

The ruggedness of the roads in the less frequented parts of the Andes, can hardly be described. In many places the ground is so narrow, that the mules employed in travelling have scarcely room to set their feet, and in others it is a continued series of precipices. These paths are full of holes, from two to three feet deep, in which the mules set their feet, and draw their bellies and their riders' legs along the ground. The holes serve as steps, without which the precipices would be in a great measure impracticable; but, should the creature happen to set its foot between two of these holes, or not place it right, the rider falls; and if on the side of the precipice, inevitably perishes. This danger is even greater where the holes are wanting. The tracks are extremely steep and slippery, and in general chalky and wet; and where there are no holes to serve as steps, Indians are obliged to go before with small spades to dig little trenches across the path. In descending those places where there are no holes or trenches, and which are sometimes many hundred yards deep, the instinct of the mules accustomed to pass them is admirable. They are sensible of the caution requisite in the descent. On coming to the top of an eminence, they stop; and having placed their fore feet close together, as if in a posture of stopping themselves, they also put their hind feet together, but a little forwards, as if going to lie down. In this attitude, having, as it were, taken a survey of the road, they slide down with the swiftness of a meteor. The rider has only to keep himself fast in the saddle, without checking his beast; for the least motion is sufficient to disorder the equilibrium of the mule, in which case

they must both unavoidably perish. The address of these creatures is here truly wonderful; for in this so rapid motion, when they seem to have lost all command of themselves, they follow exactly the different windings of the path, as if they had previously reconnoitred and settled in their minds the route they were to follow, and taken every precaution for their safety. There would otherwise, indeed, be no possibility of travelling over places where the safety of the rider depends on the experience and address of his beast.

The valleys of the Cordilleras, which are deeper and narrower than those of the Alps and Pyrenees, and present scenes of the wildest aspect, give rise also to several other peculiarities in the mode of travelling. In many parts, owing to the humidity of the climate, and the declivity of the ground, the streamlets which flow down the mountains have hollowed out gullies from about 20 to 25 feet in depth. The pathway which runs along those crevices is frequently not above a foot or a foot and a half in breadth, and has the appearance of a gallery dug and left open to the sky. In some places the opening above is covered by the thick vegetation which grows out from both sides of the crevice, so that the traveller is forced to grope his way in darkness. The oxen, which are the beasts of burden commonly made use of in this country, can scarcely force their way through these galleries, some of which are more than a mile in length; and if the traveller should happen to meet them in one of the passages, he has no means of avoiding them but by climbing the earthen wall which borders the crevice, and keeping himself suspended by laying hold of the roots which penetrate to this depth from the surface of the ground. "In many of the passes of the Andes," says Humboldt, "such is the state of the roads that the usual mode of travelling for persons in easy circumstances is in a chair strapped to the back of one of the native porters (*cargueros*), or men of burden, who live by letting out their backs and loins to travellers. They talk in this country of going on a man's back (*andar en cargueros*), as we mention going on horseback. No humiliating idea is annexed to the trade of *cargueros*; and the men who follow this occupation are not Indians, but *mullatoes*, and sometimes even whites. It is often curious to hear these men, with scarcely any covering, and following an employment which we should consider so disgraceful, quarrelling in the midst of a forest, because one has refused the other, who pretends to have a whiter skin, the pompous title of Don or Su Merced. The usual load of a *carguero* is six or seven *arrobos*; those who are very strong carry as much as nine *arrobos*. When we reflect on the enormous fatigue to which these miserable men are exposed, journeying eight or nine hours a day over a mountainous country; when we know that their backs are sometimes as raw as those of beasts of burden; that travellers have often the cruelty to leave them in a forest when they fall sick; that they earn, by a journey from Ibague to Cartago, only 12 or 14 *piasters* in from 15 to 25 days; we are at a loss to conceive how this employment of a *carguero* should be eagerly embraced by all the robust young men who live at the foot of the mountains. The taste for a wandering life, the idea of a certain independence amid forests, leads them to prefer it to the sedentary and monotonous labour of cities. The passage of the mountain of Quindiu is not the only part of South America which is traversed on the backs of men. The whole of the

ANDLAU.

province of Antioquia is surrounded by mountains so difficult to pass, that they who dislike entrusting themselves to the skill of a bearer, and are not strong enough to travel on foot from Santa Fe de Antioquia to Bocca de Nares or Rio Samana, must relinquish all thoughts of leaving the country. The number of young men who undertake the employments of beasts of burden at Choco, Ibague, and Medellin, is so considerable, that we sometimes meet a file of fifty or sixty. A few years ago, when a project was formed to make the passage from Nares to Antioquia passable for mules, the cargueros presented formal remonstrances against mending the road, and the government was weak enough to yield to their clamours. The person carried in a chair by a carguero, must remain several hours motionless, and leaning backwards. The least motion is sufficient to throw down the carrier; and his fall would be so much the more dangerous, as the carguero, too confident in his own skill, chooses the most rapid declivities, or crosses a torrent on a narrow and slippery trunk of a tree. These accidents are, however, rare; and those which happen must be attributed to the imprudence of travellers, who, frightened at a false step of the carguero, leap down from their chairs." (*Researches*, i. 69.)

In order to protect travellers, when they are sojourning in this desert country, from the inclemency of the weather, the cargueros provide themselves with several hundred leaves of a plant of the banana species, which they pluck in the mountains before they begin their journey. These leaves, which are membranous and silky, are of an oval form, 2 feet long, and 16 in. in breadth. When the travellers reach a spot in the midst of the forests where the ground is dry, and where they propose to pass the night, the cargueros lop a few branches from the trees, with which they make a tent. In a few minutes this slight timber-work is divided into squares by the stalks of some climbing plant, or by the threads of the agave. The banana leaves having in the mean time been unrolled, are now spread over the above work, so as to cover it like the tiles of a house. These huts, thus hastily built, are cool and commodious; and Humboldt mentions that he passed several days in the valley of Boquia under one of those leafy tents, which was perfectly dry, though exposed to violent and incessant rains.

No doubt the access to the Andes will, in the course of time, be facilitated by the establishment of steam packets on the Amazon and its tributaries. That this has not been attempted ere now is, we apprehend, a consequence rather of the revolutionary anarchical state in which the country has been plunged since the overthrow of the Spanish government, than of any natural difficulties in the way of such navigation. Anarchy, however, must in the end exhaust itself; and either a free government or a despotism be established in its stead. And it is hardly possible to suppose that any regular government, whatever may be its character, should be established for any considerable period without turning its attention to the means of developing the extraordinary resources of these fine countries; and of these none can be either so effectual, or so obviously indispensable, as the opening of improved communications with the coast, and with the great navigable rivers of the interior.

ANDLAU, a town of France, dep. Bas Rhin, arrond. Schelestat, on the Andlau, 10 m. N. N. W. Schelestat. Pop. 2,287.

ANDORRE (REPUBLIC OF). 115

ANDORRE (REPUBLIC OF), a small independent state on the S. declivity of the Pyrenees, between the dep. of Ariège in France, and the district of Urgel in Spain. It stretches from N. to S. about 26 m., and from E. to W. about 30, comprising three mountain valleys, and the basin formed by their union. These valleys are among the wildest and most picturesque in the Pyrenees, and the mountains, with their immense peaks, by which they are enclosed, among the highest and least accessible. It is watered by several small rivers; the largest of which, the Embalin, having received the others, falls into the Segre, an affluent of the Ebro. Pop. from 7,000 to 8,000, divided among six communes. Andorre, the principal town, has about 2,000 inhab. It has but little arable land, but a considerable extent of excellent pasture grounds, sheltered by vast forests of fir. The inhab. depend principally on their flocks and iron mines, the produce of the latter finding a ready market in Spain. This little state, though connected in some degree with both its powerful neighbours, has preserved its independence for about 1000 years. The government is composed of a council of 24 members, chosen for life, each commune electing four. The council elect two Syndics (*Hugo*), who enjoy considerable authority, convoking the assemblies, and carrying on the government when they are not sitting. It is to Charlemagne that Andorre owes its independence. In 1790, that prince having marched against the Moors of Spain, and defeated them in the neighbouring valley of Carol, the Andorrians are said to have rendered themselves so useful to the French army, supplying them with provisions, and taking care of their wounded, that the Emperor, by way of recompense, made them independent of the neighbouring princes, and permitted them to be governed by their own laws. After him Louis le Debonnaire ceded to the Bishop of Urgel a part of the rights over Andorre which Charlemagne had reserved to himself and his successors. In virtue of this grant, the Bishop acquired right to a part of the tithes of the six communes, and of the spiritual jurisdiction over the country, which he still exercises.

In 1793, the rights exercised by the sovereigns of France in Andorre being considered as feudal, were abandoned, and the republic was for a time completely separated from that country; but notwithstanding this temporary independence, the Andorrians continued to preserve their attachment to France. They resisted the violation of their territory by the Spaniards, and furnished to the French armies, during the late war, guides and assistance of every kind. At the same time they anxiously solicited the establishment of the ancient order of things; and Napoleon yielded to their wish. By a decree of the 20th of March, 1806, Andorre was declared to be a republic connected with France; its vigner, or criminal judge, was to be a Frenchman, of the dep. of Ariège; and it was allowed to import certain quantities of certain specified articles, free of duty, on payment of the trifling sum of 960 fr. a year. Except, therefore, as regards the spiritual jurisdiction of the Bishop of Urgel, which cannot be said to interfere with its independence, more than the Pope's ecclesiastical authority over Catholic countries can with theirs, Andorre is altogether independent of Spain; and, as regards France, the annual payment it makes to her is not a tribute, but an inadequate compensation for a valuable privilege; and there being little crime in Andorre, the appointment of a Frenchman for criminal judge was more with a view to deter French criminals from taking refuge in this neutral territory, than to assert any superiority. Andorre may, therefore, be justly considered as the oldest free republic in existence. The people all belong to the church of Rome, and are very religious. Their clergy, and the greater number of the inhabitants, are educated at Toulouse or Barcelona. Each curé, in addition to his pastoral duties, has charge of a school, where the poor are instructed gratuitously; but this does not give him much extra trouble, few of the peasants thinking it necessary to send their children to school to acquire what, in their land of shepherds and labourers, they imagine can be of little consequence in their future lives. Hence the great majority of the people can neither read nor write.

The Andorrians are simple and severe in their manners, the vices and corruptions of cities not having hitherto found their way into their valleys. They live as their forefathers lived a thousand years before them: the little they know concerning the luxuries, arts, and civilisation of other countries inspiring them rather with fear than envy. Their wealth consists in their sheep or cattle, or in the share they may have in iron forges, only a very few of their number being the proprietors of any land beyond the garden which surrounds their cottage. Each family acknowledges a chief, who succeeds by right of primogeniture. These chiefs, or eldest sons, choose their wives from families of equal consideration with their own, reprobating *mesalliances*, and looking little to fortune, which besides is always very small upon both sides. They never leave the paternal roof until they marry; and

if they marry an heiress they join her name to their own; unless married, they are not admitted to any share in the management of public affairs.

When there are only daughters in a family, the eldest, who is heiress of the entire property, and succeeds as an eldest son would do, is always married to a cadet of another family, who adopts her name, and is domiciliated in her family. By this arrangement, the principal Andorrian houses have continued for centuries without any change in their fortunes, *ni plus riche, ni plus pauvre*. The poorest inhabitants are not so badly off as in most other countries; their wants are few and easily supplied, the opulent families taking care of those who are not; and the latter honouring and respecting their benefactors.

The Andorrans are in general strong and well proportioned; the greater part of the diseases proceeding from the moral affections are unknown, as well as those originating in vice and corruption. The costume of the men, composed of coarse brown cloth made from the wool of their own sheep, resembles that worn by the peasants of Bigorre, with this difference, that the Andorrans wear the flowing red cap of the Catalans. There would seem to be but little gallantry among these mountaineers, for the women are not admitted to any of the assemblies where public affairs are considered; nor even to the masses performed upon the reception of the bishop or judge. Crime of every kind is rare, and punishments, though mild, are effectual. There are no law-suits relative to paternal successions; and should disputes of any kind arise, they are at once referred to the Syndics, whose decision is never controverted. The men are all liable to serve in the militia, should they be required; and every head of a family is obliged to have in his possession at all times a musket, and a certain quantity of powder and ball.

Commerce of every kind is free; but, with the exception of iron, of which it has some mines and forges, its manufactures are all of the coarsest and rudest kind. (For further particulars, see the art. on *Andorra*, in *Italo, France Pittoresque*, art. *Arize*; *Mr. Murray's Summer in the Pyrenees*, &c.)

ANDOVER, a borough and m. town of England, co. Hants, near the Anton, on the great road from London to Salisbury, being 63 m. W. S. W. of the former, and 17 N. E. of the latter. The Parl. borough and subordinate district, which last includes 10,780 acres, has 4,953 inhab., of which the borough may have about 4,000. It is compactly built, extending on either side about one-third of a mile from the market place, in the centre of which is a modern town hall, supported on arches, under which are held the markets. The church, an old Gothic building, is on the N. side of the town. There is an hospital for 6 poor men, a free school founded in 1569, and a charity school for 30 boys. Some trade is carried on in malting, and the manufacture of silk; but its principal support is derived from its being a considerable thoroughfare, and the only market for the surrounding country. It is in a thriving condition; and contains several good shops and respectable private houses. The great annual fair of Wey Hill (which see) is held within a short distance. There is a canal from the town to Southampton. It returns 2 members to the H. of C. From 1689, down to the passing of the Reform Act, the right of voting was in the bailiff and corporation. No. of 104 houses, 325; Parl. constituency, 1836-37, 220. (*Parl. and Municipal Boundary Reports*.)

ANDOVER, a town of the U. States, Massachusetts, co. Essex, 20 m. N. Boston. Pop. 4,530. It is finely situated, and has some manufactures; but it is chiefly distinguished for its literary institutions, particularly its theological academy, founded in 1807, and liberally endowed. The course of education is completed in 3 years; it had in 1835-36, 152 students, and a library of above 13,000 vols. There is also a very flourishing academy, founded in 1778.

ANDRACIO, or ANDRACY, a town of Spain, on the S. W. coast of the island of Majorca. Pop. 3,500. It is situated at a little distance from the sea, but it has a small port accessible to vessels drawing little water. Its territory is productive of olives.

ANDRE (ST.), the name of various small towns and villages in different parts of France.

ANDRE, or ENDRÉ (ST.), a town of Hungary, on the right bank of the Danube, opposite to the island of the same name, 111 m. N. Buda. Pop. 8,000. It has 1 Catholic and 7 Greek churches. The hills in the vicinity produce excellent wines, and the island in the river is celebrated for its fertility.

ANDRE' D'APCION (ST.), a village of France, dep. Loire, 8 m. W. Roanne. Pop. 1,740.

ANDRE'-DE-CUBSAC (ST.), a town of France, dep. Gironde, cap. cant. 12 m. N. N. E. Bordeaux. Pop. 3,329. It is situated at a little distance from the Dordogne; but it has a port, Cubzac, on that river. The high road from Bordeaux to Paris crosses the Dordogne at this point, passengers and carriages being conveyed across in a large ferry boat of a new construction.

ANDREW'S (ST.).

ANDRE' DE SANGONIS (ST.), a town of France, dep. Hérault, 19 m. W. by N. Montpellier. Pop. 2,150.

ANDRE' DE VALBORGNE (ST.), a town of France, dep. Gard, cap. cant. 42 m. N. W. Nîmes. Pop. 1,720.

ANDREA (ST.), a village of Naples, prov. Principato Ultra, 3 m. S. E. Conza. Pop. 2,200.

ANDREASBERG, a town of Hanover, principality of Grubenhagen, in a district which has mines of iron, cobalt, copper, and silver. Pop. 3,400. It has a college, a council of mines, and manufactures of lace and thread.

ANDREW'S (ST.), an ancient and celebrated city and seaport of Scotland, co. Fife, finely situated on a low eminence on the German Ocean, 31 m. N. E. Edinburgh, lat. 56° 20' N., long. 2° 50' W. Pop. 3,767. It chiefly consists of three principal streets, leading in a W. direction from the cathedral, is in general well built, and has been much improved during the present century. St. Andrew's was long the metropolitian see of Scotland; and is highly interesting from its numerous remains of other ages, and the historical associations connected with it, many highly important events having occurred within its precincts. Its splendid cathedral, founded in 1160, and completed in 1318, was reduced to a ruin in 1559, by the barbarous zeal of the reformers. The castle, long the residence of its archbishops, and a place of considerable strength, stood on a precipice overlooking the sea. The famous Cardinal Beaton was assassinated in it in 1546, in revenge of the share he had in bringing Wishart, a preacher of the reformed doctrines, to the stake in the previous year. Its picturesque ruins now serve as a landmark for ships. There are also, among others, the ruins of a chapel, and a square tower 108 feet high, called the chapel and tower of St. Rule or St. Regulus, supposed to be the most ancient of the existing fabrics. The priory of St. Andrew's was one of the best endowed in Scotland; and part of a gigantic wall intended to enclose the grounds of the priory, 870 feet long, 22 feet high, and 4 thick, with 11 turrets, erected by Prior Heplum in 1516, is still in good preservation, and is not one of the least interesting relics of bygone times. The parish church, founded in the 12th century, but rebuilt in 1797, has a monument to Archbishop Sharpe, assassinated in 1679. The university of St. Andrew's, the most ancient in Scotland, and now the principal support of the city, was founded in 1410, by Bishop Wardlaw, and confirmed by a papal bull dated the following year. It originally consisted of three colleges, St. Salvador's, St. Leonard's, and St. Mary's; of which the two former were united in 1747, when the buildings of St. Leonard's were pulled down. The two colleges are in different parts of the town, and their professors and discipline are quite distinct. The United College consists of a quadrangular edifice, in which some excellent rooms were recently erected at the expense of government. This institution is appropriated to the study of languages, philosophy, and science, and St. Mary's to that of theology. The chapel of the United College, founded by Bishop Kennedy in 1458, is a fine specimen of the light Gothic; but though used as the college chapel, and as a parish church, it is in a very bad state of repair. It has a tomb of the founder, on opening which, in 1663, six silver maces were found, of which three were sent to the other Scotch universities, and three retained in the college. St. Mary's college is a handsome stone structure. A library contiguous to the latter, and containing 45,000 volumes, is common to both colleges; and until the privilege was commuted, in 1836, for 456*l.* a year, it was entitled to a copy of every work entered at Stationers' Hall. The United College and St. Mary's have together eleven professors; each college has a principal, and the university is presided over by a lord-rector and a chancellor. The endowments are considerable, each professor receiving at an average about 280*l.* a year, exclusive of fees from pupils. The average number of the latter during the ten years ending with 1838-39 has been 172, of whom 42 have belonged to the theological college of St. Mary, and the remaining 130 to the United College. The fee for attending one of the literary classes is 3*l.* 3*s.*; students in the theological classes pay no fees — with the exception of a fee of 5*s.* on matriculating, which is common to both establishments. The United College has 21 bursaries, of the gross annual value of about 800*l.*, and St. Mary's, 7 bursaries, of the gross annual value of 900*l.* Recently a very large addition has been made to the facilities for education already enjoyed by St. Andrew's, through the liberality of Dr. Bell, of Madras, who bequeathed the sum of 45,000*l.* three per cent. stock for the erection of a seminary on a comprehensive plan in this his native city. A fine building for this school has been erected at a little distance from St. Mary's college. The number of teachers in the *Madras College* (the name given to Dr. Bell's establishment) is nine, exclusive of assistants. This seminary affords instruction gratis to the poor; and the fees are very low even to the rich, being only 7*s.* 6*d.* per quarter for Latin and Greek; the same for German and French; the same

for mathematics, and the same for drawing: 5s. per quarter for geography; 3s. for writing; 2s. 6d. for arithmetic; and 2s. for English. Students may attend one or more classes, and pay accordingly. The average number of pupils at this seminary has been about 800, but it is rapidly increasing. Of this number above a half are strangers, attracted to the city by the deservedly high character of this excellent institution, the best probably of its kind in the empire. The harbour, partly formed by two piers, is on the E. side of the town, extending about 430 yards inland; but it dries at low water, and the access to it being difficult, is little frequented by shipping. The society of St. Andrew's is comparatively good; the advantages afforded for education, and the cheapness of living, having attracted to it a considerable number of genteel families, whose circumstances may not be sufficiently prosperous to permit of their residing at Edinburgh or other expensive towns. It has no manufactures worth notice, unless it be that of *golf-balls*, or balls for playing the game of golf, which employs about 6 or 7 men, who produce annually about 1100 dozen balls, of which about 800 dozen are sent to other places, the rest being consumed in St. Andrew's, which has been long famous for this game. A good workman makes 8 or 9 balls a day. St. Andrew's unites with the two Anstruthers, Crall, Cupar, Kilmenny, and Pittenweem in returning a member to the H. of C. No. of 104 houses, 313; constituency in 1838, 250.

ANDRIA, a town of Naples, prov. Terra di Bari, cap. cant., 9 m. S. Barletta. Pop. 13,500. It stands in a plain on the edge of the enclosed country, and its environs are far from unpleasant. It is the seat of a bishopric, has a superb cathedral, a royal college, and 3 *monasteries*. It was founded in 1046 by Peter count of Trani, and acquired its name from the *antra*, or caverns occupied by his first settlers.—(*Swanburne's Two Sicilies*, i. p. 399; *Dict. Geog.*)

ANDRO, or ANDROS, an island of the Grecian Archipelago, lying to the S. of Negropont, and immediately to the N. of Tino, from which it is separated by a very narrow channel. It extends about 27 m. in a N. W. and S. E. direction; but its breadth does not exceed 7 or 8 m. Though mountainous, it has several extensive, fertile, and well watered valleys, and a number of villages. The pop. has been estimated at from 13,000 to 16,000. Wine is the principal article, the annual produce amounting to 200,000 gals.; exclusive of which there is a considerable export of silk, oil, oranges, citrons, &c. The corn raised in the island generally suffices for the consumption of the inhabitants. Andro, or Castro, the capital, a considerable town, with about 5,000 inhab., is situated on the E. coast of the island; its port, which is defended by a castle, is too shallow to admit any but the smallest description of vessels. Port Gairo, or Gabro, on the W. side, is a much better harbour. The Andrians took the part of the Persians in the latter invasions of Greece, for which they were afterwards chastised by Themistocles. (*Tournefort, Voyage du Levant*, i. p. 347; *Consular Return*.)

ANDROS ISLANDS, or ISLES DEL ESPIRITU SAN LO, a group of islands among the Bahamas, which extend about 120 m. from N. to S., lat. 24° to 25° 20' N., long. 77° to 78° W.

ANDUJAR, a town of Spain, Andalusia, on the Guadalquivir, in a plain at the foot of the Sierra Morena, 20 m. N. W. Jaen, lat. 38° 1' 32" N., long. 3° 59' 33" W. Pop. nearly 14,000. Mr. Townsend says, that, in 1786, it contained 6,800 families; which, if accurate, would show a great decline in the interval. (*Travels in Spain*, ii. p. 217.) It is supposed to be built of the ruins of the ancient *Forum Julium*; it is defended by an old castle, and has numerous churches and convents, a theatre, and an old bridge of 15 arches over the river. Its environs are fruitful, and the inhabitants are mostly employed in agriculture; but there are tanneries, and manufactories of wine and water coolers, made of a peculiar species of white clay found in the neighbourhood.

ANDUZIZ, a town of France, dep. Gard, cap. cant., on the Gardon, 26 m. N. W. Nîmes. Pop. 5,403, mostly Protestants. It is ill built, but agreeably situated at the foot of the Cévennes, between rocks and hills planted with vines and olives. It has a tribunal of commerce, with manufactories of hats, silk, hosiery, cloth, earthenware, and glue, a silk flature, and tannery.

ANET, a handsome town, dep. Eure et Loire, cap. cant., 9 m. N. N. E. Dreux. Pop. 1,423. It is principally celebrated for the ruins of its fine castle, built by Henry II. for Diane de Poitiers, and destroyed during the revolutionary frenzy in 1792. There are in its environs forges and paper-mills.

ANET, a village of Switzerland, cant. Berne, on a hill, 17 m. W. by N. Berne. Pop. 2,400. Roman antiquities are found in the neighbourhood.

ANGELO (ST.), the name of several towns in Italy, of which the principal are St. Angelo in the Lombardo Venetian kingdom, prov. Lodi, 7 m. S. W. Lodi. Pop.

6,000. ST. ANGELO in the same kingdom, prov. Padua, 11 m. N. E. Padua. And ST. ANGELO, in Naples, *principato citra*, 16 m. S. S. E. Campagna. Pop. 2,560.

ANGELO DE LOMBARDI (ST.), a town of Naples, *Principato Ultra*, 48 m. E. Naples. Pop. 6,400. It is the seat of a bishopric, has a college, and two parish churches. In 1664 it was almost entirely destroyed by an earthquake.

ANGELIBURG, a town of Prussia, prov. F. Prussia, cap. circ., on the Angerap, 60 m. S. E. Königsberg. Pop. 3,000. It has a castle and manufactories of woollen stuffs and leather. The Angerap falls, a little to the S. of the town, into the large, irregularly shaped, shallow lake of Mauer, celebrated for the abundance and excellence of its eels.

ANGERMUNDE, a town of the Prussian States, prov. Brandenburg, reg. Potsdam, cap. circ., on the lake Munde, 43 m. N. N. E. Berlin. Pop. 3,800. It has manufactories of hats, woollen stuffs, tobacco, &c.

ANGERS, (the *Juliomagus* of Caesar, afterwards *Andegavia*, and hence *Angers*), a very ancient city of France, dep. Maine et Loire, of which it is the capital, on the Mayenne, which divides it into two portions near its confluence with the Loire and the Sarthe, lat. 47° 28' 9" N., long. 0° 33' W. Pop. 29,066. The town is surrounded by massive walls, built in 1214 by John king of England. Speaking generally, it is ill built, and is mean looking; houses partly of wood and partly of slate, streets narrow and crooked; but since 1814 it has been in several respects improved, and some good streets have been opened. Principal objects of attraction, cathedral and castle. The first began in 1228, and of large dimensions, has its front ornamented by two symmetrical spires, each 225 feet high. It contains the monument of Margaret of Anjou, daughter of René king of Sicily, and wife of Henry VI. of England. The old castle, the former residence of the dukes of Anjou, stands on a rock having the river at its foot: its plan is that of a vast parallelogram, surrounded by high massive walls, defended by deep fosses cut out of the rock, and by 18 towers; but these, with one exception, have now been reduced to the height of the walls. The castle serves at present as a prison for the city, and a powder magazine; on the side next the river it is becoming ruinous. Angers is the seat of a royal court for the depts. of Maine et Loire, Sarthe, and Mayenne; has a tribunal of original jurisdiction, an academy, a royal college, a school for deaf and dumb, a secondary school of medicine, &c. It has also a school of arts and trades, being, with the exception of that at Chalons-sur-Marne, the only school of the kind in France. Of the pupils, 45, nominated by the minister of commerce and public works, receive their instruction wholly or partly at the expense of the state. The other pupils pay 500 fr. a year. Each department is entitled to send 3 pupils to this school—the instruction of one to be entirely gratuitous, the others paying one a fourth part and one a half of the ordinary pupils. It has also a school of design; an agricultural society, a public library, containing 25,000 volumes; a museum with about 600 pictures, many of them good; a botanical garden; a cabinet of natural history; a theatre, &c. There is a royal manufacture of sail-cloth, a cotton mill, with manufactories of linen, serges, handkerchiefs, hosiery, starch, &c., a sugar refinery, a wax refinery, and tanneries. The town has two mean bridges, and it labours under a deficiency of water, that of the Mayenne not being fit for use. Mr. Inglis describes Angers as a place where provisions of all sorts, including fruit, vegetables, and wine, are extremely cheap, and states that for 10*l.* a year a very commodious house may be had. But there are no villas in the vicinity, and the town is itself far from agreeable. Previously to the revolution Angers was the seat of a university, founded in 1246; it had also a celebrated academy of *belles lettres*; and such was the fame of its riding-school, that it was attended by Peter the Great. It suffered severely during the wars of La Vendée; but, as previously stated, since the peace of 1815 it has been comparatively prosperous, and various improvements have been effected. Angers has produced several distinguished persons, among whom may be specified Bodin, the author of the work *De la République*, published in 1576, Menage, and Bernier, the famous traveller.

The slate quarries in the vicinity of Angers, whence the town is built, and which also supply large quantities of roofing slates to other depts., are immense excavations; but for details with respect to them, see the art. MAINE ET LOIRE. (*Illego, France Pittoresque*, cap. *Maine et Loire; Inglis's Switzerland*, p. 346, &c.)

ANGERS-LEZ, a village of France, dep. Seine et Oise, 33 m. S. Versailles. Pop. 1,526.

ANGHIARI, a town of Italy, prov. Arezzo, near the Tiber, 18 m. E. Arezzo, Tuscany. Pop. 3,000. It is celebrated for the victory obtained near it in 1440 by the Florentines under Piccinini over the forces of the Duke of Milan. This also is the name of a village of the Veronese, and of a decayed city on the banks of the Lago Maggiore.

ANGLES, a town of France, dep. Tarn, cap. cant. 16 m. E. S. E. Castres. Pop. 2,870. This is the name of several small villages in other parts of France.

ANGLESEY (the *Monas* of Tacitus), an island and co. of N. Wales in the Irish Sea, separated from the mainland of Britain by the Menai Strait. It is of a triangular form, extending, Holyhead included, about 27 m. from E. to W. by about 20 from N. to S.; area, 173,440 acres; surface gently undulating; climate temperate, but liable to fogs; there is in most parts a great deficiency of wood, and it has generally a bare uninviting aspect.

Since 1768 Anglesey has been famed for its mineral riches, the celebrated copper mines in the Parys mountain having been discovered in the course of that year; but they have now greatly declined. (See *Amlwch*.) Lead ore and asbestos have also been found; and coal is wrought to some extent at Maltreath. Soil various but principally a fine loamy sand, which, when properly cultivated, is highly productive. Agriculture is not, however, in an advanced state. So late as 1810 it was no uncommon thing to take five white crops in succession, most of which were so poor as hardly to pay their expense; but an improved system is being gradually introduced. The stiff loams, of which the extent is considerable, are usually manured with a sort of shelly sand. Principal crops, oats, barley, wheat, and potatoes, the latter being grown more extensively than in any other part of N. Wales. Grazing is the principal object of the farmer's attention. About 5,500 head of cattle are annually sent from the island to the mainland, exclusive of considerable numbers of sheep. Average rent of land, in 1810, 7s. 6d. an acre. Manufactures unimportant, consisting merely of some of the coarse descriptions of woollens. Chief towns, Beaumaris, Holyhead, Amlwch, Llanerchymidd, and Llangefni. It is divided into 3 cantreds, 6 comots, or hundreds, and 73 parishes. The pop., which in 1776 amounted to 19,780, had increased in 1831 to 48,325. It returns a m. to the H. of C. for the co., and one for the boroughs of Beaumaris, Holyhead, &c. Co. constituency in 1836-37, 1439.

Anglesey seems to have been a principal seat of the Druids. The Romans, under Suetonius Paulinus, having taken it after a fanatical resistance, A. D. 61, cut down the groves of the Druids, *sevis superstitibus sacris*, and seem to have exterminated both the priests and their religion. (*Tacit. Annal.*, lib. 14, § 30.) It was subjugated along with the rest of Wales, by Edward I. and was incorporated with England and made a county by Henry VIII. The two most important events in its recent history are the discovery of the Parys mines, in 1768, and the building of the Menai bridge in 1825. (See *Davies' N. Wales, passing; Beauties of England and Wales, art. Anglesey*, &c.)

ANGLET, a town of France, dep. Basses Pyrénées, near Bayonne, famed for its excellent white wine. Pop. 2,944.

ANGOLA, DONGO, or AMBONDE, a kingdom of the W. coast of Africa, extending from 8° 20' to 9° 15' S. lat., and from 14° to 18° or 19° E. long. On the N. it is separated from Congo by the Danda; on the S. the Coanza divides it from the districts of Quassima and Libolo; on the W. it has the Atlantic Ocean; and on the E. it is joined by the territories of Genga and Dala Quileuca (the W. portion of the Malenba of the Jesuits), and the powerful interior kingdom of Matamba. It is rectangular shaped, lies nearly parallel to the equator, being about 350 m. in length from E. to W., 50 or 60 m. in width from N. to S.; containing an area of probably not less than 18,000 or 20,000 sq. m. (*Blaeu's Geog.* ix. 129.; *Barbot's Voy. to Congo*, 515.; *Lebat*, i. 59.; *Boudich, Map of Congo, Angola, and Benguela*; *Acc. of Discov.*, 22. 143.)

This country is properly a part of Congo, from which, however, it has been politically separated since the middle of the 16th century, when a chief, whose name or title was *Angola*, made himself independent of the king of Congo, and gave its present designation to his new kingdom, the native name of which was Dongo, or Ambonde. (*Lebat*, ii. 427.; *Barbot*, 520.) It is very powerful among the neighbouring states, its paramount authority of its monarch being acknowledged by several districts, some of them greatly exceeding it in extent.

Physical Character.—Angola is extremely mountainous, with no plains, except upon the sea-shore, and some small plateaus on the sides and in the gorges of mountains. The land appears, however, to be making advances on the sea, and forming islands, which are wholly of an alluvial and level character; such is the Isle of Loanda, lying a short mile from the coast, and forming with the Cabo Palmareinho one of the most convenient harbours on the W. coast of Africa. The cape itself is also a plain of the same nature, and very evidently in a state of progress westward. (*Pigafetta, Del Regno di Congo*, 10.; *McCralla, Viaggio del Congo*, 70.; *Barbot*, 521.; *Lebat*, i. 60.)

The country is extremely well watered (as, indeed, is the whole of Congo); the principal streams are the Coanza, Benga, and Danda, which run nearly parallel to each other, and to the equator; the first and last forming the S. and N. boundary of the country.

Soil, Climate, &c.—The worst soil in Angola is that upon the coast, and the more recently formed islands, which is sandy, but by no means desert; for, at any time, by digging to the depth of a foot, or less, an abundant supply of good water may be procured. It is, however, a remarkable fact, that at the ebb tide these temporary wells are always found rather brackish, while at the flood their contents are perfectly sweet. (*Pigafetta*, 10.; *Lebat*, i. 89.) The mountain sides, and the valleys of the rivers, present all the richness of soil common in equatorial countries which are well irrigated, though the useful productions of the land are said to be chiefly owing to the agricultural labours of the Portuguese. (*Barbot*, 516.) The climate is excepted by Adams (*Remarks*, 200.) from the general charge of malignity towards Europeans under which the east of tropical Africa labours; and *Pigafetta* expressly states that the "habitation is excellent, the air beyond all credit temperate." *La stanza vi è bonissima, l'air oltre ad ogni credenza temperato.* (p. 6.) He adds also, what would imply that the mountains are of no great height, that the heat on their summits is not less than that in the plains. Situated so near the equator, Angola might be expected to have 2 dry and 2 rainy seasons in each year; but this does not appear to be the case; and, indeed, the accounts of travellers on this point are sufficiently conflicting. *Pigafetta* says (p. 7.), that the rainy season is from April to August; *Lebat* (i. 107.), that it occupies November, December, and sometimes January. *Barbot* (522) leaves it uncertain, but makes the dry season extend from May to September; though he remarks that this period is not without an intermixture of pleasant showers; and to add to the uncertainty on this point, *Degrandpré* (*Voyage à la Côte d'Or d'Afrique*, i. 4.) says, that rain seldom falls, and never abundantly; that the showers are irregular, and that no one time is more subject to them than another! * The same author remarks, that the abundant dews are fully sufficient for the development of vegetation, and in this he is borne out by all the other authorities. The trade wind blows steadily from S. W. to S., the sea breezes commonly from W. S. W. and the land wind from E. by N. Angola is, however, sufficiently remote from the internal deserts to prevent the ill effects that might be otherwise feared from this breeze. Hurricanes are not unfrequent; and at such times the wind shifts violently to all points of the compass, settling, finally, into the direction of the trade. (*Barbot*, 522.; *Pigafetta*, 7.) Gold and silver have been discovered in the mountains near the coast; but no gold dust is found, though it appears to have existed formerly. Iron is produced plentifully through the energy of the Portuguese; and copper is said, but upon no clear evidence, to exist in the interior. (*Degrandpré*, i. 38.; *Boudich*, 19.) Lead, sulphur, and petroleum are among the mineral treasures; but there is no mention of precious stones. The natives are reasonably good miners, under European direction; and it is asserted that the subterranean exhalations produce as sensible a difference in their colour, as the same cause is known, in many cases, to effect in that of Europeans. (*Lebat*, i. 95.)

Vegetation has the magnificence observable in all well-watered tropical regions. A species of the Ficus, called by the natives *Enxada*, and possessing the property of dropping its branches to the ground, where they take root, and germinate like a new plant, is very abundant. Some of these trees, resembling small thickets more than individual plants, extend to more than 1,000 paces in circumference, and are said on good authority to be capable of sheltering 3,000 men! The *enxada* is an extremely useful plant; the fruit, which resembles an ordinary fig, is an important article of food; its outer bark assists in the construction of huts and boats, and an inner coating, being washed and beaten, is manufactured into cloth. (*Barbot*, 521.) The date, and every other species of palm, the citron, orange, lemon, anana, guava, banana, cocoa, tamarind, mangrove, and every fruit and forest tree common to the equatorial regions, grow here spontaneously and reward the least expense of labour with the most abundant return. The same remark holds good with regard to yams, potatoes, and the whole race of roots; and though the climate be too hot for the production of European grain, yet 4 species of wheat, Turkish, Sarasin, Massingo, and Luno, are raised in great abundance. Pulses of all kinds are likewise plentiful; and the sugar-cane, pepper-vine, and a plant called *mandioca*, of which a very good bread is made, absolutely

* If this be accurate, the discrepancies of the other authorities may arise from their observations having been made in different years; though it must be remarked that *Lebat* asserts 10 or 12 days to be the utmost difference ever observed in the recurrence of the rainy seasons. (i. 105.)

struggle with man for the possession of the soil. Many trees produce fine gums or resins; and, in a word, there is scarcely a vegetable production which Angola does not, or under reasonable care might not be made to produce. (*Lebat*, i. 112—152; *Barbot*, 516; *Dégrandpré*, i. 5—14.) The woods and mountains shelter lions, tigers, leopards, hyenas, and wolves; of smaller wild animals, there are foxes, wild cats, &c. Of the useful animals, there are hares, rabbits, all the species of antelopes, stags, goats, and hogs of the Chinese variety. The sheep, cow, horse, and ass are strangers to the country, and known only as importations from Europe; but the zebra, elephant, and rhinoceros traverse the woods, and the hippopotamus is found in the rivers. The civet cat is also a native of this country, which likewise abounds in monkeys of all kinds, among which is the chimpanzee, the most intelligent of the tribe. A species of wild dog is said to be found in the woods.

To enumerate the birds of this part of Africa, would be to give a list of almost interminable length; all that are found in other tropical regions, and some that are peculiar, flourish here. The fisher and the sergo, or honey bird, are among the latter, and with whole hosts of pelicans, and nearly every variety of parrot, constitute the chief characteristic of Angolan ornithology. Reptiles numerous, consisting of centipedes, scorpions, and exceedingly venomous serpents. Some of the lizard tribe, as the camoleon, are less dangerous than these; but the rivers swarm with two or three species of crocodiles, which make fishing dangerous, and bathing all but fatal. Life is as abundant in the waters as on the land; and besides the usual tenants of the deep, as whales, sharks, dolphins, mackerels, oysters, crabs, &c., the coasts and rivers possess an endless list of creatures, the very names of which are unknown in Europe. Insects are as numerous, beautiful, and destructive as in other tropical climates; and among the last-named class, the termites or white ant stands pre-eminent. (*Lebat*, i. 152—206; *Dégrandpré*, i. 14—38; *Barbot*, 516—518.)

Population, Customs, &c.—The population is dense for a barbarous country, the monarch being called *lucato*, from the great number of subjects under his command. (*Barbot*, 520.) It is not, however, easy to assign the amount, but it may perhaps be taken at between 2,000,000 and 3,000,000. The capital city, St. Paul, or Loanda, contains 8,000. (*Bowditch*, 8.) The natives have few of the negro peculiarities in form or feature; they are of ordinary stature, well limbed, and, but for their colour, very like the Portuguese, by whom they are surrounded. Blue eyes and red hair are not uncommon among them. (*Pigaftta*, 6.) Society is divided into 4 classes, 2 free and 2 slaves; the first 2 consisting of nobles and husbandmen or artificers; the others of slaves, native born, and those acquired by war or foreign purchase. Marriage is an extremely simple ceremony, a mere agreement between the husband and the father of the woman. The appearance of the first tooth in children is an important epoch; the infant being then carried from house to house, and gifts extorted from friends and strangers. For the rest, they do not differ much from other negroes. Dancing is a favourite diversion, and a religious rite; and, like other African people, their ceremonies are defiled with blood and cruelty. Money is of several kinds: *marked cloths*, the shell of a small fish called *simbo*, a red wood brought from Malemba, and iron, which last was introduced by the Portuguese. The year is divided into 12 months, and the week into 4 days, of which the last is observed as a sabbath. (*Lebat*, i. 110. 379. &c.; *Barbot*, 518; *Merolla*, 367. &c.; *Bowditch*, 20. &c.) The country is parcelled out into an immense number of little lordships, each under a magistrate called a *sova*. It would appear that the king is able to control the petty despotism of these governors; for they have neither wealth nor any other distinction, except the personal respect paid to them, which is, however, very profound, to distinguish them from any other freemen. (*Barbot*, 520.) The religion of the bulk of the people is Fetichism, differing in nothing from that on the coast of Guinea (See *ASANTKE*); but there are many Christian families among the natives, and at one time the Jesuits had converted nearly the whole population, and established a regular form of church government. (*Pigaftta* and *Merolla*, *passim*; *Barbot*, 521.; *Lebat*, ii. 244. *et seq.*) But the effect of their labours has now nearly vanished, and the negroes have relapsed into the idolatrous rites of their ancestors. (*Dégrandpré*, i. 47.; *Bowditch*, 112.) The language is less barbarous, and more uniform, on this coast than in most other parts of Africa; the whole of Congo, that is the country between the Coanza and the Zaire, speak a dialect of the same tongue (*Merolla*, *passim*; *Barbot*, 512.), which, according to *Dégrandpré* (i. 56.), is extremely musical and flexible; not particularly sonorous, but very agreeable; with a perfect syntax, and bearing in some points a resemblance to the Latin. He imagines that this fact may prove a guide to the obscure history of these countries: may it not, however,

be owing solely to the long intercourse which has existed between the natives and the Christian priests from Portugal and Italy?

Trade, &c.—The Portuguese established a factory on this coast in 1485 (*Merolla*, 76); and their power has been constantly extending to the present time. Two of their establishments are 700 m. inland; but it is not to be supposed that they possess a sovereignty over the whole country to this extent. Their posts, called *fairs*, or *saicras*, are little more than entrepôts for trade; though the residents exercise a political power in their immediate neighbourhood. These establishments have, it is said, excited a spirit of manufacture and commerce among the negroes; but we doubt much whether this has been the case in any considerable degree; and whatever beneficial influence they might otherwise have had, has been counterbalanced and nullified by the support given by the Portuguese authorities to the slave trade. In fact, Angola has been for a lengthened series of years the great mart whence slaves have been obtained for Brazil; and though their importation into the latter be now, in appearance at least, prohibited, it is believed that they are still conveyed in great numbers to that country. *Bowditch* gives the following account of the trade of Angola in 1803:—

Exports from Angola to Lisbon, 1803.

		Reis.
171 Quintals of Ivory, 1st quality	- -	1,770,000
77 - - 2d quality	- -	462,000
41 - - 3d quality	- -	164,000
289 Quintals	- -	2,336,000

No account is taken of the gold, iron, or other commodities exported; but in 1804, the amount of Ivory was much greater, namely, in gross—

750½ Quintals	- -	4,779,000 R.
---------------	-----	--------------

Imports from Lisbon to Angola, 1803.

	Reis.
Provisions	18,889,769
Woollen Goods	87,174,602
Linens	24,474,860
Portuguese Manufactures	36,842,655
Drugs	1,872,120
Asiatic Manufactures	240,878,320
Metals	23,665,115
Sundries	45,425,690

R. 480,789,012

In 1804, the gross imports amounted to 410,128,585 reis; but in this there is no account of drugs or Asiatic manufactures. (*Bowditch*, 9. *et seq.* 146—153.)

ANGORA, or KNGOURI, the ancient *Ancyra*, a city almost in the centre of Natolia, near the N. E. source of the Sakariah, or *Sangarius*, lat. 40° 29' N., long. 33° 18' E. After undergoing various revolutions, it fell under the dominion of the Romans; and being embellished and otherwise favoured by Augustus, the inhabitants erected to his honour the celebrated *Monsumentum Ancyranum*, a temple of white marble, on the walls of which an account of the principal events in the life of Augustus was inscribed. The ruins of this edifice still remain. Notwithstanding the demise of its powerful patron, Ancyra continued to flourish. It was here that St. Paul preached to the Galatians; and when the Christian religion spread itself over the world, it was advanced to the dignity of an apostolic see. It came into the possession of the Turks in 1359. The great battle between the Turkish sultan Bajazet, or Bayazid, and the famous Tartar conqueror Tamerlane, or Timur, &c., which ended in the total defeat and capture of the former, was fought in the vicinity of Ancyra in 1401. It continues to be one of the principal cities of Natolia; and is celebrated for manufactures of stuffs made of the silk-like wool of the *goat* of *Angora*, a variety peculiar to the country round the town. The population has been variously estimated at from 35,000 to 80,000. We incline to think that the first number is nearest the mark. (*Tournefort*, *Voyage du Levant*, ii. pp. 442. 464.; *Klein's Journey*, p. 63. &c.)

ANGOSTURA, a city of S. America, rep. of Venezuela, on the S. bank of the Orinoco, about 240 m. above its embouchure, and about 190 feet above the level of the sea, lat. 8° 8' 10" N., long. 63° 55' 20" W. It was founded in 1688. Owing to its situation in a fertile country, on a great navigable river, and its command of a very extensive inland navigation, Angostura is favourably situated for commerce, which it carried on to a very considerable extent, previously to the revolutionary struggles. These, however, have diminished its commerce, wealth, and population. The last, which in 1807 was estimated at about 8,500, does not now, perhaps,

exceed 3,500. It has a large hall, where meetings of Congress have been held; with an hospital and a college; and is defended by a fort on the opposite bank of the river. Though low, and subject to inundation, the climate is temperate and not unhealthy.

ANGOULEME (an. *Jaulema*), a city of France, dep. Charente, of which it is the capital, on a plateau elevated 221 feet above the river Charente, lat. $45^{\circ} 38' 67''$ N., long. $0^{\circ} 9' 18''$ E. Pop. 16,530. The old town, which occupies the summit of the plateau, has narrow, crooked streets, and is *triste et laide*. In its centre stands the old castle in ruins. The walls, with which the city was formerly surrounded, have been mostly demolished, and the ramparts converted into public walks. The new town, built on a declivity to the S. of the old town, has broad straight streets, good houses, and is rapidly increasing. There are also several suburbs, of which *Houmeau* is the most important. Its port is the entrepôt of the commerce of Angoulême: cathedral ancient, but neither large nor beautiful; and, with the exception of the fine bridge over the Charente, and an obelisk erected in honour of the present Duchesse d'Angoulême, the other public buildings deserve no particular notice. The *Place d'Artois* is a fine promenade, and, from its elevated position, commands a view of the valley of the Angoulême and the surrounding country. Angoulême is the seat of a court of assizes, and of a tribunal of original jurisdiction; and has a royal college; a society of agriculture, arts, and commerce, which publishes memoirs once a month; a public library, with 16,000 volumes; a cabinet of natural history; a school of midwifery; a foundling hospital, and various other hospitals; a theatre, &c. It had also a royal marine school, the buildings of which are on a large scale: this institution was, however, closed in 1830; but it is expected that it will be re-opened. Angoulême is celebrated for the extensive paper manufactures in its vicinity: it has also fabrics of serges and coarse stuffs, and earthenware; with extensive distilleries, which produce excellent brandy; tanneries, a cannon foundry, a manufacture of arms, a sugar refinery, &c. The *païs de perdrix aux truffes* d'Angoulême is sent to all parts of Europe.

Angoulême is very ancient, being noticed by Ausonius, who flourished in the 3d century. Balzac was a native of the town and so also was the detestable regicide; Ravalliac, the assassin of Henry IV. In the vicinity are the ruins of the famous abbey *de la Couronne*, founded in 1122, long the ornament of the Angoumois. This venerable and magnificent structure, after escaping the revolutionary phrenzy, was demolished in 1808. The fountain of Trouve, a few miles from Angoulême, is, next to that of Vaucluse, the most celebrated in France. (*Hugo, France Pittoresque*, art. *Charente*, &c.)

ANGOUMOIS, the name of a district in France previously to the revolution, nearly but not exactly coinciding with the dep. Charente. It formed, in connexion with the district of Santonge, one of the provinces into which France was formerly divided.

ANGRA, a town and seaport of the island of Terceira, one of the Azores, being the cap. of the archipelago, and the residence of the governor, at the bottom of a deep bay or creek, lat. $38^{\circ} 34' 33''$ N., long. $27^{\circ} 12' 33''$ W. Pop. variously estimated at from 10,000 to 15,000. It is beautifully situated on a hill, rising gradually from the sea. The streets are broad and regular, and the houses, generally of 3 stories, though gloomy, are well built. It is well supplied with water, but the streets, as well as the inhabitants, are notwithstanding excessively filthy. There are a great number of churches, and it formerly also had various monasteries and convents; but the latter have been dissolved, and the buildings applied to other uses. As a port, Angra has nothing to boast of: it is open to all winds from the S.S.W. by the S. to the E. The swell from the S.W. In particular, which acts round Mount Brazil, on the W. side of the bay, is tremendous. In the bad weather months, large vessels anchor in the mouth of the bay, abreast of St. Antonio, in 24 and 30 fathoms, to be ready instantly to put to sea in the event of storms setting in, the coast affording no shelter. The town is defended on the W. by the citadel at the foot of Mount Brazil, and on the opposite side of the bay by the fort of St. Sebastian, the distance between them being about $\frac{1}{2}$ m. (*Bold's Azores*, p. 210.; *Purdy's Sailing Directions for the Atlantic*, p. 230.)

ANGRA, a seaport town of Brazil, prov. Rio Janeiro, bears S. W., distant 78 m. from the city of that name. Its port admits large ships; it is fortified by 2 redoubts, and has some commerce.

ANGUILLA, or **SNAKE ISLAND**, so called from its tortuous figure, an island belonging to the British in the W. Indies, being the most northerly of the Caribbee islands, and separated by a narrow channel from St. Martins; lat. $18^{\circ} 8' 8''$ N., long. $63^{\circ} 12' 12''$ E. It is from 25 to 30 m. in length, by about 6 m. in breadth. Pop. about 3,000, of whom about 2,400 are blacks. Surface flat; soil chalky, and not very productive: and there is a deficiency

both of wood and water; climate healthy. By far the largest portion is uncultivated. It produces some sugar and cotton, with maize and provision of various kinds. A salt lake in the middle of the island furnishes (or at all events did furnish) a considerable supply of salt. It has no good harbour. The town, an inconsiderable place, stands near the N. E. extremity of the island. The colonists elect their chief magistrate, subject to the approval of our governor of Antigua. (*Edwards*, ed. 1819.; and *Official Returns*.)

ANGUILLA, one of the Bahama Islands, about 30 m. long, and 6 broad; lat. $23^{\circ} 36' 30''$ N., long. $79^{\circ} 20' 30''$ W.

ANGUILIARA, a town of Austrian Italy, on the Adige, 23 m. S. Padua. Pop. 2,300. This also is the name of a town of nearly equal size in the Papal states, on the S. side of the lake Bracciano, 16 m. N. N. W. Rome.

ANGUS, see **FORFAR**.

ANHALT, a country of Germany, almost surrounded by the Prussian dominions, having Brandenburg on the N., Prussian Saxony on the E. and S., the county of Mansfeld on the S. W., and Brunswick and the Prussian circ. of Magdeburg on the N. W. Its greatest length is 60 m., and its breadth varies from 12 to 16. Principal river the Elbe, by which it is intersected. Area, 1,018 sq. m. Pop. 146,253. It is mostly flat, and is very fertile and well cultivated. It is divided into the three duchies of Anhalt-Bernburg having an area of 349 sq. m., a pop. (in 1833) of 45,135; Anhalt-Cöthen, area 314 sq. m., pop. (in 1833) 40,153; and Anhalt-Desau, area 360 sq. m., pop. (in 1837) 60,945. The consent of the states is necessary to the imposition of any new tax. Inhab. mostly Protestants and very industrious. The entire principality furnishes 1,224 men to the army of the confederation. Principal towns, Dessau, Zerbst, Cöthen, and Bernburg.

ANHOLT, a small Danish island in the Cattegat, nearly halfway between Lesøe and Zealand. A lighthouse, having the lantern elevated 112 feet above the level of the sea, has been erected on its most easterly promontory, in lat. $56^{\circ} 44' 20''$ N., long. $11^{\circ} 28' 51''$ E.

ANJOU, a town of France, dep. Herault, cap. cant., 16 m. W. by N. Montpellier, Pop. 2,650.

ANIMALLY or **ANIMALAYA**, a town of Hindostan, prov. Colmbetoor, on the Alina, lat. $10^{\circ} 31' 31''$ N., long. $77^{\circ} 1' 12''$ E. In 1800 it contained 400 houses.

ANJAR, a town of Hindostan, prov. Cutch, cap. district of same name, ceded in 1816 to the British, near the N. E. shore of the Gulph, lat. $23^{\circ} 3' 31''$ N., long. $70^{\circ} 11' 12''$ E. It is fortified, but not strongly. In 1819 nearly half the town was destroyed by an earthquake, but only 165 persons lost their lives. The pop. was estimated in the following year at 10,000. (*Hamilton's E. I. Gazetteer*.)

ANJENG, a seaport town of S. Hindostan, prov. Travancore, 18 m. N. N. W. Cape Comorin, lat. $8^{\circ} 37' 31''$ N., long. $76^{\circ} 53' 53''$ E. The E. I. Company had a factory here from 1681 to 1813, when it was abolished. The best coir cables on the Malabar coast are made here and at Cochín; and pepper, coarse piece-goods, drugs, &c. are exported.

ANJOU, an ancient prov. and gov. of France, now distributed among the depts. of Maine et Loire, Loire Inférieure, Vendée, Indre et Loire, Sarthe, Ille et Vilaine, Mayenne, and Deux Sèvres.

ANKLAMI, a town of the Prussian States, prov. Pomerania, cap. circ. on the navigable river Peene, about 7 m. from where it falls into the strait separating the isle of Usedom from the continent. Pop. 7,000. It was founded in 1188; has a college and 3 hospitals, with manufactures of cloth, linen, &c., and carries on a considerable trade in ship-building and shipping.

ANKOBEI, a town of Abyssinia, cap. prov. Efat.

ANKOI, or **ANKKHO**, a town of Bokhara, 75 m. W. Balkh, lat. $36^{\circ} 48' 30''$ N., long. $66^{\circ} 6''$ E. Mayendorf says that it has nearly 4,000 houses, which would infer a pop. of at least from 25,000 to 30,000, consisting principally of Arabs. A small river flows past the town; but as it dries in summer, the inhab. are obliged to supply themselves with water from the Nile. (*Voyage à Bokhara*, p. 143.)

ANNABERG (ST.), a town of Saxony, circle Erzgebirge, 8 m. S. W. Marienburg. Pop. 5,500. It is well built, has three churches, two hospitals, and a gymnasium, with manufactures of lace and ribands. In its vicinity are mines of iron, tin, cobalt, and silver.

ANNAL, a town of Asiatic Turkey, cap. Sanjak, on the Euphrates, 160 m. N. W. Bagdad, lat. $34^{\circ} 10' 31''$ N., long. $41^{\circ} 47' 12''$ E. It is finely situated on the route of the caravans that cross the desert of Mesopotamia. It was surprised in 1807 by the Wahabites, who, after committing all sorts of excesses, set it on fire. The pop. does not probably exceed from 3,000 to 4,000. The environs are very fertile.

ANNAMABOE, a seaport town on the Gold Coast of Africa, formerly prov. Fanty, empire of the Ashantees, lat. $5^{\circ} 8' 15''$ N., long. $1^{\circ} 15' 15''$ E., one of the principal marts for slaves. It was burnt by the Ashantees in 1808. Pop. probably from 3,000 to 4,000.

ANNAMOOKO, one of the Friendly Islands (which see).

ANNAN, a borough, sea-port, m. town, and p. of Scotland, co. Dumfries. The town is situated on the E. side of the river Annan, which is here crossed by a fine bridge of 3 arches, erected in 1824, about 1½ m. above its confluence with the Solway Frith, 67 m. S. Edinburgh. Pop. 5,033. It is clean, well-built, neat, and thriving; has a handsome new church and spire; a good natural harbour, which has been much improved by an embankment constructed at the expense of Mr. Irving of Newton; and an academy well attended. There is here a cotton manufactory, which, in 1837, employed from 120 to 140 hands. Ship-building is also carried on to a considerable extent; but the principal trade of the town consists in the curing of bacon and hams for the Newcastle and London markets, and in the shipping of corn, fat cattle, and sheep, by steam, for Liverpool. In 1837 there belonged to the town 34 vessels, of the burden of 1639 tons. Annan unites with Dumfries, Kirkcudbright, Lochmaben, and Sanquhar, in returning a member to the H. of C. 104 houses in 1831, 153; constituency in 1837, 739. (*Boundary Report*, p. 137. *New Statistical Ac. of Scotland*, art. *Annan*.)

ANNAN, the river on which the above town is built. It rises on the S. side of Hartfell, a mountain on the confines of the cos. Dumfries and Peebles, near Moffat, and after pursuing a S. course of about 36 m. in a direct line, unites with the Solway Frith, 1½ m. below Annan, to which it is navigable. It has near its mouth salmon fisheries, which let in 1837 for about 550*l.* a-year.

ANNANDALE, the name given to the valley or low grounds traversed lengthwise by the river Annan.

ANNAPOLIS, a town of Nova Scotia, on the S. side of the river of the same name, near where it falls into its estuary or basin, on the S. W. side of the bay of Fundy, lat. 44° 47' N., long. 65° 50' W. The harbour is spacious and secure. This is the oldest European settlement in N. America, having been founded in 1604. It was called Port Royal by the French; but, on their ceding the prov. to England in the reign of Queen Anne, it received its present name in honour of her Majesty. Notwithstanding it was the cap. of the prov. till the foundation of Halifax in 1730, and its fine harbour, it never attained to any considerable magnitude. At present it does not contain above 50 or 60 houses, shops, &c., and the fortifications and government buildings are going to ruin. (*McGregor's British America*, i. p. 360.)

ANNAPOLIS, a city and port of entry of the U. States, cap. Maryland, on the Severn, 2 m. from its mouth, 28 m. S. S. E. Baltimore. Pop. 2,623. It is a handsome healthy town, with a stately house, a theatre, &c. The proximity and more advantageous situation of Baltimore as a place of trade have occasioned the slow growth of Annapolis.

ANNECY, a town of the Sardinian states, cap. prov. Geneva, at the northern extremity of the lake of the same name, 22 m. S. Geneva. Pop. 5,700. It is pleasantly situated among hills and mountains; and is thriving and industrious, having establishments for the spinning of cotton and silk, with manufactures of earthenware and glass, vitriol, straw hats, white iron and steel, &c. It is the seat of a bishopric, and is very ancient.

ANNET, one of the Scilly islands, about 1 m. from that of St. Agnes.

ANNONAY, a town of France, dep. Ardèche, being, though not the cap, the principal town of the dep., at the confluence of the Cance and the Doune, 7 m. from the Rhone. Pop. 7,589. It is a thriving improving town, agreeably situated on the elevated uneven ground between the two rivers, with suburbs on the opposite banks; being well, though irregularly built. The only public building worth notice, is an obelisk in honour of the celebrated aeronaut Montgolfier, a native of the place. Annonay is principally distinguished by its manufactures, particularly by that of paper, long reckoned the best in France; and hence the recommendation, so frequently seen in French catalogues, of books being printed on *papier du d'Annonay*. (See *ANNECHER*.) It has also manufactures of cloth, woollen stockings, and gloves; establishments for the spinning of cotton and silk, part of the latter of a peculiarly fine quality, being employed in the manufacture of tulles and blouses; with dye-works, tanneries, &c. The town is proprietor of a large nursery; and in its vicinity is the first suspension bridge constructed in France.

ANOPSHERR, a town of Hindostan, prov. Agra, on the W. side of the Ganges, 68 m. S. E. Delhi, lat. 28° 23' N., long. 78° 8' E. It is surrounded by a strong mud wall, and is thickly inhabited. (*Hamilton's E. I. Gazetteer*.)

ANSPACH, or **ANSBACH**, a town of Bavaria, cap. circ. Regat, on the Roar, 24 m. S. W. by W. Nuremberg, lat. 49° 14' 30" N., long. 10° 30' 15" E. Pop. 16,500. It is surrounded by walls, and has 4 gates; is the seat of the provincial authorities and of a court of appeal. The objects most deserving of attention are the castle and

gardens that formerly belonged to the Margraves of Anspach; the church of St. John, with the tombs of the princes. It has a gymnasium, an hospital, an orphan hospital, a library of 16,000 vols. with a cabinet of medals, &c.; and manufactures of woollen and cotton stuffs, earthenware, white lead, and playing cards.

ANSTRUTHER (EASTER and WESTER), two inconsiderable royal burghs and sea-ports of Scotland, co. Fife, on the N. shore of the Frith of Forth. Pop. of both burghs, with their parishes, in 1831, 1,437; Parli. const. in 1837, 63. They unite with Crail, Pittenweem, and Killybeg, in returning a m. to the H. of C.

ANTALOW, a considerable town of Abyssinia, cap. prov. Enderta, 85 m. S. S. E. Axum. Pop. probably about 6,000.

ANTEQUERA, a large town of Spain, Andalusia, 30 m. N. N. W. Malaga, lat. 37° 9' N., long. 4° 32' W. Pop. 20,150. It is built partly on a hill, and partly on a plain; has an old castle built by the Moors, several churches and convents, with establishments for the spinning of silk and cotton, and fabrics of paper, morocco leather, and soap. There are in its neighbourhood quarries of marble of different colours, and plaster, a salt lake, and a mineral spring. It was taken by assault from the Moors, by Ferdinand, afterwards king of Arragon, in 1410.

ANTHEME (ST.), a town of France, dep. Fuy de Dome, cap. cant. on the Ance, 9 m. E. Ambert. Pop. 3,201.

ANTHONY (ST.), FALLS OF, in the Mississippi, about 2,000 m. above its embouchure, lat. 44° 50' N. Here the river descends about 74 feet, viz. 16 feet of perpendicular fall, and 58 more of rapids.

ANTHONY (ST.), a cape on the coast of S. America, Argentine republic, being the S. extremity of the estuary of the La Plata, lat. 36° 15' 19" S., long. 56° 37' W.

ANTIBES (an. *Antipolis*), a sea-port town of France, dep. Var, cap. cant. on the Mediterranean, 22 m. E. N. E. Frejus, lat. 43° 34' 40" N., long. 7° 7' 50" E. Pop. 5,539. Being an important station on the side of Italy, Antibes is pretty strongly fortified. It is the seat of a tribunal of commerce, and of a school of navigation. The port, which is circular, of considerable size, and easy access, is formed by a mole projecting from the town, the distance from the extremity to the point on which Fort Carré is built being only about 150 fathoms. In most parts the port is shallow; but within and near the mole there are from 15 to 18 feet water. The inhabitants are principally employed in the fishing and curing of sardines and anchovies.

Antibes is very ancient, having been founded by a colony from Marseilles, 340 years a.c. It was afterwards occupied by the Romans, by whom it was fortified and embellished. Having been destroyed by the Saracens towards the end of the 9th century, it continued in a comparatively neglected state, till it was again fortified by Francis I. and Henry IV. It was unsuccessfully besieged by the English and Imperialists in 1746. (*Ilugo, France Pittoresque*, art. *Var*.)

ANTICOSTI, a large island in the mouth of the St. Lawrence, between 49° and 50° N. lat., and 61° 43' and 64° 35' W. long. It has an unfavourable soil, is without a single good harbour, and is uninhabited, with the exception of the attendants on the light-houses, one of which has been erected on its E. point; and another either has been or is about to be erected on its W. extremity.

ANTIGUA, an island belonging to Great Britain, in the West Indies, being one of those denominated the Windward Islands. It was called by the natives Xaymaca, but Columbus gave it the name of Santa Maria de Antigua. It is about 25 m. N. E. Montserrat, and 40 m. N. Guadalupe. It is oval-shaped, being 20 m. in its greatest length, and contains about 108 sq. m., or nearly 70,000 acres. The pop. has decreased since 1774, when it had 2,590 whites, and 37,808 slaves. In 1837, the people of colour and whites together were only about 2,600; and the blacks, all of whom were enfranchised in 1834, about 33,000. It has little of the mountainous character of the neighbouring islands, the greatest elevation being only 1,210 feet. On approaching it from the sea, instead of mountains clothed with rich foliage and luxuriant vegetation, a barren rugged coast, almost destitute of verdure, presents itself. A few miles, however, from the shore, the prospect is more pleasing, the country being agreeably diversified with hill and dale; and when not parched by the droughts, to which it is subject, green fields of canes, clumps of feathery bamboos, flowers of dazzling brilliancy, and verdant cliffs hung with beautiful varieties of intertropical plants, enchant the voyager. The island has neither fountain nor river, and but a few scanty springs among the hills. Rain water, preserved in tanks, is substituted, and it is found particularly light and pleasant to the palate. The soil in the high lands is a reddish clay on a substratum of marl; that in the lowlands, a rich dark mould on a substratum of clay. The climate is remarkable for its want of moisture, though the average

fall of rain be 45 inches. The dew is scanty, and the rainy season very uncertain, but it may be said generally to extend from June to the end of the year. The alternations of temperature are very slight, the thermometer seldom ranging more than 4° in 24 hours. The deaths among the white troops for the last 20 years, according to Captain Tulioch's tables, was 40·6 per 1000 of mean strength. Among the black troops, 28·9. The sugar cane is the principal article of cultivation; but sufficient ground provisions are also produced in favourable seasons for the supply of the inhabitants. The crops vary considerably. In the years 1770, 1773, 1778, there was no produce of any kind, the canes and ground provisions being destroyed by drought, and the inhab. would have perished, but for the importation of flour and corn-meal from America. The total value of imports in 1833 was 170,334*l.* ster., the principal of which were grain, meal, and flour, cotton manufactures, linens, woollens, and fish. In 1834, the value of the imports was 176,076*l.* There would seem to have been a very extraordinary falling off in the exports of produce from Antioch since 1834, in consequence, partly perhaps, of deficient harvests, but more, as we apprehend, of the emancipation of the slaves. The principal imports into the United Kingdom from Antigua in the under-mentioned years, have been—

	Sugar.	Rum.	Molasses.
1834	257,177 cwts.	71,445 gals.	87,882 cwts.
35	174,818 —	67,051 —	75,985 —
36	135,482 —	—	—
37	62,170 —	11,538 —	26,993 —

The shipping entered inwards in 1833, was 23,654 tons, employing 2,370 men; outwards, 32,002 tons, and 2,183 men. The legislature is composed of a governor, a council of 12, and an assembly of 25 members. The courts of equity and law are the same as in Great Britain. The governor for the time being acts as chancellor of the court of equity, and suitors have a right of appeal from his decrees to the king in council, on giving security for costs. The militia consists of 89 officers, and 993 rank and file. There are 10 public or free schools, and 4 private, 15 infant, and many Sunday schools, giving instruction, in all, to nearly 1,000 children. The manners, customs, and habits of the people differ in no degree from those of the other West Indian Islands. The revenue, in 1831, was 16,097*l.*, the expenditure 15,708*l.* The island contains 6 towns and villages, viz. St. John's, Parham, Falmouth, Willoughby Bay, Old Road, and James Fort. St. John's the capital, on the N. W. side of the island, lat. 18° 22' N., long. 64° 42' W., is regularly built, partly on a high rock, connected with the mainland by a causeway, which is, however, submerged at high water. In the harbour, there is sufficient depth of water for merchant vessels, and perfect security in all winds. English Harbour, on the S. side of the island, is however the best harbour in Antigua, and is indeed one of the best in the West Indies. It has water for ships of any size, and is well sheltered in all weathers. It has a dock-yard, a naval hospital, and every convenience for careening and repairing ships. (*Blund's American Navigator*, p. 402.) Antigua is the oldest W. I. colony, after St. Kitt's and Barbadoes, in possession of the English, having been acquired in 1632. Its planters have been remarkable for their leniency to the slaves, who were finally enfranchised in 1834. The amount awarded to Antigua out of the 20,000,000*l.* granted for the freedom of the slaves, was 425,964*l.* 7*s.* 0*d.*, those of Anguilla included. The average value of each slave was reckoned at 14*l.* 12*s.* 3*d.* (*Edwards's Parl. Papers*, &c.)

ANTILLES, see WEST INDIES.

ANTIOCH (vulg. *Antakia*) (*Antioch*), properly Antiochela (*Ἀντιόχεια*), a famous city of Syria, and once the residence of its sovereigns, on the left bank of the Aaszy (*Orontes*), 20 m. above its mouth; 53 m. E. Aleppo, and 29 m. S. Iskenderoun, in lat. 36° 12' N., long. 36° 15' E. The population, which at its most flourishing epoch probably amounted to 400,000, is now reduced to from 6,000, to 10,000, of whom about a tenth part may be Christians, and about the same proportion Jews.

Modern Antioch does not cover more than a sixth part of the area of the ancient city, the walls of which, though ruinous, may still be distinctly traced throughout their whole circuit. The Bab-Boulos (Gate of St. Paul), the entrance from the E., is now $\frac{1}{4}$ m. from the nearest houses; and, in every other direction except the W., the buildings have similarly receded from their old limits. Volhey describes it as a wretched collection of huts, built of mud and straw, with narrow and miry streets, and exhibiting every appearance of misery and desolation. Kinneir, however, says that "the houses are in the Turkish fashion, small, but neatly built of hewn stone." But though this be the case with some of them, the majority are constructed of slight materials; and, unlike the houses of other Syrian or rather Eastern towns, have sloping roofs covered with thin tiles. There are 10 or 12 mean and unimportant mosques, with low minarets;

but in this city, so famous in the annals of Christianity, there is not at present a single Christian church! The baths and bazars are numerous, but neither exhibit any thing remarkable. It has manufactures of coarse pottery, cotton stuffs, leather, &c.; but the greater part of the inhabitants are engaged in the cultivation and manufacture of silk.

All traces of its famous theatres, its circus, and its magnificent baths, have irretrievably perished. For about $\frac{1}{4}$ m. on the E. of the town, a part of the ancient pavement still exists; and on the S. are the ruins of an aqueduct, which conveyed a supply of water from the foot of the Djebel Okrah (an. *Mt. Cassius*). The old walls are, however, interesting monuments. The situation of the ancient city was most delightful. It occupied the summits and slopes of two considerable hills, and the plain between them and the river. Over these hills and across this plain, the walls were built nearly in a rectangular form, inclosing a space of several m. in circumference. They are of various ages, part being, apparently, as old as the first foundation of the town, part referable to the era of Roman power, and part the work of the crusaders. They are carried over the beds of mountain torrents, and down the sides of almost perpendicular precipices, filling up the intervening gorges and ravines, so that they vary from 20 or 30 feet in height to upwards of 70. The oldest portion of the walls is also the most perfect; it stands upon a rock, and, having been originally well built, has resisted the influence of time and the shocks of earthquakes. There are two bridges, one of 5 arches with piers, cut out of the rock, across a ravine; and one of inferior dimension across the Orontes. In the sides of the mountains to the S. E. of the town are numerous excavations, apparently intended for cemeteries or catacombs, some of which are now used as places of worship by the Christian population.

The ancient Syrian name of Antioch is said to have been Riblath; but being enlarged and beautified by Seleucus Nicator, he gave it, B.C. 301, after his father, the name of Antioch. It became at once the capital of the Macedonian kingdom of Syria, and continued for nearly 24 centuries to be the residence of the monarchs of the Seleucidian dynasty. About 65 years B.C., the conquests of Pompey brought Antioch, with the whole of Syria, under the control of Rome. At this era it consisted of 4 distinct towns, each having separate fortifications, the whole being surrounded by a common wall; hence it was sometimes called Tetrapolis. Under the Romans, Antioch continued to advance in importance: it was the centre of an extensive commerce, the residence of the governor of Syria, the frequent resort of the emperors, and the most celebrated town of the empire (the capital only excepted) for the amusements of the circus and the theatre. It is intimately connected with the early history of Christianity, the doctrines of which were planted in it by Paul and Barnabas, and in it, also, the term *Christian* had its origin as a distinctive appellation. (Acts, x. 26.) It has suffered severely on many occasions from earthquakes. One of the most celebrated and disastrous of these calamities occurred A.D. 115. The emperor Trajan, who had just concluded his victorious Parthian campaign, being then in the city, it was crowded with troops and strangers from all parts of the ancient world. The shocks are said to have continued for a lengthened period, and to have been most severe; the emperor himself narrowly escaped with some bruises; and many thousands of individuals were buried in the ruins of the city. (*Ancient Universe*, Hist. xv. 138, 8vo. ed.) It again suffered severely from similar catastrophes in the years 340, 394, 396, 458, 526, and 589; the last destroying, it is said (but such statements are almost always much exaggerated), above 60,000 persons. Notwithstanding these repeated inflictions, and its devastation by Chosroes the Persian in 548, it revived again and again, and continued to be the "Queen of the East," and a place of great importance, till 638, when it fell under the power of the Saracens. In 1098, it was taken by the crusaders, and continued to be the capital of a Christian principality till 1268, when it was taken by the Egyptian sultan, by whom it was partially demolished. It was added to the Ottoman empire by Selim I. in 1516; but its commercial importance had already vanished; and it has continued, under the barbarous sway of the Turks, to decline till it has reached its present state of comparative insignificance.

The valley of the Orontes spreads, in the neighbourhood of Antioch, into a fertile plain, 10 miles in length, and 5 or 6 in width; the town and river, occupying the extreme edge, being close to the bounding mountains on the S. E. The soil is excellent, consisting of a rich alluvial deposit, producing figs, olives, vines, and mulberries in great abundance. The deserted spaces within the old walls are now continued garden; but in general the country is ill-cultivated, being abandoned to the Turkmans and other wandering tribes. Pliny speaks of a part of Antioch lying on the right bank of the river

(Hist. Nat. v. 21.) This must have been a suburb, and probably, as in the case of Aleppo, as extensive as the town within the walls; but no vestiges of it now remain.

Modern critics and travellers differ in opinion as to the site of the grove, and village of Daphne, and temple of Apollo, in the immediate vicinity of Antioch. Gibbon has given the following description of this long-famous seat of religion and pleasure. "At the distance of 5 m. from Antioch, the Macedonian kings of Syria had consecrated to Apollo one of the most elegant places of devotion in the pagan world. A magnificent temple rose in honour of the God of light; and his colossal figure almost filled the capacious sanctuary, which was enriched with gold and gems, and adorned by the skill of the Grecian artists. The deity was represented in a bending attitude, with a golden cup in his hand, pouring out a libation on the earth, as if he supplicated the venerable mother to give to his arms the cold and beautiful Daphne; for the spot was ennobled by fiction, and the fancy of the Syrian poets had transplanted the amorous tale from the banks of the Peneus to those of the Orontes. The ancient rites of Greece were imitated by the royal colony of Antioch. A stream of prophecy, which rivalled the truth and reputation of the Delphic oracle, flowed from the Castalian fountain of Daphne. In the adjacent fields, a stadium was built by a special privilege which had been purchased from Elks: the Olympic games were celebrated at the expense of the city; and a revenue of 30,000L. sterling was annually applied to the public pleasures. The perpetual resort of pilgrims and spectators insensibly formed, in the neighbourhood of the temple, the stately and populous village of Daphne, which emulated the splendour, without acquiring the title, of a provincial city. The temple and the village were deeply bosomed in a thick grove of laurels and cypresses, which reached as far as a circumference of 10 m., and formed in the most sultry summers a cool and impenetrable shade. A thousand streams of the purest water springing from every hill, preserved the verdure of the earth and the temperature of the air; the senses were gratified with harmonious sounds and aromatic odours; and the peaceful grove was consecrated to health and joy, to luxury and love. The vigorous youth pursued, like Apollo, the object of his desire, and the blushing maid was warned by the fate of Daphne to shun the folly of unseasonable coyries. The soldiers and the philosophers wisely avoided the temptation of this sensual paradise, where pleasure, assuming the character of religion, imperceptibly dissolved the firmness of manly virtue. But the groves of Daphne continued for many ages to enjoy the veneration of natives and strangers; the privileges of the holy ground were enlarged by the munificence of succeeding emperors; and every generation added new ornaments to the splendour of the temple."—(Cassini, *Dictionnaire de la Bible*, art. *Antioche*; *Declaux and Fall*, cap. 23.; *Folney*, li. 130.; *Bourne*, 390—392.; *Kinmer*, pp. 149—161.; *Robinson*, li. 273—277.)

ANTIPAROS (an. *Oliaros*), a small island of the Grecian Archipelago, group of the Cyclades, between Paros and Siphanto, $1\frac{1}{2}$ m. W. of the former, and 16 m. E. of the latter. It is about 7 m. in length from N. to S. by about 3 m. breadth, its highest point being in lat. $36^{\circ} 59' 40''$ N., long. $25^{\circ} 3' 60''$ E. It consists of a mass of marble covered with a moderately fertile soil; and, exclusive of some cotton and wine, it produces barley enough to suffice for its inhab., consisting of some 60 or 70 families who live in a miserable village about 1 m. from the shore, and are partially employed in fishing. Though hardly worthy of notice in other respects, this island is famous for an immense subterranean cavern or grotto. Its entrance is on the side of a hill under a low arch. The passage thence to the cavern is long, narrow, and in parts precipitous. "The mode of descent is by ropes, which are either held by the natives, or joined to a cable fastened at the entrance round a stalactite pillar. In this manner we reached the spacious chambers of this truly enchanted grotto. The roof, the floor, the sides of a whole series of magnificent caverns, are entirely invested with a dazzling incrustation, as white as snow. Columns, some of which were 25 feet in length, pended in fine icicle forms above our heads; fortunately, some of them are so far above the reach of the numerous travellers who during many ages have visited this place, that no one has been able to injure or remove them. Others extend from the roof to the floor, with diameters equal to the mast of a first rate ship of the line. The last chamber into which we descended surprised us more by the grandeur of its exhibition than any other. Probably there are yet other chambers still unexplored." (*Clarke's Travels*, vi. p. 126. 8vo ed.)

The era of the discovery of this cavern in modern times is not ascertained; but it was first made fully known by the visit paid to it by M. Nointel, ambassador from France to the Porte, who descended into it with a cortège of no fewer than 500 individuals, at Christmas,

1673. On this occasion it was brilliantly illuminated. His excellency and suite remained in it for three entire days, and celebrated high mass at midnight on Christmas in this most magnificent of subterranean temples. It was also visited by the learned and excellent traveller, M. Tournefort, who supposed that he saw in it conclusive proofs of his singular theory as to the vegetation of stones. (*Tournefort, Voyage du Levant*, i. pp. 185—195. 4to ed.) It has since been repeatedly visited by other travellers; and it is said that the smoke from the numerous torches that have thus necessarily been carried within its recesses, have somewhat impaired its otherwise unrivalled splendour and brilliancy.

ANTIVARI, a town of Turkey in Europe, 19 m. W. Scutari, within a short distance of the sea, lat. $42^{\circ} 15' 20''$ N., long. $19^{\circ} 4' 15''$ E. Pop. 3,500. It is defended by a castle on a steep rock, is the residence of a Greek archbishop, and the entrepôt of the merchandise of the valley of Drin.

ANTOING, a market town of Belgium, prov. Hainault, 4 m. S. E. Tournay. Pop. 1,581.

ANTONIN (ST.), a town of France, dep. Tarn et Garonne, cap. cant. in a spacious valley at the confluence of the Aveyron and the Bonnette, 22 m. E. N. E. Montauban. Pop. 5,458. The waters of the Bonnette being charged with the refuse of various tanneries established on its banks, render the town at times unhealthy. It has fabrics of serges and other woollen stuffs, paper, &c.; and a considerable commerce is carried on in leather, prunes, and juniper.

ANTONIO (ST.), a city of Mexico, cap. prov. Texas, situated near the source of the river of this name. Pop. 2,000. Long. 101° W., lat. $25^{\circ} 50'$ N.

ANTRAÏGUES, a town of France, dep. Ardèche, cap. cant. 11 m. W. Privas. Pop. 2,023.

ANTRAIN, a town of France, dep. Ille et Vilaine, cap. cant. on the Couesnon, 14 m. S. E. Dol. Pop. 1,651.

ANTRIM, a marit. co. Ireland, prov. Ulster; its greatest length being about 55 m., and its greatest breadth about 32 m.; having N. and E. the Irish Sea, S. Lough Neagh and Down, and W. Londonderry, from which it is separated for the greater part by the Bann. It contains 758,866 imp. acres, of which 225,970 are mountain and bog, and 49,790 water, being part of Lough Neagh which lies principally within this county. The N. and E. districts are mountainous, and there are some high rugged grounds in other places, while the flat ground along Lough Neagh is in many places boggy. Still, however, there is a large extent of fertile ground. Property in very great estates; but large portions of some of them are leased for ever. Farms small: agriculture in most respects similar to that of Down (which see): average rent of land, 15s. an acre. The country round Belfast has more of an improved appearance, and the people are more orderly and industrious than any where else in Ireland. Linen manufacture universally diffused: the manufacture of cotton has also been successfully introduced, with some others of inferior importance. A coal mine is wrought atullycastle; but not extensively, the coal being of bad quality. Besides the Bann and the Laggan, which form part of its S. boundary, it is watered by many smaller streams, but none of them are navigable. The N. coast is remarkable for its basaltic columns, which are particularly conspicuous at the far-famed Giant's Causeway (which see). The lofty promontories of Bengore and Fairhead are also, in a great measure, composed of these columns. There are considerable salmon fisheries on the coast. Carrickfergus is the county town; but the principal towns are Belfast, Lisburn, Antrim, and Larne. Pop. in 1821, 262,460; in 1831, 316,909; it contains 8 baronies and 77 parishes, and returns 5 m. of the H. of C., viz. 2 for the co., 2 for Belfast, and 1 for Carrickfergus. Parl. constituency of co., 1836—37, 3,496.

ANTRIM, an inland town of Ireland, cap. co. Antrim, prov. Ulster, on the Six-mile-water near its embouchure in Lough Neagh, 94 m. N. Dublin. Its ancient name was Entriun, or Entrum-neagh, and it is supposed to owe its origin to a religious house founded by a disciple of St. Patrick. It suffered much in the wars with the Danes and with the first English settlers; and in 1641 was burnt by the Scotch, under Munroe. In 1798 it was the scene of a sanguinary conflict between the King's troops and the insurgents, in which the former were victorious, but with the loss of Lord O'Neill, who commanded a regiment of militia. Pop., including that of the suburb of Parkgate, amounted in 1821 to 2,485, and in 1831 to 2,655, being half the pop. of the par. of same name in which it is situated. In 1834 the pop. of the par. was 5,513; of which 750 were of the E. church, 1,252 R. Catholics, and 3,541 Prot. dis. The town, lying in the bosom of a fertile valley, consists of two main streets, with several branches. Houses substantially built of stone, several exhibiting proofs of considerable antiquity; its public buildings are the par. church, an ancient edifice, but lately repaired; a spacious R. C. chapel; two places of worship for Presbyterians; two for Methodists;

and one for the Society of Friends. There are schools for boys and girls, under the endowment of Erasmus Smith; and several private schools, in all of which nearly 700 children receive instruction; also a mendicant society, and a savings' bank. Previously to the Union the borough sent 2 m. to the Irish parl. The court-house, in the centre of the town, is used for holding general sessions of the peace in April and October, and petty sessions on alternate Tuesdays. The court-leet and court of record of the manor of Molenney, — within which the town is, and at which the seneschal, appointed by the Marquis of Donegal, presides, — are also held here; the latter court decides pleas of debt to the amount of 20*l*. Part of the market-house is used as a bridewell. Close to the town is the residence of Viscount Ferrard, and about $\frac{1}{4}$ m. distant is a perfect pillar-tower, 95 feet high, with a conical roof. The manufactures are those of linen, cotton, and hosiery. There are several bleach-grounds in the neighbourhood; and two paper-mills, one of which first introduced into Ireland the process of making paper in webs like cloth, instead of separate sheets. There are also several flour and meal mills, and a brewery. 8,445 bushels of malt were manufactured here in 1836. Most of the grain is sent to Belfast, its conveyance being facilitated by the contiguity of Lough Neagh, where a small quay has been erected at the mouth of the Six-mille-water. Markets are held on Tuesdays for grain, and on Thursdays for general purposes; and fairs on Jan. 1, May 12, Aug. 1, and Nov. 12. No tolls are now levied. A branch of the Ulster bank was opened in 1836. The post-office revenue increased from 34*l*. in 1830, to 432*l*. in 1836. Two caravans and three cars convey passengers between Antrim and Belfast three times a week. The average number carried is 15 each trip. (*Stat. Survey; Railway Report*.)

ANTWERP (Ger. *Antwerpen*, Fr. *Anvers*), a marit. city of Belgium, cap. prov. and arrond. of same name, on the N. bank of the Scheldt, 26 m. N. Brussels, 32 m. E. Ghent; lat. $51^{\circ} 13' 16''$ N., long. $4^{\circ} 24' 10''$ E. It is in the shape of a bow, the arch being formed by the walls and the chord by the river, and is well fortified. A strong pentagonal citadel, built by the Duke of Alva, in 1567, and improved by the French, stands on the S. side of the town, which is farther defended by various forts on both sides the river. Though much declined from its former prosperity, Antwerp is a well-built fine old city, and is in various respects highly interesting. The principal street, Place de Meer, rivals any in Europe. It is about the width of Portland Place, but the variety and richness of the architecture render it far more magnificent. The older and narrower streets, bordered by lofty houses with their gables to the street, are singularly picturesque. Altogether it is supposed to contain about 10,000 houses, mostly built of stone; and had in 1835 a pop. of 75,362. The great boast of Antwerp is its cathedral, a superb Gothic structure, begun early in the 15th and not finished till the 16th century. Its spire, of the most beautiful and delicate workmanship, is said by Schreiber and others to be 466 feet high; but according to a statement in the Penny Cyclopædia this is 100 feet too much, the height being there affirmed to be only 366 feet! The interior corresponds in grandeur with the exterior, and it contains two famous pictures of Rubens; one of which, the Descent from the Cross, is generally regarded as his *chef-d'œuvre*. Of the other churches that of St. James, which contains the tomb of Rubens, St. Andrew, and St. Paul, are the most celebrated. All of them are adorned with fine paintings. The Bourse, or exchange, is one of the finest buildings of its class in Europe: it is said to have served as a model for the London exchange, burnt down in 1837. The *Hôtel de Ville*, a marble structure, rebuilt in 1581 after being destroyed by fire, is a magnificent fabric. The convent of the Recollets has been converted into a museum, in which is a superb collection of paintings, including many that were formerly scattered among the different churches and convents. It comprises

some of the choicest specimens of the masters of the Flemish school; as Rubens, Van Dyke, Jordaens, Van Vien, Martin de Vos, &c. Antwerp has a theatre; an academy of painting (St. Luke's), which originated in the 16th century; a royal academy of the fine arts, established in 1817; an academy of sciences; an Athenæum, or college; Latin, medical, and naval schools; a gallery of sculpture; a public library with 15,000 vols.; a botanical garden; with various learned societies, and many good private collections of works of art. Its charitable institutions include several hospitals, asylums, and workhouses. It is the seat of the courts of assize for the province; of a tribunal of original jurisdiction, a commercial tribunal, &c. The people have every appearance of being in comfortable circumstances, and are quiet and orderly. The upper classes speak French, and the lower Flemish.

The manufactures are very various, and are of considerable importance and value. They comprise fabrics of silk and cotton stockings, thread and tape, linen, calico printing, &c. Embroidery, bleaching, and ship-building are extensively carried on. The business of sugar-refining employed, in 1834, from 500 to 600 individuals, and consumed about 6 millions kilogs. of raw sugar. The lapidaries of Antwerp are very skilful in the cutting of diamonds and other precious stones. Of 54 mills for various purposes, within the city in 1834, only one was wrought by steam, two by wind, and one by water, the rest being moved by horses! In this respect there is certainly much room for improvement.

The depth of water in the river opposite to the city is from 32 to 40 feet at ebb tide, with a rise at springs of from 12 to 14 feet; and as this depth is increased towards the sea, Antwerp is a peculiarly eligible situation for the formation of dock-yards and the building of large ships. Its capability in this respect did not escape the observation of Napoleon, who endeavoured to raise it to the first rank as a naval arsenal. His plans in furtherance of this object were judiciously devised on a very grand scale, and were zealously prosecuted. Two large basins, capable of admitting ships of the line, were excavated on the N. side of the town; one comprising an area of 17, and the other of 7 Eng. acres. Attached to these was an extensive dock-yard, with craning and repairing docks, storerooms, &c. all planned and executed in the best and most approved manner, and at an immense expense. On the downfall of Napoleon the dock-yard, with its fortifications, &c., was completely destroyed; and it was even debated whether the two great basins should share the same fate! Luckily, however, they were preserved; and being converted into commercial docks, are of the most signal service to the trade and navigation of the city. The fleet and naval stores in the arsenal, when it surrendered to the allied forces in 1814, were divided; two thirds being assigned to France, and one third to the King of the Netherlands.

Her fine river, and the numerous canals with which it is united, give Antwerp great advantages as a commercial emporium; and during the early part of the 16th century she was one of the first trading cities of Europe. Owing, however, to the ascendancy and jealousy of the Dutch, and the supineness of her rulers, her foreign trade was nearly annihilated during the 17th and 18th centuries. But the navigation of the Scheldt, which had been formally closed by the treaty of Westphalia, was re-opened on

the occupation of Belgium by the French, and since the peace of 1815 the trade of the town has rapidly increased; and the probability seems to be, looking at the natural advantages of her situation, that it will go on increasing. The greater part by far of the foreign trade of Belgium centres here. The imports consist principally of coffee (16,000 tons), sugar (18,000 tons), cotton, tobacco, and all sorts of colonial produce; with cotton stuffs, wine, hardware, ashes, coal, hides, pepper, indigo and other dye-stuffs, &c. The timber used in ship-building is mostly brought by water from the interior. The exports consist chiefly of corn, linseed, flax, bark and madder, linen, lace, carpets, tallow, hops, &c.

The increase in the trade of Antwerp is evinced by the fact, that while only 681 ships arrived at the port in 1824, and 800 in 1825, there arrived in 1836 1,245 ships of the burden of 176,079 tons, and in 1837 1,426 ships of the burden of 225,030 tons. In 1836, 59 ships belonged to the port of the burden of 8,754 tons. In 1837, 6 new vessels were launched.

The railway from Brussels to Antwerp, 28½ m. in length, was opened throughout the whole distance in 1836. It has been signally successful; and will, no doubt, be of great advantage to both cities.

Antwerp has produced many distinguished men, being the birthplace of the painters Teniers, Van Dyke, Jordaens, and Crayer; the geographer Ortelius, the admirable engraver Edelinck, &c.*

Antwerp is very ancient. Lodovico Guicciardini, in his *Descrizione di Paesi Bassi*, describes it in 1560 as a city of vast wealth and the most extensive commerce; adding, that it was no uncommon thing for 500 ships to enter and leave its port in a single day! And making every allowance for the exaggeration obvious in this statement, there is no doubt that it then enjoyed a more extensive foreign trade than any other city in the N. of Europe. But this prosperity was destined to be of short duration. In 1576 it was sacked and partly burned by the Spaniards. In 1585, it was invested by the famous Alexander Farnese, prince of Parma, who took it after a lengthened and memorable siege. After its capture the greater part of its merchants and principal people emigrated to Amsterdam and other towns in the United Provinces, carrying with them their capital, skill, and connections. The ruin of its trade dates from this epoch, and was consummated by the Dutch obtaining the command of the river, and by the stipulation in the treaty of Westphalia by which, as already seen, it was regularly closed. In 1794 it fell into the hands of the French, who made it the capital of the department of Deux Nethe, and held it till 1814. On the revolt of the Belgian provinces in 1830, the Dutch garrison continued to hold the citadel for the King of the Netherlands: and the latter having refused to make it be evacuated, agreeably to the determination of the great powers, a French army of 65,000 men, under Marshal Gerard, entered Belgium in November, 1832, to compel its evacuation. The details of the siege are well known. The trenches were opened on the 29th November; and after an obstinate, but not a skilful or energetic defence, the citadel surrendered on the 24th of December. (*Vandermaelen, Dict. Géog. de la Prov. d'Anvers*, pp. 4—20; *Barrow's Family Tour in S. Holland*, &c. pp. 11—41; *Murray's Handbook*; and *Private Information*.)

* It is stated in various publications that Rubens was a native of Antwerp, but in point of fact he was born at Cologne, on the 29th June, 1577, and was 10 years old when, on the death of his father, his mother, a native of Antwerp, carried him to that city.—(*Biographie Universelle*, art. Rubens.)

ANWEILER, a town of Bavaria, circ. of the Rhine, on the Queich, 7 m. W. Landau. Pop. 2,000. It has tanneries, and distilleries of Kirschwasser. Its castle, now in ruins, built by the emperor Frederic, was long the dépôt of the jewels of the crown.

ANZIN, a village of France, dep. du Nord, in the immediate vicinity of Valenciennes. Pop. 4,182. This is the seat of the richest coal mines in France. They have been wrought since 1734, and some of the pits are as much as 1,500 feet in depth. The mines of Anzin, Vieux Condé, Furnes, &c., are said to employ in all above 4,000 work-people, and to furnish annually nearly 3,000,000 hectolitres of coal. The cost of its production is estimated at 65 cent. the hectolitre; and it is stated that a company at Anzin, for working the mines, clears annually nearly 3,000,000 fr. profit. In consequence of the increased production and price of coal caused by the high duties on foreign coal. (*Hugo, France Pittoresque*, art. Nord.)

AOSTA, a town of the Sardinian States, cap. prov. same name, at the confluence of the Dora with the Dora, at the opening of the two valleys of the Great and Little St. Bernard, 49 m. N. N. W. Turin. Pop. 7,000. It has straight broad streets; and many of the houses having gardens attached to them, it covers a large extent of ground. It is the seat of a council of justice, and of a bishopric; but is principally distinguished by its ruins of edifices constructed by the Romans, among which are a triumphal arch, a superb gate with 3 arches, the remains of an amphitheatre, &c. It received different names from the Romans, being sometimes called *Civitas Augusti*, *Augusta Prætoria Julia*, and *Augusta Salassiorum*; the latter from its having been the capital of the Salassi, subdued by Terentius Varro.

APENNINES, the name given to the mountain system which traverses the whole length of Italy.

Unbrocas mediam qua colibus Apenninus
Regni Italici, nullo qua vertice tellus
Altit. nituntur, propinque accensit Olympo
Mox inter gemmas medius, se pererrat undas,
Inferni superque maris: calceque convexit,
Hinc Thyrrhena vado frangitur æquora Phææ,
Hinc Dalmaticæ obnoxa fluctibus Ansel.

Lucan. lib. 1.

At its W. extremity this range is so closely connected with the Alps, that it may be considered as an extensive offshoot of that great system. It is difficult to determine where the Alps terminate and the Apennines begin: some think that the road over the Col di Tende (7° 40' E. long.) forms the boundary; others assign for it that road which begins on the N. at Alessandria, runs in the valley of the Bormida to Acqui, Spigno, &c., and terminates on the coast at Savona, rising at its highest point to 4460 f. above the sea; others think that the sea Alps extend to the road which leads from Novi on the N. over the Pass of the Bochetta (2550 f.) to Genoa on the coast.

The *Northern Apennines* extend from the Pass of the Bochetta E., with a slight declivity to the S. through three degrees of longitude (9° and 12°) to Monte Falterona, lying E. of Florence.

The *Central Apennines* extend from Monte Falterona S. E., with some bends to either side, as far as Monte Vclino, or nearly two degrees of latitude (44° and 42°).

The *Southern Apennines*, beginning at Monte Vclino, run E. S. E. between 42° and 41° N. lat. South of the last-mentioned parallel, between the towns of Conza, Acerenza, and Verrona, and at the sources of the Brindani, they divide into two branches; of which the E., extending first E. and then S. E., terminates at Capo de Leuca, opposite Corfu. The W. range runs between 41° and 39° N. lat., nearly S. S. E., and between 39° and 38° S. W., and terminates with the Capo dell' Armi on the S. extremity of the Straits of Messina.

The *Northern Apennines*, which, near the Pass of the Bochetta, are of moderate height and breadth, occupy farther E. a greater space and rise to a higher elevation. The highest summits are between 10° and 11° E. long., where Monte Pellegrino rises to 5,161 f. and Monte Cimone to 6,975 f. Their northern declivity towards the plain of the Po is gradual and gentle; but towards the S. they lower with an abrupt and steep descent. On the S. they send off some lateral ranges, among which that which is called the Alpi Apenni is the most remarkable, and highest. It leaves the main range W. of Monte Pellegrino, and is separated from it by a considerable depression. It extends southward, and terminates at a short distance from the sea, near the towns of Massa and Carrara. It forms a mass of finely crystallised limestone nearly thirty miles long, and scarcely ever at a less elevation than 4,000 feet above the sea, rising often much higher, as in the Panni della Croce, at the S. extremity, 6,102 f., the Pizzo d'Uccello, at the N. W. end, 6,147 f., and Monte Salvo, near Carrara, 5,540 f. On the slope of the last-mentioned mountain the quarries are worked, from which, nearly for 2000 years, the finest marble has been extracted.

Besides the road over the Bocchetta, the N. Apennines are traversed by three roads; one begins at Parma, runs over the plain to Fornovo, and then in the valley of the Taro to the upper part of the range, which it crosses by the Pass of Cento Croci; it afterwards descends to Pontremoli, and then, mostly in the valley of the Magra, to the Gulf of Spezia. Farther E. is the road between Modena and Pistoja; it runs through Pavullo, Pieve Foglago, on the west of Monte Cimone, and traverses the range by the Pass of Fimalbo. The third road unites Bologna with Florence; it runs from Bologna over the plain of Lombardy to Lojano, crosses the range by the Pass of Pietra Mala, at an elevation of 3,284 feet, and descends into the valley of the Sieve, whence it passes over a lateral ridge of moderate elevation to Fiesole and Florence.

The Central Apennines may be divided into two parts. Between Monte Falterona (S. of 44°) and Monte Sibilla (S. of 48°) their general direction is S. E., and though their upper declivity is very steep, they do not seem to rise to a great elevation, one of the highest summits, Cima de Vernina, hardly exceeding 4,000 feet. Between Monte Sibilla and Monte Vellino (N. of 40° lat.) the Apennines attain their greatest elevation. Monte Sibilla rises to 7,212 feet, and Monte Vellino to 8,183 feet. Nearly at equal distance from either, and near the source of the Vellino, two lateral ranges branch off, which are overtopped by high summits; on that which runs to the S. E., towards the Adriatic Sea, is the Gran Sasso d'Italia, whose summit, the Monte Corro, attains 9,521 feet above the sea, and is the highest in the range. On the W. lateral range is the Terminello Grande, 7,034 feet above the sea. Numerous are the lateral ridges which branch off from the Central Apennines. Those running towards the Adriatic Sea, form nearly right angles with the principal range, preserve for some distance a considerable elevation, and lower afterwards rapidly but gradually. They terminate with hills, at no great distance from the shore. The lateral ridges, which traverse the much more extensive country between the Apennines and the Mediterranean, run nearly parallel to the principal range, so that nearly all the rivers of this region run in valleys extending S. E., or N. W., and form as it were terraces of different elevation, by which the country gradually lowers towards the sea. In these lateral ridges some summits attain a considerable elevation, as Monte Amiata, W. of Radicofani (S. of 43° N. lat.) which rises to 5,794 feet.

Two roads traverse the N. portion of the Central Apennines. The northern begins on the side of the Adriatic at Fossombrone, on the Metauro; runs S. to Capri, and passes over the range between this place and Sigillo, whence it continues to Nocera and Foligno, and hence by Spoleto, Terni, and Narni, to Rome. The S. road begins at Ancona, runs S. to Loreto, and hence W. to Tolentino and Belforte; between the last-mentioned place and Foligno, it passes the range at some distance N. of Monte Sibilla. Only one road traverses the southern higher part of the Central Apennines. It begins on the N. at Terni, on the Nera, a tributary of the Tiber, passes hence to Rieti and Clivita Ducale, on the Vellino, whence it traverses the range by a long mountain-pass, which terminates near Aquila, on the Aterno, and thence the road continues to Sulmona.

The undivided portion of the S. Apennines resembles, in part, the Central Apennines: its offsets, towards the Adriatic, run off at nearly right angles; but on the W. it has a lateral ridge, which runs parallel to it for a distance of more than 50 miles; and between it and the principal range extends a longitudinal valley, drained by the Volturno, and its tributary, the Calore. After these rivers have united, they break through the lateral range, and enter into the plain of Terra di Lavoro. The principal range contains some high summits, as Monte Meta 7,264 ft., Monte Miletto 6,730 ft. above the sea. The highest part, however, seems to be the Matera, an enormous mass of chalk rocks, 40 m. in circ., situated at the sources of the Biferno, nearly in 41° N. lat. On some of its summits snow is stated to be found the whole year.

Near the sources of the river Calore a lateral branch runs off nearly due W., which terminates with a high ridge on the peninsula S. of the Gulf of Naples. It contains the Monte S. Angelo di Castellamare, which rises to the height of 4,688 feet. The W. extremity of this ridge is the Punta della Campanella, opposite the rocky island of Capri. Monte Gargano, a promontory projecting into the Adriatic, is commonly considered as the E. extremity of another lateral ridge of the Apennines, but it is quite unconnected with that range, being separated from its nearest offset by a low plain, many miles in breadth.

This range is traversed by two roads: one runs from the town of Naples to Capua and Presenzano, and passes over the lateral ridge enclosing the valley of the Volturno to Venafro and Isernia. Between Isernia and

Castel di Sangro it crosses the principal range of the Apennines, and from the last-mentioned place it continues to Sulmona and Chieti. The second road strikes off E. from Naples, and passes over the first range by the pass of Monte Virgine; it then descends into the valley of the river Calore, in which it traverses the towns of Avellino and Ariano. E. of the last-mentioned town is the principal range of the Apennines, over which the road passes to Ponte di Bovino, and then enters the great plain of Puglia (il Tavolieri della Puglia), and continues to Foggia, Bari, &c.

The most easterly ridge, arising from the bifurcation of the Apennines, preserves a considerable elevation as far as the town of Altamura; but E. of that it is continued only by a series of hills, called *Le Murgie*, which extend through the whole of the peninsula lying between the Adriatic and the Gulf of Taranto. They are interrupted in several places, and terminate at Capo di Leuca.

The other chain runs directly S., and approaches by degrees the shores of the Mediterranean Sea: on the E. side of the Gulf of Policastro it comes close to it, and continues to run along the sea as far as the Gulf of S. Eufemia, where it suddenly turns to the E., but soon again to the S., in which direction it skirts the eastern shores of Calabria, between the Gulf of Squillace and Capo Spartivento. In this chain are some elevated summits. Monte Pollino (near 40° N. lat.) rises to 7,067 feet above the sea, and Monte Alto, the highest summit of the great mountain mass, in which the Apennines terminate on the Straits of Messina, is 4,380 feet above the sea.

Geology.—The N. parts of the Apennines are, in general, composed of sandstone and chalk. The former is known in Toscana by the name of *macigno*, or *pietra scabra*, and several high mountains are composed of it; others consist of chalk, and others of macigno and chalk together. In the S. ranges the chalk formation predominates, especially on the W. side; on the E. declivity sandstone occurs in a few places. A great portion of the hilly districts, which extend to the W. of the range, and intersect the plains along the Mediterranean, is composed of lava and other volcanic productions. This region extends from Monte Vesuvius on the S., to the river Ombrone, in Tuscany, on the N. Near this river is Monte Amiata and Monte Radicofani (3,060 feet high), both volcanic mountains. A volcanic country encloses the lakes of Bolsena and Bracciano, and the rocky masses near Viterbo are also of volcanic origin. S. of the Tiber other volcanic rocks of considerable extent and elevation form the mountains near Albano; hence Monte Cavo rises to 3,110 feet above the sea. The country round Rome is overpread with volcanic matter; and the Seven Hills themselves are partly composed of it. A third volcanic region occurs N. of Capua, near Terno, where several heights rise to a considerable elevation, especially Monte St. Croce. Mount Vesuvius and the volcanic country round the town of Naples, constitute the most southerly region of the volcanic tract which skirts the W. side of the Apennines. On the E. side of the Apennines, only a single extinct volcano has been found—it is Monte Vulturno, near Melfi, not far from the place where the bifurcation of the range takes place.

The lower declivities of the principal range, and a great part of the lateral ranges, where they do not rise above an elevation of 3,000 feet, are commonly clothed with woods, especially evergreen oak and chestnut. The upper parts of the principal range have, in general, an arid soil, or are formed of bare rocks, of fantastic forms, and destitute of vegetation, except a few stunted bushes. The whole range is poor in metals, none of them occurring, except iron ore in a few places, and of bad quality. But in many places excellent marble is met with, and in a few it is worked.

The higher parts of the Apennines begin to be covered with snow in October, and they are not entirely free from it before June. It is deserving of remark, that the quantity of rain falling in the countries E. of the range is much less than that with which those on the W. are favoured. In the plain of Puglia the rain amounts only to about 19 inches annually, whilst in that of Terra di Lavoro it is 27 inches.

The countries lying W. of the range are subject to frequent earthquakes, and even some parts of the range itself are visited by them. An earthquake in the country lying about Mount Matese occurred in 1806, by which 3,274 persons lost their lives, and 1,613 were wounded.

APENNADE, a sea-port town of Denmark, at the bottom of a bay of the same name, on the E. coast of Sleswick, opposite to the N. end of the island of Alsén, lat. 55° 2' 57" N., long. 9° 26' 38" E. Pop. 3,800. It is the cap. of a bailiwick. Its port is shallow, and not very safe; but it has notwithstanding a considerable trade in the export of agricultural produce, with distilleries, breweries, tanneries, &c.

APOIDA, a town of Saxony, circle of Weimar-Jena,

91 m. N. R. Welmar. Pop. 3,300. It has a castle, a college, with a bell-foundry, fabrics of cloth and cassimere, and distilleries. Its fairs, 4 annually, are well attended.

APPELDOORN, a town of the Netherlands, prov. Guelderland, 17 m. N. Arnhem. Pop. 3,000.

APPENZELL (CANTON OF), a canton in the N. E. part of Switzerland, the 13th in the Confederation. It is completely inclosed within the territory of St. Gall, and is shaped somewhat like a ham, the knuckle end stretching N. E.-ward; area, 153 sq. m. (7½ Germ.). Pop. 49,876; being next to that of Geneva the most thickly peopled of the cantons. Its surface consists chiefly of mountain ranges; of the S. belonging to the higher Alps; the principal of which, the Hoch Scntis, is 8,109 ft. high, but having its summit covered with perpetual snow; most of the others belong to the Lower or Fore-Alps (see SWITZERLAND), which inclose numerous small valleys. It is watered by several rivulets, the chief of which is the Sitter, running through its centre; there are also several small mountain lakes. The prevailing geological formations are calcareous; but pudding-stone and sandy or clay soils are likewise found. Climate cold and variable, but not unhealthy. The mineral riches of the canton consist of peat and coal; salt, chalybeate, and sulphurous springs are met with, some of which, as those of Welsbad near Appenzell, and Waldstatt near Herisan, are used as baths. Its forests, mostly of pine and fir, originally extended over the whole surrounding country; but their extent has been greatly diminished with the increase of population and cultivation; and wild animals, game, fish, &c., have become proportionally rare. Before the Reformation, the whole canton was under one government; but at that epoch, part of the inhab. having embraced the Protestant faith, while the other part continued Catholic, violent disputes were kindled between them, which, after much contest, were at length settled by a singular compromise. By an agreement in 1597, the canton was divided into two portions—*Rhodes Interior* and *Rhodes Exterior*. It was stipulated that the former should be appropriated to the Catholics, and the latter to the Protestants. Accordingly, the two parties separated, and formed two independent democratical republics, having each a distinct system of government, police, and finance. Exterior or Outer Rhodes comprises about two-thirds of the whole canton (its N. and W. parts), and has 40,000 inhab., engaged chiefly in manufactures; Inner Rhodes has 9,796 inh., principally agriculturists. Both republics have but one vote in the Swiss diet, and send their deputy by turns. Except in a few districts at the N. E. extremity, Appenzell produces neither corn nor wine; but the mountains abound with rich pastures, and cattle-breeding forms the chief occupation of the Inner Rhodes. 15,000 cows and oxen, 600 sheep, and 2,000 goats are fed there annually, it being a practice to purchase them when lean, and sell them again when fattened: cheese, beer, and a liqueur made from a fine kind of black cherry, are the other products of the agricultural districts. The manufactures of the Outer Rhodes are cotton and linen goods, and embroidery: there are about 10,000 looms, by means of which are woven an average of the same number of pieces of cloth 16 fr. ells in length. Machinery has not been introduced: weavers work from 13 to 14 hours a day. They are dispersed over the country, and combine with their business as manufacturers that of small farmers, being, in each case, assisted by their families.

The houses are distinguished by neatness, convenience, and cleanliness; and being surrounded with gardens and hedges, and thickly scattered over the country, give it somewhat of an English aspect. Weavers generally earn from 2 to 5 florins (3s. 8d. to 9s. 2d.) per week.

Outer Rhodes has communal and lesser councils, and a grand council, composed of the principal magistrates of each commune, which assembles twice a year, and exercises the executive power. The grand council proposes the laws, and submits them for approval to the *landsgemeinde*, or general assembly of all the males of the republic above 16 years of age, who meet armed on the last Sunday in April, in the open air, and either sanction, or put their veto on the laws proposed. Bankrupts, paupers, &c., are precluded from voting; and penalties are imposed on others who do not attend. The government of the Inner Rhodes is similar, except that the clergy take more part in it, and that none under 18 years of age have the right of voting in the general assembly. Public schools are universally established; in which, after the rudiments of education, arithmetic, drawing, and singing are taught. Music is very generally cultivated. Savings' banks and poor-houses are established in every parish, and there are numerous orphan asylums and other charitable institutions. Appenzell furnishes 972 men to the federal army, and contributes 9,320 Swiss francs a year to the funds of the union: the expenses of the canton are very trifling, as the services of the magistrates, &c., are gratuitous. The tax on salt is the only indirect one; the poor are not taxed at all. The Appenzellers of the

Outer Rhodes are of German, those of the Inner Rhodes chiefly of more southern lineage; all, however, are lively, intelligent, and exhibit much mechanical ingenuity, and, with few exceptions, are said to be industrious, well-behaved, prudent, and simple in their mode of life.

In the 7th or 8th century, the Frankish kings bestowed this country on the abbots of St. Gall, and it remained subject to them until 1401, when the inhabitants revolted, and, with the assistance of their neighbours of Glarus and Schwytz, achieved their liberty, defeating the Austrians and the forces of the abbot in several engagements. In 1513 it was admitted into the confederation, with the history of which it is subsequently connected.—*Cant. of Switzerland*, Letter 4.; *Poet. Statistique de la Suisse*, 1830; *Helvetic Almanack*; *Bourring's Report*, &c., pp. 21—27.)

APPENZELL, a town of Switzerland; cant. Appenzell, cap. Inner Rhodes, and seat of its executive council, in a pleasant valley on the left bank of the Sitter, 9 m. S. St. Gall. Pop. 1,400. It is dirty and ill-built; has a Gothic church, built in 1069, which contains various banners taken in former wars by the Appenzellers; two convents; a convent house; and two bridges over the Sitter. The annual general assembly of the republic is held here. About 2½ m. S. are the baths of Welsbad.

APPIN, an extensive district of Scotland, co. Argyle, which see.

APPLEBY, a borough, m. town, and par. of England, co. Westmoreland, of which it is the cap., 230 m. N. N. W. London, 28 m. S. S. E. Carlisle. Pop. of town, 837, of par. 1,459. It rhodes principally on the left bank of the river, on the slope of a hill, and consists chiefly of one broad street, having the castle at the upper end, and the parish church at the lower. The former, the property of the earls of Thanet, is very ancient, part being either of Saxon or early Norman architecture; but it was mostly rebuilt in 1686. The church was rebuilt in 1655, by Lady Pembroke, a great benefactress of the town, from whom the castle descended to the Thanet family, and has a fine monument to her ladyship. There is a good market-house erected in 1811; and a town-hall and gaol on the right bank of the river, which is here crossed by an old stone bridge. Appleby has a grammar school, founded in the reign of Elizabeth, open to all children belonging to the town on payment of a fee, and having attached to it 5 scholarships at Queen's college Oxford, and a right to participate in as many exhibitions in the same college. It has also an almshouse, founded by Lady Pembroke, for 13 poor widows. Previously to the passing of the Reform Act, the town was disfranchised, Appleby returned 2 m. to the H. of C.; but they were in reality the nominees of the Thanet and Lonsdale families. The town is without manufactures, but has a good market.

APULIENA, a town of Naples, prov. Capitanata, 7 m. N. N. E. St. Severo. Pop. 3,000.

APT (an. *Apia Julia*), a town of France, prov. Vaucluse, cap. arrond., on the Calavon, 39 m. E. S. E. Avignon, lat. 43° 2' 29" N., long. 5° 32' 52" E. Pop. 5,958. It is situated in a spacious valley, surrounded by hills, covered with vines and olives. The walls, originally constructed by the Romans, and repaired by the comtes de Provence, still partially exist. The older streets are narrow, crooked, and the houses mean; but the more modern streets are broad and straight, and the houses comparatively good. Principal public building, cathedral, of great antiquity, and remarkable for its subterranean chapels, &c. A bridge over the Calavon, of a single arch, is said to be *finonnie par sa hardiesse*. There are establishments for the spinning of cotton and silk, with fabrics of cloth, hosiery, cotton-stuffs, hats, and earthenware; the latter, and the *confitures* made here, being highly esteemed. Several remains of Roman works are found in the town and its vicinity. (*Hugo, art. Faucusse*, &c.)

APULIA, PUGLIA, or APUGLIA, a portion of S. Italy, lying between 39° 45' and 41° 45' N. lat., and 14° 57' and 18° 34' E. long., comprising the S. E. provinces of the k. of Naples; viz. Capitanata, Bari, and Otranto; having N. W. the prov. Sanio, N. E. the Adriatic, S. E. the Ionian Sea, S. W. and W. the Gulph of Taranto and the provs. of Basilicata and Principata Ultra. Area, 8,092 sq. m. Pop. (1833), 1,079,700. It has, at its S. extremity, the sub-peninsula of Otranto, which forms the heel of the fancied Italian boot; and on its N. E. shore the promontory of Gargano. Although it has 440 m. of coast, it is singularly deficient in bays and harbours, and the shores are low; forming in both respects a great contrast to the S. W. shores of Naples.

Puglia presents also a striking contrast to Calabria, and the S. W. prov. of Naples, in being almost wholly a plain country, and indeed containing by far the most considerable extent of level lands of any tract of the same size S. of the Po. It is divided into *Puglia piana*, and *Puglia montana*; the latter is composed of the Appennine chain, 155 m. in length, which, emerging from

Basilicata, runs through the Terra di Bari and Otranto to the extremity of the latter, and of the Garganese, and other branches chiefly in the N. and W. of Capitanata. The mountains of Bari and Otranto are much less elevated than the Apennines in any other region. The plains in the N. are pretty well watered while those of the central and S. parts are remarkably destitute of water, forming another contrast to the sub-peninsula of Calabria on the opposite side of the Gulf of Taranto. Chief rivers, Candelaro, with its tributary streams, Radiconia, Trilolo, Salsola, and Colone; and the Cervaro, both of which run into the Laguna Pantano Salso; the Fortore, Carpella, and Ofanto, which discharge themselves into the Adriatic, all in the prov. of Capitanata; the latter river is the only one not dried up during summer. On its banks near Canne, was fought the famous battle of Canne (see CANNE). Thence to C. St. Maria di Leuca, a tract 160 m. in length, there are only a few insignificant streams. There are no lakes, but several lagunes of some size, along the shore round and near M. Gargano, as those of Lesina, (14 m. long, and 3 m. broad), Varano, Pantano Salso, and Salpi; and a few smaller ones near Taranto.

Apulia is divided into the following provinces: —
Capitanata. Area, 3,714 sq. m. Pop. 236,793. Ch. towns, Foggia 20,647 inh., Manfredonia, M. St. Angelo, Termoli, Viesti, Ascoli.

Terra di Bari. Area, 1,712 sq. m. Pop. 425,706. Ch. towns, Bari, 18,937 inh., Barletta, 17,635 inh., Monopoli, 15,535 inh., Trani, 13,747, Bitonto.

Terra d'Otranto. Area, 2,666 sq. m. Pop. 357,205. Ch. towns, Lecce, 14,081 inh., Taranto, 14,111 inh., Gallipoli, Brindisi, Otranto.

Aspect, and Agriculture. Much of the land is uncultivated and abandoned to wandering herds of oxen and buffaloes; in other parts, a good deal of corn of different kinds is grown; but maize does not generally flourish, owing to the dryness of the soil. Corn and wool are the chief products of Capitanata, which also produces plenty of wine and oil. In the neighbourhood of Lucera (says *Cramer*, 1821), of 27,000 versasars of land (the versara = 3 acres), 1,800 were sown with corn; 3,000 with barley; 2,500 with oats; 800 with beans; 5,500 fallow; 700 covered with olives, vines, and fruit-gardens; the rest in pasture. In this prov. lands are let in large tracts, and a *cassale* or large house established near the farm, in which the *agricoli* and labourers reside. There are also extensive *tanulieri* or pasture lands belonging to the crown, capable of feeding as many as 1,200,000 sheep. The centre of Capitanata has a sandy soil, and consists chiefly of pasture. From Foggia to Manfredonia, this tract abounds with thistles, asphodels, wild artichokes, and giant-fennel, of the stalks of which latter, chair-bottoms and bee-hives are made. On the banks of the Cervaro, the mountains are clothed with fine woods, and thickets of flowering shrubs; near Bovino the plain is wooded with low stunted oaks; a forest of oak, myrtle and other ash, pitch-pine, chestnut, and evergreens (but none of them large), adorns M. Gargano; the country is well cultivated at its foot. Capitanata produces excellent vegetables, wine, and fruit of all sorts, liquorice and tobacco. A great deal of wine is produced in the Terra di Bari; the vines are cut low, but not staked as in France; it is fertile in corn, oil, saffron, almonds, tobacco, mulberry-trees, liquorice, and capers, generally without manure, though in some parts the soil is but indifferent. Its sheep (all of a dark colour) furnish the best wool in Apulia; goats and swine are kept in large numbers. This prov. yields also, annually, 1,660,000 *moggie* of salt, and 12,000 cwts of nitre. The T. d'Otranto "would be one of the richest provinces in Italy, were it not for its wretched administration." (*Rampoldi*.) Its tobacco is as good as that of Seville, but only a given quantity is allowed to be cultivated. It yields wine, olives, cotton (good and abundant), wheat sufficient for the inhab.; the arable lands are well cultivated, but there are no artificial pastures, and much of the land lies waste. The chief natural disadvantage is labour and water, the want of water, and the rain that falls is therefore carefully preserved in subterranean cisterns.

The hilly parts of Apulia feed many flocks, and produce an abundance of corn, oil, cotton, and flax; which latter is exported to Venice, Germany, and Switzerland. The shore is generally sandy, uncultivated, and covered with bushes, wild prunes, myrtles, erice, &c. that serve as food for oxen and buffaloes. The whole country, in Bari and Otranto, abounds with aromatic plants; and both the wines, and flesh of some of the animals, as the buffaloes, have an aromatic flavour. Puglia is famous for its deer and other game; the sportsmen run down hares with greyhounds, and pursue the wild-boar with lurchers and mastiffs, riding armed with a lance and brace of pistols. The shores about Taranto furnish large quantities of shell-fish. The viper, asp, a species of large black snake, the tarantula, &c., infest this part of Italy.

The dyeing of wool is an important branch of industry at Taranto; the internal commerce of Apulia, of which Foggia is the head-quarter, consists chiefly in the sale of wool, cheese (from sheep's milk), and corn.

The country is quite healthy, the people industrious, peaceable, and handsome. Many of them in various districts are Greeks or Albanians; these being, in the Terra d'Otranto, $\frac{1}{2}$ of the whole; they preserve their original customs, dress, and religion, and occupy themselves in cotton-weaving. Brigandage is prevalent about Bovino, and on the borders of Sannio, but not in other parts.

This territory was originally called Daunia, Iapygia, Peuceclia, and Messapia, and formed part of Magna Græcia. Having fallen under the Roman dominion, Augustus made it the 3d prov. of Italy, under the name of Apulia. After the fall of the empire in the W., it was occupied successively by Odoacer, Theodoric, and the Greek emperors, till, in the 8th century, it was wrested from the latter by the Arabs; and from them in turn by the Normans, in the 11th century; Robert Guiscard styling himself first Count or Duke of Apulia. It continued in the possession of his successors till the death of Manfred, at the battle of Benevento, in 1262, when it fell under the dominion of Charles of Anjou, as well as the rest of the Neapolitan territory. Its subsequent history belongs to that of Naples. (*Rampoldi, Corografia dell'Italia*; *Swinburne's Travels in the Two Sicilies*; *Craven, Tour in the S. Prov. of Naples*; *Weimar Almanack*, 1838.)

APURE, a river of S. America, Colombia, one of the principal tributaries of the Orinoco, which see.

AQUANABOIE, a territory of W. Africa, part of the state of Dahomey, which see.

AQUAPIM, a territory of W. Africa, part of the empire of Ashantee, which see.

AQUILA, a city of the Neapolitan States, cap. prov. Abruzzo Ultra, on a hill at the foot of which flows the Alterno, lat. 42° 27' N., long. 13° 28' E. Pop. (1832), 9,191: viz. 4,511 males, 4,683 females.* It is surrounded by walls, and ranks as a fortified place of the 4th class; is pretty well built; has a cathedral, and various churches, convents, and hospitals; is the seat of a bishopric, of a civil and criminal court, a chamber of finances, &c. A royal college was established at Subiaco in 1807, was transferred thither in 1816; it was soon after raised to the rank of a lyceum, differing little from a university, and is attended by about 400 pupils. There is also a secondary school, established in 1768, and various other seminaries. A handsome new theatre, built on the model of that of Vicenza, was opened in 1832. Excellent water, conveyed from the Monte San Giuliano, about 3 miles distant, by an aqueduct, constructed at a great expense, during the flourishing period of the city, is liberally distributed to some fine public fountains, as well as private houses. The town has manufactures of linen and wax; and a considerable trade in saffron raised in its neighbourhood.

Aquila was founded in 1240; and rose in no long time to be one of the richest, most populous, and powerful cities in the kingdom. But the combined influence of misgovernment, pestilence, war, and earthquakes, from the latter of which it suffered severely in 1703 and 1706, have reduced it to its present state of decadence. Latterly, however, it has been improving. (*Del Rio Descriptione delle Due Sicilie*, li. pp. 115—300.)

AQUILIELLA, a small town of Austria, Italy, near the bottom of the Adriatic, 18 m. S. S. W. Gorizia, lat. 45° 45' 32" N., long. 13° 23' E. Pop. circa 1,500. It is surrounded by a wall and a fosse, and is connected by a canal with the port of Grado, the residence of a few fishermen. This is all that now remains of one of the principal cities of ancient Italy—its chief bulwark on its N. E. frontier, and the great emporium of its trade with the nations of Illyria and Pannonia! Ausonius assigned to it the ninth place among the great cities of the empire:—

*Nona Inter clavae, Aquileia celsioris, urbes,
Italia ad Illyricos objecta coloma montes,
Neculis et portu celeberrima.*

Clare Urban, 7.

Aquila withstood a siege by Maximinus; and in 455 it opposed a vigorous and gallant resistance to Attila; but that ferocious barbarian having carried it by assault, razed it to the ground, the destruction being so complete, that the succeeding generation could scarcely discover its site! The unhealthiness of its situation has caused the miscarriage of the attempts that have been made for its restoration. In 1791, two archbishops were formed out of the patriarchate of Aquileia. (*Cramer's Ancient Italy*, l. p. 129; *Gibbon*, cap. 35.)

ARABIA, an extensive peninsula, comprising the

* The population is generally set down in late works at between 13,000 and 14,000. This, however, is an error, and no doubt refers not to the town, but to the *circumaria* (surrounding district), which contains a considerable extent of country, and some small towns. Its population in 1832 was 14,639.

S.W. portion of the Asiatic continent, situated between the rest of Asia and Africa, and between 12° 22' and 33° 45' N. lat., and 32° 50' and 58° 42' E. long. It is bounded on the S. and E. by that part of the Indian Ocean called the Arabian Sea; on the N.E. by the Gulphs of Oman and Persia; and on the W. the Arabian Gulph, or Red Sea, forms its boundary from the Straits of Bab-el-Mandeb to the Isthmus of Suez. The N. limit is less clearly defined; the desert in which Arabia terminates in this direction being continuous with that of Syria, and no well-defined line of demarcation existing between them. The most natural boundary on this side appears to be a line drawn from the head of the Persian Gulph to the most westerly point of that of Suez, coinciding very nearly with the 31st parallel of N. lat., but it is usual to include in this country a considerable part of Irak Arabi, and the desert plains S. and E. of Syria and Palestine, and under this view, the N. boundary follows very nearly the course of the Euphrates. The countries contiguous to Arabia are, on the N. the Asiatic provinces of the Turkish Empire; on the W. Egypt and Abyssinia; on the S. Aden, the most easterly portion of Africa; and on the N.E. Persia. On the E., except along the Persian Gulph, the nearest land is Hindostan. Its greatest length from Suez to Cape Ras-al-Hhad is 1,650 m., and its greatest width from the Straits of Bab-el-Mandeb to the town of Keham on the Euphrates 1,400 m. Its area, measured on D'Anville's map, is about 1,100,000 sq. m. (Compare D'Anville, *Carte d'Asie* with *Travels of Ali Bey*, li. p. 9.; *Map of the Coast of Arabia*, same work, li. p. 27.)

Divisions, Ancient and Modern.—From the earliest period of authentic history, Arabia has been the connecting link between the E. and the W. world. It was the mart whence the Phœnicians drew the supplies of gold and silver, gems and pearls, spices and perfumes, with which they furnished the countries of Europe. And even before this more extensive intercourse existed—before Phœnicia was a nation, or her “traffickers princes,” the Arabian caravan was seen upon the Nile, and on the borders of Palestine, laden with the most rare and precious products. (Genesis, ch. xxxvii.) That these were only partially, if at all, native products of Arabia, is sufficiently proved; but the W. nations, who received them from Arabia, looked at first no farther for their origin. Exaggerated notions were formed of the beauty of a land whence such precious luxuries were procured, and the term *Eden*, *Felix*, or the Happy, became connected with its name. But when, in the course of time, the Greeks first, and then the Romans, came to this fancied paradise, they found the soil, wherever they essayed to enter the country, a burning sand or an infertile rock. The possibility of an “erroneous theory was, however, seldom admitted by ancient inquiry. Arabia was still believed to be the Happy or Fortunate, but its blissful regions were supposed to be separated from the less favoured portions of the earth by an absolutely sterile zone or belt. All the country E. of Egypt had, indeed, been known, time immemorial, by the common name *Arabia*; and this designation being still retained, the inhospitable tracts upon the N. and W. received the distinctive epithet of *Regum, Deserta*, or the Desert. (Herodotus, *Thalia*, § 117—113.; *Diodorus Siculus*, lib. ii. pp. 159—167.; lib. iii. pp. 211—216.; *Strabo*, lib. xvi. pp. 767—781.; *Pliny, Nat. Hist.*, lib. v. § 11.)

Ptolemy subsequently added a third division to Arabia, including the country between the Red and Dead Seas, and between Palestine and the Euphrates: in other words, he gave to his Arabia the N. limit which, since his time, it has generally been considered as retaining. To this new district he gave the name of *Arabia Petraea*, from *Petra*, a town on the lesser Jordan, south of the Dead Sea, and the capital of the Nabatheans. (See *PETRA*.) This division of the country by the Greco-Roman geographers was universally adopted, not only by their contemporaries, but by all the western nations in the middle ages. On the revival of learning, the great work of Ptolemy was taken up as the text-book of geography, and his arrangements were universally adopted. Even Gibbon was deceived by them. “It is singular enough,” he remarks, “that a country whose language and inhabitants have ever been the same, should scarcely retain a vestige of its old geography.” (*Decl. and Fall*, v. chap. 50.) But he forgot that this “old geography” was the invention of foreign nations, possessing neither political power nor influence over the wandering Arab tribes, in almost total ignorance of the settled portion of the Arab people, and, consequently, without the means of making their divisions known among the natives, still less of causing them to be adopted. The fact remarked by Gibbon of the identity of the people and language in ancient and modern times, leads, indeed, irresistibly to the conclusion that an “old geography,” of which the natives retain neither vestige nor recollection, never had an existence among them, and that the ancient *Arabia*

divisions of this country are as identical as the people and the language with those existing in the present day. These native divisions are the following:

1. *Bar-el-tour-Sinai* (the Desert of Mount Sinai), nearly identical with the *Arabia Petraea* of Ptolemy. It comprises the small peninsula between the Gulphs of Suez and Akabah, and the country northward as far as the Dead Sea. This is the region so celebrated in Sacred History as the scene of the wanderings of the Jewish people; but, though it may be gathered from the Moslem account that it was then the residence of several warlike nations, it is, at present, nearly uninhabited. (*Niebuhr*, par. li. p. 345.)

2. *El-Hedjaz*, or the Land of Pilgrimage, occupies a considerable portion of the coast of the Red Sea. Its boundaries are E. *Nedjed*, W. the *Red Sea*, S. *Yemen*, and N. *Bar-el-tour-Sinai* and *Nedjed*. This district acknowledges a sort of doubtful authority in the grand Signior as protector of the holy cities (Mecca and Medina); but those cities, and the whole southern part of Hedjaz, called *Belad-el-Haram* (Holy or Forbidden Land) were, till within these few years, under the government of the sheriff of Mecca, the sheriff's power has, however, of late been much shaken; first by the Wahabees, a fanatical sect of Nedjed, and more recently by Melhem Ali, Pacha of Egypt. (*Niebuhr*, par. li. p. 302.; *Ali Bey*, li. pp. 29, et seq.; *Burckhardt's Travels in Arabia*, passim.)

3. *Nedjed* constitutes the central part of the peninsula. It is the largest, but the least known, of all the divisions. It is bounded N. by the Syrian Desert, E. by *Lachsa*, S. by *Yemen*, and W. by *Hedjaz*. (*Niebuhr*, par. li. p. 296.; *Burckhardt*, vol. li. p. 396, et seq.)

4. *El-Hassa-Lachsa*, otherwise *Lachsa*, *Hadsjar*, or *Bahrin*, lies upon the Persian Gulph. Its boundaries are, towards the N. the country of *Irak Arabi*, W. *Nedjed*, S. *Oman*, and E. the Persian Gulph. (*Niebuhr*, par. li. p. 293.)

5. *Oman* is bounded N. by the Persian Gulph and *Lachsa*, E. by the Indian Ocean, W. and S. by vast sandy deserts (parts of *Nedjed* and *Hadrarnaut*), in the midst of which it seems to rise like a little knot of mountains out of an extensive sea. (*Niebuhr*, par. li. p. 285.)

6. *Hadrarnaut* forms the S.E. division of Arabia, and is bounded N. and N.E. by the Deserts of *Nedjed* and *Oman*, S. and S.E. by the Indian Ocean, and W. by *Yemen*. (*Niebuhr*, par. li. p. 245.)

7. *Yemen*, the southern part of the peninsula, has the Red Sea on its W. side, the Straits of Bab-el-Mandeb and the Indian Ocean on the S., *Hadrarnaut* on the E., and *Nedjed* and *Hedjaz* N. (*Niebuhr*, par. li. p. 160.)

Yemen and *Hadrarnaut* point out the situation, if not the extent, of the *Arabia Felix* of Strabo and Ptolemy. The inhabitants regard themselves as the chief of all the Arabian people, calling their country *Belad-ed-Ulm u Belad-ed-Dyn*, “The birthplace of the sciences and of religion.” (*Niebuhr*, par. li. p. 247.) But the *Arabia Felix* of Greek geography seems to have extended much farther N., comprising the whole of Hedjaz and Oman, together with the greater part of *Lachsa*, and a very considerable portion of *Nedjed*. (Strabo, lib. xvi. cap. 3. p. 765.; Ptolemy, lib. vi. cap. 7. p. 112.) The *Arabia Deserta* included the N. parts of *Nedjed* and *Lachsa*. In Ptolemy's map this district is separated from the former by an imaginary range of mountains, running from the Persian Gulph to another range, equally imaginary, supposed to form the boundary between *Arabia Felix* and *Arabia Petraea*. The position of this last-mentioned province has been previously pointed out.

Physical Features of the Country, Mountains, and Plains.—The name (*Nedjed*) of the central and largest division of Arabia signifies high or elevated ground; and the whole peninsula, as far as at present explored, consists of an elevated table-land, with a general inclination towards the N. and E.; and surrounded by a belt of low land, varying in width from one or two days' journey, to a single mile or less. (*Niebuhr*, par. li. pp. 109, 296, &c.; *Burckhardt*, li. p. 397, et seq.) This flat belt is called *Gaur* or *Tehamu*, Arabic terms for a plain country; and the W. part of *Yemen*, on the Red Sea, has received the latter name as a distinctive appellation. A range of mountains, a continuation of the Syrian Lebanon, runs S. from the borders of the Dead Sea to *Yemen*; the face of which is much more steep and precipitous towards the W. than the E.; so that the great plain which commences immediately to the E. of these mountains is very considerably raised above the level of the sea. (*Burckhardt*, li. p. 146.) The hills of Oman seem to form the E. shoulder of this table-land, and the plains of *Lachsa* the termination of its inclination towards the Persian Gulph. (*Niebuhr*, li. pp. 255, 293.) This high plain is diversified with several considerable elevations, which cross its surface in every direction, shooting off like branches or spurs from the principal chain. *Niebuhr*

expressly states (H. p. 266.) that the portion of this plain, more particularly known by the name of *Nedjed*, is mountainous; and Burckhardt, in describing *Deirayeh*, the capital of *Nedjed-el-Ared*, says, that it is situated in a valley, the outlets of which are so narrow that only one camel can pass at a time. (*Travels*, ii. p. 399.) The main chain, supporting this table-land on the W., increases in elevation as it extends towards the S., and, although it has not been explored in the S.E. part of the peninsula, there can be little doubt that the same chain, after following the direction of the Red Sea to Yemen and Hadramaut, is continued in a line, parallel to the Indian Ocean, as far as Oman. Lord Valentia describes that part of the E. coast of Arabia, which he saw in his voyage from India to the Red Sea, as a sandy beach with a chain of mountains in the distance (*Voyages and Travels*, ii. p. 12.); and Niebuhr has no doubt that the hills of Oman form the N. termination of this chain (par. ii. p. 255.). The elevations of the land are rather in masses than in peaks, and the few great eminences of the latter kind, noticed by travellers, are referred to in terms which seem to imply that they are regarded as singularities. Thus, we are told that Mount Shalak is seen at a distance of two days' journey, rising like a tower in the midst of the plain, and that it forms a land-mark for the pilgrims travelling from Damascus to Mecca; but the notice which this mountain has attracted from all travellers along the Hadj road, leads to the inference that such land-marks are rare. (*Zach's Correspondence*, No. 18. p. 399.) Mounts Horeb and Sinai are, out of all comparison, the most celebrated in the world; they are connected with some of the most important events in sacred history; and are regarded with feelings of religious awe by Mohammedans as well as by Jews and Christians. The Sinai group is the last considerable elevation towards the N.W. of the mountains which support the table-land of the interior. This group fills the peninsula between the Gulphs of Suez and Akabah. Mount Ararat, an eminence extremely sacred in Mohammedan estimation, at a short distance from Mecca, rises from the plain country of the table-land to an elevation of 180 or 200 feet. It forms the centre of a natural solitude, being situated in a plain about three quarters of a league in diameter, and surrounded by barren mountains. The composition of the Arabian mountains, towards the N. and W., is limestone rock, with granite towards the summits; but in the higher parts of the country the bare granite rises uncovered from its very base. (See Burckhardt, *Ali Bey*, and Niebuhr, *passim*.)

The Gaur or Tehama, from its regular inclination towards the sea, and the nature of its soil—sand with saline incrustations (*Niebuhr*, par. ii. p. 161.; *Lord Valentia*, vol. ii. p. 359.)—seems to have been watered at a comparatively recent period. At Mecha the soil for 24 feet in depth is wholly composed of marine productions; and at Okella, close to the Straits of Bah-el-Maubeh, where anciently there was a harbour, in which a fœtid eel could lie, there is not, at present, much more than a foot of water. (*Lord Valentia*, vol. ii. p. 361.) The town of Musa, formerly on the coast, is now several miles inland. This fact was remarked even in Pliny's time. "Nowhere," says he, "has the earth gained more, nor in so short a time, from the water." (*Nat. Hist.*, lib. vi. c. 27.)

Rivers and Lakes.—There are no rivers, in the strict acceptance of the term, in Arabia. The most important streams noted on D'Anville's map are the Astan and the Falg, both falling into the Persian Gulph; the Massora and the Poim emptying themselves into the Indian Ocean; a nameless stream, falling into the same ocean on the confines of Yemen and Hadramaut; and the Meldam and Zebid in the S. part of Yemen. But these and every other stream of running water known to exist in this country, have more or less the character of occasional torrents. Niebuhr remarks it as a singularity, that the Massora and another small stream in Oman continued to run throughout the year; and he states, that in the Tehama of Yemen there are no rivers that retain their water during the entire summer. (*Des. de l'Ar.*, par. ii. pp. 255, 161, &c.) The few perennial streams are all reduced to insignificance during the dry season; but, under the influence of the periodical rains, these and the others often swell to an immense size, and sometimes make new channels for themselves, changing, in this way, the appearance of the coast, and leading to contradictory statements as to the number and embouchures of the different streams. (*Valentia*, ii. p. 360.)

The arid sands of the Tehama, unfavourable to the formation of rivers, are, of course, equally hostile to the accumulation of water in lakes. In fact, the dryness of the Arabian soil is proverbial; but the interior is only very partially known; and in the table-land of Nedjed lakes are supposed to exist, on the authority of Strabo, who affirms that he saw them (lib. xvi. p. 774.); and

also on that of eastern geographers, cited by Malte-Brun (*Géographie Universelle*, viii. p. 246.).

Climate.—The Tropic of Cancer divides Arabia into two not very unequal parts. It lies, therefore, partly in the torrid, and partly in the S. part of the N. temperate zone; but so many modifying circumstances exert an influence over its climate, that the mere latitude of its several parts is, perhaps, the least important element in determining the temperature, humidity, and salubrity of its atmosphere. In general, the climate is very similar to that of N. Africa. Lying under the tropic, it has, of course, its succession of dry and rainy seasons; and on the mountains of Yemen the showers regularly fall from the middle of June till the end of September. During the early part of the season the rains are most abundant, and at this time the sky is sometimes, but very rarely, covered by clouds for 24 hours together. During the dry season a cloud is scarcely ever seen. In Oman the rainy season begins in November, and continues till the middle of February. In the plain country on the coast, and in the Tehama of Yemen (though so close to the mountainous regions of regular showers), a whole year frequently passes without a drop of rain. (*Niebuhr*, par. i. pp. 34, et seq.) In this respect is found striking physical resemblance between Africa and Arabia. In the latter, as in the former, the parched plains are denied the refreshment of falling showers, and owe what share of fertility they possess to the inundations consequent upon the saturation of the mountains.

The temperature of Arabia, like that of other countries, differs widely, according to the elevation of the surface, the nature of the soil, and the neighbourhood of the ocean. In general, the mountains of the S. Yemen and Hadramaut are the most habitable, and even the coolest parts of the peninsula; but the heat of the Tehama is excessive; and great extremes of temperature are experienced within very short distances. At Mecha, on the Red Sea, the thermometer rises in summer to 94° Fahr.; while at Saana, in the mountains, it never exceeds 85°, and in this district, freezing winter nights are not unfrequent. The inhabitants of Yemen live, consequently, under several different climates, and very different species of suburbs and vegetables flourish within its limits. (*Niebuhr*, par. i. p. 4.) From the borders of Hedjaz to the banks of the Euphrates the country is a vast plain, without the slightest elevation, and wholly destitute of rivers or permanent springs. The soil is one mass of moving sand, without the slightest trace of town or village; and the dreary monotony of the scene is broken only by the appearance of a few thorny shrubs, which, taking vigorous root in the sand, supply the patient camel with the only food which he can find in these deserts. (*Joseph-el-Mihky*, in *Zach's Correspondence*, No. 18.) This country, with the Desert of Syria, seems to have formed the Arabia Deserta of Strabo and Ptolemy.

Another plain, of the same kind, and most probably even more extensive, called the *Desert of Akhaf*, lies between Yemen and Hadramaut, on the S. and W., and between Nedjed and Oman, on the N. and E. (*Niebuhr*, par. ii. pp. 245–255.) These vast sandy deserts increase very greatly the heat of the atmosphere in their neighbourhood. The wind blowing over them, about the summer solstice, becomes so dry, that paper and parchment exposed to its influence scorch and crack, as though placed in the mouth of an oven; and life, both animal and vegetable, perishes in the noxious blast. (*Ali Bey*, vol. ii. p. 46.) This is the wind known, in different and often very distant countries, by the names of the Simoom, Samiel, Sirocco, and Sorania; and which is always generated in every tropical country having extensive sandy deserts. Its grand seat is the vast desert of Sahara, in Africa; and next to it, perhaps, the deserts now mentioned. It comes from a different quarter in different parts of the peninsula, according to their position with respect to these deserts. Thus, at Mecca, the Simoom comes from the E.; in the neighbourhood of the Persian Gulph and the Euphrates, from the W.; in Yemen and Hadramaut, from the N. and N.E. The chain of hills seems to shelter the Tehama of the Hedjaz from the influence of the Simoom from the Arabian Desert, as the hottest wind known in this district comes from the African Deserts across the Red Sea, and is, consequently, very considerably cooled and mitigated in its violence.

It is only, however, during the intense summer heats that the Simoom is dreaded; and such is the general purity of the atmosphere, owing to the few exhalations from the dry soil, that both man and beast in Arabia are aware of the approach of the poisonous blast, from the sulphurous odour by which it is preceded. It is said, also, that the point of the heavens from which the Simoom is approaching is always marked by a peculiar colouring, easily distinguishable by an Arab eye. Thus forewarned, the Arab throws himself upon the ground, and the beasts hold down their heads; for it is found that this terrific blast has little or no power near the

earth, perhaps because, blowing in a horizontal direction, it is broken by the inequalities of the ground, and also, perhaps, because the few slight exhalations forced from the arid soil by the extreme heat, have power to counteract its virulence. Those who are rash enough to face it are suddenly suffocated; and in the deserts, where the Simoom blows long and strongly, whole caravans have been buried beneath the burning sands, which then rise in waves as high and strong as those of a stormy ocean. (*Niebuhr*, par. i. pp. 7, 8.)

Natural Productions.—The differences of soil and climate occasion much variety in the species and amount of the natural products of Arabia. Nothing can, perhaps, be more strongly contrasted than the vivid descriptions of the country by ancient and oriental writers, and the cold realities exhibited to the traveller or voyager who approaches its confines. Even on nearing the southern shore, the Arabia Felix, or terrestrial paradise of the ancients, the eye looks in vain for the beauty; nor is the smell gratified by the "Sabaean odours" which have been so vividly, but erroneously, described. A wide sandy beach, bounded in the distance by a range of mountains, dreary and unproductive, without a patch of verdure to relieve the eye, or a running stream to slake the thirst, or break the dull monotony of the view, constitutes the southern coast of Yemen. (*Valentia*, li. p. 12.)

The fertile spots, however, like the oases of the African deserts, are so luxuriant and beautiful, as in some measure to warrant the hyperbolic praises bestowed on the peninsula. In consequence, too, of the various circumstances of elevation, aspect, temperature, and moisture, there is no country whose productions are more numerous and varied.

The sandy plains of the centre produce the same plants as N. Africa, — the mesembryanthemum, aloe, euphorbium, stapelia, alopecurus; plants which appear a wise purpose in these wastes, by alleviating the thirst of the camel, during the painful journeys of the caravans.

The sea coast, consisting for the most part of arid sands, produces, in general, the same plants as the central deserts; but wherever the Tchama is watered by rivulets descending from the mountains, or wherever the soil is subjected to occasional inundations, a very different scene is presented. Under these circumstances, a vegetation, luxuriant and diversified, is produced, the effect of which is the more striking, from the desolation with which it is surrounded. The valleys, too, in the mountains, exposed to the influence of the regular rains, and consequently abounding in rivulets, are the seats of an abundant vegetation. In such districts, the tamarind, cotton tree, sugar-cane, banana, nutmeg, beet, and every variety of melons and pumpkins are indigenous; at all events they have grown there from the remotest antiquity (*Strabo*, lib. xvi. cap. 3. pp. 704, et seq., *Pliny*, Nat. Hist., lib. xii. cap. 8. p. 362; *Ib.* lib. xii. cap. 10. p. 363; *Ib.* lib. xix. cap. 1. p. 4.), and continue to flourish in greater luxuriance than in any other part of the world, except in the similar soil and under the similar climate of N. Africa. Arabia produces several kinds of hard wood, of which the agalochum seems to be the same with the sandal wood of the East India islands; and it may be regarded as the native home of the date tree, the cocoa, and the fan-leaved palm. Of other trees, there are the fig, orange, plantain, almond, apricot, acacia vera (producing the gum Arabic), quince, and vine. Among shrubs, the sensitive plant, castor-oil plant, and senna (both used in medicine); the globe amaranth, white lily, and pincaterina (all distinguished for their fragrance); the aloe, styrax, and sesamum are very abundant. But, notwithstanding this variety of wood, although there are some groves or thickets on the mountain side, Arabia possesses no forest, properly so called. The reason of this is obvious: the fertile, irrigated spots, small in extent, and scattered here and there, are surrounded by the sandy plain or granite rock, and, consequently, the formation of extensive woods becomes a matter of impossibility. (*Niebuhr*, par. i. pp. 127—133.)

Of Arab trees, the most worthy of notice are the coffee tree, and the tree producing the balm of Mecca, called, by the natives, *Asir Saba* (that is, the *odoraiferous tree*). Both are natives of Yemen, the coffee plantations being found chiefly on the W. slopes of the mountains, in that division of the peninsula. It is said that the Arabs have always prohibited the exportation of the coffee plant; but it is a well known fact that it was first introduced into the W. Indies from Arabia. The coffee of Yemen still, however, preserves its superiority, and fetches the highest price in the European markets. The balm of Mecca is the most fragrant and valuable of all the gum resins, but it is never met with pure out of Arabia, and there scarcely beyond the confines of Yemen. The merchants of Mocha convey it in great quantities to Medina, whence it is never exported for the

purposes of external commerce till it have been considerably adulterated. (*Niebuhr*, par. i. p. 127.)

Among the natural productions is the singular substance called *Manna*, produced from a little thorny bush, which seems to be abundant in all the deserts and their neighbourhood, and exactly answers the description in Exodus xvi. and Numbers xi.

Wherever water is found, or can be procured, the labour of the Arabian agriculturist is well repaid. Maize, wheat, dhourrah, barley, and millet cover the mountain sides of Yemen and other fertile parts. Indigo, tobacco, *Uars*, a plant yielding a yellow dye; *Fuar*, an herb which produces a red colour; together with many species of garden fruits and vegetables, are cultivated; but, in order to insure success in the cultivation beyond the districts watered by the scanty rivulets and torrents, much labour is required. It is true that the agricultural implements are of a very simple and primitive construction, but it is not in the use of these that the great labour of Arabian agriculture exists. Channels and dykes have to be constructed to conduct the water to spots where none flows naturally, and to retain it there that it may fertilise them. Great reservoirs are formed, in which the abundant rains of the wet season are collected for future use. The coffee grounds and gardens on the mountain sides are supported by *walls*, to make their surface horizontal, and so prevent the escape of the moisture. Wells are dug at immense depths; and, in short, since it is upon the amount of irrigation that the productiveness of the soil depends, it is to the collection and just distribution of water that the cares of the cultivator are principally directed; and the nature of the Arabian climate and hydrography renders these cares in the highest degree laborious. (*Niebuhr*, par. i. pp. 134—1.2.)

The fame of Arabia as the land of incense and perfumes is of very old date. But it was long since superseded, and is now well known, that the frankincense, myrrh, and similar products, with which, supplying the ancient world, were not all of its own growth, but were principally brought to its ports from Africa and various E. countries. (*Niebuhr*, par. i. p. 126; *Valentia*, li. p. 12.)

The camel is to the Arabian what the rein-deer is to the Laplander. It has been justly called the "Ship of the Desert;" and without it the Arab could never cross the seas of sand that fence his country. There are two species of this useful animal; that used in Arabia and N. Africa has only one hump, while that found in Persia and Bokhara has two. The former is frequently called the Bactrian camel, and the Arabian species is sometimes called dromedary. This last name is, however, improperly applied, the Greek term *dromas* (swift) being, most probably, unknown to the Arabians, while by the Greeks themselves it was applied to only one variety of the Arabian camel, distinguished by its greater speed from those best adapted to carrying burdens. (*Diodorus Siculus*, lib. lii. p. 125.) Arabia is generally regarded as the native country of the horse; and there are, perhaps, no breeds to be compared with those trained by the Bedouins of the desert. The horses are of two kinds: the one called *Kadschi*, that is, of an unknown race, are used for the purposes of labour, reside in the towns, and are not more esteemed than the horses of Europe. But the true Arab steed, the horse of the desert, is said to be descended from the breed of Solomon: this kind is called *Kochlani*, or horses of an ascertained race; and it is pretended that their genealogy has been preserved in the country for 2,000 years. (*Niebuhr*, par. i. pp. 142—144.) Horses are, however, by no means so numerous as has been supposed. In the settled districts the most common beasts of burden are oxen and camels; (*Niebuhr*, *passim*.) and among the Bedouins, the mare is rather a mark of distinction than a substantive part of her master's wealth. In many tribes (and those among the richest) not more than one mare to six or seven tents can be found; in some of the W. districts there are many encampments without a single horse or mare among them; and when, in 1815, the S. tribes united against Mehemet Ali, out of an army of 25,000 men not more than 500 horsemen could be mustered. The Arab tribes richest in horses live without the limits of the peninsula, in the fertile plains of Mesopotamia, and in the plain country of Syria. Burckhardt thinks that the number of horses in Arabia does not exceed 50,000. (*Notes on Bedouins*, pp. 40, 115, et seq. 246—249.)

The great cause of this scarcity is undoubtedly the difficulty of providing food for the animal, especially in the S. districts; but another cause, depending probably upon the first, is, that the Arabs almost uniformly ride their mares, and sell the horses to the town-people. The horses that they reserve are merely for the purpose of breeding, and a gelding is rarely to be seen in the desert. Although the Bedouin parts readily with the horses of his famous *Kochlani* breed, he rarely disposes of the mares until they become old, or are from some accident unfit for war; and even then he contracts with the buyer to receive the first filly foaled of any mare that he

may sell, or to receive back the mare, the buyer retaining the filly. Sometimes the first two, three, or even four fillies are thus reserved to the seller; and this, in Arab phraseology, is called selling a half, a third, or a fourth of the mare's belly. It is very rarely, indeed, that a Bedouin will part with a Kochlani mare except under such reservation of right in her future offspring. (*Burckhardt's Notes on the Bedouins*, pp. 117, 118, &c.) An Arab will sometimes take his mare a journey of several days, in order that she may breed by some celebrated horse; but, in general, the Bedouins are by no means so particular in this respect as Europeans, and consider the good qualities of the colts depend rather upon the dam than the sire. They never, however, willingly mix the *Kochlani* with the *Kadechi* breed; and if such mixture take place by accident, the colt is reckoned of the inferior race. In the towns, *Kadechi* mares are coupled with *Kochlani* horses, but in this case, also, the offspring is accounted *Kadechi*. (*Niebuhr*, par. i. p. 144.)

Kochlani horses are mostly small, seldom above 14 hands high, of a delicate but extremely graceful form, and have all some characteristic beauty which distinguishes their breed from every other. This breed is subdivided into almost innumerable families; for every mare distinguished for speed or beauty may give rise to a new breed called after her. They all, however, belong to five great divisions, named after the favourite mares of Mohammed, *Taneyye*, *Manekye*, *Kuhcy*, *Taktawyce*, and *Duffe*.

The colt, when foaled, is not suffered to fall to the ground, but is received into the arms of attendants, and attended for a while as though it were a human infant. Witnesses are assembled, before whom the genealogy of the colt is drawn out, and ascribed to the animal's neck. A colt is not mounted till it is two years old, but from this time the saddle is rarely off its back; it becomes the intimate companion of its master, sharing all his comforts (such as they are), and also all his privations. Pasture in the rainy season—barley and wheat when the plains are scorched by the tropical sun—date-paste, and dried clover when grain is scarce—form the variable diet of the Arab horse, in different districts and seasons. As long, too, as its master's camels can supply milk, it receives its share, and the Bedouin most commonly gives the fragments of his own meal to the mare on which he rides. It is, moreover, a common practice, more especially in Nedjed, to give horses flesh, both raw and cooked, particularly before the commencement of a fatiguing journey. Like their masters, the Arab horses live all the year in the open air. With little grooming and attention to their health, they are seldom ill. Being constantly in the society of their masters, they become gentle, docile, and intelligent in a high degree; they are ridden without bits—generally, too, without stirrups; and instances of vice or ill-temper are almost unknown among them. (*Niebuhr*, par. i. pp. 141–143; *Burckhardt's Notes on Bedouins*, pp. 115–123, 246–256.)

The other domestic animals are oxen, generally of a humbler kind, like those of Syria; sheep, every variety of which have extremely thick and broad tails; goats and asses, of which last there are two varieties—one not differing from those of Europe, the other large, courageous, and more desirable for a journey than even the horse. From these asses a breed of very valuable mules is procured. The buffalo, though common in Egypt, Syria, and on the banks of the Euphrates and Tigris, that is, all round the confines of Arabia, is not found within its limits; at least Niebuhr did not meet with it, and no other writer mentions the animal, except in one or two instances, where the hunted Syrian ox seems to have been mistaken for the buffalo. The latter requires a moist pasture and a plentiful supply of water. Hence it is found on the banks of the Nile and the Orontes, though in the close neighbourhood of parched deserts; but the want of water in Arabia clearly renders that country unfit for its location.

Among the wild animals are the jackal, hyæna, several kinds of asses, the jerboa, wolf, fox, boar, and panther. Besides these, there are several kinds of antelopes; the goat runs wild among the mountains, and wild oxen and asses are to be met with in the plains. Domestic poultry is very plentiful in all the fertile districts, and the plains are filled with partridge, the woods with guinea fowl, and the mountain sides with pheasants. But the most celebrated bird is one of the thrush kind, called by the natives *Samar-mug*, which comes in flocks every year from Persia, and commits great devastation among the flights of locusts. For this important service it is held in a degree of respect, amounting almost to adoration. The ostrich wanders in the sandy deserts, and is called by the Arabs *Thar-edjammel*, that is, camel bird. It is, certainly, a remarkable circumstance, that in a country lying on both sides the tropic there should be no great abundance of insects; yet this appears to be the case. *Bel Bey*, speaking of Nedjed, says, "There are few flies, and no gnats or other insects." (*Travels*, ff. pp. 45, 118.)

The locust is, however, one of the scourges of Arabia, though even this pest seems to be less destructive here than in the neighbouring countries of Syria and Persia. The esculent locust is sold in the markets, and is esteemed a great delicacy. (*Borchart, Hierozoicon*, par. i. lib. iv. cap. 6. p. 46.) These destructive ravagers come to Arabia from different quarters: a S.W. wind brings them from the Libyan desert to the shores of Yemen and Hedjaz; a N.W. wind hurls them upon Oman and Lachan, from Persia and Mesopotamia; and a wind from the N.E. frequently overwhelms Nedjed with this plague, from Syria. They seem, however, to be confined to their several localities, perhaps from inability to pass the interior deserts; for the W. flights as they may be called, or that from the African shores, never passes the mountains of Yemen, and commonly retraces its route on the day following its first appearance. No part of the year seems to be peculiarly exposed to or exempted from this plague. Niebuhr noticed locust flights in the months of January, May, June, July, November, and December. In one of these, the Red Sea between Mocha and the opposite coast of Africa was covered with their dead bodies.

Of the reptile tribes, land and sea turtles are very numerous; there are also several species of serpents, one of which, very small, and covered with white blotches, is extremely venomous, its bite being instantly mortal. The guaril, a large lizard, is said by Borchart, on the authority of Karwyni and Abdollatif, two native writers, to be equal in size and strength to the crocodile. (*Hierozoicon*, par. i. lib. iv. cap. 3. p. 1070.) All the coasts abound in fish; reefs of coral and madrepore extend along the shores of the Red Sea, and the pearl oyster is abundant in the Persian Gulph. (*Niebuhr*, par. i. pp. 142–150.)

Minerals are scarce; but this may proceed from a want of industry or skill in working them. The mountains, of an old formation, are precisely those in which the precious metals are found, and the unanimous voice of antiquity proclaims this country as the land of gold and gems, as well as of incense and perfumes. Niebuhr affirms, however, that no gold is found, and that only a small portion of silver is found mixed with lead in the mountains of Oman. There are some iron mines in the N. of Yemen, but the metal they yield is brittle and of little worth; and with regard to gems, it is now well known that the agate called *Mocha-stone* and the *Arabian corallium* come from India; and there is nothing to contradict the presumption that the other gems for which Arabia was formerly distinguished, were derived from the same source. The onyx, however, is found in Yemen, and an inferior emerald. The other minerals are basalt, blue alabaster, several kinds of spar and selenite. (*Niebuhr*, par. i. pp. 123–125.)

Population, Manners, and Customs of Arabia.—The native Arab has always been an object of interest and curiosity to the rest of the world. Descended from the same stock with the Jews, he has preserved his race almost as unmixed, and traces up his genealogy to Abraham through Ishmael, with the same pride as his competitor looks up to the same patriarch through his lawful but younger offspring Isaac. Through all the centuries which have passed over his head, he has preserved the character given to his infant ancestor in the wilderness. The desert has continued his home; he has been a man of war from his youth—"his hand against every man, and every man's hand against his."

The descendants of Ishmael were by no means, however, the first inhabitants of Arabia; and though the various eastern traditions on the subject are too numerous and too involved to be here stated, it seems pretty certain that the Arabs of the towns and those of the desert owed their origin to different ancestors—that the settled population on the coasts are descended from a more ancient, if not an aboriginal race, while the wild horseman and shepherd of the waste is the descendant of the discarded son of Abraham. Between these a marked and striking difference has existed throughout the historic period; and not only is this the case, but each class seems to have retained pretty nearly the same distinguishing features which marked it in the earliest times. The caravans from Mocha and Sanaa still convey the produce of the South to Turkey, Egypt, Syria, and Persia. (*Niebuhr*, par. i. p. 126.) As they did 3,000 years ago (*Pliny, Nat. Hist.* lib. vi. cap. 28.), though the Arab merchant be not so important a character in this commercial age, as when it could be said of him that "he must, of necessity, be exceeding rich; for with him the Roman and the Parthian leave large sums of gold and silver for the products of his woods and seas, which he sells to them without buying any thing in return." (*Pliny*, l. vi. § 28.) The Bedouins, too, or *Scenite*, are described by Pliny as living in the *black hair-cloth* tents, under which they shelter themselves at present; and he expresses his astonishment at the fact, that, being so numerous a race, the half of them, at least, should live by plunder. (*Nat. Hist.* l. vi. § 28.)

Though the younger race, the Bedouins account themselves the more noble; and the Arab is prouder of his rank than the native of any other country in the world. They have no titles of nobility, excepting such as refer to religious or political offices. The Bedouin has no idea of rank depending upon letters patent of a caliph or sultan; all men descended from the same ancestor are, in his estimation, equal in rank; and hence the preservation of their genealogies is a matter of extreme care. Among their great houses, those descended from the Prophet hold the first rank; then those whose ancestors diverged the latest from the common stock; the lowest place being seemingly assigned to those who trace their genealogy to A'cc, the second son of Adam, thus diverging from the Prophet's stock in the first accredited generation. (*Sale, Int. ad. Koran*, p. 9.; *Niebuhr*, par. i. pp. 9, 10.)

According to Niebuhr, the Bedouins are, now, the only true Arabs,—the inhabitants of the cities and towns being, in consequence of their commerce, so mixed with strangers, that they have lost much of their ancient manners and customs; whereas, the Bedouins (*As Arabs*) have always looked more to their liberties than to their ease or riches, and continue to live in separate tribes, under tents, preserving, in the present day, the same manners and customs which distinguished their forefathers in the most remote times. (Par. ii. p. 37.) Niebuhr enumerates above a hundred Bedouin tribes, each under its own particular sheikh or sheriff; these are not, however, all found within the limits of the peninsula, but extend over Syria, the plain country between the Euphrates and the Tigris, and even from the left bank of the latter river into Persia. There are, however, two classes of Bedouins; the *Ahl-el-Ahar* (true Arabs) who live entirely by pasturage and plunder, and those tribes, who, finding any portion of the country fitted for agriculture, bestow their labour on the ground, an occupation which the true Bedouin considers far beneath him. This second class of Arabs is called *Medan*, and it seems to hold an intermediate place between the Noble-Shepherd (*Ahl-el-Ahar*) and the peasant of other countries. Mr. Buckingham, who remarks this distinction in their occupations, does not, however, use the terms *Ahl-el-Ahar* and *Medan*, to distinguish them, but calls the first race *Khyat*, the other *Feldahcen*. (*Travels*, p. 87.)

The Bedouin tribes who inhabit the open country between the Euphrates and Tigris, extend as far north as Orta and Diarbekr. They are under the nominal sovereignty of the Turkish pachas of Bagdad, Mossul, and Orta; then sheikhs frequently receive the *Tukh*, or horse's tail, from the grand signor; but it appears that the bestowal, and the acceptance of this mark of dignity is almost the only assertion on the one hand, or acknowledgment on the other, of supremacy or subordination that is ever attempted or conceded; except in occasional instances, when some lordly sheikh, or pacha, has appointed another in his place, without, in the slightest degree changing the relative position of the tribe and its so-called sovereign pacha.

The Bedouins of the Syrian desert are rather more closely connected with the pachas of Syria, inasmuch as the necessity of protecting the trade between Aleppo and Damascus on the W., and Bagdad and Balsora on the E., has caused the employment of the various Arab tribes as a kind of irregular soldiery; and the bestowal of the rank of emir on the reigning sheikh of the most powerful tribe for the time being. This emir sheikh (in consideration of his rank) is obliged to conduct the caravans in safety through the desert, and to hold in check any or all of the other tribes. "We may easily judge," says Niebuhr (*Des. de l'Ar.* par. ii. p. 39.), "that this is not done for nothing." In fact, it is so, as it not unfrequently does, that the pacha is unable to fulfil his engagements with the sheikh, he is compelled to cede to him such towns and villages as border on his encampment; and thus to make him, in effect, the master of the settled, as well as of the open country. The tribe of Aneset is the most considerable of all the Syrian Arabs. It has frequently been at war with the pachas of Damascus; and, at such times, the departure of the caravans from that city for Bagdad has been delayed; and the reason, openly assigned, that the Arabs of Syria were discontented with the pacha.

The Bedouins, within the peninsula, do not acknowledge a sovereignty of any kind, except in their native chiefs. They are very numerous in Nedjed, and are scattered among the settled population in all the other provinces. The most powerful tribe of any in Arabia is, perhaps, that of Beni-Khaled; it inhabits that part of the desert which borders on the Persian Gulf, and has under its dominion not only many smaller tribes, but also most of the towns and villages of Iachsa. The reigning sheikh passes a portion of each year in these towns; but by far the greater part is spent in the open country, under tents.

The form of government among the Bedouins is strictly

patriarchal, and their manner of living is that of the pastoral ages recorded in the Bible. The head of a tribe receives a submission from his subjects, similar to that which a father receives from his family; and, in the East, that submission is unbounded. There is, however, a check upon the abuse of power in the sovereign sheikh, which, though indirect, is by no means weak. Since every tribe consists of many branches, the various heads of these sub-tribes, as they may be called, form a powerful restraint upon the chief; and should he become unpopular, though direct opposition to his will is never attempted, the discontented branch not unfrequently leaves his encampment, and either forms itself into a new tribe, or, if not powerful enough for that, joins itself to the tents of some other powerful sheikh. Instances have been known in which a Bedouin chief has been entirely deserted, and thus the names of several tribes have vanished. As, however, the pride of tribe is strong in every Arab breast, this expedient is only resorted to in the last extreme; but the assumption of supremacy by some subordinate branch, is frequent enough to render the continuance of the sovereignty of the tribe of Beni-Khaled in the same family, since the days of Mohammed, a remarkable circumstance. The preservation of their herds being the first care of the Bedouins, a wandering life seems awarded to them by nature; the search for proper pasturage leads from place to place in their extensive country, according as the desert has become temporarily fruitful under the influence of the tropical rains, or has been burnt up by the continued action of a tropical sun. Accustomed to live in a clear air, their sight and smell become extremely fine, inasmuch that, on arriving at a spot which affords nourishment, however scantily, to plants or herbage, they can at once determine at what depth water is to be found, and, consequently, whether it be worth the labour of digging for. Accustomed to privations, the Bedouin is temperate from habit as well as from disposition, and can almost emulate the endurance of his camels, which, in the burning desert, live five days without drink.

Robbery is an honourable occupation among these wanderers, but the Arab boasts of being the most refined and civilised of thieves. His robberies are never attended with violence, except in the case of violent opposition; and, as he considers his country as sacred ground, he regards the plunder of the pilgrim caravan as the most heinous of crimes, and the payment of tribute, or the levying of tribute, or payment for permission to pass through it. If the right to this tribute be recognised, and the permission to pass through the country purchased, the bargain is never violated on the part of the Bedouin; strict faith being one of the best points of his character, as his deadly spirit of revenge is, perhaps, the worst. This spirit is very easily excited; and, once aroused, descends frequently from generation to generation: the duty of pursuing the quarrels of his father being regarded as a sacred part of the Arab's inheritance. According to the Koran (chap. ii. p. 20.), whoever sheds blood, owes blood to the family of the slain; but the same law allows, and even recommends, a commutation, by way of fine. If this be not accepted, retaliation is allowed to the murdered family; but, as this usually exceeds the offence, new cause of hatred and revenge is given, till a single (perhaps accidental) murder puts blood, in Arab phraseology, between whole families for ever. But the irascibility of the Arab requires no such serious offence as the death of a relative to rouse it into action. A slighting expression, or an insulting sarcasm, is sometimes sufficient to put blood between two families. "Your turban is filthy," is frequently answered by a death-blow; and instances are on record where, for an offence as slight, the offender has been pursued for years, and fallen, perhaps in old age, at last, for the insult offered by him in his youth. Niebuhr reports, that a noble Arab being asked, scornfully, if he were the father of the handsome wife of a person named, construed the question into a sneer upon his daughter's virtue. Being unwarned at the moment, the offender escaped; and the father spent years in vainly pursuing him, during which, however, he killed both the parents, and many relations of the scolder, his slaves, his cattle, and reduced him to the verge of beggary. The offence was at last commuted by an enormous fine. (*Niebuhr*, par. i. pp. 27, 28.; *Burchardt, Not. on Bed.*, pp. 184-189, 177, 184, 206.)

A relief to this dark shade in the Arab's character is found in his hospitality. In many of the towns where the population is most unmixed, houses of entertainment are kept at the public expense, or at that of some rich individual, where the traveller is fed and sheltered without charge. But, in the desert, hospitality is a part of the Bedouin's nature; and though the influence of foreign manners has, upon the Hadj roads, considerably dimmed the lustre of this virtue, yet even there a helpless, solitary traveller, is sure of finding relief, though the assembled Hadjis should crave in vain for assistance or mercy. In districts off the Hadj roads, that is, over much the greater portion of the desert, the Bedouin considers his property less as his own than as that of the

casual stranger he may meet; however hungry, he shares his last morsel with the wayfarer; and sacrifices which he would not make for himself or his family, are made unhesitatingly for the wants of his guest. The inhabitants of the towns have fewer points of interest than the Bedouins. Niebuhr (par. ii. p. 337.) says they have lost much of their distinctive character; and other travellers speak of them, as having superseded the vices of civilised society to those of a savage state. "Superstitious, yet irreligious; performing all the rites of their faith, yet living in the practice of every vice, natural and unnatural. Hypocrites by profession, preferring a lie to the truth; even when not urged by motives of interest, deceit forms a part of their education from youth. Their governments are systems of extortion and tyranny; their traders are fraudulent, corrupt, and dishonest overreachers; the individuals of their communities are sunk into the lowest state of ignorance and debauchery." Such is the character given of the town Arabs by Lord Valentia (ii. 354, 355.), and a similar picture is unwillingly exhibited by Niebuhr (par. ii. pp. 180-190.). Ali Bey, Burckhardt, and Buckingham, *passim*.

In prosperous times, the right of entertaining a guest is frequently disputed; and should a stranger reach the encampment unobserved, it is reckoned an affront if he pass the first tent on his right hand, and enter another.

In many tribes the women are permitted to drink coffee with strangers; and in some, towards the S., the wife entertains a guest in the absence of her husband, and does the honours of the tent. To tell an Arab that he neglects his guest, is the greatest insult that can be offered. (Niebuhr, par. i. pp. 41-43.; Burckhardt's *Not. on Bed.*, pp. 100-102. 192-195.)

The superiority of the Bedouins appears to be admitted by the town residents; for the descendants of Mohammed, resident at Mecca, send their own children, eight days after birth, to the tents of the neighbouring Bedouins, where they remain till they are 8 or 10, and frequently 14 or 15 years old. All sheriffs (descendants of the Prophet) from the sovereign downwards, have been thus bred; and, as they usually take wives from the tents where they have been educated, they preserve the race and many of the customs of the Bedouins, in the midst of the mixed population by which they are surrounded. This custom is very ancient among the pure Arabs. Mohammed, himself, was educated in the Bedouin tribe of Beni Saad. (Burckhardt's *Travels*, vol. ii. pp. 424-428.)

The Arabs are of a middle height, generally extremely thin, and when either very young, or far advanced in life, of a highly prepossessing appearance. The mild but expressive countenance of an Arab boy, and his dark, sparkling eye, are spoken of in terms of admiration by all travellers. As he reaches manhood, however, a very disadvantageous change takes place; his meagre figure becomes still more attenuated, and seems as though it were parched and shrivelled up. The very splendour of the eye, buried between high cheek bones, apparently destitute of every covering except the tightened skin, is then rather a deformity. But, in old age, the Arab is truly venerable. The fine dark eye contrasts admirably with the long white beard; and the emaciation which, in middle life, seems to intimate premature decay, assimilates well with the closing scenes of existence. There are exceptions, however, to this general description. The Aeneas Bedouins are generally short, well formed, and by no means so thin as the majority of their countrymen. The lower orders, in Mecca, are generally stout. The Arab women are stouter than the men, and larger limbed. The complexion of the Bedouins is tawny, but this is evidently the effect of their exposed life; an effect which the same exposure would produce upon the most N. people. At the time of birth the infant is fair, even of a livid whiteness; and Burckhardt, who, as a physician, saw the naked arms of a sheik's lady, states that her skin was as fair as that of any European. Lord Valentia makes the same remark regarding the wives and daughters of an Arab of Djidda (ii. 308.). In the towns, the Arabs may be described as fair, especially in the mountain districts. But this remark must be understood as limited to those of pure descent: on the coasts, and in the towns of Mecca, Medina, &c., the prevailing colour is a sickly, yellowish brown, lighter or darker, according to the origin of the mother; who is, in many, perhaps in most cases, an Abyssinian slave. (Niebuhr, par. i. p. 41.; Ali Bey, vol. ii. pp. 103. 106.; Burckhardt, i. p. 322.; ii. p. 240.; *Notes on Bedouins*, p. 59.; Valentia, ii. p. 351.)

The Arabs, like other Eastern people, wear long dresses. A cotton shirt, over which the more wealthy wear a *kumbar*, or long gown of silk or cotton stuff, and the poorer classes a woollen mantle, is the usual costume. The mantle is of various kinds: one, very thin, light, and white, is called *mesumy*; a coarser and heavier kind, worn over the former, is called *abba*. In some cases, however, this last is a very splendid garment. It is usually striped white and brown, but the

rich Arab frequently clothes himself in a black *abba*, interwoven with gold, in preference to the *kumbar* or Turkish gown. The *abba* is not used in the W. districts, Yemen and Hedjaz. In the towns, large cotton drawers are worn by the men; but these rarely form a part of the Bedouin's dress, among whom any covering for the feet or legs is almost unknown. Though they walk and ride barefoot, they greatly value yellow boots and red shoes; but more as articles of ornament than use. A very rude kind of sandal is worn by the lower orders in the settled parts of the country, and the more wealthy inhabitants of the same districts use a slipper of yellow or red leather, sometimes very elaborately worked, brought from Egypt or Turkey. The head-dress is a turban, varying in form, size, and material, according to the taste or wealth of the wearer. Among those who would pass for men of superior learning and attainments, the turban is ridiculously large. The wealthy classes wear shawls, wrought with gold and silver, on their heads; and certain colours are restricted to certain families, as green to the descendants of Mohammed, black to the houses of Abbas, &c.

The women's dress is a gown or shift of most ample dimensions; which, in the tents, and among the middle and poorer classes in the towns, is of cotton; but the more wealthy of the townswomen use silk. Over this is worn a robe of Indian cotton; and this, with a handkerchief on the head, and sometimes very full trousers, completes the ordinary in-door dress of an Arab female. The women enjoy more liberty in Arabia than in any other Mohammedan country, but still the veil is indispensable in the streets. A cloak or scarf of blue and white striped linen is worn with much grace, the arrangement and placing of which is an important part of the tactics of Arab coquetry.

Rings, principally of silver, are worn in the ears and noses of the women; and tattooing of the face, arms, breast, and ankles is very common with both sexes; as is also painting, not to assist but to disguise nature, the face and hands being frequently daubed over with black, blue, and yellow, the first colour being esteemed a beauty on the *eyelids*, the last on the *teeth*. (Niebuhr, par. i. pp. 64-61.; Burckhardt's *Travels*, vol. i. pp. 334-340.; *Notes on Bedouins*, pp. 26-29. 131-133.; Ali Bey, vol. ii. pp. 105, 106.)

The Arabs are proverbially abstemious. Even the wealthy classes drink little else than water, and live principally (next to dates) upon a coarse bread made of dhourrah, steeped in camel's milk, and saturated with butter.

There is no want of animal food, but very little is consumed. The butchers in the towns on the Red Sea are foreigners, and depend entirely on the influx of strangers. Among the Bedouins, if a man of rank arrive at an encampment, a kid or lamb is killed, and being boiled is served up in a paste made of dried wheat, camel's milk, butter, and the fat of the animal. Sometimes, but very rarely, a camel is killed, and on such occasions the whole tribe meet together at the repast. In the S. districts, the Bedouins occasionally eat horse flesh. This is not, however, a matter of choice. It sometimes occurs, especially in the interior of the desert, or in times of scarcity, that not a single measure of corn can be found among a whole tribe. It is only under such circumstances of necessity that the Bedouin has recourse to a diet of milk and flesh alone; and there are many tribes (especially in the N. and near the larger towns) who, like the settled population, scarcely know the taste of animal food. Besides the *ayesh*, the dish already described, rice, boiled with camel's milk, is a common article of food, as also dhourrah bread, butter, and dates, blended together into a paste; there are also many preparations of various vegetables, among which the *kum-mage*, or desert plant, of the truffe kind, is a great favourite with the Bedouins; but wherever dates grow, or can be procured, that fruit constitutes the chief diet of both tent and town.

The date palm flourishes where most other vegetation withers, and is peculiarly abundant in the sands of Arabia. The fruit continues in season about two months, or from the end of June to the end of August; and, during this period, the new fruit forms a part, in some cases the whole, of the daily food of the Arabs. When the dates are full ripe, they are gathered, pressed into a hard solid paste or cake. This paste, which is called *adjouc*, is in lumps of about 2 cwts. each. The *adjouc* forms a part of the daily food of all people for the remainder of the year; and thus the date palm is to Arabia what the bread corns are to European nations. *Adjouc* is an article both of export and import, considerable quantities being taken to Hindoostan, while the kind most esteemed in the Hedjaz is imported from the Persian Gulph.

Arab cookery is extremely *frugal*, more so than even the Italian; but no oil is used for culinary purposes, except in frying fish. Butter is their universal sauce, and of it the consumption is immense; their rego-

table dishes all float in butter; with it they work their *adjoue* into a proper consistency; dried corn, or bread crumbs, boiled in butter, is a common breakfast with all classes; and in the desert, the *kemmayes* are prepared for use in the same manner. In short, butter may be said to be to the Arab what the potato is to the Irishman: it forms an indispensable part of his diet; and, besides the various forms in which it is taken with other articles, it is a common practice with both Bedouins and townspeople to drink a coffee-cup full of butter every morning; the former, and the lower orders of the latter, adding another half cup, which—to the disgust of strangers—they *swallow* up their nostrils! Arab butter is made from the milk of sheep and goats, that of camels not being used for that purpose. The home supply is not nearly sufficient for the consumption, and butter consequently forms an important article of importation. It is brought from the opposite coast of Africa, chiefly from Souakin, Massouah, and Upper Egypt. Sallads are unknown. Coffee is used to a great extent, though scarcely so much as might be expected; and tobacco is smoked universally by young and old.

The Arabs feed sitting, or, rather, reclining on the ground; they use neither knife nor fork, but divide and take up the food with their fingers. The practice, notwithstanding what has been said in its extenuation (see *Niebuhr*, par. i. p. 47.), is very disgusting to a European. The hands are carefully washed *before* eating; but (among the Bedouins, at least), rarely after. The common hour of breakfast is 10 in the morning; of dinner, sunset: and at these two, which are the only meals, they eat heartily. The women feed apart from the men; and, in the desert, their repast consists of the remains of that of the men. (*Niebuhr*, par. i. p. 45–52; *Burckhardt's Notes on Bedouins*, pp. 32–36, 135–138; *Travels*, i. pp. 47–56; *Lord Valentia*, ii. p. 351.) The Arabs are healthy, and instances of longevity are more frequent among them than most E. nations. The diseases to which they are most subject are, an induration and obstruction of the stomach—said to be caused by the camel's milk which they drink, and leprosy. Like the Jews, they regard the latter as a visitation from heaven; and believe that, once confirmed in a family, it can never be eradicated: it is considered as disgraceful in the highest degree, and the unfortunate leper is completely shut out from society. The other diseases to which the Arabs are chiefly exposed are, the small-pox, fevers, ophthalmia, and worms. The method of treatment is, in all cases, extremely simple; but few internal medicines are administered, and those chiefly aperient simples. In slight cases of disorder, or, as a prevention, they rub the body with oil (sometimes of a very offensive kind) or butter. In severe cases they sear the parts affected with red-hot iron; and Niebuhr, who saw this severe remedy applied to a boy who complained of the cholera, remarks, that “if he did not complain again of his first suffering, it probably was because the remedy was so much more painful.” Disorders of the teeth are very rare, and among the Bedouins unknown. The women suffer little in child-birth; and such is the general health of the people, that the profession of medicine is unprofitable, and at a low ebb. Some surgeons can set a limb, but these are principally Jews. Chronic disorders are but little known; and acute diseases either yield to the rough treatment, before described, or carry off the patient. As the Bedouin, from his mode of life, is more exposed to casualties than the townsman, instances of long life are less frequent in the desert than in the settled districts. (*Niebuhr*, par. i. pp. 114–122; *Burckhardt, Notes on Bed.* pp. 52–56; *Valentia*, ii. 350.) All household duties and menial offices devolve upon the women. This arrangement falls heavier on the Bedouin females than on those of the town, the latter having merely to attend their husbands within doors; and where slaves are kept, this is little more than superintendence. But the Bedouin women perform all the laborious out-door occupations, fetching water from the wells, driving the flocks to the pasture, and bringing them back to the tents at night; while the men, during their stay in the encampment, spend their entire time in utter listlessness, or, at best, in playing at a sort of draughts. This indolence within doors is a part of the Arab character. A merchant or shopkeeper in the towns, returning from his daily avocations, undresses himself, changes his shirt, and, with no other covering, sits for hours upon his carpet, in the projection of his latticed window. The women, according to Ali Bey, are also frequently seen at the front windows, unveiled; and sometimes entirely undressed (*Travels*, vol. ii. p. 165.); but the usual apartments of the females are in the back part of the house.

The parental character is highly respected; though the Arab children, both in the towns and in the desert, have more freedom than in any other E. country. The Bedouin child runs naked, in the open country, round his father's tent; and at Mecca, Djidda, and other towns, the children, even of the better classes, are allowed to play in

the streets, as soon as they can walk, nearly in the same primitive state. But, within doors, the strictest decorum is observed, a boy never presuming to eat in his father's presence, unless expressly invited. It would seem, however, that this is little better than mere ceremony; for, when emancipated from his father's authority, the young Arab pays him little deference, and instances are not uncommon where the old man, having fallen into poverty, is left by his, perhaps wealthy, son, to struggle with distress, or to seek for assistance at the hands of strangers. An old Bedouin is sometimes supported by the charity of the whole tribe; and the daily quarrels between the father and his adult sons form one of the most revolting features in the Bedouin character. On the other hand, however, it should be stated, that the Arab, young or old, invariably treats his *mother* with the most respectful attention. This fact is the more remarkable as contrasted with the little estimation in which the female parent is held in other E. countries; and as combined with the fact that, in Arabia, the facility of divorce (see *Laws*, &c.) tends naturally to loosen every tie that connects families. (*Niebuhr*, par. i. pp. 44, 45; *Burckhardt's Travels*, i. p. 340; *Notes on Bed.* pp. 65, 66, 199–203.) The Arab has a grave deportment, less a lively imagination; he is a stranger to gaiety, in the European sense of the word, but the silent reserve of most other E. nations is equally unknown: he delights in public meetings—especially on occasions of weddings, births, and the like; his language is animated and picturesque; he is intuitively a poet and orator, and is extravagantly fond of music. In a word, the demeanour of the Arab may be characterised as a serious cheerfulness, equally removed from boisterous mirth on the one hand, and dull apathy on the other. One of the chief amusements is listening to the recitations or songs of poets, by profession, who travel from town to town, or from encampment to encampment, after the fashion of the bards and minstrels of Gothic times, accompanying their verses, usually in praise of some native hero, with the *nebab*, a kind of guitar. Niebuhr affirms, (*Voyage en Arabie*, ii. p. 134,) that it is reckoned scandalous in people of credit to practise music; and Burckhardt (*Notes on Bedouins*, p. 143.) states, that, in most districts, slaves only perform before company. This contempt for instrumental music does not, however, extend to vocal performances: songs, or chanted poems, form the great delight of the Arabs. Love odes, closely resembling the similar productions of the Trobadoirs and Provencals of the middle ages, are in every mouth. Dancing is reckoned disgraceful in a man, but a woman piques herself upon nothing more than skill in that art. Their ordinary amusements, beyond those now mentioned, are of a sedentary and indolent kind. The military, indeed, and the young Bedouins, practise the Dyreed, and other warlike sports; but unless particularly excited, the Arab, both of the town and desert, employs his leisure in smoking, or in playing games of chance, of which chess, draughts, and cards are the principal. The cards in use are similar to those called *chinné*, which are much more numerous than those of Europe; and the games, also, are more intricate and involved. The Mohammedan law prohibits playing for money, but this prohibition is not always attended to. (*Niebuhr, Voyage en Arabie*, tom. i. pp. 141–152; *Burckhardt, Notes on Bed.*, p. 202; *Travels*, i. 377; *Lord Valentia*, vol. ii. p. 308.) All public occasions are festivals to the Arabs. The poorest will make his marriage a gala day; but the greatest family festival is that of the circumcision of an infant: on such occasions the greatest efforts are made to give a handsome entertainment. In the desert it is usually arranged that all who have families perform the ceremony on the same day, which is consequently one of great festivity. The religious festivals and the saints' days—which are very numerous—are also days of sport and rejoicing. On such occasions, the town Arabs affect great splendour in appearance, and a person would rather be thought a thief than allow one of his equals to exceed him in finery. The Bedouin, also, on such occasions, loads his wife with gold and silver, seems little careful as to what appearance he may make. Ali Bey affirms that the people of Mecca are the dullest and most melancholy he ever saw; that their marriages and births are unaccompanied by rejoicing; and that the arrival of the Hadj is the only thing that rouses them from their lethargy; and that it is rather an incentive to avarice than pleasure. (*Ali Bey*, ii. pp. 108, 111; *Burckhardt*, i. p. 338; *Notes on Bed.*, pp. 50, 51, 147, 148.) Mohammed found the slave-trade so firmly established in Arabia, that he made no effort to abolish it; and throughout the peninsula there are a great number of black slaves, Africans, or the descendants of Africans, or mixed races, besides a great number of free blacks, the offspring of emancipated negroes. The great slave-dealers are the Yemen and Muscat merchants, who annually import fresh supplies from the coast of Africa. In the towns, especially those of the Hedjaz, every man,

almost, keeps an Abyssinian mistress, whom it is reckoned shameful to sell; and whom, if she bear him a child, he generally marries. This accounts for the swarthy complexion of the people of Hedjaz. The male slaves and the females, not Abyssinian, are usually employed in domestic duties. The Bedouins never cohabit with their female slaves; but after a few years service they give them their freedom, and marry them to some of their own complexion. The offspring of these marriages are free, so that a vast number of these black naturalised Arabs are spread over the country. The emancipated slave possesses all the rights of a free Arab, but no Bedouin, male or female, will intermarry with the race, so that they remain a distinct people, discriminated by their colour from all around them. They have, however, lost much of the negro appearance, especially the woolly hair and thick lip, but the form of the head still bears witness to their origin. Greek and Syrian slaves are found commonly enough in the bazars; but they are not regularly supplied. A native Arab is by birth a freeman; and though, in many cases, the condition of the mother fixes that of her offspring, there is no difference between a man's children by his Arab wives and those by his Abyssinian slave. Instances of harsh and cruel masters occur (*Ali Bey*, ii. p. 103.), but, generally, slaves are considered as part of the owner's family: the younger ones are instructed with their owner's children; from whom, indeed, they are distinguished only by a very slight difference of treatment, and the performance of some menial offices. They are protected by legal provisions; and upon a just ground of complaint against his master the Cadi will order a slave to be sold. Severity is no bar to official dignities; indeed, the dolas, or governors of towns, are not unfrequently selected from slaves, for the express reason that they belong to that class; being supposed to be more strictly bound to their masters' interest than free Arabs of noble blood. (*Burckhardt*, i. pp. 342, 343.; *Notes on Bed.*, 103, 104.; *Ali Bey*, ii. p. 45. 103.; *Niebuhr, Des. de l'Ar.*, par. i. p. 91.; *Lord Valcutt*, vol. ii. pp. 328, 329.)

Arabia, if united under one, or even a few governments, would possess many of the elements of political power. The soil and climate has always proved a formidable obstruction to foreign invaders, while the conquests of the immediate successors of Mohammed bear witness to the effect that the combined operation of its military energies is capable of producing. Split as the country is into some hundreds of petty sovereignties, this effect is little likely to be repeated. Though every Bedouin is by birth a soldier, dreams of conquest, beyond the plunder of a camp or caravan, rarely disturb his imagination; and though the princes of the settled districts surround themselves with regular troops, they employ them rather to avert aggression than to make any attempt at foreign aggrandisement. Still, however, the military power of the Arabs is considerable. In 1815, the princes opposed Mehemet Ali with an army of 25,000 men; and in 1803, the Wahabee chief marched against the same potentate at the head of 45,000. (*Burckhardt's Notes*, p. 248.; *Ali Bey*, *Travels*, vol. ii. p. 115.) and though unable to prevent the establishment of the Egyptian power in the Hedjaz, they delayed it for some years, during which they more than once defeated the troops of the Pacha, and failed at last; more, as it would appear, from want of concert in their operations than from want of force. It should be remarked, too, that Mehemet Ali seems fully satisfied with the possession of the sea ports of the Hedjaz, and the holy cities. During 24 years he has made no attempt to extend his conquests; but has sought to conciliate his neighbours, and his new subjects, by enacting laws equally favourable to both. The sultan sheriff of the Hedjaz, previously to the Egyptian conquest, maintained a guard of 1,400 men at Djidda, and probably 3,000 or 4,000 more in the other towns of the Hedjaz; this army is still maintained. The harem of Yemen has an army of 1,000 or 5,000 men, and the harem of Muscat, one of about 1,000. The smaller settled states have also their military forces, but no return of their amounts can be obtained. As before observed, every Bedouin is bred a soldier; but a very great difference exists between his sense of duty to his sheikh when called upon to attend him in a predatory expedition, and when called out for the purposes of national warfare—such, for instance, as a contest between two hostile and powerful tribes. On the latter occasions, the hostile sheikhs have sometimes marched each at the head of 5,000 men, while in the desultory plundering expeditions 50 or 60 men frequently compose the whole force. There is a great difference, too, in the conduct of the Bedouin in these cases. Those who have encountered him in his robber character, stigmatise him as cowardly; and it appears that if he fail to effect his purpose by surprise, he generally declines attacking even a far inferior force; but in his open contests with the foe of his tribe, no soldier is braver; though, even here,

warfare is carried on at a less cost of human life than in most other countries. (*Burckhardt's Notes on Bed.*, pp. 76—84, 168—177.)

The Bedouin attends his chief much in the fashion that the feudal vassal attended his liege lord during the middle ages in Europe. He arms, equips, and clothes himself; and trusts for pay to his share of booty. The Wahabee chief, who is essentially a Bedouin, has indeed kept on foot a large body of mercenary troops; but this system is in its infancy in the desert, and it is doubtful whether it will survive the present generation. The Wahabee power, since 1815, has evidently been on the decline. In the settled states, on the contrary, the soldiers are all mercenaries, their pay being, in general, 2½ dollars per month, in addition to food, arms, and clothing. This accounts for the different appearance made by an army of Bedouins, and one belonging to the states of Yemen, Muscat, Hedjaz, &c. The former present a motley appearance as to arms and equipment; the latter have the same arms and uniform. The Bedouins use long lances, sabres, and short crooked knives; and shorter lances, for the footmen. Clubs are very common, where lances (which are never of home manufacture) cannot be procured; and the Bedouins have several kinds, some wholly of wood, some laden with iron, and others wholly composed of the latter material. Matchlocks are in great request, but not very plentiful; though, when possessed of one, the Bedouin is an almost unerring marksman. He has not yet learned to use the musket, and if he get one, he converts it into a matchlock. The pistol is a favourite weapon.

The soldiers of the settled states are armed with matchlocks, and the long crooked knife, called *jambaka*. The horsemen carry the long lance, but the shorter one is almost unknown out of the desert. The Arabs have no skill in working heavy artillery; cannon are never used in the field, and the few pieces mounted in the citadels are served by Turks.

A shield, 18 in. in diameter, covered with ox or hippopotamus hide, is a very common piece of defensive armour; in addition to which, coats of mail are worn whenever they can be procured. An iron cap, with a feather, and iron gloves, and sometimes iron boots for the legs, complete the costume of the mailed Arab. This mode of equipment is, however, chiefly confined to the Bedouins. Of all the arms in use, only the jambaka, the clubs, and the target, are of home manufacture; the lances come from Syria and Persia, the sabres *professally* from Damascus, the matchlock from Egypt, Turkey, and Europe, and the coats of mail, principally, from Syria.

It is a common practice for all Arabs, except merchants and learned professors, to go armed. The janissaries are the usual weapon. (*Niebuhr*, par. ii. p. 184—190.; *Burckhardt's Notes*, 30—32, 137, 135, 248.; *Travels*, vol. i. pp. 338, 339.; *Ali Bey*, ii. pp. 109—115.; *Lord Valcutt*, ii. p. 348., iii. p. 329.)

Agriculture.—The nature of the soil restricts the pursuits of the agriculturist to particular localities, and his return varies materially in different parts of the peninsula. In Oman, the better sort of wheat, even when the season has been peculiarly rainy, will not return more than 10 for 1; nor the dhourrah (a coarse kind of barley) more than 12 for 1; while in the most fertile parts of Yemen, wheat is said to yield sometimes as much as 50 times the seed, and the return for the dhourrah, it is affirmed, amounts to 150, 200, and sometimes even 400 for 1. But statements like these, being liable to extreme exaggeration, must be received with considerable scepticism; though, as the dhourrah yields, in this district, 2 and even 3 crops in the year, the accounts of its extreme productiveness are not so very extravagant as, at first sight, they seem to be. (*Niebuhr, Des. de l'Ar.*, par. i. 135.)

The Tehama of Yemen, wherever its arid soil is naturally, or can be artificially irrigated, is plentifully sown with dhourrah. The plough is dragged in every direction over the field, till the earth is well broken and completely mixed. The sower follows the plough, and casts the seed into the furrow, as it is formed, the return of the plough covering the grain. In about 8 weeks the dhourrah is fit for the reaper; but as the farmer wishes the corn to be extremely ripe and dry before it is gathered, it remains standing a week or two longer, and then is pulled up by the roots. As, by this process, a considerable quantity of the dry seed is shed, the plough is again passed over the ground, and, in about 10 weeks, a second crop is produced, which, being gathered in the same way as the first, is, as before stated, not unfrequently followed by a third.

The plough is of the rudest description, and even this cannot be used on the mountain side; the latter being tilled by means of an iron hoe, or rather pickaxe. These, with tools of primitive construction for cutting channels in the fields and gardens, and for forming banks or dikes to preserve the water, complete the scanty list of agri-

cultural implements. When the corn is to be thrashed the Arabs place it in two rows, ear to ear: a large stone is then drawn over it by two oxen, so that the grain is rather crushed than beaten out of the husks. A *water-mill* would be an anomaly in a country where there are hardly any streams; but, with the exception of one or two, lately introduced into the Hedjaz by the Egyptians, there are no windmills in Arabia. The corn, when ready to be ground, is placed between two stones, of which the uppermost, if small, is turned by the hand; if large, it is worked by an ox or ass. (*Niebuhr*, par. ii. p. 189.)

But, notwithstanding this rude state of agriculture, such is the fertility of the S. part^s of Arabia, that they not only supply corn for their own consumption, but for that of the greater part of the other districts, and of the wandering tribes of the desert. The Hedjaz is, however, almost wholly dependant on supplies from Egypt. (*Ltd. Valentin*, iii. 325. et seq.; *Ali Bey*, ii. 46. 101, &c.; *Niebuhr*, par. ii. 302—307.)

With the exception of the Median tribes, none of the Bedouins meddle with tillage; while the business of the dairy and pasturage are almost equally unknown among the settled population. The Bedouin depends upon the Arab of the towns and villages for his corn and clothing; the latter upon the former for his cattle and part of his butter. In the division of rural labour, the pastoral portion thus falls to the Bedouin. He is a shepherd, though a warlike one; and now, as in the days of Abraham, he counts his wealth, not by his silver or gold (though of them he is by no means negligent), but by the number of his flocks and herds, and especially his camels. The same number of these animals, which would in one part of the desert constitute their proprietary rich man, in another would mark him as comparatively poor. The tribes of poor Bedouins are those who inhabit the mountainous country, where the camels find little food, and are not very prolific. Among these, the possessor of 10 camels is reckoned wealthy; while in the plains of Nedjed some sheikhs have as many as 300, and no one with less than 30 or 40 is reckoned in easy circumstances. In the fertile parts of Nedjed, are some of the best pastures in the world, and the camels bred there are preferred by the town Arabs. These plains also produce the finest horses, and with them the town population is supplied. The wealth of the Bedouin depends, however, upon many contingencies: not only is he liable to be stripped by some more powerful tribe, but disease among his herds, or profuse hospitality, frequently reduce him to poverty. His finest pastures also sometimes fail, depending as they do upon the rainy season, and being unprovided with independent means of irrigation. Should the rain fail, herbage also fails, and the Bedouin never looks for more than three or four successive years of plenty, and considers himself fortunate if he pass ten without encountering absolute famine. (*Burckhardt*, *Notes on the Bedouins and Wahabys*, pp. 39—42. 138—141. *Travels*, vol. ii. pp. 100—402.)

Manufactures.—These are at a lower ebb in Arabia than in perhaps any other semi-civilised country. Among the Bedouins, two or three blacksmiths, and a few saddlers, are the only artists: they are not makers of the tools for which they labour, but natives of the neighbouring towns and villages. The Bedouins regard them as an inferior race, and would feel degraded were any individual of their tribe to give his daughter in marriage to one of them. It is curious, however, that while they thus regard the service of their horses (their greatest pride) as a menial occupation, they should themselves unscrupulously perform other works, which appear to us quite as low a character. The businesses of dyeing and tanning are performed wholly by the men. The Bedouins weave the coarsest of cloths, and use the bags for holding provisions, of the hair of goats and camels, but the manufacture of tent-covers is confined to the mountainous regions, where goats abound, their hair being exclusively used for that purpose. (*Pliny*, *Nat. Hist.*, lib. vi. cap. 28. p. 142.) The Arab loom is a very primitive machine. Spinning is performed by the *men*, being the only domestic occupation which they do not spurn. (*Burckhardt's Notes on Bed.*, pp. 37—39. 138.)

These are all the arts or manufactures practised among the Bedouins; and the standard seems scarcely higher in the towns. It is true that gold and silver ornaments are manufactured in Yemen; but by Jews and Banian Indians. Even the money which is coined in that district (and there is none coined in any other), is the work of the former; and the only watchmaker who ever settled in the country, was a Turk. Of machinery, there is next to none. Some rude sorts of arms are made in Yemen, as the crooked knife *Jambaa*, and a very inferior matchlock. There are also, in Yemen, several looms for the manufacture of coarse linen and this, like the hair and wool-weaving among the Bedouins, forms by far the most important of all their industrial occupations. Some woollen cloths are also woven; but this manufac-

ture is much less extensive than the former. There is, or was, a glass-house at Mocha. (*Niebuhr*, par. ii. pp. 188—190.) In Djidda, out of 224 shops, Burckhardt enumerates only twelve in which any thing is made: the others are all places of sale, and chiefly for articles of food or luxury. The 12 manufacturers are, 4 tailors, 5 sandal-makers (all Egyptians), 2 turners, and 1 watchmaker; who, like his fellow craftsmen, formerly residing in Yemen, is a Turk. These, with a few blacksmiths, silversmiths, and carpenters (mostly Egyptians), constitute all the artisans of Djidda. (*Burckhardt's Travels*, vol. i. pp. 47—84.) In the holiest of the holy cities, Mecca, not a man can be found capable of forging a lock or key. The slippers and sandals in common use, are brought from Egypt and Constantinople; and the only attempts at manufactures are confined to the construction of rude matchlocks, *Jambaa*, and lance-heads, together with vessels of copper and tin, in which the pilgrims carry away the water of the holy well, *szamant*. (*Burckhardt's Travels*, i. 313; *Ali Bey*, ii. 99, 100.) In Oman, the only manufactures are *sashes* and turbans of silk or cotton, the *abba*, or Arab cloak of wool or camel's hair, a coarse kind of cotton canvass, arms of a very rude description, earthen jars, called *mutaban*, and gunpowder. (*Frazer's Journey into Khoresan*, p. 18.)

At Suez, Hodeida, Mocha, and Muscat, some of the vessels are constructed in which the Arabs carry on their coasting and Indian trade. Till within these few years, ship-building was carried on at Djidda also (*Ali Bey*, ii. 45); but though it be still a very important shipping-station, no vessels of any kind are now built at it, and it is with difficulty that means are found of even repairing a ship or boat. (*Burckhardt's Travels*, i. 43.) The want of wood, in Arabia, lays the shipwright under peculiar disadvantages. The timber used in Suez is felled in the woods of Asia Minor, conveyed up the Nile to Cairo, and thence, overland, to its place of destination. When ships were built at Djidda, the timber came by the same route; and it may be presumed that its further transit, by the Red Sea, from Suez, rendered it too costly. In Mocha and Hodeida a part of the timber is procured from the mountain-sides of Yemen, but the greater portion is imported from the coast of Africa. (*Burckhardt's Travels*, i. 42—49.)

The ships of the Arabs, excepting those of Muscat, which are of a very superior description, are extremely rude and simple. Those called *dows* are the largest, and are the only ones that perform the voyage to India. (*Burckhardt's Travels*, i. 43.)

The unskillfulness of the Arab seamen, with the clumsy nature of their dows, render shipwrecks of very frequent occurrence. Ali Bey was wrecked on his voyage from Suez to Djidda, and again on his return from Djidda to Suez (*Travels*, ii. 34. 164.); and he affirms, that not a year passes without several vessels being totally lost, and many more, more or less injured; so that ships are always being built or repaired, without increasing the actual number employed in the coasting trade (ii. 45.) That number is, however, considerable; the ships belonging to Djidda only amount to 250; and it is estimated that about a many belong respectively to Suez, Hodeida, and Mocha. (*Burckhardt's Travels*, i. 42; *Ali Bey*, ii. 45.) Many of these ships are purchased at Bombay and Muscat; the vessels of the latter being very superior to those of the Red Sea, and their navigators much better the sailors of Yemen in energy and skill. (*See Muscat*.)

The best houses of the Arabs are built of stone, or, if upon the coast, of madrepora and coral. This latter material is of such a nature that it rapidly decomposes when exposed to the weather. In other parts they use a sun-burnt brick with little or no lime, and many of the houses are ruined by the introduction of moisture, the tropical rains bringing with them sure destruction to the neglected buildings of an Arab town, quickly reducing them to a heap of rubbish; and as the wooden materials very soon vanish in a country where wood is extremely scarce, the very ruins of many cities, formerly celebrated for their magnificence and grandeur, may now be sought for in vain. Even in towns that are populous, and stirring with activity, many houses are falling rapidly to decay; and while no part is old, many parts are dilapidated and ruinous; yet an Arab town, on the first approach to it, appears handsome and picturesque; the houses, like those all over the East, are flat-roofed, and among them rise, here and there, the dome-covered tombs, called *kobas*, which, with the tapering minarets of the mosques, give to the whole outline an air of variety and elegance. Every good house exhibits a series of gaudy lattices to its windows; and many of them are ornamented with fanciful designs in white stucco. Most of the gateways have pointed arches; and the general character of the ornamental architecture is not very dissimilar to the Gothic. The mosques are square buildings, or rather parallelograms, without much external beauty, except their tall and slender minarets, which always appear light and grace-

ful; but their interior frequently displays much skillful workmanship. The great mosque at Mecca contains more than 600 columns and pilasters of very great beauty. The houses of the poorer classes are of the most wretched description. Fluts composed of wicker work or date-tree leaves, covered on the inside with mats, and, sometimes, on the outside with a little clay; buddled together, and hardly sufficient to afford a shelter from the weather. These circumstances, with the filth collected in the unpaved streets, and never removed, impress the mind of a European with a sense of utter desolation and misery.

No remains of the fine Saracenic architecture of the middle ages are found in Arabia; singular as it may appear, that a people who have left the traces of their skill in this art in every land, from Mesopotamia to Spain, should possess no trace of it in their native country. The perishable nature of building materials in Arabia may account for this fact, for even the holy mosque at Mecca has undergone so many repairs that it may be regarded as a modern structure; but it is much more probable that, while the Arab conquerors caught the love of arts and sciences from the enervated, but refined, nations subdued by them in their headlong career of conquest, those arts and sciences did not find their way into the peninsula, and that architecture, like the rest, never flourished within its limits.

The Arabs use no levels in their buildings, consequently their floors are very uneven; and, notwithstanding the heat of their climate, they have a very bad, or, rather, no idea of ventilation. The large ventilators, placed on the house-tops in Egypt, and which diffuse a current of air through all the lower apartments, are totally unknown. In many places the windows are composed of transparent stone, built into the walls, and, consequently, incapable of opening. (*Burckhardt's Travels*, i. 17—22. 153—155. 185—242; ii. 150. 329. &c.; *Ali Bey*, ii. 30. 42. 94—104. 161—174; *Lord Valentia*, ii. 345—348.; *Fraser*, 7, 8.)

Commerce.—Owing to the situation of Arabia, nearly surrounded by the sea, and occupying, as it were, a central position between Europe, Asia, and Africa, it has always enjoyed a considerable trade, which, in former times, has been materially promoted by the resort of pilgrims to the holy cities. The hadjis, indeed, are expressly authorised by the Prophet to combine commercial pursuits with the performance of a religious duty (*Koran*, chap. ii. *Sale*); and a great amount of business is, consequently, transacted at Mecca, during the period that the pilgrims remain in that city. With the exception of coffee, and a few other articles of inferior importance, Arabia has but little native produce to export. Its trade, therefore, is, and always has been, principally one of transit. Great quantities of commodities are annually brought to Djidda, Mecca, Muscat, and its other entrepôts, from Turkey, Persia, Africa, India, the Indian Islands, Europe, &c., partly by caravans, but principally by ships: such parts of these as are not wanted for home consumption, being distributed among the pilgrims and merchants, are by them conveyed away by sea or land, as the case may be. The great centres of Arabian trade are Djidda, Mecca, and Muscat. The first is the port of Mecca, and also the principal channel through which the regular trade between the Hedjaz and Egypt is carried on; the former being principally dependent upon the latter for its supplies of corn. Since the zeal for pilgrimage has begun to abate in the Mohammedan world, the trade of Arabia has considerably decreased; but it is still carried on to a greater extent than would readily be supposed, considering the limited amount of its population and productions. Mecca is the principal seat of the coffee trade, though Lohela has of late years made some powerful attempts at rivalry; and Muscat has recently risen to very considerable eminence as a sea-port and seat of the carrying trade, particularly with India and the countries round the Persian Gulph. (*Burckhardt's Travels*, i. 20—31.; *Ali Bey*, ii. 101—107.; *Fraser*, 16.; *Lord Valentia*, ii. 370.; *Nicbuhr*, par. ii. p. 193. See also, DJIDDA, MECCA, MUSCAT, &c.)

Laws, Crimes, and Punishments. The laws of Arabia are those of a primitive people under a patriarchal government. The civil laws, founded upon the Koran, are administered by cadis, distinguished by their experience in the customs of the nation, but to whom a knowledge of the arts of reading and writing is not always indispensable. It should be observed, however, that the Arab judges are of two kinds; the *Cadi-el-ferian* (judge of customary law), and the *Cadi-el-sheryan* (judge of written law), the latter being more common in what are called the Turkish towns (that is, in towns governed by Turkish law), than in those where the unmixed customs of Arabia exist. Written pleadings are not, however, unknown, even in pure Arab towns; but precedents (in some cases, perhaps, reduced to a rude form of codification) seem to form the principal, if not the only guide, to an Arab judge's decision. The sovereign, whether he

be monarch of a state, or sheikh of a Bedouin tribe, is only president of the tribunal of justice; he cannot decide a case, either civil or criminal; every one must be referred to the proper tribunal; and the sovereign possesses no power of reversing its decision. But this protection from despotic power is, in the towns, merely apparent; for, as the sovereign names the cadis and dismisses them at pleasure, they regard themselves simply as his officers, and never dream of pronouncing a sentence of which he disapproves. Among the Bedouins, however, the office of cadi is elective, and the sheikh has no influence in the appointment. (*Nicbuhr*, par. ii. pp. 180, &c.; *Burckhardt*, *Notes on Bed.*, pp. 68, &c.)

Capital punishments are very rare; being inflicted only for blasphemy, and conjugal infidelity in women. The blasphemer is hanged; the unchaste wife, if her guilt be unequivocally proved, has her throat cut; and, by an unheard-of refinement of atrocity, her father or brother is compelled to be her executioner. This detestable barbarity is, however, rarely perpetrated; for the marriage being, on the part of the husband, of a very easy dissolution, he generally prefers sending his offending spouse back to her family, merely assigning as a reason that she does not suit him. (*Nicbuhr*, par. i. p. 21.; *Burckhardt*, *Notes on Bed.*, p. 63.) Corporal punishments are almost unknown. The immemorial usage is to award a pecuniary fine, whatever may be the nature of the crime. Every offence has its ascertained mulct, even to murder; but, in this case, the friends of the deceased are not compelled to take the compensation, being, by the law of *Thor*, or blood revenge, allowed to take the life of the homicide, or that of any of his relations within the fourth degree. If, however, the fine be accepted, the Koran expressly provides for the safety of the murderer. (*Koran*, chap. ii. p. 21.; *Nicbuhr*, par. i. pp. 28—31.; *Burckhardt's Notes on Bed.*, pp. 84—89.) Insulting expressions, acts of violence, however slight, and the infliction of wounds, have each their respective tariff of fines; and it sometimes happens that, in the course of a quarrel, mutual offences having been committed, the cadi's sentence is a curious specimen of striking a balance. *Burckhardt* (*Notes on Bed.*, p. 71.) affords an instance of this. Bokhyt called Djolan a dog. Djolan returned the insult by blowing upon Bokhyt's arm; then Bokhyt cut Djolan's shoulder with a knife. Bokhyt owes to Djolan, therefore,

For the insulting expression - - - 1 sheep.
For wounding him in the shoulder - - 3 camels.
Djolan owes to Bokhyt,
For the blow upon the arm - - - 1 camel.
* Remain due to Djolan, 2 camels and 1 sheep."

The killing of a watch-dog is paid for by placing in the earth a stick as long as the dog, from tail to snout, and this stick the offender is obliged to cover with wheat, as a satisfaction to the owner.

The decisions of the cadis are generally founded upon the amount of testimony before them; but, if there be no witnesses, the defendant is called upon to exculpate himself by oath. The judicial oaths vary in sanctity and solemnity; and if the accused swear, by the one proposed, to his innocence, he is considered as acquitted. An ordeal, not very dissimilar to that formerly prevailing in Europe, exists in Arabia. It consists of heating an iron spoon red-hot, and calling on the accused party to lick it. If he escape without injury, he is accounted innocent; if otherwise, guilty. *Burckhardt* is orthodox enough to declare, that persons have been known to lick the *be-shaa* (red-hot spoon) 20 times, with perfect impunity! (*Not. on Bed.*, p. 69.)

Though robbers be accounted any thing but infamous, those detected in the fact are very severely punished. In this case, the robber is kept in close confinement (among the Bedouins, in a hole dug in the earth,) and very scantily fed, till he fix the terms of ransom with his captor, or till he contrive to make his escape. This is a strictly legal method of proceeding; the right of detention being judged by custom, in the person of the captor; and even the mode of treatment is so well ascertained, that it is scarcely ever departed from.

Among the Bedouins, the customs of *Wasy* and *Dakheil* have all the force of law in other countries; by the first, an Arab family binds itself to be the protector of another, and this obligation, once undertaken, descends through all the generations of both. There is no Arab, from the lowest to the highest, but has his *wasy*, or guardian; and the duty of protection inferred from this character, is among the most sacred recognised in Arabia.

By the law of *dakheil*, a person in actual danger, who can touch another, or even any thing with which that other is in contact, or can hit him by spitting or throwing a stone at him, at the same time exclaiming, *Ana dakheilak*, "I am thy protected," acquires a right to the protection which he seeks, and which is always accorded to the fullest extent. Even a detected thief, if he can touch any one in his captor's tent (except the captor himself), becomes safe; for which reason he is

bound hand and foot, and beaten, till he agrees to renounce the *dakheil* for that day. It is for this reason, too, that he is subsequently buried alive, as it were; for should he become the *dakheil* of any one, his right to freedom is immediately allowed, and he is treated, in every respect, like a newly arrived guest in the tent of his late enemy. There is only one offender to whom the privilege of *dakheil* is refused, namely, the thief released &c. The responsibility of some third party, if he should, when at liberty, refuse to satisfy his bail. Under such circumstances, he is proclaimed *traitor*, and loses all the privilege in question; in fact, becomes outlawed. The *dakheil* does not apply to a homicide under the *thar*. (Burckhardt, *Notes on Bedouins*, pp. 74, 75. 89—100. 182.)

Though polygamy be allowed by the Mohammedan law, in practice it is by no means general. Few men, of moderate fortunes, have more than one wife; and many, even of the highest rank, similarly confine themselves. — (Niebuhr, par. i. p. 65.; Burckhardt, *Not. on Bed.*, p. 61.) On the other hand, the nature of the marriage ceremony, and the facility of divorce, renders changes of wives of very common occurrence. In the towns, an agreement before the *cadl*, in the desert, the slaughter of a lamb in the tent of the bride's father, completes the contract, which is broken quite as readily as it is formed. The husband having said, before witnesses, *ent takek* (thou art divorced), and sent the woman back to her family, both parties are considered free; the husband from the maintenance of his wife, the wife to form a new connection. In these cases, the woman's portion is returned; and, among the Bedouins, the husband adds to it a she-camel. The custom of divorce is, however, much more prevalent in the tents than in the towns. In the latter, it is always considered indecorous, and implying dishonour in the woman; but, in the desert, a wife may have been divorced 3 or 4 times, and yet be free from any stain or imputation on her character. Polygamy, however, is much more common in the towns than among the Bedouins.

If a man leave a widow, his brother generally offers to marry her; but this is entirely a law of custom, and not binding on either party. A man has, however, an exclusive right to the hand of his cousin; and, although he cannot be compelled to marry her, his renunciation of his right is necessary to enable her to marry another. Marriages are consummated at a very early age; it being reckoned discreditable in a man, and almost infamous in a woman, to lead a life of celibacy. (Burckhardt's *Notes on Bed.*, pp. 61—66.; Niebuhr, par. i. pp. 63—67.)

A curious custom, connected with the laws of marriage and divorce, prevails in the Hedjaz. No unmarried woman is, by the Mohammedan law, allowed to visit the holy temple; but as many rich old widows, or women whose husbands have died on the road, arrive with every haidj, a number of men are stationed at Djidda, and other frontier towns of the *Belad-el-Harem*, whose business it is to facilitate the progress of these widowed females through the sacred territory. The *muhallil* (as one of these men is called) marries the lady legally before the *cadl*, accompanies her to Mecca, Ararfat, and all the sacred places; and, on the termination of the pilgrimage, pronounces the *ent takek*, or sentence of divorce. Should he, however, refuse to do this, the law cannot compel him; but he would be prevented from any longer exercising his calling, which, though not very creditable, is so lucrative, that only two instances are recorded of such temporary marriages having become permanent. (Burckhardt's *Travels*, i. 359.)

The law of inheritance is very simple as regards property. The effects of a deceased father are shared among his children, the portion of a male being double that of a female. The succession to power is less clearly ascertained. If a sheikh or sovereign die, his successor is usually taken from among his sons; but it does not seem that any one has a well established right in preference to the others. In Yemen, it would appear that the iman is succeeded by his eldest living son, even to the exclusion of the children of an elder one deceased. (Niebuhr, par. ii. p. 179.; Burckhardt, *Notes on Bed.*, pp. 68. 75.; Lard Vateria, vol. ii. p. 380.)

Religion.—Antecedent to the earliest records, the city of Mecca had been sacred ground; and its holy temple, the *kaaba*, identified in the minds of the Arabs with every sacred feeling. The legends with respect to it, to which it is unnecessary more particularly to allude, show that the religion of the early Arabs was, to a considerable extent, mixed up with that of the Hebrews. They acknowledged one supreme God, regarding, however, the sun, moon, planets, and stars, as inferior and subordinate intelligences. This religion has been called SAMIANISM, either from SABI, a supposed son of Seth, or, as is more probable, from the word SABA, signifying the Host of Heaven. The supreme God was called *Allah Taata* (Most High God), the subordinate deities, *Al-Sakal* (the Powers). It was these titles (one par-

ticular, the other general) that led Herodotus to affirm that the Arabians worshipped only two gods, namely, *Urotak* and *Allat*; the former of whom he identifies with the Bacchus (*Asouges*) of the Greeks, the latter with Urania, the muse of astronomy. (Herodotus, *Thalia*, § 8.; *Al-Firawz*, *Shakrestan al-Us* in Pococke, pp. 110. 138. 143. 284.; *D'Herbelot*, pp. 728. 726, &c.) The Sabian religion can scarcely be deemed irrational, when professed by a rude people, inhabiting an open country, under a clear sky; who must have connected the changes of the seasons, and the returns of the periodic rains and droughts, that rendered their plains alternately fertile and sterile, with the revolutions of the heavenly bodies. But the Arabs also worshipped angels (*Koran*, chaps. lili. and lxxi.); and their images, which last they believed to be inspired by the supreme divinity with life and intelligence. This sort of idolatry having been once introduced, gradually spread; and in the 6th century, and long before, the number of these deities was very great, each tribe having chosen one to be its peculiar intercessor with the Supreme Being, and 360 were enshrined in the *kaaba*, as tutelary guardians of the days of the Arab year. (*Al-Janaub*, *Shakrestan al-Us* in Pococke, 90, et seq.; *Sale*, *Intro. Koran*, 14—22.; Burckhardt's *Travels*, i. p. 239, &c.)

The Arabs seem, indeed, to have admitted, without hesitation, all deities; and thus, in the 6th century, a figure of the Virgin Mary, with the infant Jesus, was sculptured on one of the principal pillars of the *kaaba* as an object of adoration. (*El Arak*, quoted by Burckhardt, *Travels*, i. p. 300.) It is most probable that this indiscriminate adoption of the objects of veneration of all sects, was intended to render the sacred city sacred to all men, and thus to increase the resort of pilgrims.

After the destruction of Jerusalem, by Titus, A.D. 70, many Jews fled into Arabia. These exiles made many proselytes among the natives, whole tribes embracing the Hebrew faith; so that, in a century or two, the Jewish Arabs became a very powerful section of the whole people. A similar cause, the persecution early in the third century of the Christians, drove many Christians to Arabia, whose zeal unchecked by former sufferings, led them to preach their doctrines in their new homes, and that with such success that in a short time they had made a very great progress in the country.

The faith of the Persian Magi, or the religion of Zoroaster, had, at a very early period, found its way into the peninsula; had been embraced with avidity by many tribes; and thus, in the middle of the 6th century, the population of Arabia was divided, perhaps not very equally, into Sabians, Jews, Christians, and Magians. (*Shakrestan al-Us* in Pococke, 140, et seq.; *Sale*, *Intro. Koran*, 21—24.)

Such was the state of religion in Arabia at the birth of Mohammed; an epoch which may be regarded as the commencement of one of the most extraordinary revolutions that history has to record. It occurred at Mecca in the month of May, A.D. 871, (*Dr. Prideaux*, *Hist. Moh.* 6.) or 570 (*Abul-Feda*, *Vit. Moh.* 45.). This founder of a new religion, and of a political power which, even in his lifetime, extended over his native country, and which, under his successors, threatened to embrace the empire of the world, traced his genealogy in a direct line through 11 descents from Korish, the founder of the powerful tribe that bore his name. Korish again, was affirmed to be the 10th in direct descent from Adnan; and Adnan, the 3d, 7th or 8th (which is doubtful) from Ishmael, the son of Abraham. (*Abul-Feda*, *Vit. Moh.*, cap. ii. pp. 6, 7.)

The future Prophet sprang, therefore, from the noblest tribe of the Ishmaelitic Arabs; and his grandfather was at the time of his birth, sovereign of Mecca, and guardian of the *kaaba*; consequently, from the sacredness of his territory, and the holiness of his office, a prince of great power and influence. (*Abul-Feda*, cap. vi. p. 12. *Al-Firawz al-Us* in Pococke, p. 51.; *Erechleus Chron.* or *Hist. Ar.*, par. i. cap. iii. p. 139, et seq.)

Yet, notwithstanding his high connections, Mohammed's early life was passed in comparative poverty. His father, a younger son of the sovereign of Mecca, dying before Mohammed was 2 years old, the latter, and his mother, were left with no other provision than 5 camels, and a female slave. To his grandfather, Abdul-Muttaleb, in the first instance, and subsequently to his uncle, Abu-Taleb, the future Prophet was, therefore, indebted for his infant protection; and this guardianship was exercised with the greatest kindness, the uncle especially (for Abdul-Muttaleb died when Mohammed was only 8 years old), continuing the firm friend of his ward, throughout his life, and protecting him in the dangers and difficulties which beset his first attempts to disseminate his doctrine. Under the auspices of his uncle, Mohammed began life as a merchant, accompanying a trading caravan to Syria, in his 13th year. Subsequently, and at a very early age,

Abu-Taleb recommended him as a factor to Khadija, a rich widow, to whom his skill in commerce, or his other accomplishments, so far endeared him, that, in a short time, he exchanged the name of servant for that of husband; raising himself by this alliance to an equality with the richest, if not the most powerful men of Mecca. At the time of his marriage, he was 25, and his wife 40 years of age. (*Abul-Feda*, caps. iv. and v. pp. 10. and 12.). It would be useless now to attempt to discover the proximate cause that led Mohammed to attack a system of idolatry, of which his own family were at the head. It was not, however, as some have surmised, a sudden outbreak of enthusiasm; for, after his marriage, he continued to live in all the privacy compatible with the station of a rich and highly connected individual for 13 years. At the termination of this period, he withdrew from society, resorted to a cave in the neighbourhood of Mecca, where, for 2 years, he gave out that he was in daily communication with the Divinity. At the end of this time, being then 40 years of age, he assumed the character of a Prophet, sent by the Almighty to establish a new religion; or, if we may take his own words, to restore the ancient one, professed by Adam, Noah, Abraham, the Prophets, and Jesus Christ; by destroying the gross idolatries of his countrymen, and weeding out the corruptions and superstitions by which, as he alleged, the Jews and Christians had deformed the beautiful simplicity of the true faith. (*Abul-Feda*, cap. vii. pp. 14—17.; *Abul-Pharagius*, p. 102.; *El-Macn. Hist. Sar.*, lib. i. cap. i. p. 13., &c.)

His first convert was his wife Khadija, of whose merits, in this and other instances, he always entertained the highest sense, uniformly speaking of her with an affection bordering upon reverence; and placing her, after her death, among the only *four* perfect women the world had ever seen. The other three were Miriam, the sister of Moses and Aaron, the Virgin Mary, and his own daughter Fatima. (*Abul-Feda*, caps. vii. & viii., pp. 16, 17.) The progress of the new sect was at first very slow. It is usually stated, that 9 converts only were made in the first year; but this is scarcely consistent with the fact that, in the 4th, Mohammed felt himself strong enough to abandon his private preaching, and to proclaim his doctrines publicly. (*Abul-Feda*, cap. viii. p. 19.; *Koran*, cap. xxvi. & xxvii.; *Abul-Pharagius*, p. 102., &c.)

Nothing can well exceed the simplicity of the Mohammedan doctrines, as delivered by the founder and his immediate successors; and as they are embodied in the 114 chapters of the *Koran*: The unity of God; the divine mission of Mohammed; the stated observance of prayer; the giving of alms; the observance of an annual fast; and the pilgrimage to Mecca; comprise, under 5 heads, the principal points, whether doctrinal or practical, which were to be enforced. The resurrection of the body was proclaimed, and a future state, in which men will receive the reward of their good actions and obedience to the law of the Prophet, or be subjected to a purifying punishment for their evil deeds and infidelity. The final admission of all believers to a state of bliss, is an article of Mohammedan faith (*Koran*, *pasim*, especially chaps. ii. iii. iv. v. and cxli.; *Reland's Moham. Theol.*, p. 20., &c.) The supposed divine legation of Mohammed is the principal novelty introduced. The stated prayers were only adaptations of customs already existing among the Sabians, Jews, Christians, and Magians; the annual fast was a very ancient practice among the old Arabs; and the only change effected by Mohammed in its observance, was, by prohibiting the interrelation of a month in the lunar year, to make the sacred season fixed instead of ambulatory. (*Koran*, chap. ix.) The pilgrimage to Mecca was, as has been shown, a practice followed from the very earliest times; and the rewards and punishments in another life were adopted, but with much adulteration, from the Christian doctrines. The grossly sensual character of Mohammed's paradise is, in fact, the greatest blemish in his religious system; and has had a most debasing and degrading influence over the countries where it has acquired an ascendancy.

The new religion being in most parts little more than an adaptation of various parts of the religions previously existing in Arabia, was well fitted to attract all by the respect it professed for the peculiar tenets of each, excepting the idolatrous worship of the Sabians. Accordingly, Mohammed was heard with patience by the people of Mecca, till he denounced the idols of the Kaaba. This, however, raised so strong a feeling against him, that his ruin was prevented, and his life preserved, only by the firm friendship of his uncle, Abu-Taleb, who, although unconvinced by the preaching of his nephew, protected him against his enemies. In the 6th year of his mission, the persecutions to which he was exposed became so severe, that many of his followers sought, by his permission, refuge in other lands, chiefly in Abyssinia; where they became the first instruments for planting the new faith in Africa. This event is called, by Eastern writers, the first *Hedra* or flight.

(*Abul-Feda*, caps. ix. x. xi., pp. 21—27.; *Abul-Athir, Al-Firawn et alii in Pooche*, p. 177, et seq.)

The protection of Abu-Taleb, though it preserved Mohammed from personal danger, could not prevent a very strong manifestation of hostility, in which Abu-Taleb himself and all his family were sharers. The other Korishites bound themselves to hold no communion with the family of Hashem, the great grandfather of Mohammed; and to give the greater force to their act, it was reduced to writing, and laid up in the Kaaba. At the end of 3 years, however, Mohammed, having, no doubt, previously concerted his measures, proclaimed, that God had sent a worm to eat out every word in the parchment except his own holy name; and the writing being, on inspection, found to be destroyed, the league was put an end to; and Mohammed's reputation considerably increased. In the same year, being the 10th of his mission, Abu-Taleb and Khadija died; and their deaths were by far the greatest blow which Mohammed experienced during his career. In the Mussulman calendar, this year is commemorated as the year of mourning. (*Abul-Feda*, cap. x. xiv., pp. 28—29.; *El-Macn*, lib. i. cap. i. p. 4.) The death of Abu-Taleb removed the only check to the virulent enmity of the Korishites; and a stranger having succeeded to the sovereignty of Mecca, after a troubled residence of 3 years—marked, however, by the accession of many proselytes—Mohammed, on the invitation of a deputation from Medina, fled to that city; and instantly, as if by magic, the proscribed and condemned exile became a powerful and, as it soon appeared, an all-but-invincible monarch. The flight from Mecca to Medina, the second Hedra, or *Hedra*, *par excellence*, is the epoch from which the Mussulman date their era. It occurred in the 53d year of Mohammed's age, and 13th of his mission, and coincides with the 16th July A.D. 622. (*Abul-Feda*, cap. xxi. xxiii., p. 40—50.; *Elm. Isak*, in *Sale*, p. 48.; *El-Macn*, lib. i. cap. i. p. 4.; *D'Herbelot*, pp. 444, 445.) Down to this point, Mohammed had propagated his religion by means of persuasion only; throughout 85 chapters of the *Koran*, published at Mecca, there is nothing said of a compulsory power being given to the Prophet; on the contrary, he exhorts his disciples to bear with patience the evils inflicted by unbelievers, declaring he has no authority to compel any one to embrace his religion. (*Sec*, in particular, chaps. vii. to xxiii.; xxv. to xxviii., &c.) But his doctrines breathe a very different spirit after his establishment in regal and sacerdotal power at Medina. The 18 chapters of the *Koran*, published at that city, declare, that since man had perversely rejected the missions of Abraham, Moses, the Prophets, Christ, and even the mild pleadings of Mohammed himself, God had now commanded him to extirpate idolatry from the earth, and to bring all mankind into submission to his will. (*Sec*, in particular, chaps. iii. iv. v. viii. ix., &c.) The sword, however, was first drawn against Mohammed, and not by him. Abu-Sophian, the new sovereign of Mecca, led an army, of 900 or 1,000 men, against the suppositions Prophet, who, with a force of only 319 enthusiasts, met his enemies in the valley of Bedr, near Medina, and gained a complete victory, with the loss of only 40 men; who were immediately canonised, as the first martyrs in the cause of God and his Prophet. (*Abul-Feda*, cap. xxvii., pp. 55—59.; *El-Macn*, lib. i. cap. i. p. 5.)

From this time the progress of Mohammed was, if not a continued triumph,—for he sustained some defeats, an example of the most rapid success upon record. During the next six years he fought 27 battles, exclusive of those fought by his generals, in which he was not personally present; and, at the end of that period, he entered Mecca in triumph, on the 20th Ramadan, in the 8th Hedra, or December 31, A.D. 629. The conquest of Mecca may be regarded as the final establishment of Mohammedanism in Arabia. The few contests that followed were merely the last struggles of an expiring opposition; and were mostly terminated by Mohammed's generals; while the Prophet himself was employed in destroying the idols in and round the Kaaba, and in sending embassies, inviting the Arabs to embrace his faith; which invitations were now attended with complete success. The following year, the 9th Hedra, is called, by Eastern writers, the year of embassies: missions from all parts of Arabia poured in, bringing the adhesion of the various tribes to the now triumphant faith; and the victorious founder of the new religion made a solemn pilgrimage to the temple of the Kaaba, to return thanks to Heaven for his success, and the final overthrow of idolatry. (*Abul-Feda*, caps. xxviii.—lx., pp. 61—132.; *El-Macn*, lib. i. pp. 5—10.)

All Arabia was now united in one faith; but Mohammed did not live long to enjoy his triumph. Some years previously, or in the 7th Hedra, A.D. 628, he was poisoned by a Jewess of Chailab, who, on his entering that town in triumph, offered him some eggs, previously drugged, professedly to test the reality of his divine knowledge. (*Abul-Feda*, cap. xlv. p. 82.) Henceforward his strength declined; but his death was caused by a

fever*, which having, at intervals, deprived him of his reason, terminated his existence in the space of 14 days, on the 12th of the 1st month, Rebi'ul, in the 11th Hejira (6th June, 632), in his 63d, or, according to some authorities, 65th year. He was buried at Medina; and the Mohammedan doctors differ as to which is the most sacred.—Mecca, which gave birth to their Apostle, or Medina, which received him in his flight, and contains his mortal remains. (*El-Macini*, lib. i. p. 10.; *Abul-Feda*, caps. lxi.—lxiv. pp. 135—142.; *Ockley's Hist. Ser.* i. 1.)

During Khadija's life, Mohammed abstained entirely from the right of polygamy; after her death he took 9 wives, alleging, of course, that a special revelation authorised him in exceeding the number 4, to which his law restricted his followers! By Khadija, he had 4 sons, and as many daughters; and by an Egyptian concubine, he had a fifth son; all his other wives being barren. His 5 sons died in infancy; and of his daughters, Fatima only, who was married to her cousin Ali, survived her father. From Ali and Fatima a numerous and illustrious progeny descended, the ancestors of the numerous existing Sheriffs, or *Sons of the Prophet*. (*Abul-Feda*, caps. lxvii. lxviii. pp. 146—151.)

Mohammed died in the midst of preparations to carry his spiritual faith and temporal power into other countries. His death scarcely, however, suspended the completion of his great designs: a momentary state of confusion was followed by the election of Abu-Becre, father-in-law of Mohammed, to the office of supreme head of the Mussulman religion and power, under the title of "Khalif" or "Successor of the Prophet." Under his reign, and that of his two successors, the Arab arms were carried triumphantly into all the neighbouring countries; and, by the 20th year of the Hejira, or within less than 10 years from the death of Mohammed, the conquest of Syria, Persia, and Egypt, was completed. In the 13th year of the Hejira, Damascus was taken; in the 16th, Jerusalem; in the 17th, Antioch; in the 19th, Ispahan; and in the 20th, Alexandria. (*El-Macini*, lib. i. cap. ii. pp. 16—38.; *Abul-Pharagius*, pp. 168—117.; *Ockley*, i. pp. 1—391.)

The khalifate continued elective for 4 successive elections; the last, who held the power by public suffrage, being Ali, the cousin and son-in-law of Mohammed. This FIRST BELIEVER had been thus long passed by, in consequence of his refusing to be'd as sacred any thing not contained in the Koran, the immediate traditions of the Prophet. (*Abul-Pharagius*, p. 115.) From this circumstance arose the division of the Mohammedans into two great sects, the SONNITES and the SHITES. The latter, the disciples of Ali, whom they denominate the *nicar of God*, receiving only those doctrines which he admitted to be sacred; while their adversaries (the orthodox Mussulmans) hold, at least in equal reverence, the 7,275 *Sonna*, or oral laws, which, within the first 200 years of Mohammedanism, had grown into respect and veneration. (*D'Herbelot*, arts. *Bokhari*, *Hadith*, and *Sonnah*, pp. 208, 416, and 807.)

All fell by the hand of an assassin, after a troubled reign of 5 years; and Moawijah, son of Abu-Sophian, the greatest enemy of Mohammed, usurped the throne; and, what is more remarkable, had the power or art to make the khalifate hereditary in his own family. His descendants are called the Ommyyade race of khalifs, from Ommyyah, the grandfather of Abu Sophian; and they possessed the regal and sacerdotal power through 14 generations, and for nearly 100 years. (*El-Macini*, lib. i. caps. v. and vi. pp. 39—49.; *Abul-Pharagius*, pp. 117—123.; *Ockley*, ii. pp. 1—106.)

Under the sway of this family, the whole of Africa was subdued; and the African colonies by tribes of Bedouins, that it has ever since remained, in language, manners, and religion, essentially an Arab country. The Oxus (Jihon) was very early crossed; the shepherd tribes of Turks and Tartars brought under the triumphant faith of the Arabian prophet; and, within 80 years from Mohammed's death, the sceptre of his representative extended over all the countries between the Indus and the Atlantic, and (eastward of the Mediterranean) from the Indian Ocean to the Steppes of Central Asia. (*El-Macini*, lib. i. caps. vii.—xiii. pp. 49—77.; *Abul-Pharagius*, pp. 123—126.)

Spain was the last and most remote of the conquests of the khalifs. It was subdued in the beginning of the 8th century. Roderic, the Gothic king, being defeated and slain in the battle of Xeres, July 19, A. D. 711. Subsequently to this, though the Arabs were for a short time masters of the S. of France, they made no further impression on Europe; and, in the year 732, they were completely defeated by Charles Martel, and driven beyond the Pyrenees, which barrier they never recrossed. (*Abul-Casim*, vol. i. chaps. iv.—ix. pp. 34—111.; *Roderic Ximenes*, *Hist. Ar.*, caps. xi.—xiv. pp. 10—13.)

* The epileptic, or falling sickness, to which he is said to have been subject, is nowhere so much as hinted at by the native writers. It is strongly insinuated on by Prædixus (*Life of Mah.*, p. 20.), and by Hostinger (*Hist. Or.*, lib. i. cap. 2.); but their authorities are wholly Latin; namely Ximenes, Theophrastus, Zonaras, &c.

The Ommyyade khalifs were, in the 133d Hejira (A. D. 750), superseded by the descendants of Abnah, one of the uncles of Mohammed. The Ommyyade dynasty had never received the cheerful submission of the Prophet's family; and, after a lengthened struggle, the last Ommyyade khalif was completely defeated in Mesopotamia, and again in Egypt, where he was slain. Abul-Abus-Safia, and the princes, his descendants, are known in history as the Abbasside khalifs. (*El-Macini*, lib. i. cap. xxi.; lib. ii. cap. i. pp. 95—100.; *Abul-Pharagius*, pp. 137, 138.)

The seat of government had, in the meanwhile, been removed from Medina to Damascus, and from the latter to Bagdad. It was in this new seat of empire that the Arab claim to literary and scientific eminence was first raised. It was here that the splendid courts of Haroun-al-Raschid, and his sons, Al-Mansour and Motassem, were held. It was here that, under their patronage, the Greek sages and philosophers were translated, that the native Arab genius raised its head, and carried the sciences, physical and metaphysical, together with the useful arts, to a point of grandeur unknown in former times. The names alone of the Saracen philosophers, mathematicians, astronomers, physicians, botanists, chemists, and architects, who illustrated this period of Arab history would fill a volume. Of chemistry, they may be called the *inventors*; and although, in astronomy, they did not presume to depart from the Ptolemaean hypothesis, they carried out the views of the Alexandrian philosopher, and attained results marvellous for their accuracy, when the erroneous nature of the data on which they were founded is considered. To the astronomical tables of Bagdad, Cordova, and Samarcand, subsequent observers owe a large debt of gratitude; and many of the common terms in modern astronomy, and most of the names applied to the fixed stars, attest the source whence Europe drew the elements of astronomical science. The Arabs, if they did not invent, at least were the great improvers of algebra† (the name sufficiently attests its origin), which placed in the hands of the analyst an instrument of vast and apparently unlimited power. Perhaps, however, the most important invention we owe to the Arabs, is that of the arithmetical characters, now in common use, which banished at once and for ever the cumbersome and unwieldy notation of the Romans. In medicine, the Arabs were pre-eminently great; and the magnificent remains of their public and private buildings, in Syria, Egypt, and Spain, evince their skill in architecture. The Arab court of Bagdad was, in fact, the centre of the knowledge and refinement of the period in which it existed; and, by a singular contrast, that period corresponded with the darkest and most degraded portion of European history. (*Abul-Pharagius*, pp. 150, et seq.; *D'Herbelot*, pp. 430, 545, &c.)

The khalifate shared the fate of all gigantic empires, especially of such as rise suddenly to immense power. It fell by its own unwieldiness. Spain first, and then Egypt and Africa, effected their independence. The wild Turk and Tartar tribes, among whom the Mohammedan faith had been imperfectly introduced, became dangerous neighbours to their nominal sovereigns; and, in their decreasing power, the khalifs had recourse to the desperate expedient of forming from these wild warriors a body of mercenary troops to guard their frontiers, and protect their persons. The result was identical with that which attended a similar experiment among the Romans. In a few generations the servants became the masters; and though, as in the parallel case of Rome, the destruction of this overgrown empire occupied some centuries, yet piece by piece it crumbled away, till, in the 656th Hejira (A. D. 1258), a Tartar army, having captured Bagdad, put an end to the nominal existence of the khalifate; all real power having, long before, passed into the hands of the Turkish sultans of Asia-Minor. (*Abul-Feda*, *Annales Muslemei*, ii. pp. 173—259 309. 405.; iii. 295—583. 633.; iv. 27, 315, 555.; v. 181—343.; *Abul-Pharagius*, 138—174. 198—200. 318.; *El-Macini*, lib. ii. xxii. xxxi. 97—163.; lib. iii. xli. 214. et seq.)

The foreign conquests of the Arabs made no change in the political state of the peninsula. The heads of tribes still governed their subjects, as they had governed them from time immemorial; acknowledging, in the distant khalif, no more than a general head of the Arab people, and the sacred chief of the Prophet's faith. As the downfall of the khalifate was unattended by any shock to Mohammedanism, merely transferring the office of "Commander of the Faithful" from the khalif of Bagdad to the Turkish sultan, it may be easily imagined that the Arabs had little difficulty in changing the objects of their veneration. Their holy cities were visited

† This science was, certainly, originally discovered by Diophantus of Alexandria, but its power, as an instrument of analysis, by dominant and unknown, still developed by the ingenuity of the Arab mathematicians. The first systematic work on this subject came from the court of the Khalif Al-Mansour, and from the pen of the Arab, Mohammed-Ben-Musa. (*Abul-Pharagius*, pp. 185—186.)

as before, and by larger caravans, as their faith was more diffused. Though they sent forth a host of conquerors, who subdued more countries in a shorter time than almost any by whom they had been preceded, their country escaped the fate of most victorious nations—that of being conquered in turn. Two revolutions only are recorded as having shaken Arabia, since the era of Mohammed; and both of them, like his, were of native growth, and of a religious character.

A tribe of fanatics, under the influence of a leader named Earmath, attempted, in the 297th Hijra (A.D. 890), to effect a change in the ceremonial part of Mohammed's institutions, by reasserting the prohibition of wine, and preventing the pilgrimages to the holy cities: slaughter and desolation marked the progress of the sect for more than 60 years; but, finally, it vanished, leaving no record of its existence, but the memory of its cruelties and enormities. (*Abul-Feda, An. Mus. ii. 267. et seq.*; *D'Herbelot, p. 256.*)

The other revolution took its rise in the beginning of the last century. Addul-Wahab, a native of Nedsjed, proclaimed himself a prophet sent from God, to reform the abuses which, in the lapse of years, had crept into the pure doctrines of Mohammed. The Koran, in the creed of Wahab, is the only rule of life, and the Mussulman traditions are entirely rejected. God is to be worshipped in the strictest unity, and every species of adoration paid to Mohammed, or any other created being, is denounced as idolatrous. Simplicity, or rather asceticism, seems to be the distinguishing characteristic of the new sect; they acknowledge no sating—they bury their dead without pomp of ceremony—their clothes and houses are as plain as possible—their mosques have no ornaments whatever—and they interdict the use of coffee, tobacco, and opium.

The Wahabee doctrine, so called from its founder, found a protector in Ebn Saoud, a Bedouin sheikh of Nedsjed. The preacher was proclaimed supreme spiritual head, the soldier, prince, and general of the new worship; extermination was threatened to all opposers, and, for awhile, the progress of the Wahabees was a continued triumph. Mecca was subdued in 1802, Medina in 1804; and it seemed as though a repetition of Mohammed's victorious career were about to be enacted by the sons of the first establisher and supporter of the new sect. But in 1813, Mehemet Ali drove them from the Western coast, and restored the holy cities to the nominal protection of the Porte. Since that time, the progress of the Wahabees appears to be at a stand; and though they are still strong in Nedsjed, there is reason to believe that their power is on the decline, and that their numbers are decreasing. (*Niebuhr, par. ii. pp. 298—302.*; *Histoire des Wahabites, par M. A. L., Paris, 1810, passim*; *Burckhardt's Notes on Bed., 68.*) It cannot, therefore, be supposed that education in Arabia is either very good or widely diffused. According to Niebuhr (*Des de l'Ar., par. i. p. 91.*) "the Arab princes by no means encourage science; and throughout the East, you meet few who merit the title of learned."

Public provision is however made for the education of youth; and a teacher for the children and young slaves is no uncommon part of the domestic establishment of distinguished families; so that, in the cities, the greater part of the population can read and write,—attainments which are also found commonly enough among the sheikhs of tribes in the neighbourhood of the settled districts.

To almost every mosque there is (or was) attached a school, where the poorer children may be taught gratuitously; besides which, there are in every great town more or fewer private establishments where the children of the middle classes are received. The education is of a limited kind, comprising little more than reading, writing, the simple rules of arithmetic, and the doctrines of the Mohammedan religion. School-houses, like the shops, are open to the street, so that the whole process of education is conducted in public; and to prevent the distraction incident to such a situation, the readers and repeaters speak in the highest possible key, and accompany their delivery with violent gesticulations.

Besides these, there are in many of the greater towns schools of a higher character; colleges, in fact, in which the higher sciences—mathematics, astronomy, astrology, and medicine are taught. In the Imamat of Yemen (which is but a small part of the district so called) there are two of these colleges. One of the chief studies in them is the ancient Arabic, now a dead language; for

their learned men are expected to understand clearly, not only the Koran in its original tongue, but also all the ancient commentators, of whom the number is very considerable. Candidates for offices, civil or ecclesiastical, are said to undergo a very rigorous public examination as to their literary and scientific attainments; but this is more pretence, the most illiterate persons being frequently appointed to the highest posts, while the best instructed get a precarious living as scribes, teachers, and public rectors or poets. Hence the wish to acquire a high degree of scholastic knowledge is very weak in the majority of Arabs; and the profession of teacher is far from respectable or lucrative. In many of the towns, the public schools are falling to decay; and those qualified to conduct them, prefer wandering over the country like the bards and troubadours of the middle ages, as poets and orators; in which characters, as the vellers or singers of the glories of the nation, they are welcomed and rewarded alike by the sheriffs and sheikhs. There is no public provision whatever for female education; and, among the Bedouins, whole tribes can neither read nor write. A very great obstacle to the advancement of education in Arabia is, the prejudice of the natives against printing. From the nature of the Arabic characters, interlacing each other, and frequently placed vertically, they appear handsomer, when well written, than when printed. There was not a few years ago, and perhaps there is not at present, a single printing-press in the country. (*Niebuhr, par. i. pp. 91—96.*; *par. ii. p. 184.*; *A. Bey, ii. 100.*; *Burckhardt's Notes on Bed., 42, et seq.*)

Political Divisions.—*Sources of Revenue.*—Without reckoning the Bedouin tribes, the number of which can hardly be ascertained, the settled parts of Arabia are divided into a great many independent governments; hence states, also, not unfrequently spring up. The political divisions of this country are therefore very uncertain, but at present they may be regarded as consisting of; 1st. 14 or 15 states, upon the S.S.W. coasts; 2d. A much greater number upon the shores of the Persian Gulf; 3d. The half-settled Bedouin tribes, in the N. part of that Gulf; 4th. The dominions of the Wahabee chief, Abdallah, in Nedsjed; 5th. The Hedjaz and Bahrel-tour-Sinal, on the W. and N.W. of all these. The last are the only parts that own a foreign master. The descendants of Mohammed continued to reign in the Hedjaz from his time down to a late epoch; acknowledging, however, the supremacy, first of the court of Bagdad, and afterwards of the Turkish Sultan, as head of the Mohammedan faith; ministers of the paramount power residing at the sanctuary in the holy cities. While the Turkish government retained its strength, this connection was acknowledged and respected in the Hedjaz; but in the latter part of last century, the sheriffs renounced their nominal allegiance, attacked the Turkish pachas, and finally expelled them. Scarcely, however, was this effected, when the Wahabees subdued the whole of the Holy Land, and held it till 1813-14; when Mehemet Ali, pacha of Egypt, nominally restored the Holy Cities to the protection of the Porte, but virtually made himself master of the Hedjaz; which he has since retained, and governed at discretion. The Desert of Sinal has always belonged, more or less, to Egypt. (*Burckhardt's Travels, passim*; *Notes on Wahabees, 321—420.*; *Lord Valentia, iii. 325—327.*)

Taxes in the settled portions of Arabia are pretty uniform. A tenth of the productions of the land is paid to the sovereign, and this not unfrequently in kind. (*Fraser, p. 15.*) In Yemen, however, this tax appears to be compounded for by the payment of a fixed sum annually (*Niebuhr, par. ii. p. 193.*); and with regard to the town population, this method must necessarily be general. The tithe upon land is the only legal fixed impost which the subjects of the native Arab princes are called upon to pay. But a far more productive source of revenue is found in the customs and duties upon merchandise. The Inan of Muscat levies 4 per cent. upon all goods passing up the Persian Gulf, in Arab bottoms; and this small duty is so productive, that it yields from 110,000 to 160,000 dollars annually. (*Fraser, p. 16.*) In Yemen, the Inan levies 3 per cent. upon the coffee carried from his dominions beyond the Straits of Bab-el-Mandeb, and 7 per cent. upon all that is sent up the Red Sea; and the sultan sheriff of Mecca—or rather his present master, Mehemet Ali,—takes 6 per cent. more in the port of Djirda. (*Lord Valentia, ii. 368, 369.*) The large quantities of goods that are constantly passing from India, Abyssinia, Egypt, Syria, &c., to and from trading towns of Arabia, have also their stated rates of duties; and the income derived from them is so great, that Mehemet Ali cheaply purchased his popularity in his new dominions by foregoing the settled tithe which had formerly been paid in them. One of his first acts was a declaration, that the inhabitants of the Hedjaz should be wholly free from taxes. (*Burckhardt's Notes on Bed., p. 306.*) The city of Medina was said to be impost free, even before this period. (*Ali Bey, ii. 127.*)

Certain articles of commerce are monopolies in the hands of the governments; as salt in the Hedjaz, and the same article and sulphur in Oman. (*Burckhardt's Travels*, i. p. 65.; *Fraser*, 16.) Besides which, the sovereign is frequently possessed of large landed property in private right, which he lets out precisely like any other landlord; and in certain cases, as in those of the Imans of Muscat and Yemen, he is also the most considerable merchant in his own dominions. (*Niebuhr*, par. ii. pp. 182—184.; *Fraser*, 16.)

These are all legitimate sources of revenue; but the evil in this and all other Mohammedan countries is, that the governments, being despotic, practise and tolerate all sorts of extortion. Before the conquest of the Hedjaz by the Egyptians, it was customary for the sultan sheriff of Mecca to fill the prisons with persons upon charges of disaffection to his person, that they might purchase their lives and liberties by large fines. (*Burckhardt's Travels*, i. p. 416.) In Yemen the dolas receive the taxes and customs of the towns, pay the troops, the judges, and other public functionaries, and transmit the balance to Sanaa, the seat of government. In this arrangement, the Imam squeezes all he can from the dola; and the latter, whose nominal income is very trifling, resorts to any means, however infamous, of realising a large income for himself. The chief sufferers in these transactions are the Indian, and other foreign merchants. When Lord Valentia was at Mocha, the dola used to confine the Banians and Jews in a close room, and fumigate them with sulphur till they purchased their release at the price he chose to stipulate! (*Niebuhr*, par. ii. p. 183.; *Lord Valentia*, ii. p. 353.) The collection of the customs, too, is attended with considerable fraud; and it is in the power of the officer to favour his friends, and oppress strangers, without incurring any responsibility. These abuses have, however, been considerably modified in the Hedjaz since the establishment of the Egyptian power. (*Lord Valentia*, iii. p. 325.; *Burckhardt's Travels*, i. pp. 83, 417.)

The Bedouins pay no taxes, except the tribute exacted by the Wahabee chief. The sheikhs derive no income from their tribes: their only source of revenue, beyond their private property, consists of the tribute collected from the villages in their neighbourhood, and from the caravans that cross the desert. Formerly, the Bedouins in the neighbourhood of Mecca paid a nominal impost to the sultan sheriff, but this was given up by Mehemet Ali. The Bedouin sheikhs have, however, few or none of those expenses to sustain which fall upon the sovereigns of the settled districts. The troops are the sheikhs' soldiers, and receive no pay; and the emoluments of the kadis depend upon the cases brought before them; being paid, according to the value of the property in dispute, by the party in whose favour they decide. (*Niebuhr*, par. ii. pp. 327—333.; *Burckhardt's Notes on Bedouins and Wahabees*, pp. 67—69, 306.)

The tribute exacted by the Wahabee chief, wherever his power extends, consists of the *alms*; the giving of which is a fundamental law of the Mohammedan religion, but the payment of which had been always left to every man's conscience, till the Wahabee chiefs compelled their subjects and traders to deliver them for distribution into their hands. The Mohammedan law had minutely fixed the proportion of these alms to the property of the donor, and to that law the Wahabees have rigorously adhered. For 5 camels they exact 1 sheep for tribute; 200 camels pay 4 camels of 4 years old; and between these extremes the rates vary in every possible variety. For herds no tribute is exacted under 30 heads, for which a calf of 2 years is paid; 129 heads pay 4 oxen and 3 cows. For sheep, 1 is claimed for all numbers between 40 and 120; 3 for all between 120 and 400; for 400, 4 are taken, and after this, 1 sheep for every hundred in the flock. For all horses, above 5, a sequin per head is paid, or 24 per cent. on the value of the beasts. For money, all sums above 200 *dirhems* (about 130*l.* in silver, or 20 *miscales* (about 16*l.* in gold, pay 24 per cent. (*Burckhardt's Notes on Bed.*, p. 305.; *D'Osson*, *Tableau Général de l'Empire Ottoman*, ii. 412—418.) The Wahabee chiefs divided this tribute into two parts; appropriating that derived from the Bedouins to their own use, and that from the towns to the public service. They have also introduced some changes in the collection of the tribute of produce, which have materially relieved the cultivator. Where water was abundant, they continued to draw the tenth; but where it is deficient, they have reduced the tax to a twentieth part. Merchants in the Wahabee country pay 24 per cent. upon their property yearly, stating its amount upon oath. (*Burckhardt's Notes on Bed.*, p. 306.)

Arabia has been supposed to contain from 12,000,000 to 14,000,000 inhab., though this is probably beyond the mark. The nomadic habits of the greater part of its population, and the number of petty states into which the settled pop. is divided, and the little that is known with respect to most of these, renders it impossible to assign either their limits or their population. According to Balbi,

the imanat of Yemen, or Yemen Proper, and the imanat of Muscat, on the coast of Omar, have respectively—

IMANAT OF YEMEN.	IMANAT OF MUSCAT.
Superficial extent, 55,000 sq. m.	Superficial extent, 52,000 sq. m.
Pop., 2,500,000.	Pop., 1,600,000.
Revenue, 495,000 <i>l.</i> sterl.	Revenue, 165,000 <i>l.</i> sterl.
Army, 5,000 men.	Army, 1,000 men
	Navy, 1 ship, 3 frigates, 30 inf.
Density of pop., 47 per sq. m.	Density of pop., 31 per sq. m.

The Hedjaz has been very well surveyed, especially by Ali Bey and Burckhardt, but its varying population, owing to the influx and efflux of pilgrims, together with the crowd of traders who are constantly passing between its shores and distant countries, renders it difficult, if not impossible, to assign its real numbers with any tolerable accuracy. Probably, however, it is more densely peopled than either Yemen or Muscat.

The states of Yemen, as enumerated by Niebuhr, are the following:—

- | | |
|---------------------|---------------------|
| 1. Yemen Proper. | 8. Sahan. |
| 2. Aden. | 9. Nedsjiren. |
| 3. Kankeban. | 10. Kuchlraa. |
| 4. Haschid-u-Bekel. | 11. Dajol. |
| 5. Abu-Arish. | 12. South Khailaan. |
| 6. Beled-el-Kobail. | 13. Nehm. |
| 7. North Khailaan. | 14. Jaffa. |

There are, also, a great many little states upon the Persian Gulph; and Hadramaut consists of insignificant sovereignties, mostly of not greater extent than a mile or two round the town where the chief resides. (*Niebuhr*, par. ii. pp. 160—245, 267—282, &c.)

ALABAKIR, a town of Asiatic Turkey, pachalik of Sivar, cap. saijack, 7 m. N. Euphrates, and 60 m. N.N.E. Malatlia, lat. 39° 0' N., long. 39° E. It is said to be well built.

ARACAN, a country of Asia, called by the natives *Rakkhang*, extending along the W. coast of the great E. peninsula of S. Asia, acquired from the Burmese, by the British, in 1824. It lies between 15° 53' (Cape Negrais) and 21° 30' N. lat., and 92° 20' and 94° 14' E. long.; having N. the r. Nauf, which separates it from Chittagong, E. the Yeomandong mountains, dividing it from the Burmese dominions, and W. the Indian Ocean; the two latter boundaries meeting at an acute angle at Cape Negrais, its S. extremity: length, N. to S., about 500 m.; breadth, at its N. end, 90 m.; but thence southwards continually decreasing; area, 16,250 sq. geog. m. (*Pemberton*); pop. said to be about 230,000 only, whereas, in 1795, it was estimated, but probably much beyond the mark, at 2,600,000. (*Pemberton's Report on the E. Frontier of British India*, 8vo. Calcutta, 1835, pp. 83, 84.; *Captain Laws*, in the *Geographical Journal* i. 175.)

The Yeomandong, or Anoo-pectoo-moo, mountains are a branch from those that bound S. the vale of Assam, and form the E. boundary of both Aracan and Chittagong. Their heights vary from 2,000 to 8,000 feet; Table Mountain, in 21° N. lat., and 93° E. long., is 8,340 feet above the level of the sea. Near lat. 20° they take a sudden turn E. for about a degree; but in general their direction is N. to S.; they are covered with forests, and have numerous passes, the chief being those of Khyounzah and Goa in the Burmese, and Tongo, Talak, and Aeng, in the British dominions. They are, in almost every case, mere narrow footpaths. (*Kitter*, *Ersk.*, vol. i. p. 308.; *Pemberton*, p. 59.)

The country, generally, is diversified with hill and dale, but on the N. border and the sea-shore there are low and marshy tracts. The rivers run mostly in a S. W. direction, and are frequently navigable for trading vessels of some magnitude; the largest is the Aracan (properly Kuladyne), which rises in the Burmese dominions, near 28° N. lat., and discharges itself in 20° 15' by several mouths; on one of its minor branches is situated the town of Aracan, accessible to vessels of 250 tons burthen. The other principal streams are the Nauf, Aeng, Mion, and Sandaway rivers, all in some degree navigable. (*Hamilton's Descr. of Hindostan*, vol. iv. p. 801.; *Pemberton*, pp. 7, 8.)

The coast, in the central part of Aracan especially, contains many good harbours, is much indented by creeks, and studded with islands and rocks, which render the mouth of the Aracan river somewhat dangerous to approach in the S. W. monsoon: during the rest of the year, however, the water is smooth, and there are good anchorages all along the coast, in from 6 to 20 fathoms, with a muddy bottom. (*Geogr. Journal*, i. 175.; *Hamilton*, pp. 80, 801.)

The principal islands are Cheduba, Ramree, and Akyah, between the rivers Kuladyne and Mion. They are usually separated from the main land by narrow channels, and partake of the same natural aspect. (*Kitter*, *Ersk.*, vol. iv. p. 308.)

The climate is decidedly unhealthy, except in a few spots, as Kyook-Phyoo, on the N. side of Ramree, and

especially hostile to Europeans, who are attacked by intermittent fevers, and other effects of malaria. During the Birmese war the troops died in great numbers from these causes. The country is inundated by heavy rains during the S. W. monsoon, which begins in May and ends in October. In 1832, from June to October, 196 inches of rain had fallen; during the other portion of the year it is often enveloped in heavy fogs; and violent showers sometimes occur in December, February, and April. In 1832, the maximum height of the thermometer in July was 89° Fahr., in August 94°; the minimum in both months 77° (*Ritter, Erdk.*, p. 317; *Geogr. Journal*, i. 175.)

The abundance of forests which cover the mountains have hitherto been insurmountable obstacles towards any knowledge of their geology. The primitive rocks that have been seen are mostly slate. The low or hills consist chiefly of sandstone, with a stiff clay occasionally intermixed; on every part of the coast coral and shell-fossils are abundant. A low alluvial soil extends over the whole of the country from the foot of the mountains to the sea.

Little systematic information has been collected as to the products of the country. Salt is largely produced in the creeks, &c.; its export has lately increased very rapidly, and is now (1837) estimated at about 250,000 manils. Gold and silver are said to be met with; jungles of mangrove crowd the banks of the rivers; firs are common N. of the Aracan river; teak, bamboo, the red yarud, &c. are found in the forests, and since the British occupation have been used for ship-building; the sugar-cane, cocoa, palm, indigo, cotton, rice, red pepper, cucumber, melon, plantain, mango, jacko, orange and other fruits, are indigenous: elephants, cattle, birds of many kinds, fish, silkworms, and bees are found in great plenty. (*Hamilton's Descr.*, vol. ii. p. 800; *Ritter, Erdk.*, p. 319; *Pemberton*, p. 11.)

About 11,677 dooms, each doom 6.35 acres, or 115 sq. m., are cultivated with rice; miscellaneous culture occupies about 8 sq. m. more, there being thus not 1-133d part of the whole country brought into tillage: the lands round Aracan are the best. Next to rice, sugarcane and cotton are the chief objects of culture; the chief farmers are Mussulmans, the Mugh tribes subsisting generally by hunting and fishing. The houses are bamboo huts, raised on posts 4 feet from the ground, to preserve them during the inundations, built often in thick jungles, or along the sides of rivers, and surrounded by small patches of indigo, cotton, tobacco, and fruit; even in the principal towns the houses are not of a more substantial material. Since the British occupation, articles of civilised life have been largely introduced into the markets; the imports consist of Indian and European goods, and betel nut; the exports, of rice, paddy, wood, salt, oil, buffalo hides and horns, elephants' teeth, sugar, cotton, tobacco, silk, wax, &c. The exports from Aracan, the chief port, during 7 months of the year 1833, were of the value of 53,800 rupees; the chief trade is with Bengal and Chittagong. The public revenue, which has been progressively improving since the British occupation, amounted in 1836-37 to 825,000 rupees; but is as yet hardly sufficient to pay the government expenses. British Aracan extends as far S. as 17° 52' N. lat., and is governed by three civil functionaries, one placed over each of the three provinces of Akyab, Ramree, and Sandaway; and all under the superintendence of the British governor at Chittagong. The troops employed by the government are only 8 companies of sepoy; viz., 2 at Akyab, 2 at Sandaway, and the other 4 at Kyauk Phyoo, the chief military station, and where also a part of the militia used in the late war is laid up. The inhab. are 1-10th Birmese, 3-10th Mohammedans and Indians, and the remainder Yekas or Yekas, as they call themselves, the Mughs of the Europeans. The latter are of middle height, with a broad face, high and prominent cheek bones, the nose flat, and the eyes like those of the Chinese: they are cunning, and addicted to stealing, but not to falsehood. Their language and religion resemble those of the Birmese; the latter, however (that of Buddh), they do not adhere to very strictly, since they do not abstain from animal food; Guadma is a celebrated idol amongst them, and they take as their year the period at which he introduced Buddhism into Aracan; the present year, 1839, is with them 1290. There are 2 or 3 priests in every village, who occupy themselves chiefly in the tuition of the children in schools, which are voluntarily supported, and open to all. The Aracanes are by no means uneducated; almost all of them can read and write; the latter they practise with a chalk pencil on a paper made from the bark of a tree: their records are kept on palm-leaf, lacquered in japan or red upon a gilt ground. The people are fond of finery; the dress of the women is a red binder wrapped closely round them, over this a robe reaching to the knee, and the petticoat fastened loosely on one side all down, so that in walking the whole of one limb is exposed. Women are not kept secluded, but enjoy as much liberty as the other

sex. Slavery in all its forms is tolerated. Marriages are arranged by the parents of the parties; solemnised by feasts, and ratified by the married couple eating out of one dish. If they separate at a future time at the wish of the husband, he must take upon himself all his wife's debts; if such a determination originate with the latter, she takes them upon herself, but can demand 25 rupees from her husband. If a man be in want of money, he may pawn his wife; but if she become pregnant in consequence, he can claim her again, and the contract to pay becomes null and void. The dead are either buried or burned.

This country has been very greatly improved since it came into the possession of the British, previously to which it was fit the worst possible state. The bands of robbers by which it was infested have been extirpated; and the habits of the bulk of the people materially improved. With one exception, there was no instance of dacoity (robbery) in the principal district of the prov. of Akyab during the two years ending with 1837. (*Moulmein Chronicle*.) The introduction of tranquillity and commerce has awakened a spirit of industry, and rendered the people cultivators, salt-manufacturers, and traders. Akyab is daily becoming of more and more importance. (*Paton's Hist. and Statist. Sketch, Asiatic Researches*, vol. xvi; *Pemberton*; *Ritter*, vol. iv. p. 325; *Laws, in the Royal Geogr. Journal*, i. 177.)

Before 1783, Aracan was independent, though often ravaged by the Moguls and Peguans; in that year it was conquered by the Birmese and governed by their viceroys, whose oppressions depopulated the country, causing many of the inhabitants to fly to Chittagong and Tipperah, where they settled; and others to become jungle-robbers. A revolt broke out in 1811, and the violation of the British frontier by the Birmese, both then and subsequently, was the cause of the Birmese war of 1824; which ended in the cession of Aracan to the British.

ARACAN, a town and cap. of the above prov., on an inferior branch of the Kulaitya river, which is here crossed by several lofty wooden bridges, 50 m. N. E. of Akyab, lat. 17° 44' N. long. 95° 20' E. Pop. (1845) from 8,000 to 10,000. It forms an irregular square, walled on all sides except the N. E., where it touches a shallow lake. As a fortress, however, it is worthless, being commanded by various hills in the neighbourhood. S. of the principal street which runs E. and W. are the ruins of an ancient palace and fort, the latter surrounded by a triple enclosure of stone paved up with brick. There are many pagodas, both in the town and on the heights around it. Next to Akyab it has the best market in the prov. for British manufactures and the silks of Pegu, and its river is navigable for boats at high tide; but its consequence has been gradually diminishing since Akyab began to rise into importance. Aracan was taken in 1783 by the Birmese, who captured much booty, including a large brazen image of Guadma, held in the highest veneration, and other idols. (*Pemberton's Report*, &c., p. 89; *Hamilton's Hudud*, vol. ii. p. 804.)

ARAD, a town of the Austrian empire, on both sides of the Maros; that part which is on the N. bank, or Old Arad, being in Hungary, and the other, or New Arad, in the Banat. 27 m. N. Temeswar, lat. 46° 9' 56" N., long. 21° 18' 34" E. Pop. of both parts near 18,000.

New Arad is strongly fortified; and Old Arad is the residence of a Greek bishop. The most numerous inhabitants are the Jews, who are also very opulent. "They are greatly favoured, being allowed exclusive monopolies of tobacco, corn, and other commodities." (*Hudud*.) The town is the entrepot of the products of a large tract of country, which are here embarked on the Maros, and sent by the river to the Danube, and thence to Germany, Hungary, the Black Sea, &c. On a weekly market day, Dr. Walsh found the streets choked up with cars and carts, of which he was assured there were no fewer than 7,000 in the town; filled with produce, principally for shipment. On enquiry, he found the prices of different articles to be, wheat 9s. a quarter; wine 2d. a bottle; delicious Hungarian wine at the tavern, 10d. per do.; beef 1½d. per lb.; mutton, 18d. do., &c. (*11 days' Journey from Constantinople to England*, p. 316.)

ARAFAT (MOUNT), a hill of Arabia, 15 m. S. E. of Mecca, consisting of a granite rock about 150 feet high, a principal object of the Mohammedan pilgrimages to that city.

ARAGON, one of the ancient divisions of Spain, formerly a separate kingdom, comprising the provs. of Zaragoza, Huesca, and Teruel, lying between 40° and 42° 55' N. lat., and 46° E. and 20° 7' W. long., having N. the Pyrenees, which divide it from France; E., Catalonia; S., Valencia; and W., Navarre and Castile: length, N. to S., 211 m.; breadth, 65 to 185 m.; area, 14,523 sq. m.; pop. (1833) 734,685. It is a basin every where surrounded, except on the E., by mountain-ranges; on the N. the mountains of the Pyrenees extend into the prov. as far S. as lat. 42° 10', inclosing many picturesque and fertile valleys; the Sierras Moncayo Cu-nça, Molina and

Albarracin separate it from Castile, and those of Morrell from Valencia. Another distinct chain runs parallel to the latter through the S. part of Aragon, from N.W. to S.E.: between the Sierra and this chain is the valley of the Xiloca; and between this latter chain and the Pyrenees is the extensive plain intersected by the Ebro. This, which is not only the largest of the Aragonese rivers, but the largest river which has its embouchure on the east coast of Spain, runs through the prov. in a S. easterly direction, dividing it into two nearly equal parts. Exclusive of the Ebro, there are a great number of other rivers, mostly its affluents, having their sources in the mountain-ranges that bound on either side the central plain; as the Gallego, Cinca, aral Segre, from the N., the Xiloca, Guerra, Aguas, S. Martin, Guadalupe, and Algas, from the S.: the Tagus and the Guadalquivir have, also, their origin in this region. Salt is every where abundant, and gold, silver, copper, iron, lead, nitre, alum, &c. are met with, but the mines are mostly neglected. The mine of rock salt at Homilhos, near Alagon, is, however, extensively wrought, furnishing supplies not only for the prov., but also for Catalonia and other parts of the kingdom. Climate temperate and warm in the valleys and plains, but on the Pyrenees the snow is often found 5 or 6 feet deep in June, and violent storms occur in winter. The country is, however, universally healthy. The soil of the plains is, in general, fertile, and well adapted to the growth of most products of temperate climates. Though agriculture be very defective, more corn and wine are produced than are required for home consumption; and there are also large supplies of fine fruits, with legumes, flax, hemp, oil, saffron, liquorice, madder, esparto, barilla, &c. Previously to the late war with France, the stock of sheep in the prov. was supposed to exceed 2,000,000; and though it must have been much reduced during that contest, there was, according to Mifano, previously to the present civil war, an annual export of 250,000 arrobas of wool. Horned cattle are scarce. Wolves and bears are met with in the mountainous districts; game is plentiful, and the rivers abound with excellent fish, especially eels and trout. The manufactures are confined to common woollen and other cloths, cordage, and hempen articles, gunpowder, with soap, vinegar, brandy, paper, hats, earthen-ware, and leather. The manufacture of silk in the capital and other towns has greatly diminished. Aragon is divided into 13 districts or gobiernos: its chief cities are Zaragoza, Huesca, Calatayud, and Teruel. The first is an archbishopric: there are 6 bishoprics and 2 universities. Several roads cross the prov., passing to all the great towns; and the Imperial canal, from Tudela to Zaragoza, 10 ft. in depth and 70 ft. wide, commenced in 1559 by Charles V., and completed to its present extent in 1772, serves the double purpose of promoting trade and navigation. The Aragonese are strong, and well built; not so active as the Catalonians, but industrious, brave, and honest. They are intelligent, and desirous of knowledge, but proud, sullen, and extremely opposed to foreign interference with their government. The original harsh Aragonese dialect has now become intermixed with the Castilian. The male peasantry wear a wide coat and a round jacket over it, drawn together by a thong, and a large round hat, or sometimes two, to work in during the heats of summer. The dress of the women is odd and grotesque; it consists partly of two woollen corsets, and three or four thick petticoats one over another, the whole weighing a quarter of a cwt. Under the Romans Aragon was included in Celtiberia; in A.D. 470 it was overrun by the Goths, and in 714 by the Moors. After the expulsion of the latter, it was governed by its own kings till the marriage of Ferdinand with Isabella of Castile in the 14th cent.

The gov. of Aragon, previously to the junction of its crown with that of Castile, and for sometime afterwards, though monarchical in form, was in principle essentially republican. The kings, who were long elective, retained little more than the shadow of power; it being really vested in the cortes or parliament. This supreme assembly was composed of four different arms or members; the nobility of the first rank, the equestrian order or second rank, the representatives of cities and towns, and the ecclesiastics. No law could pass without the assent of every arm, and without permission of the cortes, no tax could be imposed, no war declared, no peace concluded, nor money coined or altered. The power of reviewing the proceedings of the inferior courts, the privilege of inspecting every department of administration, and the right of redressing all grievances, belonged to the cortes; to which, however, those aggrieved did not address themselves in the humble tone of supplicants, but demanded its interference as due to them as freemen. This sovereign court was held during several centuries every year; but from the beginning of the 15th cent. was convoked only once in two years: the session continued 40 days, and the king could neither prorogue nor dissolve the assembly, after it had met, without its own consent.

Not satisfied with having erected such formidable bar-

riers against the encroachments of the royal prerogative the Aragonese, by an institution peculiar to themselves, elected a *justiza*, or supreme judge, as the protector of the people and the controller of the prince. The person of the justiza was sacred, and his power and jurisdiction almost unbounded; he was the supreme interpreter of the laws, and not only inferior judges, but the kings themselves were bound to consult him in every difficult case, and to receive his responses with implicit deference. An appeal lay to him from the royal as well as the baronial judges, and even when no appeal was made, he could interpose by his own authority, prohibit the ordinary judge from proceeding, take immediate cognizance of the cause himself, and remove the party accused to the prison of the *manifestacion*, to which no person had access but by his permission. His power was exerted with no less vigour and effect in superintending the administration of government, than in regulating the course of justice. It was the prerogative of the justiza to inspect the conduct of the king. He reviewed all the royal proclamations and patents, and declared whether they were agreeable to law, and ought to be carried into execution. He, by his sole authority, could exclude any of the king's ministers from the conduct of affairs, and call them to answer for their mal-administration. He himself was accountable to the cortes only for the manner in which he discharged the duties of his high office, and performed functions of the greatest importance that could be committed to a subject. The Aragonese were so solicitous that their monarchs should know and feel their dependence on their subjects, that even in swearing allegiance to their sovereign, the justiza thus addressed him in their name, "We, who are each of us as good, and who are altogether more powerful than you, promise obedience to your government, if you maintain our rights and liberties, but not otherwise." Conformably to this oath it was expressly declared in their constitution, that if the king should violate his compact with them, it was lawful for the Aragonese to disclaim him, and elect another sovereign, even though a heathen, in his room.

Aragon, while a separate kingdom, was the most powerful of the peninsular states. It comprised, exclusive of Aragon Proper, Navarre, Catalonia, Valencia, the Balearic isles, and Sardinia. The marriage of Ferdinand with the heiress of Castile, the conquest of Granada by their united forces, with the possessions they inherited or acquired in other parts of Europe and in the New World, by giving the sovereigns extrinsic, and as it were foreign resources, rendered them in a great measure independent of the supplies voted by their cortes, at the same time that it enabled them gradually to subvert their authority. The establishment of the Inquisition was also a great blow to the liberal institutions of Aragon and other parts of the Peninsula, which were finally suppressed during the reign of the bloody and tyrannical bigot Philip II. (*Mifano, Antillon, Schuetz. Alg. Ersk., xviii. 314-317.; Robertson, Hist. Charles V. Introd., Sect. iii.*)

ATAGUNA, a town of Sicily, Val di Girgenti 7 m. N. of Girgenti, on a hill. Pop. 5,850. It is ill-built and dirty; but is worthy of notice for its castle (containing a fine gallery of pictures), its antiquities, and for having in its vicinity the mud volcano of Maccaluba. This consists of numerous little hillocks, with craters on a kind of truncated cone of argillaceous barren soil, $\frac{1}{4}$ m. in circuit, elevated about 200 feet above the surrounding arid plain. These craters are continually in action, making a hollow rumbling noise, and throwing up a fine cold mud, mixed with water, a little petroleum and salt, and occasionally bubbles of air with a sulphurous taint. Sometimes reports like the discharge of artillery are heard, and slight earthquakes, till an eruption takes place by the ejection of mud and stones to the height of from 30 to 60 feet, the ordinary height of the spouts being only from a few inches to 2 or 3 feet. (For a further account of this singular phenomenon, see *Smyth's Sicily*, p. 213.)

ARACHIE (EL), see LARACHE.

ARAL (SEA OF), an inland sea or lake of Asia, in Independent Tartary, between 42° and 46° 12' N. lat., and 66° and 61° 15' E. long., being about 300 m. in length from S.W. to N.E., and from about 100 to nearly 250 m. in breadth; so that, with the exception of the Caspian, it is by far the most extensive inland sea of the Old World. It has a great number of islands, particularly towards the S., and is generally so shallow, that it can be safely navigated only by flat-bottomed boats. Its waters are salt, and its coasts generally low and sandy, the country round consisting mostly of vast arid steppes. It is well supplied with fish, of which sturgeon are the most valuable; seals are also met with. The Sea of Aral receives, besides the Arghans, the waters of two great rivers, the Sir or Sihoun (the *Jaxartes* of the ancients), and the Amoo or Jihoun (the *Oxus* of the ancients). But, notwithstanding it has no outlet, the prevalent opinion is, that the supply of water brought to it, and also to the Caspian Sea, is unequal to what is carried off by evaporation, and that

their level and surface are being gradually diminished. The extraordinary difference between the level of the Caspian and the Sea of Aral, and the level of the Black Sea (see CASPIAN SEA), as well as the nature of the soil in their vicinity, the traditional and historical statements with respect to their boundaries, and the opinions of the most eminent naturalists, all lead to the belief that they once extended over a much larger tract of country, and most probably made part of one great inland sea. (For further details, see CASPIAN SEA.)

ARAMON, a town of France, dep. Gard, cap. cant. on the Rhone, 16 m. E. Nîmes. Pop. 2,552.

ARANDA DE DUERO, a town of Spain, on the Duero, 48 m. S. Burgos. Pop. 2,550.

ARANJUEZ. (*Ara Jovis*.) A town of Spain, new Castle, in a fertile and well-watered valley on the left bank of the Tagus, immediately above where it is joined by the Xarama, 38 m. S. S. E. Madrid, and 22 m. E. N. E. Toledo; lat. 40° 1' N., long. 3° 37' 30" W. Pop. 4,900, unless the court be there, when it used to amount to 8,000, or 10,000. It derives its entire celebrity from its royal palace, commenced by Philip II., and enlarged and embellished by several of his successors, particularly Charles V., who added the fine gardens and groves along the banks of the Tagus, and a small but elegant pleasure house, the *Casa del Labrador*. The palace is a handsome square building, with a fine marble staircase, containing many fine sculptures, and (as well as the church and monasteries of the town) paintings of the Spanish and Italian masters, especially of Raphael Mengs. The town is built after the Dutch model; having broad and well-paved streets, houses uniform and painted, fine promenades, a square adorned with many handsome edifices, &c. The court used to occupy this palace from Easter till the end of June; but in July and August the situation is accounted unhealthy.

These statements apply, however, rather to the former than the present state of Aranjuez. The palace and gardens suffered severely during the late war with France. In 1808, the park and pleasure grounds were split into patches, and applied to agricultural purposes.

Another age has seen the golden ear
Unknown the slope, and nod on the parterre,
Deep harvests bury all that pride had planned,
And laughing Ceres resume the land.

At first the cultivators obtained very large returns, and the population of the town and its vicinity rapidly augmented. But this extraordinary productiveness, the result of the improved state of the lands, speedily disappeared under the scourge of continual cropping; and it is doubtful whether they yield more at this moment than they did previously to their being broken up. (*Milano, Schutz*, &c.)

ARARAT (Turkish *Aghur Dag*, Armenian *Macis*), a famous mountain of Armenia, on the confines of the Russian, Turkish, and Persian empires, its principal summit being about 35 m. S. Erivan, lat. 39° 30' N., long. 44° 30' E. Its base E. and N. E. is washed by the Araxes, from the low plain which it rises most majestically to an immense height. It forms the termination in this direction of a range of mountains connected with the Caucasian chain; but these, though elevated, seem in comparison with Ararat so low, as to strengthen the impression of sublimity and greatness made by contemplating it singly from the plains to the E. It consists of two enormous conical masses, one much higher than the other, but the lowest ascending far within the line of perpetual congelation. Repeated efforts had been made at different times to reach its summit, but this Herculean task was not effected till 1830, when Professor Parrot, of Dorpat, accomplished, by dint of extraordinary perseverance and energy, what had previously been reckoned all but impossible. He determined the altitude of the highest peak to be 16,300 French or 17,320 Eng. feet above the level of the sea, being about 4,760 feet higher than Mont Blanc. The summit is described as a circular plain of limited dimensions, united by a gentle descent to the less elevated peak towards the E. The whole of the upper region of the mountain, from the height of 12,750 feet, is covered with perpetual snow and ice; and not unfrequently avalanches precipitate themselves down its sides with tremendous noise and fury.

On one of the sides of the principal cone is a chasm or cleft of prodigious depth, having much the appearance of the crater of a volcano. Tournefort says, that its precipices are blackened as if by smoke, but that nothing issues from it except torrents of muddy water; but the mountain presents many appearances of volcanic action, and Dr. Rehnegg affirms that he has seen fire and smoke issue from this chasm for three days together.

Ararat is not only an object of superior interest from its mass and height, but still more from the associations with which it is connected. It is believed to be the Ararat of Scripture, on whose summit the ark rested. (Genesis, viii. 4.) And certainly it would be difficult any where to find a mountain that seems better entitled to the honour of serving as a stepping stone "d'Noë pour

descendre du ciel en terre avec le reste des créatures." (*Tournefort, Voyage du Levant*, li. p. 360, &c.; *Missionary Researches in Armenia*, p. 267, and *Introd.*; *Klein's Persian Empire*, p. 326.)

ARAS (an. *Arazes*), a river of Asia which has its source in the mountain land of Armenia, 20 m. S. Erzeroum. It flows E. past the N. base of Mount Ararat, then S. E. to Curdasha, and N. E. to Djirah, where it falls into the Kur, 60 m. in a direct line from the embouchure of the latter in the Caspian Sea. Its entire course may be estimated at 420 m. Notwithstanding its rapid current, it is in many places fordable.

ARAUCANIA, the territory known under this name is situated to the S. of Chili, and comprises the country lying between 37° and 39° 50' S. lat., and 70° and 75° 20' W. long. On the N. it is bounded by the river Biobio, which divides it from Chili; on the S. by the Valdivia or Calcañal; on the E. by the Andes; and on the W. by the Pacific Ocean.

The Araucanians divide their country into four Butalmapus or tetrarchies, viz.:—

1. Langenmapu, i. e. the maritime country.
2. Lelpunmapu, i. e. the plain country.
3. Inapemapu, i. e. the country at the foot of the Andes.
4. Piremapu, i. e. the Andes country.

Each tetrarchy is governed by a Toqui or tetrarch, and is subdivided into 9 Allaregues or provinces, at the head of each of which is an Apo-Ulmen. Each prov. is again subdivided into 9 Regues or districts, severally presided over by an Ulmen. This division existed before the arrival of the Spaniards, and is supposed to be of great antiquity.

The dignity of Apo-Ulmen and Ulmen are hereditary in the male line. In case, however, of failure, a successor is chosen by the people, and their choice is afterwards confirmed by the Toqui or generalissimo. The succession is thenceforward perpetuated in the family of the individual newly chosen. The ensign of an Apo-Ulmen is a staff, with a silver globe at one end, and a silver ring in the centre. That of an Ulmen resembles the foregoing, with the exception only of the ring, which is peculiar to the former. The ensign of the Toqui's authority is a battle-axe.

The form of government comprises a mixture of democracy and aristocracy.

The names proper of Araucania belong to the race of the Moluches, and the name of Araucanians has been given them by the Spaniards. Their range of information is extremely limited, and though Spanish writers affirm that they have some notion of geometry, and are sufficiently acquainted with astronomy to distinguish the stars by particular names, the credibility of their account is much to be questioned.

The industry of the country is confined to a little agriculture. The Araucanians cultivate a few fruits, and make a kind of cider. Their principal wealth consists of their flocks and herds, and they possess a great number of horses of the Spanish breed, as well as oxen, guanacos, and vicuñas. The oxen and guanacos furnish them a plentiful subsistence, and the wool of the vicuñas supplies them with various articles of clothing.

The Araucanians have a sort of criminal code, and the crimes which seem to be regarded as the most heinous by them, are murder, adultery, robbery, and witchcraft. The latter is visited with immediate death. (*Wimmer's neuestes Gemälde von Amerika*, vol. iv. p. 312; *Wien*, 1835.) Their religion consists in the belief of the existence of a Supreme Being, besides that of many lesser deities, and also in the immortality of the soul. (*Stern's Handbuch der Geographie*, vol. ii. p. 752; *Leipzig*, 1824.) The Araucanians maintain no standing force, but every male is inured to the use of arms, and being naturally a warlike people, it needs no compulsion to rally them in defence of their country. None of the aboriginal race of S. America have resisted with so much obstinacy and such determined bravery all the attempts of Europeans to reduce them to a state of subjection, and to the present time their efforts have been successful, and they remain independent. They are extremely proud of having maintained their independence, and call themselves the unconquered people. They have derived from the Spaniards the knowledge and the use of cavalry in battle, and their skill in this mode of warfare is scarcely to be surpassed.

The Araucanians inter their dead in square pits, with the body in a sitting posture, placing at the side of the deceased his arms and drinking-cup if a male, and her domestic implements if a female. In the grave they also place the skeleton of a horse, interred in honour of the deceased. (*Tableau civil et moral des Araucans; Annales des Voyages*, vol. xvi. p. 100.)

The clothing of the men consists of trowsers reaching to the ankle of woollen stuff, and a smock of the same materials, usually white, over which is thrown a piece of cloth 2 yds. wide, and 24 long, with a hole in the centre for the purpose of admitting the head. This garment is

styled a Poncho. Their hat is of a conical shape. The dress worn by the women is a long white tunic, and a black upper garment fastened round the hips with a girdle, together with a small mantle called an Ichilla. The favourite colour is blue, having a greenish hue. The latter wear no head-dress, and go bare-footed. They are fond of displaying a quantity of rings upon their fingers, and ornament their arms and necks with strings of beads. Every woman is obliged to present her husband annually with a Poncho of her own making, and daily with a dish cooked by herself. (*Wimmer*, vol. iv, p. 313.) Both the men and women are exceedingly hardy, and capable of enduring great fatigue. The children go naked till their 10th or 11th year.

A tribe, called Cunchil, inhabits the country between Valdivia and the Gulph of Guayatica; and another, known by the name of the Hinchil, that between the archipelago of Chonos and the Gulph of Pennas.

The reader who may desire more extensive information upon the subject of the Araucanians, is referred to *Poeppig's Reise nach China und die Amazonaswüste*, 2 vols. oct. Leipzig, 1835-6. This intelligent traveller, who resided in these latitudes from 1827 to 1832 in pursuit of scientific knowledge, gives the most recent, and perhaps the only authentic account of this people, and his book is replete with information. The glowing pictures of the civilization of the Araucanians, drawn by Molina in his *Compendio de la Historia de Chile*, &c., and by other Spanish writers, who have hitherto been looked up to as authorities upon this subject, are clearly proved by Dr. Poeppig to be much exaggerated. The warlike deeds of the Araucanians have been made the subject of a poem by the celebrated Ercilla, the prince of Spanish epic poets. Although many of the descriptions contained in the Araucana may be considered as overcharged, they are nevertheless the result of the author's own observation, as he was an active party in the wars carried on between the Spaniards and this people.

ARAURE, a town of S. America, rep. Venezuela, dep. Orinoco, on the Acarigua, 65 m. N.E. Truxillo.

ARBE, or ARBA, a small island in the Gulph of Quarneo in the Adriatic, acquired by the narrow channel of Morlacca from the coast of Croatia. Pop. 4,100. It produces corn, figs, and excellent wine; and has salt lakes. Its capital, of the same name, is situated on a bay on its S. coast.

ARBELA, or ARBIL, a town of Turkey in Asia, pachalik Bagdad, between the Greater and Lesser Zab, on the high road from Bagdad to Mosul, lat. 36° 11' N., long. 44° E. This was formerly a large city, the cap. of the prov. of Adiabene, and is renowned in history for the final and decisive victory obtained in its vicinity, anno 331 B. C., by Alexander the Great over Darius, which was speedily followed by the death of the latter, and the total subversion of the Persian empire. But, under its present barbarian masters, Arbela has sadly declined from its former greatness, and is now an inconsiderable mud town, with about 3,000 inhabitants. Part of it is built on an artificial mound, 150 feet in height, formerly surmounted by a castle. (*Niebuhr's Voyage in Arabia*, ii. p. 274; *Ainslie's Persia*, p. 300; *Rich's Travels*, ii. p. 16.)

ARBOGA, an inland town of Sweden, prefect. Westra, on the navigable river Ulvison, which falls into the Lake Mälar, near the point where the former is joined by the canal of Arboga, proceeding from Lake Hieltmar, 18½ m. W. Stockholm. Pop. 1,500. It is the entrepôt for the iron, copper, &c. of the surrounding country; has a considerable transit trade and has been the seat of several diets.

ARBOIS, a town of France, dep. Jura, cap. cant., on the Cuisance, half-way between Salins and Poligny. Pop. 7,131. It is a handsome, well-built town, situated in a valley surrounded by hills and vineyards, which produce excellent white wine. It has a royal castle, and a tribunal of original jurisdiction, with fabrics of earthenware, rape seed, oil, and paper; tanneries, and flitting mills. Pichegru was a native of this town; and after the Restoration of 1815, a bronze statue was erected to him in one of its squares. We have not learned whether it still exists.

ARCADIA, the classical name of central Peloponnesus, now an anl. nonarchy of mod. Greece, Morea, of which it occupies the high table-land, between lat. 37° 15' and near 38° N., long. 21° 44' to 22° 35' E., having N. Achala, E. Argolis, W. Elis, and S. Messenia and Laconia: length and breadth about 40 m. each. Area, 1,600 sq. m. Pop. doubtful. It is intersected by hill-ridges in various directions, and on the N. a lofty mountain range renders its access difficult. It contains several plains of tolerable extent, as that of Tripolizza, 25 m. long, and from 1 to 8 m. broad, with those of Londari, Mantinea, Tegea, &c. Its chief streams are the Rouda (*Alpheus*) the largest river of the Morea, and its tributaries, the Dognas, Ladon, &c.: its lakes are insignificant in size, but the *Symphylus* of classic fame, is amongst them. Arcadia has many geographical features

in common with Bœotia: it is copiously watered, but its valleys are often quite encased by hills, and having no good outlet, the waters are but partly carried off by subterranean channels, leaving stagnant marshes, which deteriorate the air. Arcadia, from its elevation, is much colder than the rest of the Morea; its climate is even rigorous. Much of it is uncultivated or given up to pasture, cattle-feeding being by far the most important rural occupation, the Arcadian shepherds roving about with their flocks in families of 12 or 15 persons, living in tents, and changing their locality as fresh pastures are required. Some of the plains contain many vineyards; that of Heræa was said by P'liny and others to produce a wine that made "men mad, and women fruitful;" a sweetish red wine is still made at that place, with more flavour and body than almost any other in the Morea. The Arcadians are strong and laborious, but all the operations of agriculture devolve upon the women: the men devote themselves to tending cattle, or performing necessary journeys on business. The decline of the culture and population of Arcadia dates from a very remote period. Strabo refers it, or at least the conversion of the corn lands into pasture, to the era of the foundation of Megalopolis, to settle in which city many of the smaller towns and villages were abandoned. Forests however have not apparently much increased; and that of Pelagus, in the plain of Pallantium (Tripolizza) has wholly disappeared. Arcadia presents, in many places, most beautiful scenery; as, for instance, the valley of Megalopolis. (See *Leake, Moræa*.) The plane, fir, chestnut, oak, llex, wild pear, lentisk, &c., are the most common trees: deer and some other animals will pursue wolves, which are common only in the N. Arcadia, is divided into 4 eparchies: Tripolizza, Londari, Karitena, and Andruzzena, are its chief towns. It contains the remains of the cities of Phigaleia, Megalopolis, Pallantium, &c., besides many other interesting ruins. (*Leake, Trav. in Moræa*, 1830.)

ARC-EN-BARROIS, a town of France, dep. Haute Marne, cap. cant. on the Aujon, 13 m. S. W. Chaumont. Pop. 1,520.

ARCHANGEL, or ARKHIANGHEL'SK, a government of Russia in Europe, occupying the whole country from the Oural Mountains on the E. to the grand duchy of Finland on the W., and from the frontiers of Volodga and Olonetz on the S. to the Arctic Ocean and the White Sea on the N. It includes, also, Nova Zemlia, and some other large islands in the Arctic Sea. The estimates of the area differ considerably, but it is believed, exclusive of the islands, to exceed 250,000 sq. m., or more than double the size of Great Britain and Ireland! But the largest portion by far of this vast territory is condemned to perpetual sterility. The part of it within the Arctic circle consists principally of an almost boundless expanse of sandy and mossy plains, having ice, even in the middle of summer, always a little below the surface. The country on this side the Arctic circle consists, also, of immense plains, partly occupied with forests that cover more than half the entire extent of the prov.: partly, but in a very inferior degree, by low pasture grounds; and partly with lakes, morasses, &c. Principal towns, Archangel, Onega, Dwina, Mezen, and Petchora. Pop. not ascertained exactly, but does not certainly exceed 220,000 to 250,000. Owing to the severity and variability of the climate, corn crops cannot be depended upon; and, in consequence, even in the southern districts, where the land is most fertile, they are but little attended to; though considerable quantities of hemp and flax are raised. The principal wealth of the government consists in its immense and apparently inexhaustible forests; but fishing and hunting are the chief employments. The rein-deer is the domestic animal of the Laplanders and Samoyedes, the former occupying the N. W. and the latter the N. E. parts of the government. Among the tribes inhabiting the coast, the Eskimoes the Idles of the Idles, and in the N. E. districts, the inner banks of trees, and certain species of moss, are intermixed with meal, or substituted for it in the making of bread. Horses and cattle diminutive, and but little attention is paid to their treatment. The district of Kholmogor, on the Dwina, a little below Archangel, where the pasture is exceedingly good, must, however, be excepted from this remark. A breed of Dutch cattle, imported into this district by Catherine II., and distributed amongst the inhabitants, still preserves its superiority; and the calves of these cattle, being well fed, furnish the delicate white veal so much esteemed at Petersburg. (*Tooke's Russian Empire*, iii. p. 29.) Ship and boat building, and the preparation of pitch and tar, are carried on to a considerable extent. A good deal of coarse linen is made by the peasantry of Archangel, and of the contiguous districts; and they also manufacture a good deal of cordage and immense quantities of mats, with leather, tallow, turpentine, potash, &c. The population, though originally Finnish, is now essentially Russian, the Samoyedes living in the almost the bottom of the scale of civilization, though spread over an immense surface, do not exceed 6,000 or 7,000 individuals. They are exempted from the Obrock and from compul-

sory military service, paying only the issak or tribute imposed on Asiatics. The Laplanders, who are a little more advanced, do not amount to 3,000 individuals. They are subject to the capitation tax.

ARCHANGEL, the cap. of the above government, and the principal city and port of trade in the N. of Russia, on the right bank of the Dwina, about 24 m. above where it falls into the White Sea, lat. 64° 32' N., long. 40° 32' E. Pop. in 1830, including that of the small dependent village of Solembolsk, 24,539. It is almost entirely built of wood, and has been materially improved since the fire of 1793. The principal building is the Gostinol dwor, or bazar, for the exhibition and sale of merchandise, and its protection against fire. It is of stone, and of great extent. The marine hospital also deserves to be noticed. Archangel is the residence of a general and civil governor, and of an archbishop. There is an ecclesiastical seminary with 9 professors, a gymnasium, a school of commerce and navigation, and some other educational establishments. Notwithstanding its high N. latitude, and the lengthened period during which it is annually inaccessible, it has a pretty extensive commerce. It owes this to its situation on the Dwina, one of the most important rivers of Russia, and which has been united by canals with the Volga on the one hand, and the Neva on the other. The greater part of the articles of export are brought by this channel, mostly from a considerable distance, some even from Siberia. The principal are corn, flax and hemp, timber, iron, linseed; vast quantities of mats, potash, tallow, tar, pitch, train-oil, canvass and coarse linen, furs, cordage, &c. The exports vary materially in different years, principally according to the demand for corn in this and other foreign countries. In 1831 their total value was 14,760,756 roubles; whereas in 1834, when little corn was exported, they only amounted to 8,464,625 roubles. The value of the imports, which consist principally of colonial produce, spices, salt, woollens, cottons, hardware, &c., is always much less than that of the exports. In 1831, it amounted to 1,155,872 roubles; and in 1834, to only 659,555 do. The exports being bulky articles, employ a great number of ships, varying from 300 to 500. The harbour is at the Island of Solembolsk, about 1 m. below the town; and the ships are principally loaded direct from the pruns, rafts, &c. that bring the produce down the river. There is a bar at the mouth of the river with from 13 to 14½ feet water; and vessels drawing more than this must, of course, partly load and unload by means of lighters in the river. There is a government dockyard, with slips for building ships, about 12 miles below the town, where also are situated warehouses belonging to merchants of the city. A fishing company was established here in 1803. Exclusive of the ship and boat building, and the manufacture of cordage and canvass referred to in the preceding article, there is here a sugar refinery, several breweries, &c.

The entrance to the Dwina, where Archangel was soon after built, was discovered by the famous Richard Chancellor, the companion of Sir Hugh W. Douglas in his voyage of discovery in 1594; and from that period down to the foundation of Petersburg, it was the only port in the empire accessible to foreigners. (Schützler, *La Russie*, &c. p. 630.; *Oddy's European Commerce*, p. 94.; *Russian Official Accounts*, &c.)

ARCHIDONA, a town of Spain, 34 m. N. Malaga. Pop. 5,000.

ARCHIPELAGO, a term applied to such tracts of sea as are interspersed with numerous and contiguous islands; but it is especially applied to the islands in the Egean Sea, or that part of the Mediterranean lying between Asia Minor and Greece.

ARCHIPELAGO (EASTERN). This, the most extensive archipelago with which we are acquainted, comprises a vast number of islands, some of which, as Borneo, Java, Sumatra, Celebes, &c. are of very large dimensions. It lies within the tropics between 95° and 130° E. long., and 11° S. and 19° N. lat., having N. W. and N. the Chinese Sea; N. E. and E. the Pacific; and S. and S. W. the Indian Ocean. It is divided by Mr. Crawford into the following 5 divisions, each distinguished by peculiarities of situation, climate, and products.

1st Div. From long. 95° to 116°, including Sumatra, Java, Bali, Lombok, Madura, Banka, Billiton, the Malay peninsula, and the W. and larger portion of Borneo. The soil of this div. is good, and suited to the production of most kinds of veg. food. Rice is the chief subsistence of the inhab., who are the most civilised of the archipelago.

2d Div. From long. 116° to 121°, includes Celebes, Sumbawa, Flores, Sandal-wood, Timor, and the E. part of Borneo to 30° lat. The soil is inferior to the former; rice is not so abundantly produced, and sago partly supplies its place.

3d Div. From long. 121° to 130°; lat. 10° S. to 2° N.: includes Ceram, Booro, Gilolo, Timor-lant, the Arceae I. and Papua. The climate differs from that of most of the other div.: the E. monsoon is rainy and boisterous, the W. dry and temperate; the plants and animals

ARCHIPELAGO (EASTERN).

of the 1st and 2d div. disappear, and others take their place, peculiar to this region of the world, as the clove, nutmeg, &c. Very little rice is grown; sago forms the chief food: the natives are greatly inferior to those of all the other div. in civilisation.

4th Div. From long. 116° to 128°, and lat. 4° to 10° N. includes Mindanao, the Sooloo I., Palawan, and the N.E. part of Borneo. Products of all the former div. are found here; but the clove and nutmeg are very inferior. Rice is consumed, but sago is the principal article of food; the natives are above those of the 3d div. in civilisation.

5th Div. From 10° to 19° N. lat. includes the remainder of the Philippines, and is the only portion within the limits of the hurricanes. The soil is fertile in rice, tobacco, and the sugar-cane, but not in the pepper of the 1st, nor the fine spices of the 2d div. The manners, institutions, and language of the inhab. differ from those of all the other divisions.

The E. archip. is mountainous, and its principal mountains, which are often isolated, have all a volcanic character. It is very generally covered with deep forests of stupendous trees. The number of grassy plains is very small, and there are no arid sandy deserts. It is distinguished from all other clusters of isl. by its periodical winds, and peculiar natural products, one of which, sago, "is such as man nowhere else subsists upon" as a chief article of food. Gold is found in almost every part, but especially in Borneo and Sumatra, the total yearly produce being estimated at 185,000 oz. Silver is believed to be native, tin is very plentiful in Bangka; and there are also iron and copper; diamonds are found in Borneo; sulphur pretty generally, and salt from springs, especially in Java. Palms, bamboos, and rattans are universal; the most remarkable of these trees is the sago-palm (*Macrorhiza sago*), one of the smallest of its tribe, seldom reaching to more than 30 ft. in height, and growing only where the E. is the boldest monsoon, a current extending W. to Celebes and Borneo, N. to Mindanao, S. to Timor, and E. to Papua: Ceram is its chief seat, and there large forests of it are found. The edible farina is the central pith, which varies considerably in different trees, as to the time required for its attaining proper maturity. At the age of perhaps 15 years the tree is cut down, and may yield 500 or 600 lbs. pith, but the average is about 300lbs.; this is ground into powder, clarified, and made into cakes, kept dry for use. It is eaten by the natives in the form of porridge. Sago grows well only in marshy places. "A good sago-plantation or forest is a bog knee-deep." A farina of an inferior kind is supplied by the *gumuti* (*Borassus gomuti*), another palm peculiar to this part of the world, which grows in the E. isl. in the valleys of hilly tracts, and yields also toddy, and a fibrous epidermis used in the cordage of the native shipping. Teak is abundant in Java, and the banana grows commonly in the greatest perfection; the orange and lemon tribe, shaddock, pomegranate, pineapple, guava, tamarind, jack-fruit, mango, &c. are plentiful; and several fine fruits, as the *champanak*, *mangosteen*, and *durian*, are confined to the archipelago. The latter is esteemed by the natives before all other fruits; it is as large as a pumpkin, its seeds being enveloped in a rich white pulp, the edible portion; and, although repulsive at first by a strong smell, a taste for it once acquired, is lasting. The copal tree is found in Palawan, and others yielding resins are plentiful: the palma christi, cocoa-nut, and sesamum oilium, as well as a large and handsome tree called *kanari*, peculiar to the E. isl.; xencolin, catechu, camphor, ylangium, are the gums naturally produced, and the pterocarpus, yielding dragon's-blood, grows in Sumatra and Borneo. Ebony, toon, sandal-wood, in Timor and the adjacent isl., sapan-wood, lignum-aloes, &c. are found; and indigo, annatto, safflower, and turmeric in nearly all the isl. The clove and nutmeg flourish in Amboyra and the Moluccas, black pepper in Sumatra, and ginger and cassia pretty generally; cubebs, cinjput (*melaleuca cajuputi*), and sassafras, in various parts, areca in all, as well as the *anchar* or poison tree: the *chekris*, wrongly called *upas*, is confined to Java. The sugar-cane, cotton, tobacco, capulcum, onions, cucumbers, and the sweet potato in the W. are common articles of culture: many kinds of pulse are grown as articles of food; millet is but seldom cultivated, but maize, which is next in importance here to rice, flourishes everywhere. The natives generally are very fond of flowers; those of the archip. are mostly yellow or red; blue is rare amongst them; lotuses and other aquatic plants are profusely numerous. European flowers and other vegetables transplanted thither, in general soon lose their perfume and excellence; and the same is the case with those from America, which, like the pine-apple, &c., are treated with indifference by the natives. The buffalo and ox, being both of remarkable large and fine breeds, are used in agriculture; elephants are found in the Malay peninsula and Sumatra only.

The argus pheasant and bird of paradise are the most remarkable birds; the latter is exceedingly abundant in Papua, the Arooe, and other E. isl. The edible birds' nests, so much valued by the Chinese, are built in caves, most commonly on the sea-shore, by a species of swallow (*Hirundo cuculata*). Tortoises are numerous in the E.: the shores, especially in the W., profusely abound with fine fish, as the pomfret, calcap, soles, &c.; the whale fishery of the S. sea is reputed worth upwards of 1,000,000. per ann.; sharks, whose fins are important articles of export to China, pearl oysters, cowries or gigantic cockles, are common; and the *Holothuria*, or sea slug, is fished for on coral reefs from one end of the archipelago to the other. The lac insect exists in most of the forests, especially in Sumatra and the Malay peninsula; and bees are very numerous in the E., but they have never been domesticated.

Native Tribes.—The inhab. are of two distinct races, differing widely in conformation; one having a fair or brown complexion, while the other is black. The former inhabit chiefly the W., the latter the whole of the archipel., but become more prevalent as we go farther eastward. The fair or brown tribes are short, squat, and robust, 5 ft. 2 in. being the greatest height common of the men, and 4 ft. 11 in. of the women. Their lower limbs are large and heavy, but not ill-formed, the bosoms of the women rather small than large in proportion to their size, and the arms and limbs of both sexes are round and fleshy, rather than muscular. Face round, mouth wide, teeth remarkably fine, chin square, angles of lower jaw very prominent, cheek-bones high (cheeks therefore hollow); nose not very prominent, but never flat; eyes small and black; hair on the head long, black, harsh, and generally black; elsewhere very scanty. This race is superior in appearance to the other, but less good-looking than most Asiatic nations. The black or Papuan race is a kind of dwarf African negro, never more than 5 ft. in height; spare and puny, with a projecting belly and buttocks, which are much lower than the African's; complexion sooty, nose and under-lip projecting very much from the face; hair woolly, in small tufts, and each hair with a spiral twist. For undersized people, the inhab. of the archipel. are strong and athletic, though not agile, nor, like some Asiatic nations, fond of practising and exhibiting feats, to show the flexibility of their bodies. They have a moderate strength of constitution, and ability to recover speedily from bodily accidents and resist inflammatory disorders: childbirth is a function very easily performed amongst them. Their most prevalent diseases are remittent and intermittent fevers, worms, smallpox, and other cutaneous disorders; and as medicine is in a very low state, many perish miserably. Although so unclean as to wear what clothes they have till they drop from them, and otherwise very dirty in their homes and habits, they are temperate and abstemious, and are devoted to intoxicating liquors, though they universally use betel, areca, and tobacco, and would consume much opium were the price not so high. They are good-tempered, brave, humane, hospitable, and neither bigoted nor perfidious, but very revengeful; and under certain circumstances, such as great oppression, they have a peculiar custom of *running a-muck*, in which an individual, careless of his own life, rushes forward with a drawn kris or dagger, striking at every thing and every one he meets. They are capable of attachment, gratitude, and fidelity, have great parental and filial affection, love for their country, and a regard for truth. The faculties of their mind are generally feeble; they are slow of comprehension, credulous, and superstitious; their judgment narrow, and their reason, memory, and imagination alike weak; they are, however, good imitators, and have an aptitude for music: in their manners they are grave, courteous, and reserved; they consider it most respectful to sit, cover the head, and turn the back to their superiors. The more savage tribes go quite naked, with the exception of a small piece of cloth worn round the loins. In the Philippines the dress is nearly the same for both sexes, and between the flowing dress of the Asiatics, and the close one of Europe, consisting of two coverings: excepting the Mohammedans, all wear the head uncovered. Their teeth are usually filed and blackened: the women's ornaments are chiefly of gold: pearls are never worn. All the men are armed with the kris, or dagger, which, with the spear, is the favourite weapon; the others are the club, sling, sword, and bow and arrows; the latter are often poisoned with *auchar*, which is, however, by no means a powerful drug. They are not expert in the use of fire-arms. The materials of their dwellings are commonly bamboo, ratan, palmetto-leaves, and wild grass, the two latter of which are used for roofing: houses in the neighbourhood of the seas are mounted on posts 15 to 20 ft. high, and superior residences are enclosed within temporary palings. They consist of but one floor, and their furniture is rude and scanty; the beds are rough mats, or often mere benches, on which a person lies down with his dry-dress wrapped around him. Knives and forks are unknown, and porcelain dishes are a luxury: meals are taken sitting on

the ground; the food is served up in trays of wood or metal, and grasped by handfulls by each as he wants it. The Polynesian language, which, in various dialects, is spoken over nearly the whole of the archipel., and extends as well to Madagascar, and to the farthest of Cook's discoveries toward the S., is in every respect different from all others, and probably derived from an ancient nation originally settled in Java, where it is spoken in its greatest purity. Next to the dialect of Java, those of the Malay peninsula, Bugis, and Macassar, are the most civilised; Sanskrit is introduced into the more improved islands of the W. division; Arabic has also been introduced by the Mohammedans. There is in parts also a small admixture of Chinese and Persian, Portuguese and Dutch.

By far the greater portion of the land is yet uncultivated; and of that which is, the chief part is no better than a morass for half the year. There is a wide difference in the industry of the natives; some are roaming about their forests, but the greater number have actually made "a respectable progress in social order, tamed the useful animals, applied themselves successfully to agriculture, to fisheries, to navigation, and even to mining." The negro race are fond of hunting; all are devoted to games of hazard, and in Java cock-fighting is a favourite amusement. They are fond of dancing; their dances being grave, stately, and slow: their music is not destitute of melody. Polygamy and concubinage are common amongst the higher ranks, in the more civilised states. Chastity is variously appreciated; but women are never immured, and are even eligible to govern in elective monarchies as Celebes. Slavery exists every where except in Java. The inhab. of the archipel. are clothed in cotton, mostly woven by themselves: silk they never wear generally, nor was the silk-worm ever cultivated by them; their loom they have derived from the Hindoos. They know how to work many of the most useful metals, as-iron, tin, and gold. Some of their musical instruments are made of a kind of bell-metal, which they cast themselves; and they sometimes use a metallic coinage. Iron, however, is but little used for tools and implements of agriculture: their cutlery is wretched, from a want of knowledge how to temper it; and they are unable to make a lock for a musquet. They carve kris handles, and make betel-boxes in a very superior manner, and build vessels even to 40 tons; but their sailing vessels are small, and their sails, softer, and swifter. They manufacture *batuckong*, a kind of fish-sauce, both for home consumption and exportation: salt they obtain by the usual means of evaporation, and saltpetre by boiling the soil of caves which bats and birds frequent. The manu- of glass is unknown; but they attempt that of gunpowder: the great request, however, in which they hold that of Europe, proves the inferiority of their own. In war the flower of their land-forces always consists of infantry; but their naval strength is the more formidable: their warfare has always been confined to predatory descents on adjacent islands. Every description of government is to be met with in this archipel. from unlimited freedom in a savage state, to absolute despotism in the most civilised; in no one is there an hereditary nobility, and the civil and religious authority are in every case kept distinct. The public revenues are usually derived from the three sources of taxes on land, a poll-tax, and taxes on articles consumed or imported; in Java there is a tax on fisheries. Farming the revenues is a common practice, and it is common in many states for the prince or chief to reward his officers by assigning to them, instead of paying them directly, a certain extent of land, or the amount of the value of the labour of a certain number of cultivators. The prevailing religion is Mohammedan, which was introduced into the archipel. in the 13th, and continued to spread till the end of the 16th century. Christianity prevails only in the Philippines and the Spice isl. The Mohammedan laws are those chiefly in force in the civilised parts, and are closely adhered to sometimes; but the task of avenging injuries is mostly put into private hands. The *Lex talionis* is very popular, though almost all punishments may be compounded or alleviated by paying the party injured, his friends, or the executioner: stabbing by the kris is the most usual mode of capital punishment.

Trade in the archipelago is esteemed a most honourable employment, and even sovereigns personally engage in it. Java, Sumatra, and Celebes are the chief seats of trade: from the latter 40 vessels go annually to the N. coast of Australia, and many others into the rest of the archipelago, to collect articles for the Chinese trade, the most considerable of all, yet not of 180 years' standing. The exports to China are pepper, cloves, mace and nutmegs, scented woods, ebony, ivory, horns, hides, tortoise-shell, sharks' fins, edible birds' nests, gold dust, benzoin, camphor, betel, wax, wool, tripping, and European woollens and cottons. The trade with India is believed by Mr. Crawford to have commenced at the beginning of the second century of the Christian era, and is now very extensive, the value of the imports from the archipelago into Calcutta only, in 1837-38, having amounted to 542,760*l.* These imports consist principally

of pepper, tin, betel-nut, fine woods, gold and silver, damar, spices, &c. The exports to Europe and America have very greatly increased within these few years; principally in consequence of the wonderfully extended growth of sugar, coffee, indigo, &c. in Java (which see). But, exclusive of these great staples, Java sends rice to the other islands, to the Cape of Good Hope, and even to Europe; sugar is sent to Europe, China, and Bengal; cotton is produced principally in the great south chain of the first and second divisions, but little, however, is sent beyond the archipelago. The chief imports are black tea, coarse porcelain, wrought iron, cottons and silks, brass, and tutenague ware, paper, books, shoes, fans, umbrellas, paint, and toys, from China; salt, tobacco, blue cotton cloths and chintzes, from India. Chintzes dyed red, green, and other bright colours, and especially in patterns of *running flowers*, are peculiarly acceptable to the natives. Manchester and Glasgow cottons, *bandana* handkerchiefs, cotton velvets and woolsens, English saddlery and iron, fire-arms and ammunition, glass and plated wares, raw and wrought silks, and opium, are also in great request. These nations are ignorant of arithmetic, and, excepting in Java, 1000 is the highest number they have any term to express. Interest on money lent is very high; bills of exchange are unknown; and women are almost solely the merchants, brokers, and money-changers. (For other particulars see *Articles on the several Islands*, and the learned and excellent *History of the Indian Archipelago*, by John Crawfurd, Esq., F.R.S., 3 vols. 8vo. *passim*.)

ARCIS-SUR-AUBE, a town of France, dep. Aube, cap. arrond. on the river of that name, at the point where it begins to become navigable, and where it is crossed by the high road from Troyes to Rheims. Pop. 2,752. There are no buildings worth notice. It has manufactures of woollen stockings and caps, an establishment for spinning cotton, tanneries, &c., and is the entrepôt of the iron of the valley of the Aube, and of the wire and wood-work of the Vosges. This town suffered severely during the campaign of 1814. Napoleon, who displayed equal skill and courage, repulsed at this point, with a very inferior force, one of the principal divisions of the allied army.

ARCO, or ARCH, a town of the Tyrol, with a castle, on the Sarca, 7 m. W. Roveredo. Pop. 2,000.

ARCOLE, a village of Austrian Italy, on the Alpova, 15 m. E. S. E. Verona. A series of sanguinary engagements took place here on the 15th, 16th, and 17th of November, 1796, between the Austrians and the French under Napoleon, when the former were ultimately defeated.

ARCOS DE LA FRONTERA, a town of Spain, Andalusia, on the Guadalete, 30 m. E. N. E. Cadix. Pop. 10,000. It is situated on an elevated rock, and is of difficult access. Streets unpaved, and ill adapted for foot passengers. It has two parish churches, and some convents for both sexes. The great altar of the church of Santa Maria is much adorned. The country in the vicinity is mountainous, intersected by valleys, and very fertile.

ARCOT, a marit. district of Hindostan, prov. Carnatic, presid. Madras, divided into two sub-districts, or collectorates, comprising the whole country from Coleroon river on the S. to the frontier of the Nellore district on the N. and E. of Cuddapah, Mysore, and Salem, with the exception of the Chingleput district lying round Madras. The districts are divided by the Palaur river. That to the N. comprises an area of 8,200 sq. m., and a pop. of 806,831; and that to the S. an area of 4,500 sq. m., and a pop. of 550,239. Near the sea the country is low and well cultivated; but further inland it is hilly, with extensive tracts of jungle. Agriculture is the great business of the natives; and this depends very much on irrigation, to assist in which many very large tanks, artificial channels, and dams have been constructed. The country is held under the ryotwar system (see INDIA). The revenue of the N. division amounted in 1835-36 to 277,718*l.*, and that of the S. division to 240,267*l.* The trade in piece goods has been well nigh annihilated by the introduction of the cheaper cottons of Great Britain; but cotton stuffs still continue to be manufactured at Pulicat and Irreeum, and there is an extensive iron foundry at Porto Novo. (*Madras Almanac for 1838*, part I. p. 17, &c.)

ARCOT, a city of Hindostan, the Mohammedan cap. of the Carnatic, on the S. side of the Palaur, 68 m. W. N. W. Madras, lat. 13° 54' N., long. 79° 32' E. It is well built, is inclosed by walls, and contains the ruins of the palace of the nabobs of Arcot. The population consists principally of Mohammedans who speak the Decanuy dialect, which we call Hindostani. It has a handsome Mohammedan mosque, with some other Mohammedan religious edifices. The citadel, formerly of large extent and considerable strength, is now quite in ruins, its principal defences having been blown up; but the rampart next the river, as it protects the town from inundation, is kept in good repair. Arcot

is very ancient, and has undergone many vicissitudes. It came definitively into our possession in 1801. (*Hamilton's E. I. Gazetteer*.)

ARDAGH, an insignificant village of Ireland, co. Longford. The church is very ancient; and it was the see of a bishopric, united in 1685 to the bishopric of Kilmore, but separated from the latter in 1741, when it was united to the archbishopric of Tuam.

ARDEBYL, a town of Persia, prov. Azerbeijan, 88 m. W. from the Caspian Sea, between and which there is a chain of pretty high mountains, near the edge of an extensive and elevated plain, lat. 38° 15' N., long. 48° 23' E. Pop. said by Mr. Fraser to amount to 500 or 600 families, or from 3,000 to 3,600 individuals. Houses mean and small, built of mud or sun-burnt bricks, with flat roofs like those of the poorest villages. It is surrounded by a ruinous mud wall; but the fort is a regular square, with bastions, a ditch, glacis, and drawbridge in the European style. The place is remarkable for its containing the tombs of Skeikh Süfi, the founder of the Süfiite dynasty of Persian princes and of a religious sect, and of some of his descendants. It is a good deal resorted to by pilgrims, but is now falling into decay. A fine library formerly belonged to Ardebil; but it was carried to Petersburg on the town being taken by the Russians, by whom, however, it was restored to the Persians. (*Fraser's Travels on the Shores of the Caspian Sea*, p. 226; *Journal of the Geographical Society*, lii. p. 27.)

ARDECHE, a dep. of France, lying lengthwise along the W. side of the Rhone, by which it is separated from the Drome, having S. the Gard, W. the Lozere and Haute Loire, and N. the Loire. Area, 539,000 hect. Pop. 353,752. With the exception of a narrow border along the Rhone, most part of the surface is occupied by hills and mountains belonging to the chain of the Cevennes: Mount Mezen, on its W. frontier, the highest in the dep., rises to the height of 1,774 toises (5,170 feet) above the level of the sea. Several of the smaller hills are of volcanic origin. The cultivable soil is estimated at about 129,000 — meadows, 44,000 — vineyards, 27,000 — forests, 94,000 — mountains, heaths, &c. 148,000 — and *cultures diverses*, 63,000 hect. Besides the Rhone, the dep. is watered by the Ardèche, whence it derives its name, the Eriex, Doux, &c.; and it has to boast of the source of the Loire, which rises about 18 m. W. Privas. There are mines of coal, iron, lead, antimony, &c. The produce of corn is insufficient for the consumption of the inhabitants; the deficiency being supplied by potatoes and chestnuts, of which last the forests produce immense quantities. Valleys cultivated with the plough; hills generally with the spade. The inhabitants are exceedingly industrious, as is evinced by their careful system of irrigation, and by the terraces formed on the sides of the hills planted with vines. The culture of the latter is an object of great attention; and the whites of Limony, St. Joseph, Cornas, St. Peray, &c., particularly the last mentioned, are highly esteemed in foreign countries as well as in France. The raising of the silk-worm and the production of silk is also a most important object in the economy of the dep. The culture of the olive has been abandoned, and the only oil used is now procured from walnuts. Butter and cheese yield considerable returns; great numbers of fat hogs are exported; and the sheep, which are numerous, furnish annually about 410,000 kilogs. wool. Manufacturing industry is prosecuted with much spirit and success. The dep., which from 1808 to 1812 produced at an average 732,000 kilogs. a year of cocoons, worth 2,196,000 fr., produced, in 1829, 319,600 kilogs. raw silk, worth about 16,000,000 fr., and had, at the same time, 226 establishments for spinning, organizing, &c. this silk, by which its value was raised to 23,244,256 fr. and since then there has been a considerable increase. The paper produced at Annonay and other places ranks among the very best in Europe. The manufacture is not, however, very extensive, employing only about 400 work-people, and furnishing 313,800 reams a-year. Latterly the tanning of leather, particularly of goat-skins for gloves, has become a considerable business. There are also fabrics of coarse cloth, linen, and straw hats, establishments for spinning cotton, with iron works, forges, &c. The dep. returns 4 members to the Ch. of Dep. Const. in 1837, 1,057. Total public revenue in 1831, very near 5,000,000 fr. Principal towns, Privas the cap., Annonay, Aubenas, &c.

ARDEE, an inland town of Ireland, co. Louth, prov. Leinster, on the Dec, whence its ancient name of Arderdee, "Town on the Dee," 36m. N. N. W. Dublin. A strong castle, now fitted up as a court-house, built here by one of the early English settlers, long rendered it a place of much importance; but it was notwithstanding burnt by Edward Bruce, during his invasion of Ireland, in 1315, and again by O'Neill, during the wars in the reign of Elizabeth. In 1641, it was the head-quarters of Sir Phelim O'Neill. Afterwards it fell into the hands of Cromwell, and was one of the stations of the army of James II., while retiring before that of William III.

previously to the battle of the Boyne. Pop., in 1821, 3,558, in 1831, 3,975, being about 2-3ds of that of the entire parish, which in 1834 contained 6,131 inhab., of whom 458 were of the E. church, 45 P. dis., and 5,648 R. Catholics. The town, which stands in a fertile district, consists of a main street, having several lanes branching from it; the dwellings, with the exception of some good houses, are mostly miserable cabins. The church, built in the early part of the 13th century, and originally forming part of an Augustine monastery, is a plain structure in good repair: the R. C. chapel is a new and spacious edifice. There are schools for both sexes, under the endowment of Erasmus Smith; a savings' bank, and a dispensary. In the centre of the town is another ancient castle, now fitted up as a dwelling-house, and near the entrance is a large artificial mound, called the Castle Guard. It was incorporated towards the close of the reign of Edward III., and received additional privileges from subsequent monarchs. Its ruling charter is that of 11th Anne, under which it consists of a portreeve, 23 burghesses, and an unlimited number of freemen; the municipal government being vested in the portreeve, 6 burghesses, and 6 freemen, who hold office for life. The corporation returned 2 m. to the Irish parl., and continued to enjoy a revenue of about 135*l.* per ann. The local courts have fallen into disuse; general sessions of the peace are held in January and June, and petty sessions every Wednesday: part of the ancient castle is used as a bridewell. The manufacture of malt is carried on to a considerable extent, 64,483 bushels having paid duty in 1836: there are also flour and meal mills; turf is brought from a bog, about two miles, distant by the river Dee, which is here navigable for boats. A market-place for corn was built in 1710, and shambles in 1796, in which a well stocked market is held every Tuesday. Fairs, principally for live stock, are held in a large enclosed area provided for the corporation, on 1st Mar., 10th Apr., 6th June, 8th July, 20th Aug., 23d Oct., and 17th Dec.; that of October is principally for sheep. The right of tolls, which was for some time matter of dispute and turbulence, has been decided in favour of the corporation. The post-office revenue amounted in 1830 to 317*l.*, and in 1836 to 546*l.*: a daily mail car from Drogheda to Louth passes through Ardree, carrying at an average two passengers each trip. (*Railroad Report; Priv. Inform.*)

ARDELAN, a prov. of Persia, forming the E. division of Kurdistan. It extends 200 m. in length, from the stream Sharook to the Turkish district of Zuhauk, and is nearly 160 m. in breadth. From the Sharook to Senaa, cap. prov., in lat. 35° 12' N., long. 40° E., the surface presents successive clusters of hills, heaped, as it were, on each other, on extensive table lands, covered with huts, and the flocks of tribes passing the summer months here, and migrating in winter towards Bagdad. The soil is good, and will yield abundance of wheat and barley; but the Kurds, who prefer a pastoral life, content themselves with raising only what is absolutely necessary for their subsistence. Tobacco is cultivated in small quantities; and the extensive forests of oak on the mountains W. of Senaa afford abundance of timber and gall-nuts. The former is floated down the Zab in rafts into the Tigris, and the latter exported to India. Various tribes inhabit Ardelau, which are represented as robust, brave, temperate, and living to a great age; but they are averse from settled habits; war and rapine are their delight; and they scarce consider murder and parricide as crimes! They have a language of their own, and are proud of their descent, which they trace back to the most distant epochs. Some of their chiefs have great power. (*Kiuser's Persia*, p. 142.)

ARDENNES, a dep. in the N. of France, having N. Belgium, E. dep. Meuse, S. dep. Marne, and W. dep. Aisne. Area, 517,385 hect. Pop. 306,861. It derives its name from the old forest of Ardennes, which occupies its N. division. It is divided into two portions by a mountainous ridge, a ramification of the chain of the Vosges, by which it is traversed from S. E. to N. W. Principal rivers Meuse and Aisne, connected by means of the canal of the Ardennes and the Bar. Soil of very different degrees of fertility. The N. is interspersed with mountains or high hills covered with forests and heath, and some plains in the S. W. district are naked, arid, and barren. But it has some large and fruitful valleys, particularly that of the Aisne, one of the best corn countries in France. The extent of its principal divisions is set down as follows in the official tables, viz. cultivable lands, 314,000; meadows, 48,000; forests, 95,000; and heaths, &c., 11,000 hect. Agriculture has recently made much progress, and more corn is now produced than is sufficient for the consumption of the inhabitants. The crop of 1831 was estimated at about 570,000 hect. while that of 1832 was estimated at 512,000. Some inferior wine is made in the S. districts. There are large herds of cattle and flocks of sheep, there being among the latter, which are celebrated for their mutton, several of the long-wooled and merino breeds. Average annual

produce of wool, 560,000 kilogs. This dep. is distinguished by its mines and manufactures. Among the former are those of iron, lead, calamine, &c., with quarries of slate and marble, the former the most important of the kind in the N. of France; coal is also found, but it is not worked, at least to any considerable extent. The annual produce of iron is estimated at above 4,500,000 kilogs. bar, and above 700,000 kilogs. cast. Charleville produces annually above 3,000,000 kilogs. nails: the copper works furnish above 180,000 kilogs. sheet copper, with above 110,000 kilogs. brass-wire for pins, clock-work, &c., and copper for caldrons and boilers. Above 6,000 individuals are employed in the manufacture of Meubles in the nail trade, and 600 in the manufacture of ironmongery goods. Immense quantities of slate are quarried at Fumay, Pepin, St. Barnabé, &c. Fabrics of superior earthenware, glass, white lead, tanneries, &c. are met with at Montherme and other places. There are also numerous establishments for the spinning of wool; and various branches of the woollen manufacture are extensively carried on at Sedan, Bethel, &c. The great manufactory of fire-arms on account of government, carried on at Charleville, has been transferred to Feltri and Chantelleraut. Besides furnishing timber and other products for exportation to the contiguous depas. and Belgium, the forests are the great source of the productive-ness of the mines, timber being the fuel used in the iron and copper works. The dep. returns 4 m. to the Ch. of Dep. Const. in 1837, 1,322. Public revenue in 1831, 8,075,840 fr. Principal towns Mezières, Sedan, Charleville, Bethel, Givet, &c. (*Hugo, France Pittoresque, art. Ardennes; and Official Tables.*)

ARDES, a town of France, dep. Puy-de-Dôme, cap. cant. on a small river that falls into the Allier, 10 m. S. W. Issoire. Pop. 1,830.

ARDGLASS, a marit. town of Ireland, co. Down, prov. Ulster, on the N. E. coast, a little to the N. of St. John's Point, between Dundrum Bay and the entrance of Strangford Lough, 68 m. N. N. E. Dublin. It was formerly of such commercial importance that a mercantile company from London settled here in the reign of Hen. IV., and in that of Hen. VI. its trade exceeded that of any port to the N. of Drogheda. It was also a place of considerable strength, as appears from the gallant stand made in it by Simon Jordan, at the close of the reign of Elizabeth, who maintained it successfully during a siege of three years against the earl of Tyrone; but subsequently, in consequence of its exclusive commercial privileges having been purchased up by the Crown, and transferred to Newry and Belfast, its trade declined, inasmuch that it has been for many years merely a fishing station and watering-place, and the port for embarkation to a few passengers to the Isle of Man. Pop. in 1834, 1628, of whom 661 were of the E. church, 29 Prot. dis., and 938 R. Cath. It stands on the side of an elevated tract of land overlooking the sea, between two remarkable hills. The late proprietor expended a considerable sum in buildings suited to make it a fashionable bathing-place. It now consists of a long semicircular street, with lanes branching from it; a range, called the Crescent, overlooking the bay, and several detached residences. The pn. church and R. Cath. chapel are neat buildings. Schools, on the foundation of Erasmus Smith, educate 90 boys and 80 girls; there are also several private schools, in which about 100 pupils are instructed. The castle, now the occasional residence of the proprietor, consists of a range of very ancient buildings, supposed to have been stores for merchandise, converted into a castellated mansion of three stories. A manorial court holds pleas to the amount of 100*l.* The harbour, which has been much improved. It consists of an inner cove, capable of admitting vessels of 100 tons, but nearly dry at low water, and of a large outer harbour, which, having been still farther enlarged by a pier, extending 300 feet into deep water, admits vessels of 500 tons at any time of tide: it has a lighthouse at its extremity. A constabulary force and coast-guard are maintained here. There are no manufactures: its trade is confined to that of grain, of which considerable quantities are shipped. Its low state in these reports is indicated by its post-office revenue, which in 1830 was but 90*l.*, and in 1836 was not returned. In its commercial arrangements it is considered as a creek or dependency of Killough, with which port its custom duties are consolidated. (*See KILLOUGH.*) The fishery is the almost exclusive occupation of the working classes; that of herrings being most followed. During the season, which continues from the beginning of June to the close of August, vessels assemble here, not only from the fishing ports on the E. coast of Ireland, but from the Isle of Man, and Cornwall. In 1834 about 300 vessels were collected, of which a third were Manx, a third English, from Penzance in Cornwall, and the remainder Irish. Besides herrings, most kinds of round and flat fish are abundant; but they are not so much sought for. The fishermen, as a body, are orderly, well conducted, willing to work, and not more addicted to the use of ardent

spirits than most others of the same grade. When disabled by age or accident, they are principally supported by their children and friends. It is observed, that though the takes of fish are frequently very large, the quantity brought in for sale never exceeds the demand. (*Fishery Report; Priv. Infor.*)

ARDJA, a town of Turkey in Asia, on the left bank of the Euphrates, 45 m. N. W. Bussorah.

ARDNAMURCHAN POINT, a promontory on the W. coast of Scotland, Argyshire, being the most westerly point in the mainland of Great Britain, lat. 56° 45' N., long. 6° 45' 30" W.

ARDNAREE, a marit. town of Ireland, co. Sligo, prov. Connaught, 1604 m. W. N. W. Dublin, on the Moy, a bridge over which river connects it with the town of Ballina. It being, therefore, in reality a suburb of the latter, the particulars relative to it will be found under BALLINA.

ARDOCH, a village of Scotland, co. Perth, pa. Muthil, 8 m. N. Dumbane, remarkable for having in its vicinity one of the best preserved Roman stations or forts in the empire. It is an oblong, 420 feet by 375 within the lines. On the W. side it is defended by the steep banks of the river Knags, on the S. by a deep morass and two ditches, and on the other sides, where it is most exposed, by no fewer than five parallel ditches and six ramparts. On the S. side the ditches have been partially destroyed in the process of cultivation, and the W. side has been injured by carrying (unnecessarily) the military road from Stirling through Crieff to the Highlands through part of the works; but it is now luckily inclosed and protected from further depredation. The pretorium, which is well preserved, is a square, 60 feet in the side, but it is not exactly in the centre of the station. Near this strong fort are three camps of different magnitudes, one 2,800 by 1,950 feet, estimated to accommodate 25,000 men; another, 1,910 by 1,340 feet, accommodating 12,000 men; and the third and smallest, 1,060 by 500 feet, accommodating 4,000 men. Nothing certain is known as to the period when, or the general by whom, this station and camps were constructed; but they are generally supposed to have been the work of Agricola. A little to the W. of Ardoch a cairn formerly existed 182 feet in height; but it is now nearly demolished, the stones having been carried away to build houses and fences. (*Ruy's Military Antiquities; New Statistical Account of Scotland, art. Muthil.*)

ARDOYE, a town of Belgium, 14 m. S.S.W. Bruges. Pop. 5,900.

ARDRA, or AYEM, a country of Africa, formerly independent, but now a prov. of Dahomey. Ardra is also the name of the capital of the above country, about 40 m. inland.

ARDELS, a small but well-fortified town of France, dep. Pas de Calais, cap. cant., 9 m. S. E. Calais. Pop. 2,150. In the vicinity of this town, in June, 1520, was held the famous meeting between Francis I., king of France, and Henry VIII., king of England. The pomp and magnificence displayed on both sides, during 18 days that the meeting lasted, acquired for the place of rendezvous the name of the *Champ du drap d'or*. The interview had no very important political result.

ARDROSSAN, a parish and sea-port town of Scotland, co. Ayr, the town being 24 m. W. S. W. Glasgow, 20 m. S. Greenock, and about 1 m. N. W. Saltcoats. Pop. of parish in 1851, 3,597; of Ardrossan at present (1858) from 1,000 to 1,100. The town was founded by the late Earl of Eglintoun. His lordship's intention was to make a harbour here that should be accessible at all times of the tide; and as a project was, at the same time, set on foot for bringing a canal from Glasgow to Ardrossan, it was supposed that the latter would become the port of the former, and that the circuitous navigation of the Clyde would be avoided. In furtherance of this design, Lord Eglintoun expended vast sums on the harbour and town. The harbour, partly formed by a small islet called Horse Isle, which shelters it on the N.W. and by a lengthened circular pier, and a breakwater. Within the extremity of the latter, there are 26 feet water at spring ebbs, shoaling gradually to 15 feet, where the pier commences. The wet docks which it was intended to construct have not been proceeded with. The town is laid out on a regular and magnificent plan; there is a splendid establishment of baths; and latterly the place has been a good deal resorted to by visitors in the bathing season. The projected canal from Glasgow to Ardrossan not having been excavated further than the village of Johnstone in Renfrewshire, an act was obtained, in 1827, for constructing a railway from Johnstone to Ardrossan; but hitherto it has been only completed as far as Kilwinning. There can, however, be little doubt that a railway will, at no distant period, be carried from Glasgow to Ardrossan; and when this is done, the latter will become the point whence the steam packets will sail for Liverpool and Belfast. The shipping of coal from Ardrossan has lately increased rapidly. During the year 1856 there entered the port 1963 vessels, of the burden of

108,549 tons. (*New Statistical Account of Scotland, art. Ardrossan; Priv. Information.*)

AREBO, or ARBON, a town of Benin, on the river Formosa, 60 m. from its mouth. Lat. 5° 58' N., long. 6° 8' E.

ARECIFE, a sea-port town, cap. island of Lancerota, one of the Canaries, on its E. coast, lat. 28° 56' N., long. 13° 28' W. Pop. 2,500. The harbour, which though small is secure, is formed by several rocky islets. It has two entrances, the N. having a depth of 12, and the E. of 174 feet at low water, with a 9-feet rise of tide. Both entrances are defended by bomb-proof forts. The inhabs. are mostly engaged in the fishery on the opposite coast of Africa. (*Journal Geog. Society, v. p. 287.*)

ARENDAL, a sea-port town of Norway on the Arendal, 75 m. N. E. Christiansand, lat. 58° 37' N., long. 8° 50' 25" E. Pop. 1,800. It is mostly built on piles, and small vessels reach almost all parts of the town by means of the canals by which it is intersected. The harbour is protected by the opposite island of Trombe. There are iron mines and forges in the vicinity; and a good deal of trade is carried on in iron and timber.

ARENDOUK, a village of Belgium, prov. Antwerp, 54 m. E. by S. Turnhout. Pop. 2,500. It has manufactures of stockings and linens, and distilleries.

ARENIS DE MAR, a town of Spain, Catalonia, 26 m. N. E. Barcelona, near the sea. Pop. 5,000. It is neat and clean, has a fine parish church and a convent, fabrics of silk and cotton stockings, a school of pilots, a yard for the building of small vessels, and anchor-forges. The women employ themselves in making lace.

ARENSBURG, a sea-port town of European Russia, gov. Livonia, capital of the island of Oesel, in the Baltic, at the mouth of the Gulph of Riga, being situated on the S. side of the island, lat. 58° 15' N., long. 22° 17' 45" E. Pop. 1,800. It has a castle, a Russian and a Lutheran church, a public school, and an hospital. The water in the harbour being shallow, vessels are obliged to anchor in the roads at a considerable distance from town. The articles of export consist of corn, timber, butter, cheese, tallow, hides, and seal oil. (*See OESU.*)

AREQUIPA, a city of S. America, rep. Peru, cap. prov. same name, in the valley of Quilca, on the Chila, at the foot of M. Omate, 7,700 feet above the level of the sea, 30 m. E. from the Pacific Ocean, and 200 m. S.S.W. Cuzco, lat. 16° 30' S., long. 73° 11' W. It was founded by order of Pizarro, in 1536. The houses, though low, on account of the prevalence of earthquakes, are strongly built; and the cathedral, a bronze fountain in the great square, and the bridge over the Chila, deserve notice. It has four convents, a college, a workhouse, &c.; and it has, or had, flourishing manufactures of gold and silver cloths, woollens, and cottons. Its environs, notwithstanding their elevation, are very fruitful; and by means of its port Mollendo, and of the road passing through it from Lima to the S., it is the seat of a pretty extensive commerce. It is very subject to earthquakes, from several of which it has sustained great injury. The accounts of its pop. differ very widely; but it may perhaps be estimated at about 35,000.

ARETHUSA, a famous fountain of Sicily, which rises close to the sea, in the city of Syracuse. Cicero says of it, *In hac insula (Ortygia) cetera est fons aque dulcis, cui nomen Arethuse est, incredibili magnitudine, plenissimo piscium; qui, fons totus operitur, nisi mutatione ac mole lapidum a mari diijungatur esset.* (*In Ver.*, lib. v. § 53.) Poetry and fable have combined to give an enduring celebrity to this fountain. It was supposed that the river Alpheus, which flows past Olympia in Greece, and falls into the Sicilian Sea, did not terminate its course there; but that it continued to flow in a subterranean channel, preserving the purity of its waters, till they again reappeared in the fountain Arethusa; and in proof of this it was affirmed that things cast into the Alpheus were after a while thrown up by the fountain! Virgil alludes to this circumstance when he says,

Sic tibi, cum fluctus subter labere Sicanae,
Doris amara suam non intermiscet undam.

Eclat. x. lin. 4, 5.

and it is referred to by Pliny (*Hist. Nat.*, lib. ii. § 3.), Seneca (*Quaest. N.*, lib. iii. § 26), and other ancient authors. The poetical account of the fountain may be seen in *Ovid's Met.*, lib. v. lin. 572.

This celebrated spring is now sadly changed. The sea has made its way, probably by the agency of the earthquakes so frequent here, into the fountain; so that, instead of being sweet, the water, which also is greatly diminished in quantity, in consequence of a large portion rising in the sea, is brackish and unfit for any purpose but that of washing. Its fish have disappeared with the sacred groves and temples that adorned its banks; and this glory of ancient Syracuse is now degraded into a sort of public washing tub for the poorer classes of the modern city. (*Swimburne's Two Sicilies*, ii. p. 332. 4to. ed.: *Hughes's Travels*, i. p. 41. 8vo. ed.)

AREVALO, a town of Spain, Old Castile, prov.

Arels, on the Adaja, 29 m. N.N.E. Avila. Pop. 4,500. Besides churches, it has two hospitals and two corn markets.

AREZZO (an. *Arretius*), a city of Tuscany, in the rich plain of Chiana (which see), 81 m. E. by N. Siena, lat. $43^{\circ} 18' 53''$ N., long. $12^{\circ} 0' 39''$ E. Pop. 10,000. It is surrounded by walls, has a citadel, but is neither well built nor well laid out. It is the seat of a bishop, and has a Gothic cathedral. Its finest building, *le Logge*, containing the custom-house and theatre, in the principal square, has a magnificent portico, 400 feet in length. It has also numerous churches, convents, and 4 hospitals. There are manufactures of woollen stuffs and pins. Petrarch was born here, on the 20th July, 1304; and this also is the native country of Vassari, Bacci, and of Leonardo Bruni, called Aretin, Redi, &c.

Arezzo is very ancient, having been one of the principal states of Etruria. After it became subject to the Romans, it was reckoned a post of great importance as a defence against the incursions of the Cisalpine Gauls. It was famous for its terra-cotta ware, ranked by Pliny with those of Samos and Sarcotum (*Hist. Nat.*, lib. xxxv. §12.). The remains of the ruins of an amphitheatre are still visible. It was taken by assault by the French on the 19th of October, 1800.

ARGANIL, a town of Portugal, prov. Beira, 21 m. E. Coimbra. Pop. 1,700.

ARGELET, a town of France, dep. Pyrénées Orientales, 14 m. S. E. Perpignan, near the sea. Pop. 1,967.

ARGENTAN, a town of France, dep. Orne, cap. arrond., on the river of that name, 22 m. N. by W. Alençon. Pop. 5,772. It is agreeably situated on a hill in the middle of a large and fertile plain. The walls by which it was formerly surrounded have been demolished, and its ramparts converted into agreeable promenades. It is pretty well built, has a tribunal of original jurisdiction, with manufactures of linen, lace (called *point d'Alençon*), tanneries, bleaching-grounds, &c.

ARGENTAT or **ARGENTAC**, a town of France, dep. Corrèze, cap. cant. on the Dordogne. Pop. 3,029. There are mines of coal and lead in the environs.

ARGENTEUIL, a town of France, dep. Seine et Oise, cap. cant. on the Seine, 13 m. N. W. Paris. Pop. 4,536. Heloise was educated in a nunnery in this town; and it was to the same place that she retired, in 1120, after the misfortune of Abelard, before she became Abbess of Paraclet. There is here an hospital, established by St. Vincent de Paul.

ARGENTIERE, a town of France, dep. Ardèche, on the Ligne, 20 m. S. W. Privas. Pop. 3,000. It derives its name from mines of silver, wrought here in the 12th century. It is situated on a rock in a deep valley, has narrow crooked streets, and is ill-built and filthy. It has flatures and fabrics of silk.

ARGENTON-SUR-CREUSE, a town of France, dep. Indre, cap. cant. on the Creuse, 16 m. S. E. Châteauneuf. Pop. 4,315. This town is divided into two parts by the Creuse. The higher and more ancient part contained a vast Gothic castle, dismantled by Louis XIV., and of which there are now hardly any remains. The bleaching grounds for woollens at this place have been long celebrated. Argenton was called *Arquitomagus* by the Romans; and medals, and other remains of that illustrious people, are still found in the town and its vicinity.

ARGENTRE, a village of France, dep. Ille et Vilaine, cap. cant., 5 m. S. E. Vitre. Pop. 2,060.

ARGENTRE-SOUS-LAVAL, a village of France, dep. Mayenne, cap. cant., 6 m. E. Laval. Pop. 1,702. It has valuable marble quarries.

ARGOS, a city of Greece, in the Morea, in antiquity the cap. of Argolis, the kingdom of Agamemnon, and one of the most ancient and celebrated of the Grecian cities. It is situated about 2 ms from the bottom of the Gulph of Argos (*Argolicus Sinus*), and about 4 m. N. W. Napoli di Romania, lat. $37^{\circ} 40'$ N., long. $22^{\circ} 44'$ E. Some fragments of its Cyclopean walls, and vestiges of the theatre, are the only remains of the ancient city that can be identified below the acropolis. The latter stood upon a pointed rock of considerable elevation, and great natural strength, which is now surrounded by a castle, built on the foundations of the ancient citadel. The town suffered much during the revolutionary struggle between the Greeks and Turks, but it is said to have since rapidly risen from its ruins; the buildings however, are mean and poor. Pop. probably 3,000.

ARGOSTOLI, a sea-port town, cap. island of Cephalonia, on the E. side of the gulph of the same name, lat. $38^{\circ} 10' 40''$ N., long. $20^{\circ} 29' 16''$ E. Pop. from 4,000 to 5,000. Situation low and unhealthy, and the houses mostly mean and poor; but both the appearance and police of the town, particularly the latter, have been much improved since it came under the protection of the English. The Gulph of Argostoli is about 8 m. in depth, by about 1½ or 2 m. in width, and has in most parts good anchorage.

ARGUIN, a very small island, in the gulph of the

same name, on the W. coast of Africa, about 54 m. S. E. from Cape Blanco. It is abundantly supplied with fresh water, and is supposed, apparently on good grounds, by D'Anville, Bougainville, Hennell, &c., to be identical with the island of Cerne, where Hanno settled a colony during his famous voyage of discovery. In modern times it has been successively possessed by the Portuguese, Dutch, and French; but has been abandoned for more than half a century. The dangerous bank or shoal of Arguin extends S. E. a considerable distance from Cape Blanco. It has been the scene of numerous shipwrecks; among others of that of the French frigate *la Méduse*.

ARGUNSKOI, a town and fortress of Siberia, on the Argun, 162 m. from its mouth.

ARGYLE, or **ARGYLL**, a marit. co. Scotland consisting partly of mainland, and partly of islands, of which the principal are Islay, Mull, and Jura, having N. Inverness-shire, E. Perth and Dumbarton shires, S. the Irish Sea and the Frith of Clyde, and W. the Atlantic. Its shores are extremely irregular, consisting of lengthened promontories and deep bays and inlets. The total area is estimated at 2,954,400 acres, of which 1,446,400 are mainland, and 608,000 islands. The rivers are unimportant; but the freshwater lakes in the mainland and islands are supposed to cover 51,940 acres. Owing to its deep bays and gulphs, the sea coast of the mainland is estimated at about 600 m. A large portion of the surface consists of heathy moors, morasses, rocks, and wild rugged mountains. Ben Cruachan, the most elevated of the latter, rises 3,670 feet above the level of the sea. Woods and plantations cover from 35,000 to 45,000 acres. Lead, copper, and iron are met with, and coal is wrought near Campbellton. Good marble is found in the island of Tiree, and several other places; and the slate quarries of Easdale and Balachulish supply a large portion of the demand for Scotland. Climate mild, but wet, variable and boisterous. The entire extent of the arable land is not supposed to exceed 170,000 acres, so that grazing constitutes the main business of the farmer. Argyle is celebrated for the excellence of its native breed of black cattle; they are small, hardy, easily fed, and, when fattened in the rich pastures of the Lowlands of Scotland or England, afford the very best beef that is brought to table. The stock is estimated at from 55,000 to 70,000, furnishing a large annual supply for exportation. Sheep farming is not carried on so extensively as in some other Highland counties; but latterly it has been a good deal extended, and the breeds of sheep much improved. Property in a few hands. Farms of all sizes, extending from a few acres to many square miles. In various districts the practice of holding land in partnership, or what is called *run-rig*, is still kept up. Under this system, a number of persons take a farm in common, each being bound for the rent for the whole, and divide the arable land into small contiguous portions, or ridges, as equally — quantity and quality taken together — as is possible; the space falling to each tenant being determined by lot, sometimes for the whole lease, and sometimes only for a single season! Ploughing and most other sorts of labour are performed in common; and if, as is usually the case, any hill pasture be attached to the low ground, it is let in common. In some of the low Highland districts occupied in this way, the land falling to the share of an individual does not exceed from 2 to 7 acres, and that, perhaps, is divided into some dozen or twenty patches. It is needless to enlarge on the pernicious influence of this mode of holding land. Where it prevails it is obvious there can be nothing like industry, nor any thing deserving the name of agriculture. We are, therefore, glad to have to say that, though still much too prevalent, it is rapidly declining both in this and other Highland counties, partly in consequence of the extension of the sheep farming system, and partly from many landlords having set themselves against it, and divided the lands held in common into separate possessions. Farm buildings, various as those of the largest and best farms good and substantial; but, in general, the houses of the smaller class of occupiers, and of the cottiers, are miserable hovels, sometimes without either windows or chimneys. Improved cottages are, however, begun to be introduced; and it is to be hoped that they may be universally diffused. Principal crops oats and barley, especially the first. Potatoes are very extensively cultivated, and form an important part of the food of the inhabitants. Average rent of land, including islands, in 1810, 1s. 11d. an acre. Kelp is made along the shores both of the mainland and islands; but the business has latterly fallen very much off. This, also, is the case with the herring fishery, which used formerly to be prosecuted to a much greater extent than at present, in Loch Fyne and other arms of the adjacent sea.

Argyle is peculiarly divided into the seven districts of Argyle, Cowal, Kintyre, Lorn, Appin, Islay, and Mull; and contains 50 parishes. Principal towns, Campbellton, Inverary, and Oban. It had, in 1831, 17,146 inhab. houses, 19,232 families, and 100,973 inhab., having increased

from 71,859 in 1801. It sends 1 m. to the H. of C. for the co., and Campbellton and Inverary join with Ayr and Irvine in returning a m. Parl. constituency in 1837, 1852. Valued rent, 149,596*l*. Scotch; annual value of real property in 1816, 227,493*l*.

ARGYRO CASTRO, a town of Turkey in Europe, in Albania, the principal place in the extensive and well cultivated valley of Deropoll, near the river Drino, on the lower declivity of the mountains on the W. side of the valley, at a short distance from the site of the old Roman town of *Hadrianopolis* or *Justinianopolis*, 45 m. N.W. Yannina. It has an imposing and peculiar aspect, being built on three separate ridges, divided from each other by deep chasms or ravines. The houses, which are mostly good, are not contiguous, but stand in various positions.

"Some are placed on commanding eminences, others beneath projecting crags, and many on the ridges of precipices; but the greater part upon the flat surface of the rock, between its deep ravines: the whole appearance is singularly striking, and its fine effect augmented, not only by the minarets of its mosques, but by the grand castle or fortress, upon a much larger scale than any ever before constructed in this country." (*Hughes*, ii. 360, 8vo. ed.) Pouqueville estimated the population, previously to the capture of the town by Ali Pacha, at 2,000 families, making probably from 12,000 to 13,000 inhab. (*Voyage dans la Grèce*, i. 839.) Mr. Hughes, who visited the town soon after its capture in 1813, states that it was supposed to contain about 15,000 inhab., which corresponds pretty closely with Pouqueville's estimate. It is probable that the pop. has not differed materially in the interval. According to Urquhart, (*Spirit of the East*, ii. 234.) Argyro Castro contains 2,000 Albanian and 200 Greek families. * It has a good bazar, which used to be well supplied with articles of commerce. Previously to its subjugation by Ali Pacha, it was a place of considerable industry, had a pretty extensive internal trade, and enjoyed a considerable degree of independence.

ARIANO, a town of Naples, prov. Principato Ultra, on a steep hill, in one of the peninsulas of the Appennines, 17 m. E. Benevento, on the high road from Naples to Foggia and Manfredonia. Pop. circa 8,000. It is the residence of a bishop, and has a fine cathedral, with numerous churches, convents, and *monti-de-plète*; a seminary, an hospital, and a manufacture of earthenware. It suffered much from earthquakes in 1456 and 1732, and seems lately to have been declining.

ARICA, a sea-port town of S. America, on the Pacific Ocean, at the mouth of a small and well-watered valley, 210 m. N. W. Potosi. Lat. 18° 29' 48" S., long. 76° 13' 30" W. It naturally belongs to Bolivia or Upper Peru, but it belonged in 1826, and probably still belongs, with a narrow strip of land extending as far as the Pavillon de Pica, to Peru. It was nearly destroyed by an earthquake in 1606; and has been ever since in a comparatively poor state. But it is the natural outlet of one of the principal mining districts of S. America, and of a large extent of country; and now that the disqualifications under which it laboured, during the Spanish régime, are removed, it will, no doubt, become a port of very considerable importance. It is a better landing place than the contiguous ports of Ilo, Mollendo, and Quilica; and it is much better situated for commerce than Lamar, that has hitherto been the principal port of Bolivia. But notwithstanding its superiority to most other ports on this part of the American coast, it is, owing to the heavy surf, at all times difficult to effect a landing, and sometimes quite impossible, unless in the *balsas* of the natives. These are sort of floats made of inflated seal-skins; and so dexterous are the natives in their management, that there is not the least risk of being upset, or even wetted with the surf. On the W. side of the landing place the rafts, all merchandise is landed at Arica; and the specie, and other articles of export, are conveyed to the vessels in the bay, unless the sea be unusually calm, and the surf run very low. (*Stevenson's S. America*, iii. 323, &c.)

ARIENZO, a town of Naples, prov. Terra di Lavoro, 8 m. N. Nola, and 18 m. W. N. Naples. Pop. 11,000. It is situated on Mount Tifali, on the high road from Naples to Benevento, and has 7 parish churches, an hospital, and a *mont-de-piété*.

ARIGONA, a town in the N. of the co. Roscommon, Ireland, on the W. side of Lough Allen, at which are coal and iron mines that have been worked at different times with various success; but generally with great loss to the parties carrying them on. The coal is of an inferior quality. The proceedings of a company formed in London, in 1834, for working the Arigona mines, were of so singular, or rather so disgraceful a character, as to give rise to an inquiry before a committee of the House of Commons. Full details as to these mines may be found in *Ward's Survey of Roscommon*.

ARINTH (A), a town of France, dep. Jura, cap. cant., 21 m. S. Lons-le-Saulnier. Pop. 1618.

ARISPE, a town of Mexico, in the intendency of Sonora, near the source of the river Yagrin. Pop. 7,600.

ARKANSAS, a large river of N. America. It rises in the Rocky mountains, in about 41° N. lat., and 110° or 111° W. long.; and, pursuing an E. S. E. direction, unites with the Mississippi in lat. 33° 30' N., long. 91° 10' W. It has a course, following its bends, of above 2,000 m. It has several important tributaries, of which the Great Canadian, falling into it on the right, is the principal. During the periodical swell, the Arkansas is navigable to the Rocky Mountains; and at other times it may be navigated for above 600 m. from its confluence with the Mississippi. Its navigation is safe, being uninterrupted by rocks, shoals, or rapids. If the Missouri be reckoned the first in magnitude among the tributaries of the Mississippi, the second rank is due to the Arkansas, it being longer, and draining more surface than the Ohio, Mississippi, proper, or Platte. (*Darby's View of the United States*, p. 216.)

ARKANSAS, one of the United States of N. America, so called from the above river, by which it is traversed through its whole extent from W. to E. between 33° and 36° 30' N. lat., and 89° 44' and 94° 30' W. long., having E. the Mississippi, by which it is divided from the states of Tennessee and Mississippi. Area about 50,000 sq. m. Pop. in 1820, 14,273; in 1835, 58,134, of whom about 7,000 are slaves. Besides the Arkansas, the principal rivers are the White River, the St. Francis, Washita, and Red River, all affluents of the Mississippi. The country is divided into three portions, viz. 1st, the E. portion, or that lying along the Mississippi, low, flat, and covered with a dense forest; 2d, the central portion, a little more elevated, and containing several extensive prairies; and the 3d, or W. portion, which, compared with the others, may be called mountainous. All descriptions of soil are met with. Cotton is raised in the S. The mineral riches of the state are very imperfectly explored; but it contains vast quantities of salt, which, indeed, render the waters of the Arkansas brackish. Arkansas was erected into a separate territory in 1819, and into a state in 1836. Suffrage universal; senate, elected every 4 years, to consist of not less than 17, nor more than 33 members; house of representatives, elected biennially, consists of not less than 51, nor more than 100 members. Governor elected for 4 years; judges for 8 years. Slaves not to be emancipated without owners' consent. Cap. Little Rock, or Arkapolis, on the S. bank of the Arkansas about 80 m. in a direct line from its mouth. (*Darby's United States*, p. 487; *American Almanac* for 1838, &c.)

ARKLIE, a sea-port of Abyssinia, at the bottom of the bay of Masahah, being, according to Lord Valentia, a mere collection of miserable huts. Lat. 15° 32' N., long. 39° 45' E.

ARKLOW, a marit. town. E. coast of Ireland, co. Wicklow, prov. Leinster, on the Ovoca, at its mouth, 39 m. S. by E. Dublin. It was taken possession of, and a castle erected by the first English settlers. In 1649 it was taken by Cromwell, and dismantled. A severe conflict took place here in 1798, between the royal forces and the insurgents; in which the latter were defeated with much slaughter, and their leader killed. Pop. in 1821, 3,408; in 1831, 4,383; being two thirds of the parish, which in 1834 had a pop. of 6,394; of whom 2,037 were of the E. church, and 4,357 R. Cath.

The town, placed on the declivity of a hill on the S. side of the Ovoca, which is crossed at a short distance below by a bridge of 19 arches, is divided into the Upper Town, consisting chiefly of a main street, formed of well-built houses, and of the Lower Town, called also the Fishery, from being chiefly inhabited by fishermen. The church, a handsome building in the English style, was erected in 1823. The R. C. church, built in 1821, a new, modern structure. The Methodists have a small place of worship. A male school is supported on the foundation of Erasmus Smith; two female schools by private contributions, and some others in the same manner; in which, and in private seminaries, about 550 children receive instruction. A fever hospital, with a dispensary, is in the immediate vicinity of the town. A small infantry barrack stands on the site of the ancient castle, and a coast-guard station is in the neighbourhood. Petty sessions are held every Thursday. The town is a non-stagnant station. The inhab. derive their support chiefly from the fisheries. There used to be an abundant summer fishery for herring and hake; but the former have deserted the coast for some years, and the winter fishery is also declining. The oyster fishery continues to be a great and constant source of employment to the fishermen; who attribute the comforts they enjoy to its continuance. The oysters are carried in boats to Banamaria, in Anglesey, where they are laid on bunks, and raised, when required, for the Liverpool market. These people build their cottages on the sandy beach; few have any kind of garden. Their exertions are much impeded by the defects of the harbour, which has a bar at its mouth, with seldom more than 5 feet water even at high spring tides. The boats when returning home are obliged to lie off

* *Flahis* says (3d ed. p. 584.) that it contains from 4,000 to 9,000 inhab.

ARLÂNC.

the bar and watch the opportunity of crossing it on the rise of the wave, and few boats come in without striking. The fishermen keep up a light, at their own expense, during the season, to point out the bar. The vessels and men engaged in the fishery in 1836 were,

	No.	Tonnage.	Men.
Decked vessels	39	1174	186
Half-decked, ditto	39	730	540
Open sail-boats	10	..	80
Row-boats	5	..	90
Total	144	1894	766

Malting is carried on to a small extent, the quantity paying duty in 1836 being 9,081 bushels. The commerce of the town, owing to the very defective state of the harbour, and the want of any kind of quay or landing pier, is very limited. The principal exports and imports for 1836, were as follows:—

Exports.	Imports.
Corn - 548 tons.	Coals 4186 tons.
Copper ore 8,180 cwt.	Oatmeal 1020 cwt.
Herrings - 100 barrels.	Salt - 2160 bush.
Beer - 1260 gallons.	Groceries £1063 value.

The estimated value of which, besides a few other minor articles, was: Exports, 3,677*l.*; Imports, 6,763*l.*

The markets are held on Thursdays; the fairs on the 11th of January, 22d of March, 19th of April, 14th of May, 28th of June, 9th of August, 25th of September, and 15th of November. The post-office revenue for 1830, was 302*l.*; and for 1836, 262*l.* The mail-coach road from Dublin to Wexford passes through Arklow; and a car, conveying on an average three passengers each trip, plies between it and Dublin, six times a week. (*Fishery Report; Railroad Report; and Priv. Inform.*)

ARLÂNC, a town of France, dep. Puy de Dome, cap. cant., on the Dolore, 10 m. S. Ambert. Pop. 4,198. It manufactures ribands, and articles of *menue-mercerie*.

ARLES (an. *Arletus* or *Arletia*), a city of France, dep. Bouches du Rhone, cap. arrond., on the left bank of the Rhone, at the point where the river divides into two branches to inclose its delta, or the island of Camargue, 46 m. W. N. W. Marseilles, lat. 43° 40' 21" N., long. 4° 37' 47" E. Pop. cant. (the largest in France, 20,634; town, 13,342. Its situation, though pleasing, is, owing to the adjacent marshes, not very healthy; and its streets being narrow and dirty, and its houses mostly old and mean, it is indebted for its celebrity principally to the historical associations connected with its name, and its monuments. It was an important town on the invasion of Gaul by Cæsar, who calls it *Arrelate*. It subsequently became a Roman colony; and was long a large, rich, and populous city. Its amphitheatre (which does not, however, appear ever to have been quite finished) is a noble monument, capable, according to Martinière, of accommodating 30,000 spectators: it is of an oval form, 1284 feet in circumference, three stories high, occupying the highest place in the city, and is older, larger, and more magnificent than that of Nismes, but not so well preserved. The obelisk of Arles consists of a single block of granite about 54 feet in height; though, unlike other monuments of the same kind, it is without hieroglyphics, it is all but certain that it has been brought from Egypt; but there are no authentic accounts with respect to it, except that, after being long buried in the ground, it was erected on the pedestal, 20 feet in height, on which it stands, in 1676. A beautiful statue of Venus, now in the museum of Paris, was discovered here in 1681; and, exclusive of the above, the ruins of an aqueduct, of two temples, of a triumphal arch, an extensive cemetery, and numerous fragments of granite and marble, all evince the former grandeur and importance of the city. It has a cathedral, and numerous churches; and has been the seat of several ecclesiastical councils. The town-hall built by Mansard is a handsome edifice; and it has a school of navigation, a college, a museum of antiquities, a small public library, a theatre, &c. Silk, soap, glass bottles, &c. are manufactured; and the sauses of Arles are in the highest esteem. To obviate the difficulties in the navigation of the Rhone and Durance, a navigable canal has been made from the city to the sea at Port Boue, about 12 m. E. of the embouchure of the Rhone, and from the city to the Durance opposite to Cadene. It is also connected with the canal of Beaucaire, and consequently with that of Languedoc; so that it has become the centre of a considerable and growing trade.

After being pillaged, A. D. 270, Arles was repaired and embellished by Constantine, whose son, Constantine II., was born in it. It declined under the Merovingian kings. In 855 it became the capital of a kingdom of the same name, until in 933 to that of Burgundy. It was sacked by the Saracens in 710. In the 12th century it constituted a republic; and in 1251 it submitted to Charles of Anjou. (*Martinière, Grand Dictionnaire*, t. i. pp. 413—417. *Hugo, Bouches du Rhone*, &c.)

ARMAGH.

155

ARLESHEIM, a village of Switzerland, cant. Bale, 4in. S. E. Bale. It has baths and a fine botanical garden.

ARLES-SUR-TECH, a town of France, dep. Pyrénées Orientales, cap. cant. 6 m. W. S. W. Céret. Pop. 2,225. It has but mineral springs.

ARLEUX, a town of France, dep. du Nord, cap. cant. on the Sautet, 6 m. S. Douay. Pop. 1765.

ARLON (an. *Orvalnum*), a town of the low countries, duch. of Luxembourg, cap. cant., on a hill in the middle of forests, 16 m. W. N. W. Luxembourg. Pop. 3,683. It has iron works, and some manufactures of linen and woollen stuffs, and earthenware. Arlon is very ancient, and was formerly fortified, and of much greater importance than at present. It was nearly burned down in 1785.

ARMA (SANTIAGO DE), a town of S. America, New Granada, on the Arma, an affluent of the Cauca, 240 m. N. by E. Popayan.

ARMACAO, a small town of Brazil, on the island of St. Catherine, that was, and perhaps is, a considerable fishing station. Lat. 27° 30' S., long. 48° 40' W.

ARMAGH, an inland co. Ireland, prov. I. ster, having N. Lough Neagh, W. Tyrone and Monaghan, S. Louth, and E. Down. It is about 31 m. in length from N. to S., and 20 m. across where broadest, containing 324,183 Imp. acres, of which 42,472 are unimproved mountain bog, and 18,394 water, being part of Lough Neagh. Surface partly rugged and mountainous, but generally flat. Soil pretty fertile. Property to a great extent in the hands of the church, colleges, and corporations; but some noblemen and gentlemen have good estates. Minor estates numerous, and the tenures by which they are held such as to reduce them into the minutest portions. Farms very small, from 2 and 5 to 25 acres; those of the latter size and up to 40 being deemed large. Of 1,500 tenants on Lord Gosford's estate, in the barony of Fews, there are not more than 60 or 70 who occupy so much as 20 acres. This is the estate on which Mr. Blacker has introduced his system of stall feeding into the smallest farms; but through a vast improvement on the old scourging plan, it is quite visionary to suppose that there can be any thing like a really good or profitable system of cultivation on such patches. Potatoes, oats, and flax are the principal crops; but a considerable quantity of good wheat is raised. There are some dairies which produce butter; and cattle of an inferior breed are reared in the mountains. Average rent of land 17*s.* an acre. Linen manufacture widely diffused. Cottages preferable to those in most Irish counties, with the exception of Down and Antrim. The rivers Ban and Newry being joined by the Newry canal there is a navigable communication between the sea at Carrlingford Bay and Lough Neagh. Armagh contains 5 baronies, and 20 parishes. Principal town, Armagh. Pop. in 1821, 197,427; in 1831, 220,651. It returns 3 m. to the H. of C. viz. 2 for the co. and 1 for the city of Armagh. Parl. constituency of co. 1836-37, 4,041.

ARMAGH, a city of Ireland, prov. Ulster, cap. of the above co., on the Callan, an affluent of the Blackwater, 70 m. N. by W. Dublin, lat. 54° 20' N., long. 6° 37' W. It is said to have been founded by St. Patrick, A. D. 450, who is reported to have made it the seat of a college, which became so celebrated as to be speedily attended by above 1,000 students! Afterwards it suffered greatly from the devastations of the Danes, who were ultimately driven out in 1041. It was sacked by Edward Bruce, in 1315; and again by Sir Phelim O'Neill, in 1641; and in 1688 was pillaged by the troops under William III. Since the Revolution it has gradually increased in extent and prosperity, particularly in consequence of having been made the residence of Primate Butler; and, subsequently, of its being the seat of a college, each of whom contributed to its improvement by liberal donations or bequests. It was originally called *Drum-sailagh* and *Ardsailagh*, "the hill," or "height of shallows." Its modern name, Armagh, "the field on a hill," is obviously derived from its situation on a rising ground of considerable elevation. The population in 1821, was 8,493; and in 1831, 9,470. In 1834 the total number of inhab. was 10,764; of whom 3,586 were of the E. church, 1,532 Prot. diss., and 5,546 lit. Catholics. The number of houses in 1831 was 1,572, giving an average of 6,902 inhab. to a house. It is well built, chiefly of a hard reddish marble, raised in the vicinity. The streets, which are well constructed, sagged, and macadamised, diverge from the cathedral down the sides of the hill on which it is built. A plentiful supply of water is conveyed through them, in pipes, from a reservoir at some distance, and they are kept perfectly clean, and are well lighted with gas. A library, containing upwards of 20,000 volumes, was built and endowed by Primate Robinson, the great benefactor of the town, as was also an observatory, to which a fine astronomical apparatus has been supplied by him and some of his successors, particularly the present primate, Lord John Beresford. Robinson endeavoured to restore the city to its ancient rank, as the seat of a university,

but this he was unable to effect. The Tontine buildings consist of a suite of apartments for assembly-rooms, and occasionally for dramatic entertainments; part of them is occupied by a news-room and a savings' bank. An enclosed space, called the Mall, adjoining the town, and neatly laid out and planted, affords the citizens a convenient place of recreation in fine weather. The primate's demesne also, near the town, is open for respectable people to walk in; and two of the resident gentlemen have imitated this example by throwing open their pleasure-grounds. The archbishop's mansion is plain in style, but elegant in its architectural proportions, and near it is a private chapel. Barracks in the vicinity afford accommodation for 800 men.

Armagh derives its corporate privileges from a charter of James I., in 1613, confirmed by William III. The ruling body consists of a sovereign, 12 burgesses, and an unlimited number of freemen, chosen by the former classes; but at the alteration of the franchise by the Reform Act there were but 2 freemen. It returned 2 m. to the Irish parl.; but only sends 1 m. to the Imp. parl. The electors are the burgesses and freemen residing within 7 m., and the 102 householders, their number in 1837 being 454. The Reform Act has also laid down a new boundary for electoral purposes, which comprises only 277 acres, whereas the former municipal boundary included 1147 acres. A senechal's court is held for the archbishop's honor, for pleas of 10s. and under, but its jurisdiction does not pervade the whole place, part of the city being in the adjoining manor of Mountaine. The assizes and general sessions of the peace are held twice a year; a court for insolvent debtors three times a year; and a court of petty sessions every Saturday. The sessions-house is a handsome modern building. The gaol, at one end of the Mall, is a plain substantial building, not sufficiently large for the proper accommodation of the numbers confined in it: it has a tread-mill. The commitments for a series of years have been as follows:—

1824—334	1825—490	1834—350
1825—334	1830—301	1835—369
1826—348	1831—403	1836—563
1827—574	1832—303	1837—258
1828—549	1833—404	

The sentences of those committed in the last-named year, were,—death, none; transportation—for life, 3; for 14 years, none; for 7 years, 17; imprisonment—for 3 or 2 years, none; for 1 year, 13; for 6 months, 124; fine, 11; acquitted, or discharged for want of prosecution, 86.

The city is the seat of the archdiocese of Armagh, and the residence of the archbishop, styled Primate of all Ireland. His right to this title was long contested by the archbishop of Dublin. The controversy commenced in 1182, and was not terminated until 1634, when the right of precedence, and the style of primate of all Ireland, was confirmed to Armagh, and the inferior style of primate of Ireland given to Dublin. The ecclesiastical prov. comprises the 10 dioceses of Armagh, Clogher, Meath, Down, Connor, Derry, Raphoe, Kilmore, Drogheda, and Ardagh; but under the provisions of the late act for regulating the sees of Ireland, the prov. of Tuam is to be consolidated with it on the demise of the existing interests, and to be held by six prelates, according to the following arrangements:—1. Armagh and Clogher; 2. Tuam, Ardagh, Killybegs, and Achonry; 3. Derry and Raphoe; 4. Down and Connor; 5. Kilmore and Elphin; 6. Meath. The diocese of Armagh is divided into the upper or English part, which includes the cos. of Louth and Meath, and the lower or Irish part, containing Armagh, Tyrone, and part of Londonderry. It extends over 100,563 acres, of which 87,809 are profitable; the annual income, by rents and renewal-fines, is stated to be 17,670*l.*, which, on the demise of the present archbishop, is to be reduced to 10,000*l.* The cathedral, a large ancient building, after suffering often by fire and violence, is at present undergoing very extensive repairs. It contains several fine monuments: that of Brian Boru, interred in it after the battle of Clontarf, cannot now be traced. A chapel of ease, near the Mall, is consecrated to St. Mark. In the R. Catholic arrangements, the parish is one of those belonging to the archbishop, who resides and has his cathedral in Drogheda. The parish chapel, which is remarkable for its triple roof, is too small for the congregation. There are places of worship for Presbyterians, Seceders, Independents, and two for Methodists.

Armagh has one of the free grammar-schools so liberally endowed by James I. It is a large building, in an enclosed area, with accommodation for 100 resident pupils. The present primate maintains a separate school, for the general education of the boys of the choir. There is a charter school for boys and girls, under the endowment of Mr. Drellincourt, a Lancastrian, a national, and a Sunday school, besides several private establishments; affording together instruction to about 650 pupils in the endowed, and 600 in the unendowed schools.

ARMENIA.

The county infirmary is in the town, the fever hospital and lunatic asylum in its vicinity; the latter, which receives patients from Armagh, Monaghan, Fermanagh, and Cavan, is in an enclosed area of 13 acres, used for the exercise and horticultural employment of the inmates. The building is intended for 122 cases, and there were 116 patients in it at the close of 1837, who were maintained at the annual charge of 2,184*l.*, being an average of 18*l.* 10*s.* each. The other charitable institutions are, a mendicity asylum, the paupers of which are employed in cleaning the streets; and two loan funds. A bequest for the foundation of a blind asylum has not yet been brought into action.

Though little or no manufacture be carried on in the town, Armagh is the centre of a large inland trade, chiefly in grain, linen, and yarn. The linen-hall, a large and well-arranged building, is open for sale on Tuesdays, chiefly for brown linens, the weekly average of which is 8,000 webs, estimated at 12,000*l.* The weekly sales of yarn at the yarn-market, average 3,500*l.* There are, in or near the town, two distilleries, a brewery, and several tanneries and flour-mills. Markets are held on Tuesdays for linen, yarn, flax, flax-seed, and provisions; on Saturdays, for grain and provisions; and on the first Saturday in every month for cattle. A market-house, with extensive ranges of buildings for the exposure of goods, has lately been erected. The tolls, having been bought up by the inhab., are regulated by a committee; the profits, after clearing off the principal advanced, amounting to 1,700*l.*, together with the interest accruing thereon, are to be expended on the improvement of the town. Fairs are held on the Tuesday after Michaelmas, and in the week before Christmas. The Bank of Ireland and the Provincial Bank have branches here. The chief vents for the goods sold in the fairs and markets, are by the Blackwater, which passes within 4 m. of the town, through Lough Neagh to Belfast, by the Lagan canal, and to Newry by the Newry navigation. The canal now in process of construction between Loughs Neagh and Erne, passes within 1 m. of the city.

The amount of Excise duties collected in the Armagh district during the undernamed years, was as follows:—

£	£
1828—84,077	1832—69,730
1829—76,157	1833—72,137
1830—78,777	1834—76,506
1831—66,516	1835—69,076

The general appearance of Armagh is pleasing. Its situation, on the declivity of a high hill, gives it an imposing aspect, and tends considerably to its cleanliness and salubrity. The houses are substantially built; the number of thatched cottages in its suburbs, very inconsiderable. The residence of the primate, and of several of the dignified clergy, together with the immediate vicinity of a number of resident noblemen and gentry, induces an expenditure highly beneficial to all classes, which is still farther increased by the circulation of gold money by the markets. The habits of the higher classes are social and refined. The working classes suffer little from poverty or want of employment: their dress, both men and women, is substantial; their habitations comfortable, their food above the equality common throughout the country; the fuel, coal, is brought from Great Britain by the canals, or from the collieries in Tyrone: peat is also much used. (*Prim. Information.*)

ARMEGON, a sea-port town of Hindostan, on the coast of the Carnate, 66 m. N. Madras, lat. 14° N., long. 80° 11' E. An English factory was established here in 1625.

ARMENIA, an extensive country of W. Asia, consisting principally of the table land lying between the Kur on the N. and the Kurdistan mountains on the S., having the Euphrates from the ridge of Mount Taurus to Erzingan on the W., and approaching to near the Caspian Sea on the E. But the limits of Armenia differed widely at different periods, and were at no time exactly defined. The flat parts of the country are, probably, not less than from 5,000 to 6,000 feet above the level of the sea, and it is intersected by several lofty mountain chains, the summits of some of which—as that of Ararat (see ARARAT)—ascend within the line of perpetual congelation. Armenia gives birth to some large and celebrated rivers, as the Euphrates and Tigris, flowing S. to the Persian Gulph; the Cyrus or Kur, and its important tributary, the Araxes or Aras, flowing E. to the Caspian Sea; and the Akampsis or Chorak, flowing N. to the Black Sea. It has three great lakes; those of Van, Shabee or Urmlah, and Goukcha or Sevan. The circumference of the first is estimated at 240 m.; it has several islands; and its waters, though brackish, are drunk by cattle. The other two lakes are also very extensive. The water of that of Urmlah is excessively salt, and so buoyant that one can with difficulty stand where it is 8 feet deep. The soil and products are very various; but in general the former is abundantly fertile, especially in the few spots where it is irrigated. In the higher parts all sorts of corn may be advantageously

cultivated; and the valleys produce excellent cotton, tobacco, grapes, &c. The ploughs are all drawn by oxen or buffaloes; no fewer than 8 or 10 of the former being frequently attached to one. The only minerals raised in modern times are copper, iron, and rock salt; but in antiquity the precious metals ranked among its products. Owing to the great elevation of the country, the climate is in most parts rather severe; but though the winters last long, the summer heats are sufficient to bring all the fruits of the earth to perfection. The country is in many parts desert, and is everywhere very thinly peopled. Besides the Armenians, or old inhabitants, who are principally engaged in agriculture and trade, the population consists of Turks, Persians, and Russians, and wandering pastoral hordes of Turkomans and Koords. The principal towns are Erivan, Erzeroom, Nakhchivan, Akhlat, Van, Akhalzik, &c., which see.

Armenia, though it has long since been effaced from the list of nations, was governed, for a lengthened period, either by independent princes or by vassals of the Assyrian and Persian monarchs. It subsequently became the theatre of long-continued struggles between the Persians and Romans; and, notwithstanding the hardness of the inhabitants, and the natural advantages of the country for defensive warfare, it seems never to have been able to oppose an effectual resistance to any invader. In the 13th century it was overrun by the Moguls; and in the succeeding century the last trace of its independence disappeared, and the Armenians ceased to have a country.

The people early began to seek an asylum in foreign parts from the oppression under which they suffered at home, and they are now widely diffused over Turkey, Persia, Russia, and India. Their emigrations have not, however, always been voluntary. In 1604, Schah Abbas, emperor of Persia, in order to protect his dominions on the side of Armenia against the Turks, resolved to carry off the inhabitants, and to lay waste a large portion of the country, so that it might no longer be able to support an army! This monstrous resolution was executed with the most revolting barbarity. The inhabitants, driven off like cattle, perished by thousands, while their houses were burnt down and every vestige of civilisation obliterated. A part of the survivors were settled in one of the suburbs of Ispahan, where they were kindly treated; but the greater number, being settled in an unhealthy part of the prov. of Mazanderan, were soon swept off by disease. Until recently, Armenia was divided between Turkey and Persia; but the former ceded to Russia, by the treaty of Adrianople, a considerable portion of her Armenian territories; and in 1827, Russia acquired the entire prov. of Erivan from Persia. These acquisitions have been consolidated into the government of Armenia.

Whatever may be its influence in other respects, there can be little doubt that the occupation of part of Armenia by the Russians will be of singular advantage to its inhabitants. Great numbers of Armenians have already emigrated from the Turkish and Persian provinces to those of Russia, where they have been advantageously settled. The depredations of the petty chiefs and of the wandering tribes will now be effectually restrained; and for the first time for these several centuries, the Armenians will be made aware of the advantages resulting from the security of property, and from living under a strong and (compared with those under which they formerly lived) a liberal and tolerant government. Col. Montebell bears decisive testimony to the benefits that have resulted to Georgia and other Transcaucasian countries from their occupation by Russia. You may now, he says, "travel in perfect security, with post-horses, from the mouths of the Phasis to the Kur and the Caspian, through countries where, in 1816, the roads were all but impracticable, and exposed to the unrestrained attacks of robbers and other banditti." (*Journal of the Geographical Society*, vol. iii. p. 47.)

The total number of the Armenian nation is estimated by Mr. Conder at about 2,000,000, of whom about two thirds may be within the Ottoman dominions. With the exception of the Jews, no other people is so much scattered. It is supposed that there are about 200,000 in Constantinople and the adjacent villages; about 40,000 in India; 10,000 in Hungary and the contiguous countries; and they are met with in Africa and even America.

Like the Jews, the Armenians found in foreign countries are mostly all engaged in some department of commerce, or of the employments connected therewith. The moment, in fact, that they leave their native soil, they endeavour either to get themselves or their children into some branch of trade. They begin with the lowest departments; the more able or fortunate ascending gradually from one grade to another, till they arrive at that of banker, the summit of their ambition. A large proportion of the foreign and internal trade of Turkey, Persia, Southern Russia, India, &c., particularly the first, is in their hands. They are exceedingly industrious; and, not free from the vice produced by slavery and ignorance, are honest in their

dealings, and less prone to practise deceit, than the Greeks.

The Armenians are Christians differing but little from those of the Eastern or Greek church. They reject the decrees of the council of Chalcedon, and admit only a divine nature in Christ. Their officiating clergy, or *variedas*, are obliged to marry; but celibacy is enjoined upon those of a higher grade, as patriarchs, bishops, &c. The election of the officiating clergy is in the hands of the people, and is uniformly exercised by them; but, notwithstanding this circumstance, and that the priests have no fixed incomes, but depend entirely on fees and other perquisites, they do not appear to have much influence, or to be very attentive to their duties: they are uniformly almost in the last degree illiterate, and their morals are not represented in the most favourable point of view. (*Missionary Researches*, p. 245.)

The Armenians, with the exception of a small minority, do not acknowledge the supremacy of the Pope; but since 1441 have recognised, as their spiritual superior, the patriarch of Echmiadzin, residing at the famous convent of the three churches, near Erivan, now in possession of Russia. The patriarchs of Constantinople and Jerusalem have no authority in ecclesiastical affairs; but the Turkish government consider the former as the head of the Armenian rayahs: through him all applications are received and all orders issued; and he is accustomed to receive an annual stipend from the different bishops, which was paid him even by the patriarch of Echmiadzin till the latter became a Russian subject. Previously to 1441, the patriarchs of Sis and Athamar (a monastery on an island in Lake Van) shared the spiritual authority with the patriarch of Echmiadzin; and latterly the Porte has been endeavouring to sever the connection between its Armenian subjects and their old spiritual head, now under the control of a foreign power, by directing their attention to, and reviving the pretensions of, the patriarch of Sis, resident within the Turkish territories. (*Elliot's Travels*, i. p. 470.)

The language of Armenia is harsh, and overloaded with consonants. Besides great many Indo-Germanic roots, it exhibits numerous relations with the Finnish idioms of Siberia, and other languages of N. Asia. Its grammar is exceedingly complex. The ancient Armenian is no longer spoken, and exists only as a dead language in books: it is so very different from the modern Armenian, that it is no longer understood, except by those by whom it is studied. The modern language is largely made up of Persian and Turkish words; and its grammar, and the construction of its phrases, are totally distinct from those of the ancient language.

The alphabet of the Armenians, introduced A. D. 406, and still in use, consists of 38 letters, of which 30 are consonants, and 8 vowels. At an early period, the Armenians had a literature and learned men; and though the great bulk of the nation be now plunged in the grossest ignorance, they continue to this day to possess both, and works of considerable merit are still printed in their language. They have printing-presses at Constantinople, Venice, Moscow, Calcutta, and other places.—(For further particulars, see *Thornborough*, vol. ii. pp. 389—401; *Jaubert*, *Voyage en Perse*, &c. en Pers.; *Smith and Deight's Missionary Researches in Armenia*, with the learned Introductory Discourse by Conder; *Colonel Montebell's Paper*, in the *Journal of the Geographical Society*, vol. iii.; and the excellent article by Klaproth, in the *Encyclopédie des Gens du Monde*.)

ARMENT, a village of Upper Egypt, near the left bank of the Nile, m. N. Esné. It occupies the site of the ancient *Hermopolis*. It has in its environs a temple, on the walls of which, among other figures, is a griffin, — an animal now unknown in Egypt.

ARMENTIERES, a frontier town of France, dép. du Nord, cant. in the Lys 13 m. N.W. Lille. Pop. 6,512. It is well built, clean, and handsome; has a communal college; an establishment for spinning cotton; fabrics of table-linen, mattresses, laces, thread, tobacco, &c., with bleaching-grounds, soap-works, distilleries, and a refinery of salt. Large quantities of bricks made in the environs are exported by the Lys, and boats are built for its navigation. It has a celebrated market for seed corn.

ARNAU, a walled town of Bohemia, on the Elbe, 18 m. N. E. Gitschin. Pop. 1,400. It has manufactures of linen, bleach-works, print-works, and copper forges. ARNAY-LE-DUC, a town of France, dép. Côte-d'Or, cap. cant. near the Arroux, 39 m. S.W. Dijon. Pop. 2,617. It has manufactures of cloth, serges, druggets, &c. On the 25th June, 1870, the great Huguenot leader, Admiral Coligny, defeated near this town the army of the Marshal de Cosé-Gonior.

ARNEDO, a town of Spain, prov. Burgos, on the Cidacos, 10 m. S. Calahorra. Pop. 1,600. It is said to have had no fewer than *nine* parish churches! Good wine is made in its neighbourhood.

ARNEE, a town of Hindostan, prov. Carnatic, 74 m. S.W. Madras, lat. 12° 46' N., long. 79° 22' E.

ARNEMUYDEN, a small town of the Netherlands, island of Walcheren, 3 m. E. Middelburg. Its port, which was formerly considerable, has been filled up, and it is now nearly 2 miles from the sea; with which, however, it is connected by a canal.

ARNHEM, a town of the Netherlands, cap. prov. Guelderland, on the right bank of the Rhine, at the foot of the Veluwe hills, 34 m. E. by S. Utrecht, lat. $51^{\circ} 58' 47''$ N., long. $5^{\circ} 54' 45''$ E. Pop. 14,600. It is a fortified place of the first class; its fortifications having been greatly improved and enlarged, in 1702, by the famous engineer Coehoorn. The ramparts, planted with elms, afford an agreeable promenade. The town is well built; has a good port on the river, which is crossed by a bridge of boats; and is advantageously situated for trade. It is the residence of a governor, and is the seat of a court of assizes, of a tribunal of original jurisdiction, and a tribunal of commerce; and has a college, a literary society, an agricultural commission, &c. In the church of St. Eusebius are the tombs of the old Dukes and Counts of Guelderland.

ARNO, a considerable and celebrated river of Italy (Tuscany), the *Arno* of the Romans, has its source in the Apennines, at Mount Falterona, 5 or 6 m. N. Prato-vecchio. At first it flows S. to Ponte a Burianno; thence N.W. to Pontassieve, where it receives the Sieve; whence it pursues a westerly course, flowing through Florence and Pisa; 7 m. below which it falls into the Mediterranean. Its embouchure was formerly a good deal farther to the S.; but having become obstructed, it was diverted into a new channel cut for it in 1603. Its course may be estimated at from 140 to 150 m. It is naturally navigable from the sea to Florence, and has been made navigable from Florence to near its source by means of 27 locks; but its navigation is liable to many obstructions, at certain seasons from floods, and at other seasons from droughts: to guard against the injurious influence of the former, it has been embanked for the greater part of its course. The Val d'Arno, or the country between Florence and Pisa, is one of the richest, best cultivated, and most beautiful of any in Italy.

ARNSBERG, a town of Prussian Westphalia, cap. reg. and circ. of the same name, on the Rur, by which it is almost encompassed, 87 m. N.E. Cologne. Pop. 4,500. It is the residence of the provincial authorities, and has a court of appeal for the regency, a Catholic gymnasium, an agricultural society, &c. The inhabitants are principally employed in the preparation of potashes, and in distillation.

ARNSFELD, a well-built town of Saxony, princip. Schwarzburg-Sondershausen, on the Gera, 11 m. S. by W. Erfurt. Pop. 4,500. It has a castle, a college, a cabinet of natural history, and fabrics of cotton and brass, with a considerable trade, in corn, timber, wool, furs, and colonial produce.

ARNSTEIN, a town of Bavaria, circle Lower Mayne, on the Werpe, 16 m. N.N.W. Würzburg. Pop. 2,000. It is the birth-place of the historian Schmidt.

ARNSWALDE, a town of the Prussian states, prov. Brandenburg, cap. circ. 19 m. S.E. Stargard. Pop. 3,800. It is nearly surrounded by three lakes well supplied with fish.

AROLSEN, a town of the principality of Waldeck, on the Aar, 13 m. N. by W. Waldeck. Pop. 1,500. It is the residence of the prince, and the seat of the principal authorities of the province; is well built; has a fine castle, in which is a valuable collection of coins and antiquities, with a library and a picture gallery; there is also a college, grammar school, &c.

ARONA, a town of the Sardinian estates, prov. Novara, on the Lago Maggiore, near its southern extremity, lat. $46^{\circ} 45' 33''$ N., long. $8^{\circ} 34' 18''$ E. Pop. 2,000. Its fortifications, which were formerly considerable, were demolished by the French after the battle of Marengo. It is well built, has a gymnasium, an hospital, a collegiate church and 3 others, a port on the lake, with yards for the construction of vessels for its navigation, and a pretty considerable commerce. St. Charles Borromeo was a native of this town; and in 1697 a colossal statue was erected in honour of the saint, by the people of Milan, on a neighbouring eminence. This immense work, the chief-steward of Zanelli and Falconi, stands on a granite pedestal 46 feet high, and is itself 66 feet high. The head, hands, and feet are cast; the drapery and book which he holds in his hand are hammered out of sheet copper, set on timber framing: the execution is very fine, particularly the expression of the countenance, looking down upon the world "more in pity than in anger." The attitude of the body is remarkably easy and simple, and the proportions are so good that the idea of a colossus does not enter the mind until a comparison has been made with objects of known dimensions situated near it, such as the travellers every day seen at the foot of the statue. A sort of staircase leads from the bottom to the top of the statue. (*Simond's Italy*, p. 30.; *Cosnier's Italy*, vol. i. p. 310.)

ARONCHES, a town of Portugal, prov. Alentejo, 16

m. S.E. Portalegre. Pop. 3,000. It has a church, a convent, an hospital, and a workhouse.

ARPAÇON, a small town of France, dép. Seine et Oise, 11 m. W. Corbeil. It has tanneries, a brewery, and some trade in flour.

ARPAIA, a miserable, bleak-looking village of Naples, prov. Principato Ultra, between Capua and Benevento, 3 m. E. Arsenzo. It would be unworthy of notice were it not that it is supposed by some to occupy the site of the ancient *Casertum*, memorable for the great disaster that there befell the Roman arms, anno 311 a. C. But the better opinion seems to be, that the defile situated a little to the N. of Arpaia, between St. Agato and Molano, is the real scene of this disaster and the place so celebrated by the name of the *Furca Caudina*. The Forks consist of a small plane, traversed by a stream, having a narrow outlet at each end, and shut up every where else by continuous and impracticable mountains. A powerful Roman army having unwarily entered this defile, the Samnites immediately blocked up the further outlet; and the Romans, having retraced their steps, found that their enemies had anticipated their movement, by blocking up the pass by which they had entered as well as the other. Caught thus, as it were, in a trap, they were obliged to accept the terms dictated by the Samnites, who granted them their lives, on their delivering up their arms, and passing one by one half naked under the yoke. (*Liv. lib. ix. cap. 1-7*.)

ARPINO (an *Arpinum*), a town of Naples, prov. Terra di Lavoro, 6 m. S.W. Sora. Pop. 9,000. It is agreeably situated on some eminences, has various churches, an hospital, with manufactories of the best cloth made in Naples, paper, and tanneries. This is a very ancient city. Having been wrested from the Samnites by the Romans, it became a municipal town, and its citizens were enrolled in the Cornelian tribe 302 years a. C. (*Liv. lib. x. § 11*, and *lib. xxxvii. § 36*, and *Cicero pro Co. Laelio*.) But it is chiefly memorable for being the birthplace of two of the most distinguished men Italy ever produced.—Gaius Marcius sustained the third founder of Rome; and M. Tullius Cicero, the prince of Roman orators. The latter frequently alludes to Arpinum in his Letters, and dwells with complacency on the rude and primitive simplicity of its inhabitants. (*Cramer's Ancient Italy*, vol. ii. p. 114.)

In its environs is a paper-mill recently established at an expense of above 11,000*l.*, and employing 200 workpeople. Balbi says that it produces 60 reams a day, and that the pulp is converted into dried paper in less than a minute! We suspect this is an exaggeration, otherwise it exceeds any thing done in this country; about 3 minutes being required here, in the best mills, for the conversion of pulp into dried paper. (*Arbrégé*, ed. 1837, p. 415.)

ARQUA, a town of Austrian Italy, prov. Padua, 12 m. S.W. Padua, in the bosom of the Euganean hills. The pop. does not exceed 1,000; and the place would not be worth notice, but for its having been the residence of Petrarch during the latter years of his life, and the place where that great poet and restorer of modern literature breathed his last, on the 19th of July, 1374. "His ashes are preserved in the churchyard of the town, in a sarcophagus of red marble, raised on 4 pilasters on an elevated base, and preserved from the association with meaner tombs." The kindred genius to whom we are indebted for these details, observes:—

They keep his dust in Arqua, where he died;
The mountain village where his latter days
Went down the vale of years; and 'tis his pride —
An honest pride — and let us be their praise,
To offer to the passing stranger's gaze
His mansion and his sepulchre; both plain
And venerably simple, such as raise
In feeling more accordant with his life,
Than if a pyramid form'd his monumental fane.

"The house in which Petrarch resided is on the edge of a little knoll overlooking two descents, and commanding a view not only of the glowing gardens in the dales immediately beneath, but of the wide plains, above whose low woods of mulberry and willow, thickened into a dark mass by festoons of vines, tall single cypresses, and the spires of towers, are seen in the distance, which stretches to the mouths of the Po and the shores of the Adriatic. The chair in which the poet breathed his last is still shown among the precious relics of Arqua." (*Childe Harold*, canto iv. § 31. and note 9.)

ARQUA, an ancient village of Austrian Italy, on the Castagnaro canal, 5 m. S.S.W. Ruvoigo. Pop. 2,800. It has some trade in cotton and silk.

ARQUENNES, a village of Belgium, prov. Hainault, 13 m. N.W. Charleroi. Pop. 1,500. It has valuable lime and marble quarries.

ARQUES, a small decayed town of France, dép. Seine Inférieure, about 3 m. from Dieppe. During the middle ages this was the principal bulwark of Normandy towards the N.; its castle, now in ruins, having withstood several sieges. In the vicinity of this town, in 1569, Henry IV. defeated the troops of the League under the Duc de Mayenne.

ARRAN, an island of Scotland, co. Bute, in the arm of the sea between the Mull of Cantire and the Ayrshire coast; being separated from the former by Kilbrannan Sound, and from the latter by the Frith of Clyde. It is 4½ m. from the nearest point of the Isle of Bute, 3½ m. from the nearest point of Cantire, and 10½ m. from Ardrossan point in Ayrshire. It is about 16½ m. in length from N. to S., and from 6 to 9 in breadth*, comprising about 72,000 acres, of which about 11,000 may be arable. It exhibits a striking contrast in its N. and S. divisions: the former, or that to the N. of Brodick, presenting lofty bare and rugged granite mountains, connected by steep ridges and intersected by deep valleys and ravines. Goatfell, the highest mountain in the island, rises to the height of 2,865 feet above the sea. The S. and largest division of the island is composed of undulating hilly ground, the eminences of which are of a flattened or rounded configuration, and covered with a deep stratum of peat and other alluvial matter. Round the greater part of the coast an almost uninterrupted broad bank or girdle of gravel has been formed by the action of the sea, the soft greensward on which affords a pleasant and convenient access along the sea-side. The shores are generally steep and rocky, but high cliffs are not frequent. Three deep bays indent the island.—Ransa on the N. W., and Brodick and Lamlash on the E.; the latter, being defended from the W. gales by Holy Island, 1 m. in length, is one of the best asylums for shipping in the Frith of Clyde. Marble, Jasper, agates, calrin-gorms, and a fine species of rock crystal, called the Arran diamond, are met with. The red deer and wild goat, formerly very abundant, are now nearly, if not entirely, exterminated. Cheviot sheep are generally introduced, and the native breeds of cattle and horses are being superseded by the larger and more esteemed breeds of Argyleshire and Ayrshire. Swine are raised in considerable numbers; and the steam boats that touch at the island have opened a new market for fowls and eggs. Grouse and black-cock are very plentiful. The system of agriculture formerly followed in Arran was as bad as can well be imagined; the lands were held jointly by several tenants on the common or *run-rig* plan (see *ARGYLE*), and were scourged by a constant course of corn crops, which succeeded each other in a series, unbroken except by the occasional introduction of potatoes, as long as the soil would produce any thing; but, since 1815, the Duke of Hamilton, who is proprietor of nearly the whole island, has laboured strenuously and successfully to introduce a better system; partly by letting farms to individuals for a fixed term of years, excluding subtenants and assignees; partly by introducing conditions into the leases fitted to insure a better system of management; and partly by expending large sums on the building of houses, inclosures, making drains, roads, &c. The people at first were very much opposed to the change; but their prejudices have gradually given way, and they are now for the most part sensible that it has been as advantageous to them as to the proprietor. Since the occupiers have enjoyed possessions each might call his own, they have steadily advanced in habits of industry; and though in this respect they are still behind the tenants and labourers of the mainland, it is believed that in no insular Highland district is greater industry shown than in Arran.

There are now a number of large farms inclosed, subdivided, and well cultivated, having valuable stocks of cattle and comfortable farm-steading, where formerly there were numerous huts without chimneys or windows, and ridges running in all directions without a single inclosure or subdivision. The general rotation, except on the shores, is, 1. Oats; 2. Green crop—potatoes, turnips, beans or peas, with manure; 3. Bear or bigg, wheat, or oats, often manured; 4. Hay; 5. Pasture grass; 6. Pasture, sometimes grass a year or two longer. On the shores and holms, the rotation is, 1. Oats; 2. Green crop; 3. Bigg or wheat—these often with manure; 4. Hay; and then oats, &c. again. These rotations are not always adhered to by the tenants having the small possessions, but they all sow grass seeds with the corn crop which succeeds the green one; and this of itself necessarily leads to better management than they formerly practised. Wheat to a considerable extent has for a few years past been raised by the tenants of the larger possessions, and a great number of the small tenants also grow from half an acre to two acres each of that grain.

By these changes in the mode of possession, and by the improvement of the soil, it will easily be seen that more and better cattle may be reared and supported than formerly, and the produce of milk is also much greater. Since 1822, the Duke of Hamilton has supplied good Argyleshire bulls, at his own expense, for the cattle on his property, keeping always in the island from 20 to 30, placed at convenient distances. The

consequence of this arrangement is, that the cattle have been surprisingly improved, in every respect. On a few of the larger farms stocks of Ayrshire cows are kept, and succeed very well.

The rental of the island amounts to from 11,000*l.* to 12,000*l.* a year.

A number of boats employed in the herring fishery belong to Kilbride and Brodick, the principal villages. But the herring fishery in the Frith of Clyde and Loch Fyne is not nearly so prosperous at present as it once was. Luckily its decline is little, if any, loss to the island; for, having no considerable town population, the fishery is principally carried on by the cottiers and small farmers, engrossing their attention at the time their services are most necessary on shore, at the same time that it has a tendency to generate and keep alive idle and dissipated habits. Kelp used to be produced in considerable quantities, but its manufacture has now nearly ceased. Most of the woollen cloth formerly used in the island was made by the women, but a good deal is now imported.

The yearly export of produce from Arran cannot be given with perfect accuracy but the following statement is believed to be a pretty near approximation to its quantity and value:—

900 black cattle, at 5 <i>l.</i> 10 <i>s.</i>	4,500
450 swine, at 1 <i>l.</i> 7 <i>s.</i>	600
Fowls and eggs	700
Sheep and goats	2,500
Bees or bigg, 2,500 qrs., at 2 <i>s.</i>	2,500
Wheat, 700 bolls at 2 <i>s.</i>	840
Beans and peas, 300 bolls, at 1 <i>s.</i>	750
Oats, in grain and meal, 3,000 qrs., at 2 <i>s.</i>	3,000
Potatoes, 3,000 bolls, at 1 <i>s.</i>	1,500
Herring, caught by 100 wherries, at 4 <i>s.</i> per wherry	4,000
Butter and cheese	1,000
Shell-fish, about	100
Freestone and limestone	500
Total	£ 21,860

A good deal of illicitly distilled whiskey was formerly exported; but that branch of industry, if it may be so called, has all but ceased.

Brodick, the principal village, is finely situated, at the bottom of Brodick Bay on the E. side of the island. Near it is Brodick Castle, a seat, and occasional residence, of the Dukes of Hamilton. Though Gaelic be generally spoken, English is understood by every body.

Arran is divided into two parishes. Its population amounted, in 1755, according to Dr. Webster, to 3,646; in 1801 it amounted to 5,179; and in 1831, to 4,271. It declined somewhat during the 10 years ending with 1831; but is again on the increase. (*Anderson's Highlands; McDonald's Survey of the Hebrides; and Paterson's Account of the Duke of Hamilton's Improvements in Arran, in the Transactions of the Highland Society.*)

ARRAN (N. ISLES OF), on the W. coast of Ireland, co. Donegal, opposite Danglee, the most N. extremity of the largest, called Arranmore, being in lat. 56° N., long. 8° 29' W. A lighthouse is erected on this point, with a red light elevated 200 feet above the surface. This island contains about 2,000 acres, and nearly 1,000 inhab., the land being divided into the minutest portions, such as a "cow's foot," or the quarter of a cow's grass. They are mostly fishers. On a smaller island, a fishing village, called Rutland, was erected by the Fishing Board, in 1786, but it is now nearly deserted.

ARRAN (S. ISLES OF). These consist of three islands stretching N. W. and S. E., about 12 m. along the mouth of Galway Bay, in Ireland, being part of the co. Galway. They contain in all about 7,000 acres; the largest, Arranmore, comprising about 4,607; Inishmore, 1,338; and Inish Lee, 909. Pop. 3,191. They are the property of Mr. Digby, and yield a rent of above 2,000*l.* a year, the tenants paying from 2*l.* to 6*l.* each. They are very fertile, but occasionally suffer from a scarcity of water. The fishing of cod and ling is carried on to a considerable extent, a pier having been constructed at the village of Killaney (pop. 1,000) on the largest island, at the expense of the Fishery Board, for the accommodation of the craft employed. The principal products are fresh fish, and cured fish, oats, feathers, the produce of puffins, and great quantities of smuggled whiskey. A lighthouse, with a revolving light, has been erected on the highest point of the largest or most northerly of the islands, lat. 53° 7' N., long. 9° 40' W., having the lantern elevated 498 feet above the level of the sea. These islands give the title of Earl to the family of Gore. The inhab., who are very poor, continue in a very primitive state, and the Irish language is universally spoken. (*Dutton's Statistical Survey of Galway, p. 2, &c.; Reports on the Fisheries of Ireland, sup. p. 104, &c.*)

ARRAS, a city of France, dép. Pas de Calais, of which it is the cap., on the Scarpe and the Crinchon, 60 m. S. E. Calais, lat. 50° 17' 54" N., long. 2° 46' 25" E.

* These are the dimensions as given in John Arrowsmith's map, it is generally represented, as much larger, or from 30 m. to 35 m. in length, and from 12 m. to 30 m. in breadth.

Pop. 23,485. It is situated in the middle of an extensive and fertile plain: the Scarpe divides it into two parts: it is well built; houses stone; several of its squares and public buildings handsome, and worthy of notice. Among the latter are the old Gothic church of St Waast, the hôtel of the Préfet, theatre, belfry, barracks, &c. The cathedral, a fine old Gothic building, was destroyed during the revolutionary phrensy. Arras was fortified, during the reign of Louis XIV., by Vauban. The citadel, which is very strong, is separated from the town by an esplanade, but it is included within the line of the works. It is the seat of a bishopric; and has a court of assizes, a tribunal of original jurisdiction, a college, a grand diocesan seminary, a secondary ecclesiastical school, a school of engineering (*école réglementaire de génie*), an academy of belles-lettres, a literary society, a botanical garden, a school for deaf and dumb, a school of design, a cabinet of natural history and antiquities, a museum of pictures, a public library containing 36,000 volumes, &c. There are establishments for the spinning of cotton, manufactures of cotton stuffs, hosiery, lace, coarse woollen stuffs, and potteries; and fabrics for the preparation of beet-root sugar, soap, starch, beer, rape-oil, &c. The Scarpe becomes navigable at this point.

Arras is a very ancient city, and has been the theatre of many sanguinary contests. The revocation of the edict of Nantes gave a severe blow to its manufactures. It also suffered much during the revolution, having been for a considerable time at the mercy of Lebon, a ferocious terrorist, a native of the place. Robespierre, of infamous memory, was also a native of Arras; as was Damiens, the assassin of Louis XV. (*Hugo, France Pittoresque, art. Pas de Calais.*)

ARRAYOLLOS, a town of Portugal, prov. Alentejo, 15 m. N.W. W. Évora, at the foot of a mountain on the summit of which is a citadel. Pop. 1,900. It has some fabrics of stained paper.

ARRIÈGE, a dep. in the S. of France, on the Spanish frontier, having S. the Pyrenean mountains, E. the dépts. Pyrénées Orientales and Aude, and N. and W. the Haute Garonne. Area, 458,000 hectares. Pop. 260,536. This dep. consists principally of the N. slope of the Pyrenées; the mountains, which cover the greater part of its surface, increasing gradually in elevation as they approach its S. frontier; the altitude of the highest summits varying from about 7,000 to about 10,500 feet above the level of the sea. The principal valleys are those of the Arriège and the Salat, the only navigable rivers in the dep. According to the official tables, the cultivable lands occupy about 148,000, meadows 34,000, woods (on the mountains) 90,000, vineyards 11,630, and heaths, wastes, &c. 136,000 hectares. Gold has been found; and there are valuable iron mines near Vic Desosses, and other places. The N. portion is pretty fertile and well cultivated, producing wheat, rye, oats, maize, millet, &c. Horses an inferior breed, and oxen and mules frequently employed in their stead. The total produce of wine is estimated at 115,000 hectolitres a year; but the quality is inferior, and it is wholly retained for home use. The forests have not been taken proper care of; and in many parts, owing to the consumption of the iron furnaces, and the want of sufficient attention, there is a scarcity of wood. The working of metals is the principal branch of manufacturing industry; but there are also manufactures of cloth, serges, flax-silk, cotton stuffs, &c. It returns 3 m. to the Ch. of Dep. Const. in 1838, 806. Public revenue, in 1881, very near 8,000,000 fr. Principal towns, Foix, Massat, Pamiers, &c. (*Hugo, France Pittoresque, art. Ariège.*)

ARROYO-DRL-PUERCO, a town of Spain, Estremadura, 10 m. W. Cáceres. Pop. 5,000. It has a parish church, adorned with some good pictures by Morales; with manufactures of cloth and earthenware.

ARS-EN-RE', a sea-port town of France, dép. Charente Inférieure, on the W. coast of the Isle de Ré. Pop. 3,608. Salt is produced in its vicinity, and shipped in considerable quantities from its port.

ARSIERO, a village of Austrian Italy, prov. Vicenza, 6 m. N. by W. Schio. Pop. 2,400. It is famous for its marble, and a quantity of fine white veined marble.

ART, a town of Switzerland, cant. Schwitz, at the S. extremity of the lake of Zug, 7 m. S. Zug, at the foot of mounts Rigi and Rosburg. It is well built. The church of St. George is remarkable for its architecture, and for an immense fountain, formed of a single block of granite. There is a convent of Capuchins, with a good library. The valley of Art is very picturesque and interesting, from its position among the highest mountains of breccia anywhere to be met with.

ARTA, a town of Spain, island of Majorca, on its N. W. angle. Cape Pera, where there is a small fort, depends on it. Pop. 8,000. Its territory, which is very fruitful, produces cotton, and has mill-stone quarries.

ARTA, a town of Turkey in Europe, Albania, on the Arta, about 7 m. above where it falls into the gulph of

that name. It is a place of considerable size and trade. When visited by Dr. Holland, Jan 1812, it contained 6 mosques, a large cathedral, and a great number of Greek churches, and was supposed to have a population of about 6,000. It suffered severely during the Greek insurrection; and Lieut. Wolfe, by whom it was visited in 1880, says that in many places, masses of ruins impeded the passage of the streets, and that an aspect of desolation and misery hung over it. We understand, however, that it has begun to improve. Its population was estimated by Mr. Wolfe at 7,000, at a maximum. It is governed by a bey, under the pacha of Yannina, and is the seat of a Greek bishop. It has manufactures of cottons, woolsens, and leather. * The foccates, or shaggy capotes made here, are reckoned very superior. Embroidery is said to be brought to considerable perfection; and all articles of dress from Arta are highly prized. Each trade has its separate street or bazar; but, by a judicious regulation, butchers are obliged to kill, and sell their meat outside the town. The market is abundantly supplied with fruit and vegetables. There is a curious Venetian bridge over the river, consisting of one large and several very small arches.

There can be no doubt that Arta occupies the site of the ancient *Ambracia*. Traces of the ancient walls may be seen in many places, but especially under the more modern remains of the ruined castle: the stones consist of vast quadrangular blocks, so admirably fitted that it is with difficulty the point of a mallet can be inserted between them:—no mortar seems to have been used in their construction. There is here, also, the ruins of a convent, built in 845, now converted into a caravanserai. (*Holland's Travels in Albania, &c.*, p. 82. 4to ed.; *Wolfe's Observations on the Gulph of Arta, Journal of the Geogr. Society*, vol. iii. p. 77.)

ARTA (GULPH OF), the *Sinus Ambracius* of the ancients, is a deep inlet or gulph of the Ionian Sea, between the Turkish province of Albania and the N. W. part of the new kingdom of Greece. The entrance to it, between Preveza on the N. and the fort of L. Antiochia on the S., is only 700 yards across. The fort now mentioned is built at the extremity of a low, narrow, tongue of land, celebrated in history as the *Promontory of Actium*. Outside the entrance is a bar, composed of gravel, coarse sand, and sea-weed, with 15 feet water when shallowest. On entering the Gulph, we first come to what is called the Bay of Preveza, occupying the space between the mouth of the Gulph and Cape La Scorta on the N. and Madonna on the S., and it is only after passing these two headlands that the Gulph properly opens. It is a noble sheet of water: its extreme length from W. to E., including the Bay of Preveza, is about 25 m., and its greatest breadth about 10 m.; but in several places it is a good deal narrower: the depth varies from 13 and 14 to 36 fathoms. The S. shore consists of high land, with bold promontories, clothed with rich and extensive woods; the N. shore is for the most part low, and has encroached considerably on the water. Part of the vast chain of *Pinus* is seen from the Gulph. It has been long celebrated for the variety and excellence of its fish: red and grey mullet are the most abundant; and there are plenty of soles, eels, prawns, &c.: sardine fishing is extensively carried on.

The entrance to the Gulph of Arta was the scene of one of the most memorable and important conflicts recorded in history. The battle of Actium, which decided the fate of Augustus and Mark Antony, and of the Roman world, was fought off the promontory of that name, at the southern entrance to the Gulph, a.m.c. 29. The exact space occupied by the hostile fleets has been disputed. Most probably the battle raged all round the promontory, but principally on its W. side, or in what is now called the harbour of Preveza, and the contiguous sea. (See the authorities cited in the previous article, *Ferguson's History of the Roman Republic*, cap. 35.; *Plutarch's Life of Mark Antony, &c.*)

ARTAGONA, a walled town of Spain, Navarre, 15 m. S. Pampeluna. * Pop. 2,000.

ARTAKI, a small sea-port town of Turkey in Asia, on the S. W. coast of the peninsula of Colicula (which see), Sea of Marmara, 75 m. W. S. W. Constantinople. It has a convenient anchorage.

ARTERN, a town of Prussian Saxony, reg. Merseburg, on the Unstrut, 30 m. W. by S. Halle. Pop. 2,400. It has a castle, a brine-spring, and a distillery.

ARTHUR'S SEAT, a hill in the immediate vicinity of Edinburgh, on the S. E. side of the city, rising 822 feet above the level of the sea. Its ascent from the latter is gradual and easy; but on the side towards the city, it rises abruptly, and in parts, almost perpendicularly, from the low grounds. On the S. side of the hill, above the footpath leading from Edinburgh to Duddingstone, is a superb range of porphyritic greenstone columns, from 50 to 60 feet high. The part of the hill nearest Holyrood House is called Salsbury Crag, and till within these few years, its quarries furnished most part of the paving stones used in London. The view from the top of

Arthur's Seat is one of the most diversified and fine in the empire.

ARUDY, a town of France, dép. Basses Pyrénées, cap. cant., on the Oseaux, 12 S. E. Oloron. Pop. 1,725. It is the centre of an active and considerable commerce with the neighbouring valleys.

ARUNDËL, a burgh, m. town, and pa. of England, co. of Sussex, on the N. bank of the Arun, about 3½ m. from its embouchure, 55 m. S. S. W. London. Pop. 2,808. The town is pretty well built, and has a thriving appearance. It derives its entire consequence from its being immediately contiguous to Arundel Castle, formerly a strong fortress, now the magnificent baronial residence of the Dukes of Norfolk, having been rebuilt at a great expence by the late Duke. The possessor of this castle enjoys, without further cession, the dignity of earl. Previously to the Reform Act, Arundel returned two members to the H. of C., the right of voting being vested in the inhabitants paying scot and lot; but since the Reform Act it only returns one member. Constituency, 1896-37, 336. The Arun, which is here crossed by a neat bridge, is navigable thus far; and is joined by canals with the Thames on the one hand, and Chichester harbour on the other.

ARVERT, a town of France, dép. Charente Inférieure, 24 m. W. Saintes. Pop. 2,360. It is the chief place of the peninsula of the same name formed by the Gironde, the Seudre, and the sea. It has a considerable trade in wine, and fresh and salt fish, particularly sardines.

ARZAMAS, a town of Russia in Europe, gov. Nijni Novgorod, cap. district, at the confluence of the Choka and Tioncia, 62 m. S. Nijni Novgorod. Pop. 8,000. It is old and ill-built; has 24 churches and 2 convents, with soap-works, tanneries, print-works, iron-foundries, &c. It has two great annual fairs.

ARZANNO, a town of France, dep. Finistère, cap. cant., arond. Quimperle. Pop. 1,957.

ARZANO, a village of Naples, in the immediate neighbourhood of the capital. Pop. 4,500. It has numerous villas; and flax and hemp are largely produced in its environs.

ARZEW (an. *Arsenaria*), a sea-port town of Algiers, prov. Tlemcen, at the mouth of the Sigg, 30 m. N. N. E. Gran. lat. 35° 45' N., long. 4° 54' E. The bay is small, but, though open to winds from the E. and N. E., it is the best on this part of the coast. The modern town, which is ill built and inconsiderable, occupies the site of the ancient Arsenaria: fragments of columns, inscriptions, cisterns, and other remains of the ancient city, being scattered all round. Corn and salt are both exported. The latter is obtained from the salt pits of Arzew, about 5 m. inland.

ARZIGNANO, a town of Austrian Italy, 10 m. W. Vicenza. Pop. 4,000. It is situated in an agreeable plain, surrounded with cultivated hills; and has flatures of silk, fabrics of cloth, dye-works, and brick-works. Its territory produces good wine, and has two coal-mines.

ASAPH (ST.), a city of N. Wales, co. Flint, 185 m. N. W. London, 5 m. N. Denbigh, finely situated in the Vale of Clwyd, on an eminence on the banks of the Elwy, near its confluence with the Clwyd, over both of which it has bridges. Pop. of parish 3,144, of city 2,000? It consists principally of a single street; and is remarkable only as being the seat of a bishopric, worth 6,300l. a year. The cathedral, a plain building, was erected towards the end of the 15th century, but has since undergone many repairs: it is not used for public worship; the parish church, in the lower part of the town, being appropriated to that purpose. Drs. Barrow (uncle to the famous Dr. Isaac Barrow), Beveridge, Tanner, Horsley, &c., have been bishops of this see; and in the cathedral is a handsome monument, erected in 1823, in memory of the celebrated Dean Shipley. It has a free grammar-school, endowed by Bishop Beveridge; and an almshouse, for 8 poor widows, endowed by Bishop Barrow. It unites with the other boroughs of this co. in returning a m. to the H. of C.

ASARO, a town of Sicily, prov. Catania, 9 m. S. Nicosia. Pop. 3,000.

ASCALON, an ancient sea-port town of Palestine, 15 m. N. Gaza, and 45 m. E. S. E. Jerusalem, lat. 31° 39' N., long. 34° 38' E. There is not a single inhabitant within the old walls, which are still standing; but a modern suburban village, called Scalona, from the ancient name, has a pop. of 300 or 400, and is frequented by the small vessels trading to this coast.

The ruins present a strange mixture of Syrian, Greek, and Gothic remains. There are also the remains of a Roman amphitheatre, and the columns of a temple, supposed to be that of the Syrian Venus, mentioned by Herodotus (l. 1. § 106.), or a Greek edifice raised in imitation of it.

Ascalon is exceedingly ancient. Before the establishment of the Israelites in Palestine, it was one of the lordships of the Philistines. Subsequently, it became one of the ports belonging to the tribe of Judah; and, on the downfall of the Jewish kingdom, it fell to the

king of Assyria. It afterwards formed part of the Persian empire, then of the kingdom of the Ptolemies; and, on the subversion of the latter in the last century a.c., it was subjected to the dominion of Rome. It was a bishop's see in the first ages of Christianity; was conquered by the Saracens at the commencement of their conquests, and became the scene of more than one battle during the time of the Crusades. It was one of the strongholds of the W. Christians; but Saladin, on gaining possession of the town, destroyed its works. It has since continued in a state of decay: the prophecy of Zachariah, 'Ascalon shall not be inhabited,' and that of Ezekiel, 'It shall be a desolation,' are now actually fulfilled.

Ascalon stands at the mouth of a stream (the Sorek), where the accumulation of soil is so great, that the ruins are every day removing farther from the sea. (*Vulney*, li. 228.; *Robinson*, l. 21.)

ASCENSION, an island in the Atlantic Ocean, between Africa and Brazil, about 8 m. in length by about 6 in breadth, its fort being in lat. 7° 20' N., long. 14° 24' W. It is of volcanic formation, and one of its hills, of tuffous limestone, rises to the height of above 2,800 feet. It has a bleak and barren appearance and was uninhabited till the imprisonment of Napoleon at St. Helena, when it was garrisoned by a small British force, through whose exertions it has been partly cultivated and wonderfully improved. Springs of fresh water have been discovered. Vast numbers of turtle are taken on its shores. The climate is remarkably healthy, and the anchorage, though open, is said to be good. The object in occupying it is that it may serve as a depot for stores, and a place for watering ships cruising on the coast of Brazil or in the S. Atlantic Ocean. Its name is derived from its having been discovered on Ascension-day, the 20th of May, 1501, by a Spanish navigator in the service of Portugal.

ASCH, a town and lordship, N. W. frontier of Bohemia, circle Elnbogen, 14 m. N. W. Eger. The town has 2,500, and the lordship, which belongs to the family of Zedlitz, above 8,000 inhabitants.

ASCHAFFENBURG, a city of Bavaria, circ. Lower Main, on a hill, on the Mayne, which is here crossed by a stone bridge, 38 m. N. W. Nuremberg. Pop. 7,000. The town is indifferently built, and the streets are narrow and crooked. It has, however, a fine palace, formerly occupied by the electors of Mayence, to which magnificent gardens are attached. It has also an old Gothic church, containing the tombs of its princes, a town-hall, &c.; with a lyceum, a gymnasium, an ecclesiastical seminary, a school of design, a public library, a collection of pictures, &c. It manufactures tinted papers, and has a good deal of trade in timber, wine, tobacco, &c.

ASCHERSLEBEN, a town of the Prussian states, prov. Saxony, reg. Magdeburg, at the confluence of the Elbe and the Wipper, 14 m. E. S. E. Quedlinburg. Pop. 9,730. It has five Protestant churches, 1 Cath. do., a synagogue, a gymnasium, 2 hospitals, &c.; and very considerable manufactures of woollen and linen stuffs, and earthenware.

ASCOLI, a town of Italy, States of the Church, cap. deleg. same name, on the angle formed by the junction of the Castellano with the Tronto, 15 m. above where the latter falls into the Adriatic, lat. 42° 51' 24" N., long. 13° 25' 15" E. Pop. 12,000. It is a well-built, handsome town; has a cathedral and numerous churches, many of which are ornamented with valuable paintings by native artists. The church of St. Gregorio Magno consists principally of the remains of a Roman temple. Of modern buildings, the principal is the *Palazzo Arzianale*, containing a museum, a library, and a theatre: there is also the palace of the governor, and numerous palaces belonging to resident nobles. Ascoli is a frontier town, on the side of Naples, and is a place of some strength, being surrounded by old walls and towers, and furnished with a citadel. Its harbour, at the mouth of the Tronto, is a good deal frequented by coasters, and is defended by two small forts.

Ascoli, the *Asculum Picenum* of the Romans, is one of the most ancient of the Italian towns. It is described by Strabo as a place of great strength, surrounded by walls and inaccessible heights. It was the first city to declare against the Romans when the Social War broke out; and, in the course of that war, it sustained a long and memorable siege against Pompey; by whom, however, it was finally taken. (*Cramer's Anc. Italy*, l. p. 288.)

ASCOLI DI Satriano (an. *Asculum Apulum*), a town of Naples, prov. Capitanata, 13 m. E. by S. Rofino. Pop. 6,000. It is situated on a hill; has a fine cathedral, a diocesan seminary, an hospital, and some convents.

This town is very ancient: It was under its walls that Pyrrhus encountered the Roman legions for the second time, with no decisive advantage on either side. It was almost entirely destroyed by an earthquake in 1460.

ASDOUD, (the *Ashdod* of Scripture, and *Asdod* of the Greeks,) a sea-port town of Palestine, on the coast of the Mediterranean. Lat. $31^{\circ} 45' N.$, long. $34^{\circ} 27' E.$, 36 m. W. Jerusalem, and 11 N.E. Ascalon, on the summit of a grassy hill, surrounded by luxuriant pasture-grounds. Its present pop. is very limited, probably not more than 300 or 400. It has no ruins; and would be unworthy of notice, were it not for the figure it makes in sacred history. It was one of the five lordships of the Philistines (*Phishtines*), and thither the Ark of the Covenant was brought when that people took it from the Jews. (1 Sam. v. 1.) It may be gathered, generally, that the Philistine power yielded to the arm of David (2 Sam. v. 29, et seq.; 1 Chron. xviii. 1.); and it is probable that Ashdod became then a Jewish town. If this, however, were the case, it did not remain so; for, 300 years later, the destruction of the walls of Ashdod is reckoned among the triumphs of Uzziah over the Philistines. (2 Chron. xxvi. 6.) It appears to have fallen into the hands of the Assyrians soon after this; and, ultimately, according to Herodotus (ii. 3. 187), stood a siege of 29 years by the Egyptians, under Psammetichus. It is not afterwards heard of as a place of importance. The existing village is celebrated only for the number of scorpions that infest it. The water upon this part of the coast is shallow, and the land perceptibly gaining on the sea. (*Volney*, ii. 283; *Robinson*, i. 21.)

ASHANTEE, an extensive native kingdom of W. Africa, lying along the Gold Coast of Guinea; extending from $4^{\circ} 37'$ to $10^{\circ} N.$ lat., and from $4^{\circ} 48'$ W. to $19^{\circ} 10'$ E. long., being about 280 m. in length and as many in breadth. It may contain about 70,000 sq. m. *Physical Features of the Country.*—*Mountains and Plains.*—This is a mountainous country, though it has few eminences very abrupt or precipitous. None of the mountains approach the snow line, being, like those of Africa in general, more remarkable for breadth and extent than for height. With regard to composition, all the species of granite, quartz, and slate are met with, but there is an almost total absence of calcareous stone. There are some small tracts of level land on the E. and W.; and the whole country N. of $7^{\circ} 4'$ or 8° lat. is a large plain, terminated on the N. W. by a mountainous country, called, from the name of its surface, *Kowé*, and on the N. E. by the sandy desert of Ghofan. (*Jacrt. Voy. Guinée*, 249; *Bondville*, 163, &c.; *Dupuis*, par. ii. 30, &c.; *Capt. Adams's Remarks*, 176.)

Rivers and Lakes.—Though not lying in the basin of any one of the first-class African rivers, few countries are better watered. Along the coast are found the embouchures of several respectable streams, the various affluents of which intersect the country in every direction. The Assinee, a large river, is usually reckoned the line of demarcation between the Gold and Ivory Coast; and forms, for some miles from its mouth, the W. limit of Ashantee. The Volta, or Assini, the largest of the Ashantee rivers, runs into the sea in $30^{\circ} E.$ long.; its length is estimated at about 400 m. There are several lakes which, in the summer season, frequently overflow their banks.

Climate.—*Soil and Natural Products.*—The heat and insalubrity of the climate of Guinea are proverbial, but both appear to be exaggerated. It seems to be now admitted that countries under and near the Equator are less hot than those under and near the Tropics, the annual motion of the earth keeping the latter regions for a much longer period vertically beneath the sun. From this cause, therefore, the heat of Ashantee might be expected to be less than that of countries 12° or 15° farther N. The accumulation of water serves also to lower the general temperature, and, upon the whole, though during 6 months, or from October to March, the heat is extremely violent, during the other half year it is so far from being inconvenient, that fires and warm clothing are frequently desirable. The nights (always nearly of the same length) are cold, even during the hot months, and, in a night-halt in a forest, a blaze is as necessary against the cold howling dew as against the ferocious beasts. (*Bosman*, 90; *Barbot*, 193, 194; *Hutton*, 145; *Adams*, 234, N.) The coast is, however, extremely unhealthy, especially to Europeans. Bosman (90, 92.) ascribes this partly to the scorching dews followed by chilling nights, but more to a sulphurous mist (apparently a species of miasma) which rises from the valleys and the neighbourhood of rivers every morning, especially during the rainy season. Poor food, bad accommodation, and exposure to the night air, add to these evils, which are still farther increased by a want of regularity in living among both natives and Europeans; but, after all, the climate of this coast is not worse than that of most others similarly situated, and much superior to that of W. Africa farther N., or to that of Guiana, in the same lat.,

on the other side of the Atlantic. The interior, though covered with dense forests, and consequently exposed to the effects of vegetable decomposition under a vertical sun, enjoys a comparatively salubrious atmosphere; and Isert (p. 288.) recommends the erection of hospitals, in the inland parts, for the benefit of sufferers from the European fevers on the coast. The air is usually calm, except in the cases of tornadoes, which sweep from the desert, called *Harmattan*. The former, however, are pretty frequent, and, in the dry season, particularly annoying, from being followed by violent cold rains. The Harmattan is mostly experienced between the end of December and the beginning of February. It has a N.E. or an E.N.E. direction; is perfectly dry, extremely cold, and loaded with an impalpable powder, sufficiently thick to obscure the sun at noon. It is exceedingly destructive; its dryness being such that it absorbs the moisture from every thing with which it comes in contact; opening the seams of ships, the joints of floorings, and destroying all animal and vegetable life opposed to its unmitigated violence. It is, in fact, a cold simoom (see *ASABIA*), dried in passing over the great desert, and subsequently cooled in crossing the high mountains S. of the Niger. It blows usually for two or three days, but occasionally for a fortnight at a time, and with much force. Like other tropical countries, Ashantee has its dry and rainy seasons, or rather two rainy and one dry season in each year. The first rains, ushered in by violent tornadoes, occur about the latter end of May or the beginning of June; being followed by fogs and hazy weather, extremely pernicious and particularly powerful in July and August. The second rains come on in October, and thence till April is the dry and hot season. The range of the thermometer in 1817, at 2 p. m., was between 86° (Jan. 2.) and 71° (Oct. 12.); this was at Cocomassie, among the mountains. In a sandy plain, near the mouth of the Volta, Isert (*Obser. Met.* 25.) once saw it rise to the extraordinary height of 130° ; but even there the average, at 1 p. m., was not more than 78° . (*Bosman*, 90—99; *Barbot*, 191—194; *Isert*, 298; and *Isert. Met. passim*; *Bondville*, 315, 477; *Adams*, 45, 164—168; *Hutton*, 388; *Dupuis*, i. 84.)

A small part of the coast, towards the E. and W. boundaries, is sandy, but the greater portion, and all the interior, is an argillaceous and alluvial soil, mixed with a rich black earth. This, with the abundance of water, renders the country extremely fertile. From $7^{\circ} 4'$ N. lat. down to the water's edge, Ashantee presents a solid mass of forest, extending E. and W. from the Volta to the Assinee rivers. (*Dupuis*, par. ii. 29.) The trees have all the stupendous characteristics which mark African vegetation, but are strikingly different on the coast and in the interior. Near the sea flourishes the gigantic baobab (*Adansonia digitata*), the cactus (probably introduced from America), the mangrove (*Rhizophora mangle*), various species of palm, the cotton, and other large trees, mixed with a wild entanglement of thorny bushes, itself growing to a size inconceivable to a European. (*Jacrt*, 98, 103, 140, &c.; *Barbot*, 205.) About 15 m. inland, on reaching the summit of the first mountains, the baobab disappears, but a tree equal in magnitude supplies its place (*Jacrt*, 285.); the mangrove also vanishes, and palms become very scarce, except the oiliferous (*Elæis guineensis*), and the viniferous (*Phœnix*). Instead of these appear many peculiar species, among which is one tall tree of great elegance, bearing flowers like the tulip; a new kind of aloe and citron; and, in a word, a whole forest of trees unknown elsewhere. (*Jacrt*, 244—247.)

N. of 7° or 8° lat., trees and shrubs appear only in widely distant patches, the lands are covered with jungle and Guinea grass, which grows to an enormous height and thickness; and which, being fired, is used by the natives to manure their plantations. (*Dupuis*, par. ii. 30, 34.) The sugar-cane grows wild; and the country produces, besides, tobacco, maize, dhourra, millet, yams, rice, potatoes, and all the alimentary plants, in the utmost profusion. Of fruits the list is interminable; including the pine-apple, orange, banana, cocoa, fig, papay, and in short all that are produced in any part of the world between the Tropics. Of gum and aromatic plants the list is very great; as is likewise that of dyes and hard woods. The exuberant abundance of aloes, balsams (*Glossa superba*), tuberoses, lilies, and amaranths, gives to the flora of Ashantee a splendour and magnificence nowhere excelled, and but rarely equalled. (*Bosman*, xiv. 267, 289; *Barbot*, 190—205; *Isert*, 118, 189, 183, 263; *Adams*, 173.)

The animals are as various and numerous as the plants. Elephants, rhinoceroses, giraffes (*Dupuis*, i. 56.), buffaloes, deer, antelopes, aloes, civet cats, apes, monkeys, baboons, porcupines, and goats, are among the

* *Kowé* is the generic term for a mountain, in the language of the Mandingoes. (*Currier's Travels*, Appendix, lxxvii.)

† These countries, called by the natives *Foté* and *Yamou*, do not appear in Currier's list of countries. (v. 373—376.) They differ in many respects, as the size of the head, nature of the fur, &c. from the

Tardigrada of America, but their habits are identical, and, unless wilful and gratuitous deception be supposed in authors of deserved high credit, their existence in this part of Africa cannot be questioned. (*See Bosman*, 237; *Barbot*, 312; *Dupuis*, i. 30.)

harmless kinds: Rons (*Dupuis*, l. 94. 49. &c.), tigers, leopards, jackalls, wolves, wild boars, and wild cats, among those of a ferocious sort. The rivers swarm with hippopotami and alligators of several species; some of which are eaten by the natives. A gigantic rat, an odoriferous mouse, and a small animal called *arompo* (*man-eater*), which digs up and devours dead bodies, seem to be peculiar to Ashantee. The domestic animals are the same as those of Europe, but the horse is scarce, and of a bad breed, and the sheep peculiar in form. Reptiles are prodigiously numerous: serpents of every size, from the enormous boa to a frightfully venomous creature, scarcely a yard long, infest not only the woods and long grass, but the dwellings of the natives, and the forts of the Europeans. Scorpions (sometimes as big as a small lobster) and centipedes—the wound from which, though not dangerous, is extremely painful—abound in every place; and toads and frogs are not only as plentiful as in Europe, but the former grow to such a size, that Bosman, when he first saw one, took it for a land-tortoise (p. 257.). Lizards of all sizes; from the iguana downwards, including two species of camellons, are found, here. (*Bosman*, 224—247. 257—259.; *Barbot*, 206—216.; *Icrt*, 53. 103. 185. &c.; *Bowditch*, 237—329.; *Adams*, 184—188.) Of birds, there are pheasants, partridges, wild ducks (of a beautiful plumage), doves, crown birds, parrots, paroquets, Guinea sparrows, beccaficoes, and a multitude of all kinds, great and small, many of them yet unclassified by naturalists. The water-fowl are—herons, bitterns, and sea-mews: the birds of prey—eagles, kites, and a peculiar species, which, though not larger than a dove, is bolder and more rapacious than any other. A large and ugly bird, called the pookoe (of great service in destroying the field-rats), is peculiar here, as is also a creature, about twice the size of a sparrow, with a remarkable hollow and piercing voice, the sound of which is regarded by the natives as of evil omen. The general characteristic of the Ashantee birds is extreme beauty of plumage; but pleasing voices are rare among them, the nightingale and thrush being the only songsters known. Snakes and swallows are very numerous; and the domestic fowl are the same as those of Europe. (*Bosman*, 229. 248—256.; *Barbot*, 217—220.; *Icrt*, 21. 104. 185. 257., &c.) The woods abound in bees; and the destructive species of ant, called termites, is so numerous and rapacious, that a sheep attacked by them during the night has been found a perfect skeleton in the morning. (*Bosman*, 260.) It is said they will attack any animal, even the most powerful and venomous serpent, and destroy him. (*Dupuis*, l. 28.) Fire-flies, dragon-flies, a fly exactly resembling the candle-flies in appearance and sound, together with all the insect tribes common to the Tropics, except the *musquito*, (*Bowditch*, 321.) are found upon the coast; and in the interior, *Icrt*, among a vast variety of species, observed several which appeared to be peculiar. The locust is not wholly unknown, but its destructive visits are rare; owing probably to the great distance of the desert, and the intervention of high mountains between it and Ashantee. Black and hump-backed whales are numerous on the coast between September and December. Sharks are very numerous, are frequently captured, and form the most common food of the Gold Coast negroes. Other sorts of sea fish are very abundant; and the rivers are as well supplied as the sea, yielding, among others, great quantities of oysters and crabs, which feed upon the branches of the mangrove and other trees, but are not good for food if the water be fresh. (*Bosman*, 16. 269—266.; *Barbot*, 221—227.; *Icrt*, 96. 257. &c.; *Adams*, 189—195.) Gold is more abundant in Ashantee than in any other part of Africa, probably, than in any other part of the world, not excepting even S. America. It is procured partly by washing the sands in the beds of rivers and torrents after violent rains, and partly by sinking mines or pits, in a very artificial style, among the mountains, whence it is dug up for use. Of the amount obtained annually, Europeans are, and must be, ignorant; for the superstition of the natives deprives them of access to the mines, all of which are dedicated to the national gods, and some considered too sacred for even an Ashantee to cut into. The pits and washings in Tokoo alone, are, however, reported to yield sometimes as much as 3,000 oz. per month; and Bosman, in 1726, gave the following as the average amount of the exports, which are now, probably, exceeded:—

	Marks.	Lbs.
Dutch West India Company	1,800	750
English African Company	1,200	600
Dutch Private Traders	1,500	750
English	1,000	500
Portuguese and Danes	1,000	500
Portuguese and French	800	400
Total	7,000	3,500

Or above 1½ ton annually. (*Bosman*, 61—97.; *Adams*, 166.)

Population, Habits, Manners, and Customs.—*Bowditch* (p. 316.) estimates the pop. of Ashantee Proper at 1,000,000; of whom 204,000, he says, are warriors; 101,000 children under 10 years; 50,000 boys between 10 and 16; 7,000 old men; and 638,000 females; and the pop. of the whole empire may, perhaps, be somewhere about 3,000,000. The men are well made, more muscular on the coast than in the interior, free from the more revolting peculiarities of negro form and feature, and some of them have even aquiline countenances. The higher order of females (those not subject to hard labour) may be said to be handsome, with features rather of an Indian than an African mould. Both sexes are cleanly, washing from head to foot every day, and afterwards anointing themselves with the grease of the shea, or butter-tree; a good cosmetic, and a preservative of the skin in this hot climate. The clothes of the better classes are convenient, and not ungraceful, consisting of immense cloaks, exactly like the Roman toga, manufactured of the most costly silks. The war-dress substitutes for this a close vest, covered with metal ornaments and scraps of gorilla-hair writing as spells against danger, loose cotton drawers, and large boots of dull red leather. The superior chiefs have gold breast-plates; and all who can procure them, wear gold ornaments in profusion. Some of these are well wrought, others are merely lumps of rock-gold hung to the wrist: the war-cap consists of gold or gilded ram's horns, supporting an extravagant plume of eagle's feathers. In peace, the head-dress is usually a fillet. The lower orders wear nothing but a piece of cloth fastened round the waist. Bosman (112—118.) enumerates five degrees, or orders of society;—the king, the caboccers, the gentry, the traders, and the slaves. Besides the king, however, there is, in fact, but one distinction, that of slave and freeman; to the latter appertain, of course, all the better employments of war, state, &c.; to the former, all the meaner and more laborious occupations, of which the women get much more than their fair share. The caboccers (magistrates of towns and villages) are taken indiscriminately from the gentry; and these, again, are merely such as have surprised themselves by trade or inheritance, and who, not unfrequently, were born slaves. The occupations of trade are practised alike by the poorer freemen and the better class of slaves. The intercourse between the sexes is on the worst possible footing. Marriage is effected by paying a sum of money to the parents of the girl, and a family feast. The property of the man and woman (if she have any) does not become common. Polygamy is allowed; the king's wives amounting to the extravagant number of 3,333, a mystical number which is carefully kept up, to enable him to reward any distinguished caboccer by the *present of a woman*, but never exceeded. Few, however, except the richest individuals, have more than one wife, and very many have none; for the husband having unlimited power of life, limb, and liberty, over his wife, (and prostitution being noways discreditable,) females frequently refuse to marry: the father, in such cases, never attempting compulsion, but instantly disclaiming all future interest in his daughter. Infants are not unfrequently married to infants. The food of the higher classes is very various; soup of dried fish, fowl, beef, or mutton; wild hog, deer, and monkey's flesh together with the whole stock of vegetables which the soil produces. Well-stocked and well-regulated markets are held in the towns, for the supply of these necessities, as well as for articles of clothing and European manufacture. The poorer classes, excepting household slaves, live almost exclusively on fish and *dhourra*. The common drink is palm-wine; one species of which is said to create a ravenous appetite.

The Ashantees have two high festivals: one annually, at the yam harvest, in September; the other at intervals of about 21 days. The last is called the *adal* custom, and alternately the great and little *adal*. It forms the calendar; the year, which commences in October, being divided by it into equal parts, and terminated by the great yam festival. At these festivals, as on all public occasions, the most brutal excesses, and the most atrocious cruelties, are practised. The skulls of all the kings and chiefs whose fall has swelled the power of the reigning monarch, together with those of rebellious caboccers, to the amount of more than 200, are paraded before the assembled multitude. Rum and palm-wine are swallowed like water, till the guests are brought to a state of intoxication and madness, when hundreds of human victims are sacrificed. They seem, in fact, to delight in cruelty and blood. The death of a free person is, in almost all cases, attended by the slaughter of a human being, to "wet the grass;" and that of a chief invariably causes a frightful sacrifice of life. If a man of ordinary rank marry a royal female, he must be killed on his wife's grave, should he happen to survive her; and the oceras (personal attendants on the king) are all murdered on their master's grave, together with many others, male and female, often amounting to some thousands. Cannibalism, as far as respects the blood

and heart of an enemy, is practised, though not avowed; and the teeth and smaller bones of vanquished foes are ostentatiously worn as ornaments; and the skulls and larger joints being preserved as public trophies. Such are the disgusting enormities perpetrated by this nation of savages; who, if they contrast advantageously with other negro tribes in energy and decision of character, yield to none in that cruelty and bloodthirstiness which seem to be leading features in the African character.

Singular as it may seem, the music of the Ashantees is said to be pleasing and melodious; and Bowditch has reduced to notes several airs that struck him as possessing merit. Their instruments are horns made of elephants' tusks, reed flutes, a sort of bagpipe without a drone, gongs, and cymbals. They have a game of chance, called *Worra*, played with a number of shells and a board full of holes.* They play also the Polish draughts, and a third game, which, from its description, appears to resemble the childish amusement called "*fox and geese*," in Europe. To complete their character, it may be further observed, that they are great thieves and extraordinary observers of etiquette. (*Bosman*, 100—120. 160—170. &c.; *Isert*, 162. 210. 212. &c.; *Bowditch*, 274—308.; *Hutton*, 84. 89. 92., &c.; *Dupuis*, 1. 140., &c.)

Diseases and Remedies.—The Ashantees are subject to several malignant disorders, of which the most peculiar, and perhaps the most dreadful, is the "*Gumma-worm*," a reptile, which, formed beneath the skin, causes the most frightful sufferings. It is sometimes so large as to pass quite round the body, but more frequently varies from 5 or 6 to 8 or 9 inches in length. Extraction is the only cure; but if in effecting this the worm be broken, to avoid which much care and patience is necessary, the part left behind corrupts in the body, tainting the whole mass of the wretched patient's blood. This loathsome disorder is supposed to be owing to bad water, which is the more probable as it is confined to the coast; in the interior, where the water is pure and good, it is unknown. Charms and amulets are much resorted to for cures; they have, however, some knowledge of medicine. Bowditch gives a list of 37 simples, as forming their *Materia Medica*. Surgery does not form one of their arts; and those who are wounded, and recover, are indebted for their restored health to the *vis medicatrix nature*. (*Bosman*, 94—96.; *Isert*, 217. 336.; *Bowditch*, 370.—380.; *Hutton*, 383.)

Agriculture, Arts, Manufactures, Commerce.—Dupuis (i. 67.) has justly remarked, that the labour of clearing away obstructions in a rankly luxuriant soil is about equal to that of overcoming sterility in poor and barren lands. The former is the chief employment of the Ashantee agriculturist; and in this his chief instrument is fire; by means of which he both clears the ground, and spreads a mass of rich manure upon the soil. The only implement in use is a rude hoe; but this is sufficient, in productive grounds, flooded twice a year, to produce two crops of most kinds of corn, and an abundant supply of yams and rice. The plantations are laid out with considerable order and neatness, and the cultivated grounds are pretty extensive, though inadequate to the wants of the consumers. Despite the fertility of the soil, the approach of harvest is almost always preceded by scarcity, if not by famine. Though they do not smelt metals, the Ashantees, like several of the African nations, have blacksmiths and goldsmiths of a superior grade to what might be expected. The former manufacture all their arms (except muskets), razors, &c. The goldsmiths forge sundry ornaments, as rings, chains, brooches, &c., and cast figures of tame and wild beasts. They are also the great idol-makers, and are able to produce fine gold thread. The fineness, variety, and brilliance of the cloths of the native weavers would not disgrace an English loom; the patterns are painted by means of feathers, with sufficient regularity to have the appearance of a coarse print. Dyers, potters, tanners, and carpenters, complete the list of Ashantee artificers; of whose handwork a number of manufactured and other articles, in case 6, room 1., of the British Museum, are specimens. The houses, generally of one story, are thatched, and the external walls decorated with a rude hieroglyphic sculpture: they are usually painted, but not floored; and pretty closely resemble an English barn. It should be mentioned, to their credit, that all good houses have their cloacas, which agree well with the Ashantee character for cleanliness; and evinces, in this respect, a superiority to most other negro nations. Commerce with Europe having now been carried on for some centuries, the natives have become shrewd and expert dealers; they practise all sorts of frauds; and their dexterity in adulterating gold equals that of a first-rate chemist. Barbot (230.) affirms, that the Portuguese taught them this art, as a means of driving the other European nations from the coast; and if this be true, they have shown themselves, in this instance, much more

expert scholars than in any other. Gold is now, perhaps, the chief article of export; and some little is also done in the way of exporting ivory, and dye and hard woods. Slaves are exported on every possible opportunity; and notwithstanding the vigilance of the British cruisers, there is reason to think that considerable numbers find their way across the Atlantic. The imports are principally muskets and other arms, gunpowder, spirituous liquors, tobacco, iron, tin, copper, lead, with cotton and Indian goods, which are taken, chiefly for their colours, to be unravelled and remanufactured in the native looms. The last-mentioned articles are, however, received chiefly through the interior from Dagomba, Fexzan, &c., with which the Ashantees maintain a very extensive trade, supplying them in return with liquors, iron, and other European commodities; but never with arms. The currency is gold, either in dust or small lumps; but the cowrie-shells, in use farther N., are not unknown. The denominations and values may be given as follows:—200 cowries (5 strings) = 1 tokoo (about 8d.); 8 tokooks = 1 akkie; 16 akkies = 1 newmeen (ounce); 24 ounces = 1 benda; $\frac{1}{16}$ benda = 1 perguin. (*Bosman*, 6. 109. &c.; *Barbot*, 196. 227—235. 262. &c.; *Isert*, 107.—116. &c.; *Bowditch*, 334—341. 330—343. &c.; *Dupuis*, par. i. 68—67. par. ii. 69—75. &c.)

Government, Constitution, Laws, Revenue.—Before the power of the Ashantee king had swallowed up that of the other states, each possessed its own peculiar form of government and administration; some as *Fantees*, *Mina*, &c. were republics; others, and by far the greater number, were despotisms; but now all are alike brought under the Ashantee constitution; the legislative power of which lies professedly in the king, an aristocracy, consisting of only four persons, and the assembly of caboceers or captains. The aristocracy was formerly much more numerous; but Sal Cudjo, who reigned between 1753 and 1785, began to reduce it, by uniting the stool (seat of authority) of a deceased noble to that of a living (*Bowditch*, 336.); and this plan has been successfully pursued, till the present result is the consequence. On all questions of foreign policy, the aristocracy have a voice equal to the king's, extending even to a veto on his decisions. In domestic affairs, they have considerable influence; but it is exercised in both cases privately, the public announcements always appearing to emanate from the sole will of the monarch. The assembly of caboceers has no deliberative voice: they are mere recipients of the laws promulgated by the king and aristocracy, to which, by their office, they are bound to give effect in their several governments. The influence of the aristocracy is curbed by their poverty: they are privileged from capital punishment, but may be despoiled for any offence; a regulation that has made and keeps them beggars; and thus, in effect, though not in form, the monarch is absolutely despotic. He is also heir to the gold of every one. The king's family are not exempted from capital punishment, but their blood must not be shed: if death be awarded them, they are drowned in the Dah. Death is the punishment for cowardice, for picking up gold dropped in the market-place; for killing *an equal*; for treason; and, in some cases, for theft and adultery. The common punishment for the latter is, however, fine, or, if committed in the open air, slavery; for the former, restitution by the friends of the thief. Mutilation is inflicted for many offences; but all accusations are mostly made at the peril of the accuser, who, if he fail to establish his charge, must himself undergo the penalty of the offence. Property is hereditary, but in a way that will appear rather extraordinary to Europeans; the children of the sister succeeding, on account of the uncertainty as to the wife's fidelity! This also is the law of succession to the Stool, or Throne. The state of the country, as respects security, may be inferred from the fact that interest of money is at 33 per cent. for 40 days, and the creditor has the power of seizing his debtor and family as slaves. Two or three species of ordeal are practised in doubtful cases; one of which consists in making the accused chew about 1 of an ounce of a poisonous bark, and then drink 3 or 4 calabashes of water. If he vomit, he is pronounced innocent; but if his stomach be potent enough to retain the poison, it is held to be a conclusive proof of guilt. The revenue, as far as it can be ascertained, consists of—1st. The gold of deceased persons, and the goods of disgraced nobles. 2d. A tax on slaves purchased for the coast. 3d. The gold mines and washings in Sokoo, Dinkra, Akim, and Assin. 4th. The washings of the market-place. (See *Var. Præd.*) 5th. Tributes from the recently conquered states, varying from 50 bendas to 300 penguins of gold annually. In some cases this tribute is taken in kind, the largest amount for any one town being 500 slaves, 200 cows, 400 sheep, 400 cotton cloths, and 200 silk cloths. (*Bosman*, 136—150. 171—177. *Bowditch*, 252—260. 319—321. *Hutton*, 87. 314—320.)

Religion.—The allegory of "The Book and the Calabash" is prevalent through all the Gold Coast and the states of Ashantee. The Great Spirit, after creating three

* This game is played also in Syria, and is well described by Dr. Ross (*Voy. in Alexandria, Damascus, and Jerusalem*, ii. 67.) under the name of "mangala."

white and as many black men and women, placed before them a large calabash and a sealed paper, giving to the black race the choice of the two. They took the calabash, which contained gold, iron, and the choicest productions of the earth, but left them in ignorance of their use and application. The paper, on the contrary, instructed the white men in every thing; made them the favourites of the Great Spirit; and gave them that superiority which the negroes always readily acknowledge.*

From this fable it is clear that they have some notion of one supreme deity; but they have, notwithstanding, lapsed into the absurdities of Fetichism (see AFRICA), or of the lowest and grossest species of idolatry. They have an evil principle, of whom they stand in great dread, but it is denied that they pay him adoration. On the contrary, it is said that one of the most solemn ceremonies of many tribes is an annual assembly of men, women, and children, to drive the evil spirit from the towns and villages. They have a fixed belief in a future state,—kings, priests, and caboceros being believed, after death, to reside with the Great Spirit, in an eternal sacrifice of their earthly state; and it is said that the renewal of so many human beings on the graves of their kings is intended to supply them with attendants in the future world. The victims also, it is affirmed, are not altogether averse from this sacrifice; since by it they believe they will partake the superior heaven of their chiefs; their own being, at best, mere slaves to their labour in the house of some inferior Fetich. An uncommon number of charms, omens, lucky and unlucky days, and an implicit submission to the Fetich, complete the superstition (for it would be absurd to call it religion) of the Ashantees. In some tribes, Tuesday is observed as the general Fetich day or Sabbath; but different families generally consecrate different days; all, however, observing one. There are many Mohammedans among the Ashantees; some, by their lighter complexion, attesting their Arabic origin; but the majority are not distinguishable from the other negroes. They have great influence in the court of Coomassie, are subject to their own officers in all spiritual affairs, and, where very numerous, as is the case in several towns, are governed by them also in temporal matters. (*Bosman*, 121—136. *Barbot*, 304—317. *Isert*, 187—196. *Bowditch*, 261—273. *Dupuis*, par. ii. 10, 15.; *Adams*, 196—200.)

Language.—The European who has observed the affinities among the languages spoken in his own division of the world, the W. of Asia, and even the N. of Africa, is ill prepared for the babel of tongues that prevails E. of the Sahara. In 60 m. of the Gold Coast, no fewer than seven or eight languages are found, each unintelligible to the tribes speaking the other, and bearing no relation whatever to any other (*Bosman*, iii.). *Bowditch* (*Appendix*, 563) gives the numerals of 31 tribes, whence it appears that, though some few may be considered as variations from the same root, the majority do not assimilate in the slightest degree. The Ashantees, Fantees, Wossaus, Akimsee, Assinsee, and Aquapims, speak dialects of the same language; but for the rest of the tribes that make up this barbarian kingdom, an imaginary line often separates two who possess no means of social intercourse. This formidable obstacle to all communication is, no doubt, a chief cause of the continued degradation of the negro race, more especially as none of their languages possess symbolical characters. In Ashantee, as in other parts of Africa, the only persons who can read or write are the Moslems, and the only written language the Arabic. (*Isert*, 180—182.; *Bowditch*, 314—360.; *Hutton*, 368—384.; *Adams*, 195.)

History.—The Ashantees have two traditions as to their first establishment in their present homes; first, that they came in 12 tribes from a country nearer the sea (*que*. the Atlantic?); the other, that they were driven from the interior by the Mohammedan conquests in the first days of Islamism. (*Bowditch*, 228.; *Dupuis*, 224.) It may be that these accounts, though apparently contradictory, are but different versions of the same tale. But without stopping to inquire into this, we find them, in 1640, seated in the centre of their present possessions, and occasionally exercising an influence over the surrounding states of Akim, Assin, Quahou, and Akreya. Then, and for near a century later, the paramount state of the gold countries was Dinkra; but in the beginning of the 18th century, the king of that country having deflowered a wife of the Ashantee monarch, the latter, though considered a very inferior potentate, invaded the Dinkran territories, defeated his enemies in two decisive battles, killing, it is said, 100,000 men, and carrying off immense plunder. (*Bosman*, 67.) Dinkra, upon this, became vassal to the Ashantee dominions, and from this epoch the extension of the latter proceeded rapidly. One by one the different states between the Assinee and Volta rivers were subdued; and, in 1807, the invasion of Fantee brought the Ashantees

into collision with the British. Cape Coast Castle, the principal fort of the English on the Gold Coast, was in the Fantee country, and held, like the other European forts upon that coast, not as a territorial right, but at a rent from the native government. After the conquest of Fantee, the rent was claimed by and paid to the king of the Ashantees; but some difficulties made about recognising his sovereignty, led to much discussion, and to two embassies (those of Bowditch and Dupuis) to the court of Coomassie. In justice to the king it must be admitted, that, whatever may be thought of his conduct to the natives, an uncommon degree of forbearance marked his behaviour to the British authorities. The treaty concluded by Dupuis in 1820 was not ratified by the council at Cape Coast Castle, because, by the 8th article, it recognised the questioned sovereignty of the Fantee country; but the heart-burning necessarily consequent on this step did not break out for some time after. The death of Sal Quamina (king of Ashantee), who, according to Dupuis and Bowditch, was the steady friend of the whites, seems to have been the signal for hostilities. His successor declared war against the English; and on the 21st of January, 1824, Sir C. M. Carthy, governor of Cape Coast, at the head of 1000 men, was totally defeated by the Ashantees. It took almost three years before the English power on the Gold Coast recovered from this blow; but in 1826, the Ashantees having suffered a ruinous defeat, consented to pay 6000 oz. of gold as the price of peace, and to send the king's son for education, or rather as hostage, to Cape Coast Castle. The Ashantee power on the coast, since this event, may be considered as nearly destroyed. (*Bowditch*, 228—250.; *Dupuis*, 224—264. 194—223.; *Public Papers* for 1826.)

ASHBOURNE, a m. town of England, co. Derby, on the E. side of the Dart, 122 m. N. W. London, 134 N. W. Derby. The parish, in which the town is situated, contains 12,000 acres, and had, in 1831, 4,884 inhab., of which about a half belong to the town. It has an old church with a fine spire, a free grammar-school, two elementary schools, one for 30 boys, and the other for 30 girls, almshouses for poor men and women, and some other charitable institutions. Doveclad, famous for its romantic beauties, is in the immediate vicinity of this town.

ASHBURYTON, a borough m. town and par. of England, co. Devon, hund. Teignbridge, the borough being situated within 14 m. of the Dart, on the high road from London to Plymouth, 170 m. W. S. W. London, and 19 m. S. W. Exeter. The parish contains 8,320 acres, and had, in 1831, a pop. of 4,165, of whom 3,467 belonged to the town. It has a handsome Gothic church, with a tower 90 feet in height, a grammar-school, and free schools, which supply elementary instruction to about 100 children. It is the seat of one of the stannary courts. Serge is, or was, manufactured in the town; and there are tin and copper mines in the vicinity. Previously to the Reform Act, Ashburton returned 2 m. to the H. of C., the franchise being vested in freeholders having lands and tenements holding of the borough only. The Reform Act deprived it of one m. and made the boundaries of the parish and parl. bor. identical. Const. II. 1836—37, 193. It was the birth-place of Dunning, the famous lawyer, who was created Baron Ashburton; and of William Gifford, the translator of Juvenal, and the original editor of the Quarterly Review, who, on his death, left a legacy to the town. It now gives the title of baron to the head of the family of Baring. (*Boundary Report*, &c.)

ASHBY-DE-LA-ZOUCH, a m. town and par. of England, co. Leicesters, hund. W. Goscote, 16 m. N. W. of N. London. The par. contains 8,300 acres, and 4,727 inhab., of whom about 4,000 may belong to the town. It consists of one main street, and some smaller ones; has an old church; several free schools, for girls as well as boys; and manufactures, on a small scale, woollen and cotton stockings, and hats, and has some trade in malting. In the vicinity are the extensive remains of Ashby Castle, built by Lord Hastings, in the reign of Edward IV., and dismantled in that of Charles II.

ASHBURN, a m. town and par. of England, co. Kent, lathe of Scray, the town being situated on an eminence near the junction of the upper branches of the Stour, 47 m. E. S. E. London, 14 m. S. W. Canterbury. The par. contains 2,980 acres, and 2,809 inhab. The church, a Gothic fabric of considerable note, has a lofty well-proportioned tower, and several ancient monuments. There is a free grammar-school of some eminence, founded in the reign of Charles I. by an ancestor of the present Sir Edward Ashburn, and some other charities.

ASHRUFF, a town of Persia, prov. Masanderan, about 8 m. from the W. extremity of the bay, and 53 m. W. from the city of Asterabad. Near it are the ruins of an extensive and magnificent palace, built by the greatest of the Persian monarchs, Shah Abbas. The town, which was in a great degree dependent on the palace, has been seriously affected by the decay and ruin of the latter; and did not, in 1821, contain above 500 houses, thinly scat-

* Some believe that the reward of virtue in this world is, to be transformed into white men in the next. (*Bosman*, 131.)

tered through an extensive jungle. (*Fraser's Caspian Sea*, p. 19.)

ASHTON-UNDER-LYNE. A pa of England, co. of Lancashire, hund. Salford, 6th long N. to S., 4 m broad; area, 9,900 acres. Pop. in 1801, 15,632; 1821, 28,507; 1881, 33,497; nearly half of whom reside in the town. A pa. of about 10,000 in the hamlets of *Longcliffe*, *Ashtons*, and part of *Staley-bridge*. At present (1880), the pop. probably exceeds 42,000. Most parts of the parish abound in coal. There are about 30 shafts in operation, and the number of miners may be from 600 to 700. This is one of the principal seats of the cotton manufacture, and most part of the pop. are employed in and dependent upon it for support. There were, in all, about 80 cotton factories, employing about 18,000 hands in the parish, in 1839; of which 42 factories and 9,000 hands belonged to the town of Ashton; 23 factories and 7,000 hands to *Staley-bridge*, *Mossley*, &c.; and 10 factories and 2,000 hands to the rest of the parish. Stout printing calicoes and ginghams are the articles principally produced. The woollen manufacture is but inconsiderable. The manor and ecclesiastical patronage belong to the Earl of Stamford.

ASHTON-UNDER-LYNE. A m. town of England, co. of Lancashire, in the above pa., on the N bank of the *River*, 187 m. N. W. of London, and 6 m. E. of *Manchester*. Pop. in 1821, 9,229; in 1831, 14,670. It is well laid out, well built, and is eminently thriving. Its rapid growth is owing to the still more rapid extension of the cotton manufacture. Exclusive of the factories engaged in the cotton department (see previous article), it has a hat manufactory and a silk mill, an old and a new church, with numerous chapels and other places of worship, an excellent market, the buildings connected with which, cost above 10,000, has been erected within these few years; and it has a court-house, a theatre, concert-room, &c. The free school is but slenderly endowed; but there are several other schools, a mechanics' institute, with 300 members, and six large Sunday schools, having each from 1,000 to 1,200 children.

There are at present (1834) 4 banks in the town. Market-day, Saturday. There is a cattle market on the first Saturday in each month: *Fairs*, March 23, April 29, July 14, 15 and 26, Nov. 10 and Nov. 21.

Ashton is admirably situated for trade and manufacture, in the centre of a populous neighbourhood, having an unlimited command of coal, and communicating by means of canals and railways (now in the course of being formed) with all parts of the empire. It was anciently a borough, but for some cause or other has long been disfranchised. The Reform Act conferred on it the privilege of sending one m. to the H. of C. It had in 1831, 612 10f. houses, and, in 1837-8, a constituency of 617.

ASIA, the largest, most early civilised, and in many respects the most interesting of the great divisions of the globe, extends from 10° 20' to 78° N. lat., and, when the islands belonging to it are included, from 11° S. lat. From west to east it extends from 26° to 190° E. long. The most northerly point of the continent is *Cape Taimura*, 78° N. lat.; the most easterly, *Cape Tchukotakoi Nops*, 190° E. long.; the most southerly, *Cape Buros*, 1° 20' S. lat.; and the most westerly, *Cape Baba*, in *Asia Minor*, 26° E. long. *Cape Taimura* and *Cape Buros* are more than 4,300 m. distant from each other, and this consequently is the extent of Asia from N. to S. Its greatest breadth occurs under the parallel of 70° N. lat., between *Cape Baba* and the E. coast of the *Corea*, where it extends about 5,600 miles from W. to E. Its surface is supposed to cover about 17,500,000 sq. m., being above four times the area of Europe.

SKETCH OF ASIA.—On the N Asia is washed by the Arctic Sea, which separates it from the arctic countries of America; on the E by the Pacific Ocean, which divides it from the continent of America, on the S by the Indian Ocean, which lies between it and Australia, on the W. It is continuous with Africa and Europe. The boundary-line between it and Africa is formed by the Gulf of Aden, the Straits of *Habelmandeb* (where the two continents are only about 16 miles apart), the Red Sea, and the isthmus of *Suez*, where both continents unite for about 70 miles. Asia is separated from Europe by the *Mediterranean Sea*, the *Egean Sea* or *Archipelago*, the Straits of the *Dardanelles*, the Sea of *Marmara*, the channel of *Constantinople*, and the Black Sea. From the eastern shores of the latter sea, the boundary-line runs along the crest of *Mount Caucasus* to the *Caspian Sea*, which constitutes the boundary as far as the mouth of the river *Oral*. Thence it follows the course

of that river up to its source in the *Ouralian Range*, which latter forms the remainder of the boundary-line to the Gulf of *Kara*, E. of the island of *Novaya Zemla*.

To the S. and S. E. of Asia is the greatest of all archipelagos, containing many thousands of large and small islands. These belong partly to Asia, and partly to Australia, but they are not separated by any natural boundary. When the Portuguese and Spaniards began to be acquainted with the islands of India, they conquered or settled those only which were supposed likely to repay the expense and trouble. These were then, and are still, considered, as belonging to Asia. The others, which did not offer such advantages, and were not settled or visited at that time, are now included in Australia. In this way, Japan, Formosa, the Philippines, the Moluccas, and that long chain of islands, which, in the east, begins with *Timor*, and on the west terminates with *Java*, are considered as belonging to Asia, whilst the numerous islands dispersed between the Moluccas and New Guinea, and lying at a short distance from the former, are included in Australia.

In looking at the map of Asia, we are struck by observing, that the Pacific Ocean, which divides it from America, no where reaches immediately to the coasts of the continent, but is separated from them by several chains of islands, which, with the coast, form a number of basins. The most important of these sea-basins is the *Sea of Kamtschatka*, lying between the N. E. extremity of Asia and the N. W. of America and separated from the Pacific by the *Alutian Islands*. The *Kurilian Islands*, extending from *Cape Lopatka* to *Yesso*, the most northerly of the islands forming the empire of Japan, separate another sea-basin from the Pacific, it is called the *Sea of Tarakai*, from the large island forming its W. side, and commonly called *Saghalien*. Farther S lies the *Sea of Japan*, shut up by the islands constituting that empire, and the opposite coasts of *Manchouree* and *Corea*. Then follows the sea, called *Tongo Ha* (Eastern Sea) by the Chinese with its extensive northern gulph the *Wang-Hai* (Yellow Sea). This basin is more open towards the Pacific its entrance being shut up only by two or three small groups of islands, among which the *Loo Choo* have obtained some celebrity in later times. The island of *Formosa* forms the southern boundary of this basin. From this island to the equator extends the *Han-Hai* (Southern Sea) of the Chinese, called by the Europeans the *Chinese Sea*, because it is traversed by them in their voyage to China. The eastern boundaries of this basin are the Philippines and the islands of *Palawan* and *Borneo*, and it forms two great gulphs in the continent, those of *Tonkin* and *Siam*. The formation of these five sea-basins is partly owing to the three great peninsulas, which project from the continent, the peninsula of the *Tchuktschs*, occupying 60,000 sq. m. and those of *Kamtschatka* and *Corea*, which are nearly of the same extent.

The S. coast of Asia is not surrounded by close seas, but is quite open to the Indian Ocean, except where it borders on the Chinese Sea, but in these parts are several gulphs which deeply penetrate into the continent, and thus form extensive peninsulas. The principal are the Bay of Bengal, the Sea of Arabia, the Persian Gulph, the Gulph of *Ajan*, and the Red Sea, separating Asia from Africa. The peninsulas which occur on this side are those of India without the Ganges, which has an area of nearly 800,000 sq. m., India within the Ganges, and Arabia. Each of the last mentioned comprising upwards of a million sq. m., the three together being nearly equal to Europe in extent.

Where Asia approaches Europe, we meet the large peninsula of *Asia Minor*, covering a surface of more than 200,000 sq. m. which being surrounded by the Mediterranean and Black Sea, facilitates the intercourse of both continents by sea as well as by land.

The N. coast of Asia, indented by numerous deep bays, and having several projecting tongues of land, would give great advantages to maritime intercourse with other countries, did the severity of the climate not render them inaccessible all the year round. They are nearly every where enclosed by ice.

1. Great Northern Plain.—*Conformation of the Surface.*—*Rivers.*—Along the coasts of the Arctic Sea, always covered with ice except in the summer months, when it is open along the shores to a distance of a few miles, extends the great plain of the globe. This plain not only covers nearly the whole of Northern Asia, but advances westward, extending over the east of Europe, and reaching to the very shores of the North Sea opposite Great Britain. We may again affirm, that the low and level countries which in England occur along the North Sea between the Thames and Humber, constitutes the farthest W. corner of this vast plain. For a traveller departing from London, and advancing eastward between the parallels of 53° and 58° N. lat. as far as 80° E. long., and hence between 56° and 60° N. lat., will arrive at *Takutzk*, on the river *Lena* (130° E. long.) without having passed any mountain-range. The

highest ground in his way would occur about 66° E. long., between the river Oural and the sources of the Tobol, where a chain of hills rises, but only to an absolute height of less than 2,000 ft. In this long journey he would have traversed 180 degrees of long., or more than a third part of the curvature of the earth, and this is the length of the great plain in this parallel. But along the Arctic Sea it stretches farther east, and terminates at 165° E. long. on the banks of the river Kolyma.

This plain would extend from the Atlantic to the Pacific Sea, but for two mountain-ranges, which rise at its western and eastern extremities, like high walls, to abate itself against the encroachments of the sea. At its western extremity are the Scandinavian mountains, lying N.N.E. and S.S.W. At its eastern extremity are the Aldan mountains, which extend from 55° N. lat., close along the shores of the Sea of Tarakal or Gulph of Okhotsk in a W.S.W. and E.N.E. direction, till they terminate on Behring's Strait with East Cape and Cape Tshukotok Noss. The S. extremity of this range is, at the sources of the river Aldan (about 55° N. lat.), closely connected with the chain of the Great Khing-Khuan. It occupies a considerable width, being probably no where less than 180 miles across, but does not rise to considerable height, the highest of its summits which have been measured attaining only 4,055 ft. above the sea, and its mean elevation being estimated at less than 2,000 ft. Its N. branches fill up the whole country between the peninsula of Kamchatka and the Polar Sea with mountains of moderate elevation, many of which, however, are always covered with snow on account of their high latitude near the Polar Circle.

It is worthy of remark, that in the seas adjoining the two boundary-ranges two of the most active volcanic systems are met with. To the west of the Scandinavian mountains a great number of volcanoes are placed on the island of Iceland, and as it seems also on the neighbouring island of Jan Mayen. On the east of the Aldan range the peninsula of Kamchatka offers a similar phenomenon. It seems, that the chain of mountains is mostly covered with volcanic matter, and several very high summits are still active volcanoes. The highest of the two summits of the volcano of Shivelush rises to 10,581 ft. above the sea, and that of the volcano of Khatavak even to 15,825 ft. The tracts of low land which extend along the sea-coasts of this peninsula are partly covered with thick forests, and partly with fine grass, but neither agriculture nor the rearing of cattle is attended to, the very scanty population finding it more easy to get its subsistence by fishing.

Besides the two ranges, forming the boundary of the plain to the K. and W., it is nearly in its middle traversed by another chain, the Ouralian mountains, which run nearly due N. and S., on both sides of 60° E. long. This range, which in breadth occupies hardly any where more than 50 or 60 m., exhibits near its N. extremity a few summits, which rise to from 4,000 to 5,000 ft. But the mean elevation is probably not more than 2,000 ft. above the sea. Between 55° and 60° are also some summits which attain between 4,000 and 5,000 ft. At the sources of the river Oural the range lowers considerably, and divides in several ridges; of which one, called the hills of Mugodsharak, advances in a S.W. direction, and terminates on the plain which divides the Caspian Sea from the lake of Aral. Thus this chain does not join the mountain-ranges in the interior of Asia.

Nearly in the middle of the S. border of the Great Plain, on both sides of the hills of Mugodsharak and the countries lying S. of it, between 45° and 64° E. long., occurs the most remarkable depression on the surface of the earth. A tract of country, extending over an area of more than 300,000 sq. m., exclusive of the Caspian Sea, is, according to the supposition of Humboldt, lower than the surface of the ocean. The lowest part of it is occupied by the Caspian Sea, which was supposed by Humboldt to be no less than 246 ft. below the surface of the Black Sea; but later, and it is believed more correct measurements make the level of the Caspian Sea only 116 ft. below, and that of the Lake of Aral, 14 ft. above the level of the Black Sea. According to Humboldt, this depression extends between the rivers Kooma, Volga, and Oural, up to a line drawn from Saratov to Orenburg, whence its boundary runs to the Lake of Ak-sa-kal (48° N. lat., and 63° E. long.), and then includes the countries traversed by the lower courses of the Sir-Daria (Siloon, *Jaxartes*) and Amoo-Daria (*Oxus*). This country is so little elevated above the great lakes, which lie in the midst of it, that a strong N.W. wind of some continuance forces their waters over many miles of the adjacent tracts. Its soil consists partly of sand, and partly of hard clay, on which neither trees nor shrubs grow, and which, only in spring, after the melting of the snow, is covered with a scanty but nourishing grass and numerous flowers. It is only used as pasture by the nomadic tribes which wander about in this desert. Natural wells are no where found, but water is met with on digging some feet down in those districts which have a

sandy soil, but not in those where it consists of clay. Along the banks of the watercourses trees and shrubs grow, and the soil is fit for agricultural purposes, but is commonly used as meadows.

Along the shores of the Caspian Sea this low and desert country extends to the very verge of the table-land of Iran (Persia), where it terminates between 36° and 37° N. lat., but from the table-land of Eastern Asia it is separated by a mountain-region, which comprehends the countries of Khokan and Badakshan, and between them and the desert extends Bokhara, whose surface is broken into ridges of moderate height, and valleys of considerable width, which, being watered by artificial canals, are very productive of all kinds of grain and fruit. This country, therefore, offers a succession of fertile and sterile tracts over the whole of its surface.

The Caspian Sea, which covers a surface of 150,000 sq. m., is very deep towards its S. extremity, where it is surrounded by the mountain-ranges of Iran, but where it borders on the desert it is shallow. Its waters are salt. The Lake or Sea of Aral, lying farther east, has a surface of between 40,000 and 50,000 sq. m., and its waters are likewise salt, as is the case with all the numerous smaller lakes which occur in the above-mentioned desert. The Lake of Aral receives the two largest rivers, which drain the S. parts of the desert, and descend from the table-land of E. Asia. The Sir-Daria, which in its upper course flows through Khokan, runs about 950 m., and the Sir-Amoo, which rises in Badakshan, and flows through Bokhara, and afterwards through the desert, has a course of nearly 1,100 m.

The Oural dividing Asia from Europe, the great plain is divided between these two continents. Though that portion of it which belongs to Europe, has immense tracts of very fertile land, especially in the centre of Russia, the plain of Siberia no where exhibits such a soil. Those parts which lie contiguous to the great depression, and as far E. as 82° E. long., are steppes, that is, level countries with a sandy, gravelly, or clayey soil, destitute of trees, except along the bottoms of some of the rivers, and covered partly with low shrubs, and partly with coarse grass, which affords only very scanty pasture. In most parts they are destitute of water. The great steppe of Barabinskai, between the river Irtysh and the nearly covered with low swamps, and interspersed with numerous salt-lakes, some of considerable extent; the remainder has a dry sterile soil, but when it begins to rise in hills towards the Altai range, many districts are fit for agriculture and are cultivated. This last observation applies still more to the countries farther E., between the river Obi and Yenesei, where agriculture has already advanced from 56° N. lat., to Krasnoyarsk. This portion of the plain is considered the granary of Siberia. Its surface is rather hilly. The countries lying east of the Yenesei do not exhibit a level plain, but rather an undulating surface, which in some parts is even broken. But as the climate is less mild than farther west, agriculture is only pursued in a comparatively few sheltered places, and the rearing of cattle and the chase affords subsistence to its scanty population. This part of the plain is covered with immense forests of pines, birch, &c. of which the W. steppes are destitute, and its pastures are also much richer. That portion of the plain which extends N. of the Polar Circle has its surface frozen ten months of the year, and even in July ice is met with at the depth of a foot. It is an immense desert, covered with moss, and interspersed with numerous lakes and swamps. In summer its whole surface is changed into a swamp, and then it is inaccessible. This mossy desert is called *tundra*. It is worthy of remark, that at the mouth of the Lena, and between it and that of the Indighirka, immense masses of bones, and even entire skeletons of elephants, rhinoceroses, and antediluvian animals, are found imbedded in the ice, which never is dissolved by the rays of the sun.

This plain is drained by the numerous rivers, which, descending from the Altai mountains, on the southern border of the plain, traverse it in a northerly direction. Some of them may be enumerated among the largest rivers of the globe. Such are the Obi or Obi, which unites with the Yrtish, and whose whole course rather exceeds 2,000 miles. The Yenesei is still longer; for if we take for its source the Selenga, which falls into the Lake of Balkal, and issues from it under the name of Lower Angara, but changes it afterwards into that of the river Tunguska, it runs not less than 2,500 miles. The Lena, which is joined by the large tributaries Witim and Aldan, has a course of hardly less than 2,000 miles. Farther E. is the Yana, which flows about 400 m., the Indighirka about 700 miles, and the Kolyma 900 miles.

2. *Elevated Table-land of Eastern Asia.*—The boundary of this extensive region lies near the parallel of 50° N. lat. between 82° and 122° E. long. On the W. the boundary is formed by a line extending first from 50° N. lat. and 82° E. long., to 40° N. lat. and 72° E. long., and hence nearly due S. to 34°. From this point it

follows the range of the Himalaya mountains in its S.E. direction, to 82° E. long., where this chain, which constitutes the S. edge of the table-land, begins to turn nearly due E., and continues in that direction as far as 97° E. long., near the parallel of 28° N. lat. Hence it passes S.E. to the table-land of Yu-nan, 25° S. lat., and 103° E. long., which forms the most southerly point of the Great Table-land of Eastern Asia. The eastern boundary runs along the range of the Yun-ling mountains, which extend from the most southerly bend of the river Yang-tse-kiang (26° N. lat., and 103° E. long.), in a N.N.E. direction to the most northerly bend of the river Hoang-ho (41° N. lat., and 105° E. long.). At this place the Yun-ling is divided only by the narrow valley of the river from another mountain-range, the In-shan, which hence forms the boundary of the table-land running E. to 116° E. long., where, turning to the N., the mountain-chain is called Khing-khan, and meets the N. boundary of the table-land between 51° and 52° N. lat., and 121° E. long.

The whole of the immense area included within these lines is considerably elevated above the level of the sea. Only a few comparatively small tracts of country are supposed to have less than 3,000 ft. of absolute elevation, and many of its southern plains rise to more than 10,000 ft. According to our present information, we may suppose that the whole country rises continually higher in form of terraces as it approaches its southern boundary, the Himalaya range. But, examining the course of the rivers, we are obliged to suppose, that this country gradually declines towards the east, as those rivers which flow from it to the west rise only on the very borders of the table-land, but many of those, which traverse its internal plains, descend to the Pacific Sea. Even those, which are not connected with the sea, but terminate in lakes having no outlet, run mostly from W. to E.

This table-land does not extend in one uninterrupted plain, but besides its being almost everywhere surrounded by mountain ranges, its interior is likewise traversed by several extensive chains. We shall first indicate the ranges which are met on its borders, then those in the interior, and make a few observations on the countries lying between the mountain chains.

Along the N. edge of the table-land runs the Altai range, a chain of mountains which varies in width between 200 and 300 m., and extends along the table-land about 1,400 miles in length, but it continues more than 600 miles farther east, terminating at the mouth of the river Amur. The name of Altai properly applies only to the W. portion as far as the Lake of Baikal, that portion which lies S.E. of the lake being called by the Russians Da-urian Mountains, and by the Mongols Khing-gan. That part of the chain, which lies farther E., is named by the Russians Yabloni Khrebet, and by the Mongols and Chinese Khing-khan Yugurick. The highest part of the range is near its W. extremity, where, on the banks of the river To-bumay, an upper branch of the Obys, it rises in some summits to more than 10,000 ft. above the level of the sea, and is always covered with snow. The mean elevation of the whole range probably does not exceed 5,000 or 6,000 ft., but the larger portion of it, lying within the Chinese empire, has not been examined. In this range is encompassed the greatest alpine lake, that of Baikal, 355 m. in length, by 30 and 40 m. in width, and covering a surface of 14,800 sq. m., so that it is larger than half Scotland.

The W. boundary of the table-land, between 50° N. lat. and 82° E. long., and 40° N. lat. and 72° E. long., is not formed by a mountain-chain, but by a country with a broken surface, which we shall notice hereafter. But between 40° and 34° N. lat. a continuous range rises to a great height. It is called, on our maps, Bolor Tagh, but, by the natives, Tartash, and by the Chinese geographers Tartash-i-ling. We know nothing of it, except that it rises to a very great elevation.

The vast range of the Himalaya mountains runs along the S. W. and S. edge of the table-land, from 34° N. lat. and 72° E. long., to 28° N. lat. and 97° E. long., being about 1,300 m. in length, and from 250 to 350 m. wide. From the low plains of India, which border on the range on the S.W., the mountain-mass rises abruptly to about 4,000 or 5,000 feet. Behind it lies a belt of an extremely broken surface, from 100 to 200 m. in breadth, overtopped by numerous high summits, which grow higher and higher as they approach the table-land. The base on which they rest also rises gradually, till it attains near the table-land the height of 8,000 or 9,000 ft. Then follows the highest portion of this stupendous range, the crest of the *Himālas* or *Indus* of the ancients, some of whose summits exceed by 10,000 and 11,000 ft. the altitude of Mount Blanc, and are the highest in any country hitherto discovered. The Dhawalagiri (28° 30' N. lat., and 83° 30' E. long.) attains 26,862 ft. above the sea, and the Chamalari (28° N. lat., and 89° 30' E. long.) is probably but little lower. The Tawahir (30° 22' N. lat., and 79° 57' E. long.) rises to 23,749 ft. There are probably above 210 summits which rise more than 18,000 feet above the sea, and are covered

with eternal snow. In fact, the name Himalaya or Himalah is merely a Sanscrit term for snowy; a circumstance of which Pliny was well aware when he says, *Indus incolarum lingua niveorum significat.* (*Hist. Nat.*, lib. vi. § 17.) By far the greater number of these high summits lie W. of the Chamalari; for E. of that high pinnacle, the mountains, which attain the snow-seem huge, but few. On the S.W. are the plains of India, which are nowhere more than 1,000 ft. above the sea; and on the north of the range are the plains of Tibet, which have at least 10,000 ft. of absolute elevation. The highest crest of the range towards this table-land is between 16,000 and 18,000 ft. high, the Neetec pass, one of the lowest, rising to 16,560 ft. above the sea.

The country which lies between the E. extremity of the Himalaya range (97° E. long.) and the table-land of Yu-nan (between 100° and 104° E. long.) is entirely unknown. It contains the sources of the Irawaddi, and seems to rise to a great elevation, and to be overtopped by high summits. The table-land of Yu-nan itself must be of considerable height, as the winters are very cold, though it be placed near the tropic. Some mountain-summits, which rise from it, attain the snow-line; they are mostly situated along the most southerly bend of the river Yang-tse-kiang, and may be considered as the most southerly extremity of the Yun-ling.

The Yun-ling, which rises on the E. edge of the great table-land, and runs in a N.N.E. direction between the great bends of the rivers Yang-tse-kiang and Hoang-ho, is also of considerable height, so that it is frequently called by the Chinese the Sine-ling (Snow range). The snow-capped summits are numerous, between 30° and 36° N. lat., and more especially between 32° and 34°. The length of this range is little short of 1,200 m.

Respecting the In-shan and Khing-khan ranges little is known; the first has never been seen by a European, and we have only acquired some notion of its position from the Chinese geographers. But towards its E. extremity it is traversed by the great road leading from Kiachia to Peking, and here the highest part of the mountain-pass rises to 5,525 ft. above the sea-level. The Khing-khan seems not to rise much above the elevated plains which extend from its western declivity westward, but it is much elevated above the valleys contiguous to its E. descent. Its absolute elevation does not appear to be great, as at the places where it was traversed by European travellers it was covered with stunted trees and low bushes to its very summit. The length of the In-shan does not much exceed 360 miles. But the Khing-khan, whose northern extremity advances to the most northerly bend of the river Amur, has a length of nearly 800 miles.

The most northerly of the mountain-ranges traversing the interior of the great table-land of Eastern Asia is the Thian-shan. It begins at the northern extremity of the Tartash-i-ling, or Bolor Tagh, (40° N. lat.) with which it forms a single range. But, properly speaking, it projects under the name of Ak-Tagh into the plains of Bokhara, lying farther W. The Thian-shan runs from W. to E., between 70° and 96°, and then it terminates abruptly in the plain. Its western portion, which is called Muz-Tagh, does not rise to a great elevation, and is passed by the caravans between Guldsha and Khashghar. Here its breadth does not exceed 30 or 40 miles. But near 79° E. long., where it is traversed by the road between Fuldsha and Akku, the highest part of the mountain-pass is covered with snow, and leads over a glacier. Hence this pass is called Musur dabahn, or the glacier-pass. Farther E. is the high volcanic peak, called Pe-shan. The centre of the whole range is occupied by an extensive mass of very high rocks, which rise far above the snow-line, and this mass is known as one of the highest mountains in northern Asia by the name of Bogdo Oöla. To the east of this high mountain-mass occurs another volcano, named the volcano of Ho-theou (Fire-town). Snow-capped mountains appear likewise on the east of the Bogdo Oöla, but we are very little acquainted with this part of the range.

It was formerly supposed that a high mountain-range, running S.W. and N.E., connected the western extremity of the Thian-shan with the western extremity of the Altai range, but it is certain that no such range exists. The country lying between these ranges is indeed traversed by several lower ridges, of which some are of considerable extent, but they are not connected with each other, wide plains extending between them. These plains do not much differ from the steppes of Western Siberia, being only covered with coarse grass; but along the rivers are considerable tracts of knud, fit for agriculture, and yielding rich crops of rice and millet. Besides, there are similar tracts along the foot of the ridges. But, as this country is placed between two great deserts stretching far to the E. and W., and inhabited only by nomadic nations, agriculture was entirely unknown down to the middle of last century, when it was conquered by the Chinese, who took great pains to introduce agriculture, which is now in a flourishing state

in several districts. This country is, besides, remarkable for the great number of large lakes which are met with over its whole surface. The most remarkable are the Balkash, which is said to extend from 120 to 140 miles from N. to S., the Issoulk or Temuri, which is half as long, the Ala-kul, Zaisan, Kijilash Noir, Ike-Aral Noir, Ubra Noir, and a great number of smaller ones. Except the Zaisan, they have no outlets, and the water of none of them arrives at the sea. Another remarkable circumstance is the occurrence of volcanoes, at a distance of about 1,000 miles from the sea. For, besides the volcanoes noticed in the Thian-Shan range, there occur others to the N. of the chain, and one is found on an island in the Lake of Ala-kul.

Not far from the S. extremity of the Tartash-iling (between 38° and 36° N. lat.) another mountain-range, running E. and W., is connected with it. This chain is called, by the Chinese geographers, Kien-luen, or Kul-kun. We know very little of it, except that it stretches over the whole breadth of the great table-land, and nearly in the middle of its extent (about 92° E. long.) divides into two ranges, of which that which declines somewhat to the N. is called Nan-Shan, and is probably connected with the In-shan by the Ala-Shan, a range of mountains extending along the banks of the Hoang-ho, where it flows N. The other branch of the Kuen-luen, which declines somewhat to the S., is called the Bayan Kara mountains, and frequently also the Kuen-luen, and unites with the Yun-ling about 33° N. lat. Nothing else is known of these ranges, except that they rise to a great height, and in many parts are covered with snow all the year round; whence they frequently are called Siue-mountains (snow-mountains) by the Chinese.

The immense tract of country which lies to the N. of this range (on the W. between it and the Thian-Shan, and on the E. between it and the Altai Mountains,) is known by the name of Gobi, or more properly Gobi (the desert in the Mongolic language), or Shamo (Sand-sea in Chinese). But the whole of this tract is not a desert. The W. portion of it, between 72° and 90° E. long., or between the Thian-Shan and Kuen-luen, is only from 300 to 400 m. across, and nearly 1,200 m. in length. Here we find a tract of country from 50 to 80 m. across, along the foot of the Thian-Shan range, fertile in many districts, producing different kinds of grain, cotton, wine, and fruit, or covered with nourishing grass. Through this tract runs the great commercial road, which connects W. Asia with the more eastern countries, and here are situated the commercial towns of Khasghar, Aksu, Kutshe, Kurashar, Turfan, and Khamil, or Ilami. The W. portion (between 72° and 77° E. long.) is also not a desert. Though the tracts separating the rivers are steppes, i. e. plains without trees, and producing only a coarse grass, the lands bordering the banks of the watercourses are fertile in grain and cotton. Here is the town of Yarkand, and, towards the Kuen-luen, Khotun, through which two places a road runs, which connects N. Asia with India. It is supposed that the term *cotton* is derived from the name of the last-mentioned town. The remainder of this region is a desert, and mostly of the worst kind, where the sandy surface, according to a Chinese author, moves like the waves of the sea. This desert is sometimes distinguished by the name of Shan-shin, or the Gobi of Lop Noir. The Lop Noir is one of the extensive lakes without an outlet, which frequently are met with in this desert. It receives from the W. the Erghenish, or river of Yarkand, which runs probably not less than 1,000 miles. This part of the Great Table-land is supposed to be between 4,000 and 5,000 ft. above the sea-level.

It seems, that under the meridian of Khamil (90° E. long.) the desert is narrowed to about 150 miles across by the fertile district of Tangut, which skirts the N. declivity of the mountains of Nan-shan, and extends far northward into the desert. The desert, dividing it from Khamil, and called Gobi of Tangut, is also less level, more stony, and better adapted for pasture, than farther E. or W. Hence the Chinese government has extended its N.W. prov. of Kansu, through this desert to the N. side of the Thian-Shan mountains.

The Great Desert, Ta-Gobi, extends from the eastern extremity of the Thian-Shan (96° E. long.) to the Khing-Khan (120° E. long.), nearly 1,200 miles in length, and its width between the Altai range on the N., and the Nan-Shan, Ala-Shan, and In-Shan, on the S., varies between 500 and 700 miles. Through the middle of this tract extends, in the whole of its length, what is properly called the Shamo (Sand Sea). It is from 150 to 250 miles across; and in it sand almost exclusively covers the surface, which commonly is level, but in some places rises into hills, on which masses of loose stone are met with. Small and shallow lakes are frequent, but their water is either salt or bitter. The vegetation is very scanty, and affords but indifferent pasture. In a few places a small number of stunted trees are met with. This part of the Gobi is about 3,000 ft. above the

sea-level, but it sinks in some places even to 2,600 ft. In those parts of the Gobi, which lie to the N. and S. of the Shamo, the surface is between 3,000 and 4,000 ft. above the sea. Here it is not, in general, covered with sand, but with gravel and pebbles, and in many places rocky. The vegetation is much more vigorous, and the pastures consequently richer. It is even thought that, in many districts, agriculture would succeed, if the Nomadic nations inhabiting these countries would attend to it; and in some districts which border on China, millet is grown abundantly, and even wheat and barley, though not to a great extent. Trees are also met with, as well on the N. as on the S. of the Shamo, especially fir, birch, and poplars, but not in large forests. The countries are likewise better provided with water than the Shamo, which could not be traversed, if walls were not dug at certain places where the roads pass. The northern and southern districts have also a less level surface, ridges of stony and rocky hills traversing it in many places; they run commonly from W. to E., and are called the Black Clouds. The few and sluggish rivers, which are met with, are lost in lakes without outlets. Only in the north-eastern angle are the Kerloon and Khalka-Pira rivers, which, joining, form the Arsgoun, the principal branch of the Amur. The temperature of the air is extremely low over the whole Gobi, the waters being covered with ice six months of the year.

The country, which is included between the two branches of the Kuen-luen range, the Nan-Shan, and Bayan Kara mountains, is called Thioing-Hal, or Khoo-khoo-noor. The latter name is derived from an extensive lake, in its N.E. district. It is very little known, and seems to exhibit a succession of narrow valleys and very high mountains, whose numerous summits pass far beyond the snow-line. These mountains form very extensive and high masses in the bend of the Hoang-ho, which river has its sources in the W. districts of this region.

The whole country, S. of the Kuen-luen mountains, as far S. as the Himalaya range, is comprehended under the name of Tibet. It is, doubtless, the highest part of the great table-land of Eastern Asia, and there are good reasons for assigning it an average absolute elevation of 10,000 ft. above the sea-level, though, towards the east, above the sea, some rivers may be considerably less. A mountain-range runs through it from W. to E. It is connected with the Himalaya range by a level table-land of 14,000 ft. elevation, which surrounds the sacred lakes of Manaasa-Rowora and Ravan-Iirad, and on which, or near which, are the sources of three great rivers, the Indus, Ganges, and Yarrow-Zangbo-tsu. The mountain-chain itself is called Gang-dis-ri on the W., but further E. it bears the name of Zang. Its E. extremity is separated from the Yun-ling by the valley of the Yang-tse-kiang, which here flows from N. to S. Little, or rather nothing, is known of this range, which probably being placed on so elevated a base, passes with its summits the line of congelation.

Of the country which lies to the N. of this range very little is known, if we except the most westerly corner, where the Indus river, issuing from a table-land between mountain-ridges, enters the spacious, level, and fertile valley of Loh, or Ladak, and runs in it about 300 miles, till it breaks through the mountain-ranges which oppose its course, and enters the plain of India. On the W. of this fine, but elevated valley, is the Himalaya range; and on the E. another high chain, the Karakorum mountains, which, extending N.W. and S.E., connect the Kuen-luen chain with the Gang-dis-ri mountains.

The country east of the Karakorum mountains, and extending between the Kuen-luen and the Gang-dis-ri ranges, is called Katshe, or Kor Katshe. There occur in it some ranges, but the greater part extends into the plain, similar to the steppes, but abundantly provided with good pasture. More is not known of it. Near the Gang-dis-ri range is an extensive lake, called Teigri, and N. of it are the sources of the Yang-tse-kiang, and perhaps also those of the rivers Mackhum and Thalien.

The country between the Gang-dis-ri range and the Himalaya mountains is Tibet Proper, and is somewhat better known, at least as far E. as H'Lessa, its capital. Its surface exhibits only low rocky hills, without any signs of vegetation, rising on extensive arid plains, covered at certain seasons with rich grass, and affording pasture to numerous herds of cattle. The valleys in which the rivers run are considerably depressed below the surface of the plains, and in these valleys agriculture is carried on with great care. All kinds of European grains are cultivated, and in some places rice. Most of the fruit-trees of Europe also succeed. But, as the portion of the country which is fit for agriculture is only a small part of the whole, the population, though far from numerous, is partly supplied with corn from the adjacent countries. The climate is very severe, and the rivers covered with ice for some months. The E. part of Tibet is very little known; it seems to be

traversed by high ranges, and not to exhibit the large plains which occur farther W. In Tibet is the lake Paiké, which has a large island in its centre, so that the lake has the form of a ring. The Yaroo-Zangbo-tsu, or Samsu river, runs through this country from W. to E., and after a course of more than 1,000 miles, breaks through the chain of the Himalaya range, about 95° E. long., and joins the Brahmaputra under the name of Di-hong.

The table-land of Yu-nan, which forms the most southerly portion of the great table-land of Eastern Asia, has an extremely diversified surface, being a succession of mountains which in some places rise above the snow-line, and of valleys, which, however, frequently widen to small plains. The climate indicates a considerable elevation above the sea-level, but it is not so high as to preclude agriculture, corn being raised in the valleys and plains, and in some districts rice. Towards the N.W., however, it rises much higher, as there the rearing of cattle forms the principal occupation of the inhabitants, who have herds of chowry-tailed cattle (Bos grunniens), which are only found in very cold countries.

3. *Countries lying to the East of the Table-land of Eastern Asia.*—East of the desert of Gobi extends Shing-king, or Manchouria (the country of the Manchoes), to the coasts of the Pacific. It is divided from the desert by the Khing-khan mountains, which on the side of the desert are destitute of wood, but towards Manchouria are covered with fine forest-trees, among which oak is frequent. The N. boundary is formed by the Yablonoi Khrebet, or Khing-khan Tugurik. From this range (56° N. lat.) it extends to the neighbourhood of the Hoang-Hai, or Yellow Sea (41° N. lat.); from which it is divided only by a range of hills. But in advancing farther E. these hills rise to a high mountain-chain, the Chang-pe-Shan, or Shan Alin, which attains the snow-line where it runs on the boundary between Manchuria and the peninsula of Corea. It then approaches the coast and runs so close along it as to leave only at some places a very narrow stripe of low country until it terminates at the mouth of the river Amur, opposite the Yablonoi Khrebet. Along this coast the mountain-chain rises with great steepness to from 4,000 to 5,000 ft. above the sea. The countries enclosed by these mountain-ranges exhibit different characters. The S.W. part of it, N. of the river Sira Muron, or Leao-ho, is a desert, and may be considered as part of the Gobi, which here projects beyond its natural boundary, the Khing-khan range. It has a scanty vegetation, and is only inhabited by nomadic nations. E. of, and far N. as the Amur river, the country is traversed by ridges of mountains and hills, between which, however, spacious valleys extend, whose fertile soil is in some places well cultivated, and yields rich crops. The mountains and hills are partly covered with trees, and partly afford rich pasture-walks for numerous herds of cattle and sheep. The climate of this portion of Manchouria is very temperate. N. of the river Amur the whole country is covered with mountain-masses, intersected by narrow valleys. Here agriculture ceases, and cattle form as to principal riches of the inhabitants, who also apply themselves industriously to the chase of animals affording furs, of which there is a great abundance. The principal river is the Amur, whose upper branch, the Argoun, runs through the N.E. districts of the Gobi, and after entering the mountains joins the Shilka, when the river is called Amur, or Sakhalien. The whole course of this river does not fall short of 2,000 miles.

The peninsula of Corea is separated from Manchouria by the Chang-pe-shan, and from this range another branches off to the S., which runs close to the E. shores, towards which it descends with great rapidity, and in these districts the level or cultivable tracts are of small extent. The numerous offsets to the W., which are less steep and elevated, contain between them large and well-cultivated valleys. But the whole country seems to have a considerable elevation above the sea-level, as its climate is very cold, its N. rivers being covered with ice for 4 months; yet rice, cotton, and silk, are produced in abundance.

China Proper occupies the remainder of the countries lying between the Great Table-land of Eastern Asia and the Pacific. Several mountain-ranges issuing from those that surround it, traverse its interior. Where the In-Shan and the Khing-Khan meet, stands a high summit, the Petcha, more than 16,000 ft. above the sea-level, and from it a chain runs first S.W. and then S., 400 m., and terminates at the last great bend of the Hoang-ho. It is called Kho-tsing-Shan, and though high, does not rise to the snow-line. Near 34° N. lat. two ranges branch off from the Yun-ling, the Piling (northern range) and the Tapa-ling, and they continue as high mountain-chains as far E. as 110° or 115° E. long., when they sink down to hills. These ranges contain some snow-capped summits towards the W., and are steep and rugged. From the K. side of the table-land of Yu-nan branches off another range, called Nan-ling (southern range), which constitutes the most extensive mountain-system in China.

It runs E. as far as 116° E. long., passing about 150 miles to the north of Canton; it then inclines to the N.E., in which direction it continues with a slight bend to the W. to its termination on the sea, near the harbour of Ning-po, opposite the islands of Chusan. Several summits of this range rise above the snow-line, W. of 110° E. long., and here it extends also to a considerable width. East of 110° E. long. no snow-capped summits occur, though some rise to a great elevation, but every where the descent of the range is steep and rugged.

The country lying between the Kho-tsing-Shan and the Tapa-ling is full of high and extensive mountain-masses, and intersected by valleys, which are very narrow, except two which are drained by the Wei-ho, a tributary of the Hoang-ho, and by the Kan-kiang, a branch of Yang-tse-kiang. These are wide, and afford large tracts for agricultural purposes. The large tract, which extends between the Tapa-ling and the Nan-ling, is traversed by many ridges of mountains and hills, which mostly branch off from the last-mentioned range, but these elevations rise only to a moderate height, and the gentle declivities are mostly cultivated. Besides, they are separated from one another by very wide valleys, which frequently are intersected by pretty extensive plains, that every where recompense the industry of the cultivator. They are, in fact, hardly inferior in fertility to the great Chinese Plain.

This great plain occupies the N.E. part of China, extending in length 700 miles from the Great Wall, N. of Pe-king, to the confluence of the rivers Yang-tse-kiang and Kan-kiang, near 30° N. lat. Its breadth is various. North of 35° N., where it partly extends to the shores of the Hoang-hai, and partly borders on the W. declivity of the Chang-tung mountains, a low range, occupying the peninsula of that name, the width of the plain varies between 150 and 250 m. Between 35° and 34° N. lat. the plain enlarges, and in the parallel of the Hoang-ho it extends more than 300 m. E. and W. Farther S. it grows still wider, and reaches nearly 500 m. inland in the parallel of the mouth of the river Yang-tse-kiang. This large plain, though the N. districts have mostly a sandy soil, and the E., between the embouchures of the Hoang-ho and Yang-tse-kiang, are partly covered with swamps, is, perhaps, the best cultivated and most populous portion of the globe, producing abundance of rice, cotton, wheat, and tobacco, &c. It contains at least 210,000 sq. m., so that it is seven times as large as the British empire, and more than twice that of Lombardy. The internal communication of this fertile tract is rendered easy by the Great or Imperial Canal, which traverses it from S. to N., and whose length exceeds 500 m. In a straight line, but probably its whole length is not less than 700 m. It is, also, traversed by the lower courses of the two great rivers of China, the Hoang-ho and the Yang-tse-kiang, which flow through it from W. to E. The Hoang-ho runs upward of 2,000, and the Yang-tse-kiang more than 2,500 miles, if their bends be taken into account.

4. *Countries lying to the South of the Great Table-land of Eastern Asia.*—This region comprises the two peninsulas, which are known in Europe by the name of India with and without the Ganges.

The peninsula without the Ganges is traversed by four mountain-ranges, of which the three farthest east are connected with, or branch off from, the table-land of Yu-nan, the most southerly extremity of the Great Table-land. The most easterly, which may be called the Anam range, begins at 22° N. lat., and runs S.E. till it approaches the Chinese Sea, near 17° N. lat.; hence, farther south, it proceeds parallel to the shore of that sea, and terminates at Cape St. James ($10^{\circ} 15'$). This range occupies about 100 m. in width; its elevation has not been ascertained, but it seems to be considerable, though far from rising to the snow-line, except, perhaps, where it is connected with the table-land of Yu-nan. Two other mountain-chains branch off from the S.W. side of the same table-land, between 38° and 37° E. long., and run nearly due S., including the narrow valley of the Thaluén river. The most westerly, which may be called the Birman range, terminates at a point of considerable elevation at the mouth of the Thaluén river; the other, which runs to the E. of that river, and may be called the Shan or Slam range, continues farther S., but gradually declining in height till it disappears entirely N. of the most narrow part of the peninsula of Malacca, the isthmus of Krai ($11^{\circ} 30'$ N. lat.): for the low mountains, which occupy the interior of the S. part of that peninsula, are not connected with it.

Between the Anam range and the Gulph of Tonkin lies a large plain, that of Tonkin, about 100 m. in length and width: it is low, level, and extremely fertile, especially as far as it can be irrigated. It is surrounded on the N. and W. by very fertile valleys, and traversed by the river Song-ca, which rises on the table-land of Yu-nan, and runs in an E.S.E. direction probably more than 700 m. The plain of Tonkin terminates between 19° and 20° N. lat: farther S. the offsets from the Anam

range approach close to the sea, and leave only between them larger or smaller valleys, which commonly are very fertile. South of Cape Aravella steep rocks occupy nearly the whole of the country.

We know very little of the N. portion of the country occupying the extensive tracts which separate the Anam range from the Shan range. It would seem, that as far S. as 16° N. lat. it exhibits several pretty high mountain ridges, which include valleys and surround elevated plains. S. of 16° N. lat., however, low plains constitute the general character of the country. For though several ridges occur, they do not seem to rise at any place above the elevation of high hills. These low plains have a greater abundance of water than any other country of Asia. A considerable portion of their surface is covered with permanent lakes: others are formed during the rainy season, by the inundation of the numerous and large rivers; and at that season a great portion of the land is changed into immense swamps. Though the soil is very fertile, and yields very rich crops of rice and every kind of vegetables cultivated for food between the tropics, civilization is less advanced than either in China or Hindostan; because its inhabitants, being unable to turn this abundance to their advantage, it acts as an incentive to idleness. Three large rivers drain this country. The most easterly is the Sal-gun, which runs along the Anam range, and falls into the sea near Cape St. James: its upper course is entirely unknown, but from its size towards its mouth it is supposed to run from 500 to 600 m. The Mackhaun, or river of Cambodia, is called by the Chinese Lan-san-kiang, and rises in the interior of the Great Table-land, so that its width probably exceeds 2,000 m.: it falls into the sea, W. of the mouth of the Sal-gun river. The third river is the Menam, or river of Siam, which runs about 700 m., and falls into the Gulph of Siam.

The valley, in which the Thaluon runs between the mountain-ranges of Siam and Birmanh, is narrow; its soil is stony, and too much elevated to be irrigated by the water of the river, which rushes with great impetuosity down its confined bed, descending from the Great Table-land, where it is called Loo-kiang, or Noo-kiang. Its whole course probably exceeds 1,500 m.

The peninsula of Malacca, which constitutes the most southerly part of the continent of Asia, and terminates with the Capes of Bueros and Romania, between which the island and town of Singapore are situated, is connected with the main-land by the isthmus of Krai (between 9° and 11° S. lat.), about 150 m. long, and from 70 to 80 m wide. It is low, and its soil is formed by alluvium. The peninsula itself contains a mountain-ridge in the interior, which rises to 3,000 or 4,000 ft., and is mostly covered with thick woods, but along the shore extends a level country, which in some districts is very fertile, but mostly not very productive.

The most westerly of the four mountain-chains, which traverse the peninsula beyond the Ganges from N. to S. nearly in its whole length, is the Aracan range, dividing Aracan from the Birman empire. It is not connected, like the others, with the table-land of Yu-nan, but with the Himalaya range. The Himalaya mountains are considered to terminate at the sources of the Brahmapoutra (97° $30'$ E. long, and 28° N. lat.). The mountains which surround the upper course of that river are called the Langtan mountains, and many of their summits rise above the snow-line; the highest of those which have been measured, the Dupha Boon, attaining 13,713 ft. above the sea-level: the passes which lead over it do not sink below 11,000 ft. From these mountains, which rather constitute a large mountain-knot than a range, a chain issues, running W. parallel to the Himalaya range. That portion of the chain, which is immediately connected with the Langtan mountains, is called Yaskel mountains; it seems to be much lower, and more accessible. Farther W. they are called the Naga mountains, which are still lower, and extend to about 93° $30'$ E. long., where they are succeeded by the Garrow hills, which rarely rise to more than 6,000 ft., and terminate opposite the mountain-ridges which surround the enormous pinnacle of the Chamalari in the Himalaya range.

Between this range and the Himalaya mountains extends the valley of Assam, or of the Brahmapoutra, one of the largest in Asia: its length exceeds 400 m., and in width it varies between 30 and 50 m. Its soil is very fertile, and the climate such as to bring to perfection nearly all productions cultivated between the tropics; but here also the too great abundance of water retards the progress of agriculture and the increase of the population.* The Brahmapoutra runs more than 500 m. through the centre of this valley, and is here joined by the Di-hong, which, under the name of Sampo, of Yar-zangbo-tsu, flows through the plains of Tibet, and has run a course of more than 1,000 m. before it reaches the Brahmapoutra. Issuing from the valley of Assam,

the Brahmapoutra runs 360 m. farther through the plain, of Bengal.

The country which extends along the mountain-chains constituting the S. boundary of the valley of Assam, and advances as far S. as 24° N. lat., seems to be considerably elevated above the sea, the plain on which the town of Moonpore is built having an elevation of nearly 2,500 ft. But the plains are commonly not of great extent, and the valleys are narrow, though the mountains which cover the greater part of the surface do not rise to a great elevation. As far as is known (for the eastern portion of this region has not been visited by European travellers) these ranges run S. and N., and form right angles, or nearly so, with the range from which they issue. One of these ranges, extending along the meridian of 91° E. long., is called the Khiebunda mountains, between Moonpore and Katarah, but farther S. the Aracan mountains. This chain, whose length rather exceeds 700 m., attains towards the S., only a mean elevation of about 3,000 ft. above the level of the sea, though some of its summits rise to 5,000 ft. and upwards. Its mean width may be 50 miles: it terminates at Cape Negrais.

Between the Aracan mountains and the Birmanh range lies the greatest part of the Birman empire. A small portion of its surface consists of rich cultivable lands: these lie in the wide valley of the Irawaddi, and in two large plains; one, situated between 22° and 23° N. lat., along the N. side of the great bend of that river, and the other between 16° and 18° N. lat.: the latter comprehends the large delta of the Irawaddi and the adjacent low country as far E. as the Birman mountains, and may have a surface of nearly 100,000 sq. m. But its agriculture suffers from excess of water. The country E. of the Irawaddi, and S. of its great bend, is a high country, from 1,500 to 2,000 ft. above the level of the sea; whose hilly surface suffers from want of water, the soil being sandy and dry. The Irawaddi, which drains the Birman empire, rises in that unknown region E. of the Langtan mountain-knot, and runs upwards of 1,200 miles, if its bends be taken into account.

Aracan, or the country lying east of the Aracan mountains, is hilly, and even mountainous in its northern districts, the table-mountain (near 21° N. lat.) rising to 8,340 ft. above the sea: but its middle parts are occupied by the rather wide valley of the Huritung, or Aracan river, and this is continued farther S. to 19° N. lat., being separated from the sea to the S. of the mouth of the river, by a ridge of broken hills, which rise to between 500 and 700 feet. The rains during the south-west monsoon being extremely heavy, and of long-continuance, agriculture is here also retarded by the abundance of water.

Hindostan, or the peninsula within or on this side the Ganges, is not connected either with the table-land of Eastern or that of Western Asia, being separated from each by a wide plain, extending first from the mouth of the Ganges along the southern declivity of the Himalaya range to the shores of the river Indus, in a W.N.W. direction, and thence along the mountains, forming the boundary of the table-land of Iran, in a S.S.W. direction to the mouth of the Indus. Thus this plain has the form of a right angle; and is, on account of its different character in the eastern and western district, with propriety divided into the plain of the Ganges and that of the Indus.

The plain of the Ganges may be compared with the great plain of China, in respect of fertility and extent, though not of population. Its length is upwards of 1,000 m., and its width varies between 120 and 350 m.: it covers an area of more than 200,000 sq. m. From the mouth of the Ganges it rises imperceptibly towards the N.W.; but, even at a distance of 250 m. from the sea, its surface is not 1,000 ft. above it. The country between the W. mouth of the Ganges, the Hooghly, and that of the Brahmapoutra, to a distance of nearly 100 m. from the sea, is extremely low, and frequently inundated by high tides. It is called the Sunderbunds, and is nearly uninhabited on account of its unhealthiness, being covered with large forest-trees, and frequented by tigers and other beasts of prey. The country which lies N. of the Sunderbunds, to an extent of 200 m. and upwards, is subject to the annual inundations of the Ganges; by whose deposit it is fertilized, so as to give the most abundant crops of rice. It is cultivated with the greatest care, and nourishes a very numerous population. N. of 25° N. lat. the annual inundations of the river cease; and where no artificial means are employed to effect an irrigation for the culture of rice, the country produces wheat and other grains. But the natural fertility of the soil decreases as we advance higher up the river. It becomes more sandy, and N. of Delhi the tracts along the rivers can only be cultivated. At 30° N. lat. it is a complete desert. Between this plain and the lowest range of the Himalaya mountains extends the Tariyana, a narrow stripe of land from 12 to 20 m. wide, covered with immense forests, and frequented by a great

* The eastern portion of the valley is hardly more than 400 ft. above the sea-level, and at its western extremity it sinks down to 200 ft.

number of elephants, tigers, and other animals. It is uninhabited, on account of its unhealthiness, the surface in the rainy season being converted into an immense swamp; but between November and March it may be visited without danger. The people inhabiting its borders are disfigured by gottos.

The river which drains this plain, the Ganges, rises in the highest and most northerly range of the Himalaya mountains, bordering on the table-land of the sacred lakes of Manassa, Rowarra, and of Ilrawan Hrad. Its several sources unite before it issues from the mountains at Haridwar. It soon begins to change its W. into a S. and south-easterly course. In the latter direction it traverses the upper part of the plain. But from its junction with the Jumna it runs E. to the neighbourhood of Rajamahall, where it again turns to the S. E., and soon after begins to form its extensive delta, dividing in a great number of branches, of which the most easterly and principal falls into the Bay of Bengal, a few miles W. of the mouth of the Brahmaputra; but the western mouth, called the Hooghly, is in a straight line 180 m. from it. All rivers descending from the Himalaya mountains, between 78° and 90° E. long., increase its waters, and most of them inundating the lands contiguous to their banks during the rainy season, contribute to increase the fertility of the plain. The course of the Ganges exceeds 1,300 m.

The plain of the Indus is somewhat less in extent, and greatly inferior in fertility. It extends in length about 600 m., and in width 300 at an average. Its surface may cover an area of 180,000 sq. m. Its N. part is called the Penjab (country of five rivers). It is intersected by five large rivers, which afterwards join the Indus. This tract is commonly very fertile along the watercourses, and there are even, between the rivers, districts whose soil recompenses the labour of the husbandman; but in general they have a light soil, which frequently passes into sterile sand or clay. This description also applies for the most part to the tract of land which lies on the right of the river, between it and the ranges which separate it from the table-land of Iran. But on the left of the Indus extends an immense sand desert, which in the N. is called Maricab, and in the Great Desert, and to the S. Tiur, or the Little Desert. It extends over the delta of the Indus, and occupies nearly half the whole plain. At its southern extremity is the Rumi, an extensive salt morass, connected with the Gulph of Cutch. In the desert also occur smaller lakes and marshes, in which salt is produced. It is only inhabited in a few places, where rocks protrude through the sand, having their surface covered with scanty grass. The Indus, which drains this plain, has its sources near those of the Ganges; descending through the spacious valley of Leih or Ladak, it breaks through the mountains at the north-western extremity of the Himalaya range. Its whole course amounts to upwards of 1,500 m.

Where the two plains of the Ganges and Indus meet, in the parallel of Delhi, between 76° and 77° E. long., begin the mountainous countries of Hindostan, which extend to its most southern extremity, Cape Comorin (near 8° S. lat.). This immense tract may be divided into two triangles, connected at their bases at the Vindhya mountains, which extend between 22° and 23° from the Bay of Cambay, to the plain of the Ganges, N. W. of Calcutta. This chain is of moderate elevation, its highest summits probably not exceeding 3,000 ft. above the sea, and the most frequented of its mountain-passes, that of Jaum, only rising to 2,328 ft. At its western extremity, about 30 m. from the Bay of Cambay, it is connected with another chain, the Aravalli range, which first runs N., in broken masses, up to the vicinity of 24° N. lat., but farther N. forms a continuous range, running N. E. It descends westward, with a steep declivity, to the desert; at Haridwar it presents the sand of that district from encroaching on the fertile country lying farther E. Its average elevation probably does not exceed 3,000 ft., though some summits rise higher, and the Abou or Aboda Peak (between 24° and 25°), even to more than 5,000 ft. These two chains, the Vindhya mountains and the Aravalli range, constitute two sides of the northern triangle, and from them the country gradually lowers, until it meets the plain of the Ganges, not far from the banks of the Jumna. Contiguous to the mountains are two considerable plains; the table-land of Malwa, well known by its extensive plantations of opium, skirts the northern declivity of the Vindhya mountains for about 300 m., and has an average breadth of 50 m. Near the mountains its elevation is between 1,800 and 1,900 ft. above the sea level; but towards the N. it imperceptibly lowers to less than 1,800 ft. The table-land of Mawar extends along the Aravalli range; it is between 180 and 180 m. long, from S. to N., and from 70 to 100 m. wide. Its elevation near the mountains is about 5,000 ft. above the sea, but on its eastern border it sinks to 1,400 ft. In fertility it is much inferior to the plain of Malwa; it produces different kinds of grain, but little rice. The

tracts of country which separate these plains and extend to the plain of the Ganges, have a very broken surface, which on the E., in Harraoutee, rises in steep and rugged hills, but farther W., in Bundelcund, presents more gentle acclivities, and wider, as well as more fertile, valleys. The rivers which drain these countries fall into the Jumna, a tributary of the Ganges.

The peninsula of Gujerat, lying opposite the mouth of the rivers Nerbudda and Tapti, is united to the continent of Hindostan by an isthmus more than 50 m. long, between the southern part of the salt morass called the Rumm and the Bay of Cambay. This isthmus is so low that, in the rainy season, the waters of both gulphs unite and convert the peninsula into an island. The districts contiguous to this isthmus, as well as those bordering on the gulphs of Cambay and Cutch, have an undulating surface, and contain extensive tracts of fertile and well cultivated land. The lands along the western coast are rather level, but their surface is stony, covered with little earth, and not fertile. The interior of the peninsula, and all the districts along the southern coast, have a very broken surface, and are mostly covered with bare rocks, but contain a number of fertile valleys. The mountains in the centre of the peninsula attain a moderate elevation. The whole is well supplied with running water, except the north western extremity, but is destitute of wood, except on the hills along the southern coast.

Contiguous to the eastern extremity of the Vindhya mountains, but S. of them (between 81° and 83° E. long., and 22° and 23° N. lat.), the country rises to a considerable elevation, prolonged to more than 5,000 ft. It is overtopped by numerous summits, which rise 2,000 ft. higher. This rugged country, which seems to constitute a mountain-knot, from which ridges and rivers run out in all directions, is called Omerkuntuk. The most considerable of these rivers is the Nerbudda, which runs westward in a deep valley, overlying on the N. by the steep acclivities of the Vindhya mountains, and bounded on the S. by another range, the S. Sautpoora mountains. This valley, which is wide, except at its eastern extremity, and of considerable fertility, is considered as the boundary line between Hindostan Proper, lying N., and the Deccan, extending S. to Cape Comorin. The length of the valley, and of the river, is about 600 m. Similar is the valley in which the Tapti runs along the southern declivity of the Sautpoora mountains, parallel to the Nerbudda, but its course does not much exceed 300 m.

To the S. and S. E. of Omerkuntuk, between the lower part of the plain of the Ganges, and as far S. as the course of the river Godavery, extends a tract of country whose elevation above the sea has not been determined; but the comparatively low temperature of the air, and the healthiness of the climate, seem to indicate that it must be between 3,000 and 4,000 ft. Its surface is broken; the hills rise to 2,000 ft. above it, but they are separated from each other by wide valleys, and frequently by plains of moderate extent and indifferent fertility, except along the foot of the ridges, where the soil commonly is rich. The eastern border of this rugged table-land is formed by a chain of mountains, which does not seem to rise considerably above it, but they are so steep as to be almost impassable on horse or wheeled carriages. Their distance from the sea varies between 60 and 80 m. The narrow tract lying between them and the sea is called the Circars. It is not a level, but commonly a succession of hills and dales; though there occur some levels of considerable extent. Its soil along the sea-coast is generally sandy, but it improves gradually towards the mountains; and produces abundant crops of cotton, tobacco, and grain; including rice, when artificially irrigated.

On the mountain-knot of Omerkuntuk rises the river Mahanuddy, which traverses this broken country in an E. S. E. direction nearly in the middle. It falls into the Bay of Bengal, after a course of more than 500 m., and forms at its mouth an extensive delta.

South of the mouth of the river Tapti, and nearly in its parallel, rises suddenly from the plain a continuous mountain range called the Ghauts, extending southward as far as the river Ponany (11° S. lat.), through 10° of lat. In some parts it is 30 or even 40 m. distant from the sea; in others it constitutes its very shores. It rises abruptly with a steep ascent from the low coast, and attains a mean elevation of from 4,000 to 5,000 ft.; but some of its summits rise much higher. The highest portion are the Nelgherry hills (11° S. lat.), which are more than 9,000 ft. above the sea; the Liliandumale (12° N. lat.) is above 5,500 ft.; and the Subramuni (12° 30') above 5,400 ft. In many points, the range sinks down to less than 2,000 ft., and over these depressions lead the ghauts or mountain-passes; whose name has been transferred to the range itself.

The narrow tract of country which intervenes between this range and the sea-coast is called Malabar. It is mostly occupied by the short offshoots of the Ghauts, which

preserve their character of steepness, but include small valleys which display a vigorous vegetation. The narrow tract of level land along the sea, which seldom exceeds 3 m. in width, and is in general much less, is separated from the sea by low downs; this gives them the advantage of irrigation during the rainy season. The fresh water descending from the mountains has no vent, and must therefore stagnate until it evaporates: hence these tracts produce much rice, though their soil is poor, consisting chiefly of sand.

The Nellocherry hills constitute the S. extremity of the Ghauts, which are called the W. Ghauts, to distinguish them from another chain of mountains, called the E. Ghauts. The last-mentioned mountains begin on the banks of the river Cavery (11° 20' N. lat.) and extend thence, first in a N. E. direction, as far as 13° N. lat., where, opposite the town of Madras, they turn to the N., and continue so to the banks of the river Kistna (near 17° N. lat.). Between this river and the Godavary are a range of hills, which connects them with the mountains which separate the Circars from the elevated country lying further W. The E. Ghauts do not form an uninterrupted chain, being at several places broken by the rivers which rise on the E. declivities of the W. Ghauts, and descend to the Bay of Bengal. They also do not form one mass; but are frequently divided in several ridges, by longitudinal valleys. These mountains do not rise to the elevation of the W. Ghauts; yet to the W. of Madras, the Nalla Malia mountains attain 3,000 ft. and more, and farther S. (near 12°) the Sherwahary mountains rise to 4,935 ft.

The extensive country enclosed between the two ridges of the Ghauts is an elevated table-land. Its surface extends nearly in a level, which is only here and there broken by short ridges or groups of hills, rising a few hundred ft. above it. Its elevation above the level of the sea, where it is contiguous to the W. Ghauts, varies between 2,000 and 3,000 ft., and thus it may continue to the middle of the table-land; but it sinks in approaching the E. Ghauts, where, in most places, it has barely 1,000 ft. or less of elevation. Its soil is rather fertile, and well adapted to the culture of rice, where it can be irrigated, and where not, it produces abundance of wheat and other grain. The S. part is called the table-land of Mysore, and the N. that of Balaghaut.

The Eastern Ghauts arc at a distance of about 150 m. from the sea, or coast of Coromandel. The surface of the intervening country extends mostly in wide plains, which here and there are interspersed by hills of no great elevation. The soil is dry, light and sandy, but nevertheless it gives rich crops, wherever it is irrigated, which is rendered easy by the great number of rivers descending from the Western Ghauts, or originating in the Eastern Ghauts. The coast is low, sandy, and without harbours, surrounded by shoals, and exposed to a very heavy swell, which renders it extremely dangerous during the north-eastern monsoon. Europeans have, however, preferred it to other parts of India, having found here more settlements than any where else. Three large rivers descend from the eastern declivity of the Western Ghauts through the table-land of Mysore and Balaghaut, to this coast, and fall into the Bay of Bengal. The most southerly is the Cavery, which runs about 450 miles. Farther N. is the Kistna, or Krishna, and the Godavary, the former flowing about 600 the latter 700 miles. These rivers, though in many parts very valuable for irrigating the contiguous lands, are only navigable in the low plain of the Carnatic. On the table-land they in general have little water, and where they break through the Eastern Ghauts, they are broken by numerous rapids and cataracts.

On the parallel of the embouchure of the Cavery river, (11° N. lat.), the peninsula may be traversed without passing any mountain. Here exists a great depression in the Western Ghauts, called the Gap of Colimatore. The narrowest passage is at the fortress of Annimaly (77° E. long.), where the level low country between two mountain-ranges presents a valley about 12 miles wide. The elevation of the highest part of this gap is only 400 ft. above the sea level. The whole country in this district is covered with large forest-trees, especially with teak; but during the rainy season it is converted into a swamp.

To the S. of the Gap of Colimatore the Ghauts rise again with a very abrupt ascent: they attain also a great elevation. The Permaul Peak, situated W. of Dindigul, nearly in the middle between both seas, is 7,367 ft. above the sea level, and according to the statements of the natives the mountains farther W. rise to the snow line. The chain lies here farther from the sea, leaving a low tract from 30 to 40 m. across between them, and runs S. S.W. towards Cape Comorin, terminating abruptly at a distance of about 20 En. m. from the Cape with a huge mass of granite, 2,000 feet high: a low rocky ridge extends to the Cape. The mountains are here covered with thick forests.

The country W. of these Southern Ghauts is wonder-

fully intersected by inlets of the sea, which often run for great length parallel to the coast, receiving the various mountain streams, and communicating with the ocean by different shallow and narrow openings. Between Cochín and Quilon these lakes form a continual series, being united to one another by short channels, and affording an easy means of communication. The low country, which extends for some miles inland from these lakes, has a good soil, and, being abundantly watered, gives very rich crops of rice and other tropical productions. Still more vigorous is the vegetation in the valleys which are enclosed by the offsets of the mountains, but they are not cultivated with equal care. The low coast is here exposed to a continual and very heavy swell from the ocean, and can only be visited by vessels during the north-east monsoon (from Oct. to May).

The plain and nearly level country, which on the E. of the Southern Ghauts extends to an average width of between 70 and 80 m., is partly covered with extensive forests and partly with cultivated fields, yielding rich crops of rice: their irrigation is rendered easy by the numerous small rivers. Along the shores of the Gulph of Mannar and of the Palk Strait are a great number of salt swamps and lagunes, which mostly communicate with one another. Between them and the sea are sand dunes, which in some places extend to several miles across. The stagnating water renders these places very unhealthy.

Decan, being placed between two seas and the conflict of the monsoons, is always cooled by sea breezes. Its surface being formed by a series of terraces, and lying within the tropics, enjoys all the advantages of tropical countries, without partaking of their disadvantages. On the sultry coast the luxuriance of vegetation is displayed in the cocoa-palm, the mango-tree, the cinnamon-laurel, and the pine-apple; it thence passes through forests of teak-trees to the table-land of Mysore and of Balaghaut, and still higher, on the conical summits of the mountains, it offers the fruit-trees and corn-fields of Europe, flax plantations, and rich meadows.

5. *The Hindoo-Coosh*.—The N. W. extremity of the plain of the Indus is only about 300 m. distant from the plains drained by the Daria Amu, which form the southern districts of the level country that extends S. of the great depression, in which the Caspian Sea and the Lake of Aral are placed. This tract, between the S. and N. plains, is occupied by a mountain system, called the Hindoo-Coosh, which, like an isthmus, connects the great table-land of Eastern Asia with Iran, the most easterly of the table-lands of Western Asia. The whole tract is occupied by high and steep ranges, running in every direction, but the principal of them runs E. and W., and seems to be a prolongation of that high chain which is called on the great table-land of Eastern Asia, the Kuen-luen range. Many summits in this range rise far beyond the line of congelation. One of them, the Son Tchookeur, N. E. of the town of Peshawar, is at least 22,500 ft. high; but that snow-capped enormous mass, which properly is called the Hindoo-Coosh, seems to attain a much greater elevation. The valleys of this mountain region are but narrow, except that in which the river of Cabul flows, which is of considerable breadth. The mountains present mostly naked rocks on their steep declivities, but afford pasture ground where the slopes are more gentle. Some parts of them are well wooded.

Western Asia, or the countries lying west of the plain of the Indus, the Hindoo-Coosh mountains, and the plains of Bokhara, is, like Eastern Asia, an elevated table-land, but each differs considerably from the other. Whilst in Eastern Asia the table-land forms one mass, extending in all directions, that of Western Asia has nearly in its middle and in the direction of its greatest extent, from S. E. to N. W., a deep depression, which at its south-eastern extremity, where it is occupied by the Gulph of Persia, varies between 30 and 200 m. in width, but farther to the N. W. extends over the basin of the river Euphrates and the adjacent desert, so as to run from 600 to 800 m. across. The whole length of this depression, from Cape Ras el Had (Sat), the south-eastern point of Arabia, to Romkala, where the Euphrates issues from the mountains and enters the plain, does not fall short of 1,500 m. in a straight line. On the N. E. of this depression is the table-land of Iran, the mountain-region of Armenia, and the table-land of Asia Minor; the latter projects far beyond the depression. On the S. W. of it is the table-land of Arabia, which latter is connected with the table-land of Asia Minor, by the mountain-range of Soristan (Syria), whose mountains separate the north-western part of the lowlands from the Mediterranean Sea. Besides, the table-lands of Western Asia do not rise to so high an elevation as the southern portion of the table-land of Eastern Asia: they attain only the height of the northern region, but being placed farther to the S., and nearer the sea, they enjoy a better climate, and are more adapted to agricultural purposes. It is also to be observed that the table-lands of Western Asia descend almost every where with a steep

descent to the adjoining plains or seas, and are not surrounded as those of Eastern Asia on all sides by lowlands.

6. *The Table-land of Iran* (Persia) extends from E. to W. from the plain of the Indus to that of the Euphrates, and from S. to N. from the Gulph of Persia to the Desht Kowar, or desert of Khiva (38° N. lat.), and the southern shores of the Caspian Sea. The interior of this great tract of country extends in large and level plains, only in a few places broken by rocky hills, mostly unconnected with one another. The elevation of these interior districts scarcely exceeds 5,000 ft. above the sea-level, and as rarely to descend to less than 3,000 ft. These plains are bounded on every side by a broad border of more elevated tracts, whose surface is diversified by mountain-ridges, valleys, and some table-lands of moderate extent.

The highest portion of this elevated border is at the eastern boundary of the table-land, contiguous to the plain of the Indus. From this plain the country rises in several steep ridges, running parallel to the plain, and including deep and narrow valleys. These mountains are called, S. of 29° Hala mountains, and N. of this, Soliman mountains. The former are somewhat lower than the latter, which seem to preserve in the greatest part of their extent more than 10,000 ft. of elevation, its highest summit, the Takht Soliman (the throne of Soliman), attaining 12,836 ft. Adjacent to these parallel ridges, on the west side, are several elevated plains of moderate extent, especially the plains of Kelat (29°), Kwelia (31°), and Chikun (33° and 34° N. lat.); of which the former is elevated between 7,000 and 8,000 ft., and the latter probably more than 9,000 ft.; yet they are cultivated, especially towards the hills that surround them, and the depressions of their surface, which frequently descend some hundred feet: the higher districts afford good pasture. All these tracts are very cold, and covered by deep snow during winter.

The southern border of the table-land of Iran, extending from the plain of the Indus as far W. as the Strait of Ormuz, does not rise to a great elevation. From the sea however the mountains rise rapidly, having only a narrow low stripe along the shores, but their height probably does not exceed 2,000 ft. North of this ridge is a mostly level plain, which, as it contains extensive plantations of date-trees, cannot have a great elevation; it is otherwise sterile, and has few spots which can be cultivated. North of this plain is another much more elevated chain, the Wushutee mountains, which probably attain 5,000 ft. In this part the mountainous border of the table-land is hardly 120 m. across; but towards its western extremity a mountain-group projects northward (near 60° E. long.), the Surhid mountains (cold mountains), which seem to attain a higher elevation, but have several fertile valleys towards the E. From this mountain-group issues northward a rocky ridge, which is narrow, and in general low, but has a few elevated summits. This ridge, advancing to the northern border, divides the interior plain of Iran in two parts, and forms the political boundary between Afghanistan, or East Iran, and Persia, or West Iran.

By far the greater part of the plain of East Iran is occupied by a sandy desert, which, from the Wushutee mountains, extends northward to the parallel of Ferah, Ghirlah, and Kandahar (from 27° to 32° 10' N. lat.), nearly 400 m., and from E. to W. nearly the same distance. Its southern part, the desert of Beloochistan, is covered with fine sand, which, when moved by the wind, rises some feet above the solid surface. It is entirely uninhabited. The northern portion, the desert of Sigestan, or Seistan, has a few small oases, and considerable tracts of fertile and cultivated ground along the banks of the river Heermind, which rises on the western declivity of the Hindoo-Cooah, and runs about 500 miles. Half its course is through the desert, and it loses itself in the Lake of Zareh, about 120 m. long and 50 m. wide, but when swelled by the melting of the snow in the more elevated regions, it occupies a space more than double these dimensions. Along the northern border of the desert lies a country whose surface is partly hilly and partly undulating, but its breadth is not considerable, being between 50 and 80 m. across.

The northern border of East Iran is formed by an extensive table-land of very broken surface; the upper part extends in wide level plains, but they are frequently intersected with deep valleys. This region, the Paropamisus of the ancients, has been called by modern geographers the mountain-region of the Elmaks, and Hazareh, from the savage nations which inhabit it. It extends S. and N. about 400 m., and nearly double that extent E. and W. The ground is cultivated only in the narrow valleys, but the extensive pastures nourish large herds of cattle and sheep. On the N. it is separated from the plain of Bokhara by the Hazareh mountains.

The interior plain of West Iran is of greater extent, its length from the boundary of Afghanistan to the neighbourhood of the Caspian Sea, N. of the town of Kasbin,

exceeding considerably 500 m., whilst its mean width may be 400 m., but towards the north-western extremity it narrows to 150 m. and less. Its middle is occupied by a desert, called the Salt Desert, its surface being impregnated with nitre and other salts. Towards the boundary of Afghanistan it may be 250 m. across, but farther W. its width hardly exceeds 100 m. Its length is 400 m., or nearly so. It is entirely uninhabited. Those portions of the plain which extend on both sides of the desert have a broken surface, but the level plains are extensive, and the hills, though sometimes high, do not occupy a great space. These districts, far from being infertile, are frequently well cultivated and abound in pastures. In many districts fine fruits are raised plentifully: but rocky plains also occur frequently.

The northern border of West Iran seems not to exceed 100 or 120 m. in width. It is likewise composed of different ridges, which mostly run in the direction of the table-land E. and W. Though very rugged and steep, the mountains do not rise to a great elevation above the elevated plains lying southward, before they arrive at the meridian of 68° or 55° . From hence, westward, they rise higher, but their width narrows to from 60 to 80 m. This more elevated part of the chain is called the Elburz mountains, and runs parallel to the southern shores of the Caspian Sea, at an average distance of 20 m., descending to it with a descent which is extremely rapid. Its offsets, which are not less steep, though less elevated, fill up the space between the principal range and the sea, with the exception of a narrow stripe along its shores. The valleys, though not very wide, are very fertile. The mean elevation of the Elburz mountains may be 7,000 or 8,000 ft.: some summits rise higher: the highest is the Demawend, N. E. of Teheran, which exceeds 10,000 ft. above the sea.

The S.W. mountainous border of the plains of West Iran is still more distinctly marked. The mountain-tract, about 80 or 90 m. wide, extends from the Straits of Ormuz along the Gulph of Persia, and farther N. along the plain of the Euphrates, to the place where the Tigris, breaking through the mountains, enters the low plain N. of the town of Mosul. This mountain-tract consists of from three to seven ridges, running parallel to each other, and separated by as many narrow longitudinal valleys, which sometimes are many days' journey in length. They are separated from the sea by a narrow low coast called the Gurmish (warm region), and rise in the form of terraces towards the interior. The valleys in the southern portion of this region are cultivated, but N. of the parallel of 36° N. lat. they are inhabited by different tribes of Kurds, who prefer a nomadic life and the rearing of cattle. This northern range was anciently called Zagros, but is now known under the general name of mountains of Kurdistan. Their elevation has not been ascertained, but some summits rise to the snow-line.

The great commercial road which connects the western countries of Asia with India, traverses the table-land of Iran. It runs between the deserts and the northern mountain border, through the fertile and cultivated district between them, passing from the town of Tabriz in Azerbaijan through Casbin to Teheran, and thence to Nishaboar, Meshed, and Herat. Thence it declines from its eastern direction to the S. to avoid the mountain region of the Elmak and Hazareh, and leads to Kandahar, where it passes over part of the table-land of Ghilzai to Caubul. It then follows the valley of the river Cabul to Peshawar and Attock, where it passes the Indus, and traversing the Penj-ab, enters the plains of the Ganges.

7. *The mountain-region of Armenia.*—The most northern and narrow extremity of the interior plain of Iran reaches to the vicinity of the river Kizil Osezi, and N. of it extends a country filled with mountain-masses, which rises higher and higher as they proceed northward. East of Tabriz is Mount Selsevan, which attains an elevation of 12,000 or perhaps 13,000 ft. above the sea-level, and other summits seem not to be much lower. Between these mountains are numerous deep valleys, which are partly cultivated, but the inhabitants must depend on their herds of cattle and sheep for subsistence. A few plains lie embosomed between the mountains: the most extensive are those which are filled up by the Lakes Urmia and Van. The former is 300 m. in circumference, and its waters are salt, more salt than those of the sea, but they are perfectly clear. The Lake of Van is somewhat less in extent, and its waters are likewise salt, but not to such a degree. North-east of the Lake of Van the mountain-region attains its highest elevation in Mount Ararat, whose summit is 17,360 ft. above the sea-level, and the country which extends W. of it to the sources of the river Aras and the two upper branches of the Euphrates, the Kara-su and Murad, has at least 6,000 ft. of absolute elevation, as the town of Erzeroum is 5,500 ft. above the sea-level. Four mountain-ranges, rising from 4,000 to 5,000 ft. above their bases, run E. and W. between

38° and 41° N. lat., and the most northerly descends to the Black Sea with great steepness, and so close to its shores that no road can be made along the coast E. of Trebizond. Though the mountains occupy the greater portion of its surface, the valleys along the large rivers are so wide that they may be taken for plains, being from 10 to 15 miles across. These valleys, though cold, are mostly very fertile, and yield rich crops of corn, whilst the declivities of the mountains afford abundance of pasture. The farthest south of the above-mentioned mountain-ranges, that which, branching off from Mount Ararat, contains the sources of the Murad river, or eastern branch of the Euphrates, and which farther W. is broken through by this river, after its two upper branches have united, is to be considered as the continuation of Mount Taurus, which traverses Asia Minor. But it does not constitute the southern boundary of the mountain-region of Armenia: this is constituted by a much less elevated mountain-range running E. and W. between the rivers Euphrates and Tigris, about 37° 20' N. lat., and on whose southern declivity the town of Merdin is built. After breaking through this range at Homkala, the Euphrates enters the plain; the Tigris does the same N. of Mosul.

8. *Nakolia, Nadoli, or Asia Minor*.—This extensive peninsula is to be considered as a western continuation of the mountain-region of Armenia. It is nearly of the same breadth, and lies between the same parallels (37° and 41°); but there is doubtless some change in the direction of the mountains where both regions border on each other. From the Gulph of Iskenderoon, on the side of the Mediterranean, to the town of Trebizond on the Black Sea, the ranges run from S. W. to N. E., as is also clearly indicated by the south-western course of the Euphrates between 39° and 36° N. lat. It would therefore seem that these ranges are only a prolongation of those of Soristan, which continue southward in the same direction. The middle part of this tract, between the towns of Sivas, Malatiah, and Cæsaria (Kaisariyyeh), seems to form a table-land of considerable elevation, as the winters are severe and snow falls abundantly; the summers are short and not warm. Probably its height above the sea is from 5,000 to 6,000 feet. Its surface is a succession of levels, divided from each other by ridges of low elevation; the plains are fertile and produce rich crops of corn. The southern border of this table-land is Mount Taurus (near 38° N. lat.), which seems to rise to a great height, and sends off some branches to the Mediterranean, among which the Alma mountains (Mons Amanni), which enclose the Gulph of Iskenderoon on the E., seem to attain the highest elevation. A northern offset of the Taurus, the Ali Tagh mountains, terminate near Cæsaria with Mount Ejliah, which is always covered with snow, and probably rises to 12,000 ft. above the sea-level. The mountains extending from Sivas to Trebizond are also high, but we know very little of them.

From this eastern and much elevated border the peninsula extends nearly 500 m. westward. Along the Mediterranean as well as along the Black Sea, it is traversed by ranges of mountains. That which runs along the Mediterranean constitutes a continual range of elevated mountains, the Mons Taurus of the ancients. The average distance of the highest part of it from the sea may vary between 30 and 70 m.; but the whole tract lying between them is filled up by mountains of considerable elevation. They attain the greatest elevation on the broad peninsula between the Gulphs of Adalia and Makry (29° and 31° E. long.), where Mount Taghtali is 7,800 ft. high. But the mountains farther inland are even in August covered with snow for a fourth part of the way down their sides, which indicates an elevation of at least 15,000 ft. above the sea-level. Farther W. the mountains rapidly decrease in height, and are only of moderate elevation, where they terminate on the shores of the *Ægean* Sea, on both sides of the Gulph of Kos. The rocky masses of this chain press so closely on the shore of the sea, that commonly only a narrow stripe of low or hilly surface intervenes, except along the innermost part of the Gulph of Adalia, and along the N. shores of that of Iskenderoon, where low plains of moderate extent occur. In some places high mountains constitute the very shores of the sea, for many miles together.

The mountains which occur along the Black Sea do not form a continual range, being frequently broken by deep, and commonly open valleys, by which several larger or smaller rivers find their way to the sea. They therefore constitute several separated ranges, and have neither in ancient nor in modern times been designated by a general name. The several ridges which lie between these valleys run E. and W., parallel to each other, forming commonly a wider mountain-border on the N. of the peninsula, than the higher chain of the Taurus on the S.; their mean breadth may be 100 m. None of their summits seem to pass the snow-line; the highest which has been measured is Damaun-Tagh, the Mons Olympus of the

ancients, S. E. of Brusa, more than 9,000 ft. above the sea-level. The wide and extensive valleys which lie between the mountain-ranges of this tract contain much cultivated land, which sometimes extends, even on the gentle slopes of the mountains themselves, whose higher parts are used as pastures, whilst nearly the whole of Mount Taurus is only available for the latter purpose.

The country which lies between these two mountain-districts, and the meridians of Cæsaria (35° 30') and Kutahya (30° 20'), is, properly speaking, a plain whose elevation has not been determined, but it does not seem to be much above or below 2,000 ft. above the sea. Its surface is not every where level, but it exhibits extensive level plains, and the ranges of hills which occasionally occur do not occupy much space, nor are they commonly much elevated above their base. The soil is dry, but not sandy; and, along the water-courses, or where water for irrigation can be got, rather fertile; but the tracts where no water can be procured are very extensive, and serve in winter as pasture grounds to several nomadic tribes, who in summer retreat to Mount Taurus, or the high-lands E. of Cæsaria: even the fertile tracts are not cultivated, because exposed to the continual robberies of these tribes. The soil in the S. districts is strongly impregnated with nitre and other salts, and hence in these parts a considerable number of lakes occur whose waters are salt, and from which great quantities of salt are procured. These lakes have, as is commonly the case with salt-lakes, no outlet. The most important of the rivers which drain this table-land is the Kiliz-ermak, which rises at a short distance E. of Sivar, and runs 200 m. westward, and afterwards nearly 300 m. N. E. and N. It is the Halys of the ancients.

The table-land seems to extend even W. of the meridian of Kutahya, but in these parts its surface begins to be broken in hills and dales. The hills seem to increase in height, as they proceed westward, and the valleys to sink deeper, and to become wider. Both the hills and valleys continue to the shores of the *Ægean* Sea, which is indicated by the indented sea coast, which consists of boldly projecting promontories and deep bays between them, forming excellent harbours. This is by far the best portion of Asia Minor, the cultivated land extending over the valleys, and on the sides of the mountains, and yielding rich crops of rice, cotton, and corn, whilst the gardens produce many kinds of excellent fruits. This region is also the most populous, and contains probably more than half the population of the peninsula.

9. *Soristan, or Syria*, which unites the table-land of Nadoli with that of Arabia, is a country which has a very peculiar physical constitution. Two elevated ranges run from its northern extremity (37° N. lat.) through its whole length, and terminate on both sides the Gulph of Akaba (28° N. lat.), the farthest east of the two gulphs which the Red Sea forms at its northern extremity. But both mountain-ranges, with the intervening valley and the adjacent shores of the Mediterranean, occupy only a space from 60 to 70 m. across. The most easterly of the two mountain-chains lowers considerably soon after having branched off from the Alma Tagh; and in the parallel of Aleppo (35° 10' N. lat.) it sinks down to hills of moderate elevation, nor does it rise much higher until it reaches 37° 20', where it rises to a considerable height, probably 5,000 ft. and more: it is called Jebel Asharki, the Antilibanus of the ancients. It preserves a considerable elevation as far S. as 32° 55', where it lowers again, but soon widens in an extensive mountain-region, called El Kura, which extends to 32° 10'. Hence it continues as a rocky ridge of moderate elevation on the eastern side of the Dead Sea, to its southern extremity N. of the Gulph of Akaba. The western range is much higher at least in the northern districts. As a high mountain-range, it skirts the eastern sides of the Gulph of Iskenderoon, and at some distance S. from it is broken by the river Aazzy (Orontes), but S. of that river it again rises to a considerable elevation. Its highest portion, however, is between 34° 30' and 33° 20': this is the famous Libanus of the ancients, its northern and more elevated portion still retaining the name of Jebel Libân; but towards the S. it is called Jebel el Drus, from its being inhabited by the Druses. The highest summits of the Jebel Libân are always covered with snow, and that which bears the name of Jebel Makmel (34° 12') attains to 12,000 ft. above the sea. S. of 33° 20' the mountains sink much lower, and these low ridges continue to its southern extremity, on the rocky peninsula between the Gulphs of Akaba and Sues. Near the most southerly point they terminate with the stupendous and famous mountain-mass of Mount Sinai, whose highest summit is probably more than 9,000 ft. above the sea.

The valley, which extends between the two ranges, has nowhere a great width. N. of 33° N. lat. it may vary between 8 and 20 m., but is much wider N. of 34° N. lat. than between the two ranges of the Libanus

From the southern extremity of the Dead Sea, to the Gulf of Akaba, it is reduced to a narrow, rocky, and waterless cleft in the mountains, probably not more than 1 m. or 1½ across. The northern and wider part of the valley is watered by the river Aazay (the Orontes of the ancients); the middle and highest part, lying between the two ranges of the Libanus, by a small river, the Liettanie: this district is probably 2,000 ft. above the sea. S. of the Liettanie, the valley is watered by the Jordan, which traverses the Lake of Tiberias, and empties itself in the Dead Sea, after a course of about 100 m. The Dead Sea, called by the Arabs Bahr-el-Looz, is about 50 m long, and nearly 15 m. broad where widest; it is remarkable for the asphalt or bitumen found on its shores, and for the remarkable events and associations connected with its history.

Between the western mountain-range and the shores of the Mediterranean, are some extensive plains, S. of 33°, where the country for many miles inland is low and sandy, but without harbours. Between 33° and 35° is the country of the ancient Phœnicians, lying between the sea and the Libanus. The whole tract from the sea to the mountains is filled with hills, and, in advancing to the shores, these hills form numerous small harbours: the country further N. is of the same description.

The southern part of the region just described is nearly desert. S. of the Dead Sea the surface is mostly nothing but bare rocks, destitute of vegetable mould and water. It is therefore called Arabia Petrea, or Stony Arabia. N. of it is Palestine, whose plain towards the Mediterranean is nearly a desert, on account of its sandy surface: but the higher portion, between this plain and the Jordan, is rather fertile, where cultivated, though some districts have a stony soil. The valley of the Jordan is not distinguished by fertility. The country W. of the Libanus is more fertile, especially along the range, and in its small valleys, and even on its declivities: but on its side some of the valleys are sterile, and the E. declivity of Libanus is a naked rock. N. of Libanus the country improves and is in general fertile, and partly well cultivated. E. of the mountain-range is the Syrian desert, which belongs to the great depression in the interior of Western Asia; but this desolated country does not advance to the foot of the ranges: it is divided from them by a tract of most fertile country, intermixed with sandy spots. This tract may be 50 or 60 m. across, but it becomes more sandy and sterile in advancing further E.

10. *Arabia* is a table-land of considerable elevation, but we are unable to determine the line where it begins to rise from the low plain of the Syrian desert. Probably this line is a good way S. of the caravan road leading from Damascus to Bussorah, but not far from a line drawn from the most northerly corner of the Gulf of Akaba to the mouth of the Euphrates. The table-land rises abruptly on the other three sides, at a distance of from 3 to 40 m. from the sea, except along the northern coast of the Gulf of Persia; to which it descends with a gentle declivity. The low narrow border, with which the table-land is encompassed on all sides, is called the Tehama, and the table-land itself Nejd, or Nedjed. The rocky and uneven border, which divides the Nejd from the Tehama, is mostly called Jebel (mountain), or Hedjaz.

The Nedjed is divided into two parts by a rocky ridge, which cuts the Tropic Circle with an angle of about 30°. It begins on the W. near 25° N. lat., and terminates near the Gulf of Persia, near 25°. This ridge, called Jebel Aared, divides the table-land into two parts, of which the southern is nearly a complete desert, and seems almost uninhabited. North of the Jebel Aared, sand also covers by far the greater part of the Nedjed, but is in numerous places interspersed with rocky tracts and some hilly grounds; where, during the rainy season, water collects and forms small streams, by which these tracts become inhabitable, and even fit for the culture of some kinds of grain: especially dhoura, a kind of millet. There occur also extensive plantations of fruit-trees, especially date-trees. The sandy desert which separates these inhabitable spots is also covered, after the rainy season, with grass and flowers, and the Bedouins, or wandering Arabs, find there all the year round subsistence for their horses, camels, and sheep. It has not been determined to what elevation above the sea-level any part of the Nedjed rises, but its cold climate in winter seems to indicate that it exceeds the general elevation of the table-land of Iran, though probably not that of Ghilni or Kelat.

The Hedjaz, or rocky edge of the Nedjed, is narrow N. of the Tropic, where it probably never exceeds 15, or at the utmost 20 m., except in two or three places where it is contiguous to a rocky district of the Nedjed. S. of the Tropic it considerably widens, and here its mean breadth may be about 50 m.: S. of Mekka the Tehama and Hedjaz together extend more than 100 m. from the Red Sea. The Hedjaz resembles much the rocky tracts enclosed by the Nedjed, except that water is

more abundant, and that therefore it is better adapted to agriculture. In it are extensive plantations of coffee.

The low plains of the Tehama have a sandy soil, which it is supposed has been deposited by the sea along the foot of the great mountain-mass, by which the Hedjaz and Nedjed are supported; and it is maintained that it is still increasing in width. As it does not rain, frequently for many consecutive years, it could not be cultivated but for the watercourses, which, during the rainy season, descend from the adjacent Hedjaz. Irrigated by them, with the addition of some artificial means, these sultry dry plains yield good crops of some kinds of grain, and are rich in fruits, dates especially.

11. *The Plain of the Euphrates* comprises the whole of the great depression in the interior of Western Asia, except that portion which is occupied by the Gulf of Persia. Its northern boundary is formed by that range of mountains which, on the W. of the Tigris, begins a little above Mosul, and running westward near the towns of Mordin and Orfa, terminates on the banks of the Euphrates, near Rumkoka. On the W. it is bounded by the table-land of Iran, on the E. by the mountain-region of Syria, and on the S. by the northern declivity of the Nedjed. That portion of it which lies contiguous to the Nedjed and Syria, up to the eastern banks of the Euphrates, is a complete desert, mostly covered with sand, and subject to the pestiferous mist of the *simoom* or *samsel*. It is, however, inhabited by some wandering tribes of Arabs; and through it run the roads which lead from Aleppo and Damascus to Bussorah. It is called the Syrian Desert. It spreads even beyond the Euphrates to a considerable distance from the river in its middle course, where its banks are hardly better inhabited than the desert itself. In the northern districts of the plain sand also prevails, but it is frequently interspersed by extensive tracts of rocky ground; and as these patches have commonly mould on them, they are cultivated and planted with trees. This tract, through which runs the road from Aleppo to Bagdad, extends on the banks of the Tigris to the last-mentioned place. S. of Bagdad the country between the two rivers is fertile, well irrigated, which is done by water derived from the rivers themselves, and from several canals; but those tracts, which lie to the E. and W. of these rivers, are only cultivated along their banks, sandy deserts beginning at a short distance from them. The two rivers, which water this great plain, the Euphrates and Tigris, rise nearly in the same parallel, between 38° 30' and 39° 30' N. lat., on the declivities of the same mountain-range in Armenia; but the Euphrates, running first W., has already had a course of 500 m. before it arrives at the parallel of the sources of the Tigris. It then by degrees turns S.E., and continues in that direction, approaching gradually nearer to that river, and unites with it about 100 m. from its mouth. The united river is called the Shat-el-Arah, and falls in the northern extremity of the Gulf of Persia.

12. *Mount Caucasus*, which at present is considered as the boundary between Asia and Europe, does not constitute a part of the table-lands and mountain-regions of Western Asia, being separated from the mountain-masses of Armenia by a kind of valley, about 100 m. across. This valley is a level plain, where it approaches the Caspian Sea, and at a distance of about 100 or 150 m. from it. Farther W. the surface of the valley is hilly, intermixed with some undulating plains, of moderate extent. It rises in higher hills, between 43° and 44° E. long., where a ridge of low mountains forms the watershed between the river Kur (the Cyrus of the ancients), and the Rioni (the Phasis of the ancients). The most westerly district of the valley, which is watered by the Rioni, is almost entirely filled with hills, the valleys and level tracts occupying only a small part of its surface.

Mount Caucasus itself rises from this valley, with a rather steep descent, and forms a continual mass of high rocks, running from E.S.E. to W.N.W., from the shores of the peninsula of Absheron, on the Caspian Sea, to the small town of Anapa on the Black Sea, a distance hardly less than 700 m. Its width does not exceed 130 m. where widest, and hardly more than 60 or 70 m. where narrowest. This mass of rocks covers 56,000 sq. m., or nearly the surface of England and Wales. Its highest summit, Mount Elbrooz, or Elborus, attains an elevation of 17,785 ft., and is situated nearly in the centre of the range. The portion of the range, which extends W. of that high pinnacle, nowhere rises to the snow-line, but several snow-peaks occur to the E. of it, among which Mount Kasbock is 14,500 ft. high. Traces of agriculture are met with in but few of its valleys, the inhabitants living almost exclusively on the produce of their flocks. This mountain-system is remarkable for the great number of nations, belonging to different races, which inhabit its elevated valleys. At both extremities of Mount Caucasus are places, where the soil is impregnated with naphtha or bitumen, especially in the peninsula of Abcharen.

13. *The Islands of Asia.*—The *Alutian* islands, which extend between the peninsula of Kamtschatka and the peninsula of Alaska in America, as well as the *Kuril* islands, which lie S. of Cape Lopatka, and terminate near the eastern shores of Japan, are of volcanic origin, and in some of them are still found active volcanoes. Their soil is mostly rocky, and destitute of wood, but the most southerly islands of the last-mentioned group are cultivated on the lower grounds.

The large island, which, between 45° and 55° N. lat., extends along the coast of Manchouria, called *Sakhalien*, *Tsarakai*, or *Karafu*, is very little known, except that it forms an enormous mass of rocks, which rise towards its centre probably to the height of 3,000 or 4,000 ft., and perhaps even higher. It is mostly destitute of trees, and no part of it is cultivated: its scanty population subsists on the produce of their fisheries.

The islands of *Japan*, consisting of four large (*Yezo*, *Niphon*, *Sikokuf*, and *Kiotsioo*) and a considerable number of smaller ones, are also formed by immense masses of rocks, which, especially on Niphon, rise above the snow-line. In most places the steep or gentle declivities of the rocks extend to the very shores of the sea, but at others plains of considerable extent extend between them. Though the soil does not seem to be distinguished for fertility, but is rendered productive by great care with which it is every where cultivated; corn-fields extend on the slopes of the mountains to a considerable elevation. In many districts the surface consists of lava.

The island of *Formosa*, divided from the continent by a channel about 70 or 80 m. wide, extends from N. to S. more than 200 m. Its southern extremity is a level, but not of great extent, for not far from it rises that mountain-range which traverses the island in its whole length, and which in its higher parts seems to attain an elevation of from 10,000 to 12,000 ft. above the sea. Its valleys towards the western shores, and the small level spots which occur along the sea, are fertile and well cultivated. The country E. of the range is not known.

The island of *Hainan*, near the S. coast of China, is separated from the mainland by a strait hardly more than 10 m. across. It extends from S.W. to N.E. more than 180 m.; its average width is about 100 m., or somewhat more. In its centre rises a mountain-mass to a considerable height, from which some lateral ridges branch off, but they do not reach the shores, except in some parts on the E. coast. Every where else a low flat country separates the mountain from the sea. The flat districts are either sandy, or covered with grass and without trees, like the savannah; in some places they are cultivated and fertile, as are also the valleys.

The extensive group of the Philippines, which lies between 10° and 60° N. lat., comprises more than 100 islands; of which, however, most of the smaller ones are uninhabited. Most of them are mountainous, and the smaller ones are covered with rocks; but the larger islands contain many plains of considerable extent, and of a very fertile soil. They are well watered—perhaps too much so: some of them are volcanic.

The *Sooloo* islands, between Magindanao and the eastern coast of Borneo, have a rocky and uneven soil, but it is very fertile, being covered with a thick vegetable mould. But the large island of Palawan, lying farther N., is a rocky mass, rising in the middle to a high range, in which some summits attain a great height. The rocks are commonly bare; in some parts the sides of the mountains are covered with trees, but agriculture is confined to a few small spots on the coast.

Borneo, the largest of the Asiatic islands, and not much inferior to France in extent, is nowhere mountainous except in the peninsula which projects N.E. from the main body of the island; and even there, as it appears, the mountains do not attain a great elevation. The remainder, which comprises at least four fifths of its whole surface, seems to be a plain, on which a few ridges occur at great distances. This plain has an alluvial soil, to a distance of several miles from the shores, and afterwards the country rises gradually, perhaps 200 or 300 ft. The whole of this plain, as far as it is known, seems to possess great fertility; and the want of culture, which every where is visible, is probably the effect of the too great abundance of water, as the island is subject to continual rains. All kinds of productions and fruits, commonly met with between the tropics, grow to perfection.

The island of *Celebes*, divided from Borneo by the Strait of Macassar, is traversed by four ranges of mountains, which, however, do not attain a great elevation, except where the four mountain-ranges and the four peninsulas, of which the island consists, meet together; in this part the mountains are of considerable height. The surface of the whole island is hilly or mountainous, the flat tracts along the coast being of small extent. Its soil is rather sandy, and not distinguished by fertility. Its produce in rice is not equal to the consumption of the inhabitants; but it produces many tropical fruits, and *sago* in great abundance.

The *Moluccas*, lying W. of Celebes, consist of some hundred of smaller and larger islands, divided in several groups between 5° N. lat. and 8° S. lat. They rise mostly with a steep ascent from the sea shore, but rarely to a considerable elevation. Many of them seem to owe their origin to volcanoes; and on eight still exist volcanoes, in activity. Their soil, though mostly sandy and stony, is fertile, and particularly adapted for some productions. Amboyna has large plantations of cloves, and the Banda group furnishes muscat nuts and mace. The culture of rice and other grains is very limited, as the soil seems not favourable to their growth; but this want is supplied by the extensive plantations of sago-trees.

That series of mostly considerable islands which begins on the E. with the island of Timour and terminates on the W. with that of Bali, including the islands of Rotti, Savoo, and Sandelbosh, which lie S. of the series, are called by geographers the *Lesser Sunda Islands*, to distinguish them from the group of the *Larger Sunda Islands*, comprising Borneo, Celebes, Java and Sumatra. The Lesser Sunda Islands are mountainous; and in some of them the mountains rise to 8,000 or 9,000 ft. above the sea, and probably higher. Several of them are active volcanoes, which frequently interfere with the view of the island, and which are situated. We are not well acquainted with these islands, nor with the degree of fertility they possess; but from the few indications we have received, it may be inferred that, in general, they are as far from being sterile, as from an exuberant productiveness. Many of the tropical productions grow to perfection.

Java, the most important of the islands of the Indian Ocean, is properly a continuation of the former series. It extends in length nearly 700 m., but its breadth hardly exceeds 100 m. where widest. A continuous chain of mountains runs through the island in its whole length, lowering more rapidly towards the N. than the S., where the coast is high and nearly inaccessible. Some summits of this chain rise to more than 12,000 or 13,000 ft. The highest are the Semeoro and Tagal. Most of these summits are volcanoes, either extinct or still active, and their frequent eruptions have in later times laid waste several districts. The more fertile tracts lie along the northern shores, which are low, and from which a flat country extends several miles inland. Their fertility is very great, and they produce rich crops of every kind of grain or roots cultivated between the tropics. But part of these flat lands are so low and so badly drained, that they are converted into swamps during the rainy season. Some tracts preserve their swampy soil all the year round; and hence arises the insalubrity of these coasts.

Sumatra, only second to Borneo in extent, is 900 m. long and from 150 to 230 m. wide. In its length it is traversed by a mountain-chain of great elevation, several of its summits exceeding 12,000 ft. of elevation; Mount Ophir exceeds 13,000 ft. Many of these summits are volcanoes, but most of them appear to be extinct. The volcano Gunong Dempo is more than 11,000, those of Ber Api and Barawai more than 12,000 ft. high. The declivities of these mountains extend in many places to the western shores, which therefore afford several good harbours. The eastern shores are flat and sandy, and the adjacent plains extend in some places 100 m. and more inland. Some tracts of these plains are swampy, and others sterile and covered with sand. Still a great part of its surface is fertile, and affords many valuable productions. The western districts, being more uneven and consequently better drained, are more fertile and much more healthy. In the extensive woods, which cover the declivities of the mountain, the camphor-tree is frequent, and yields the best camphor. From the eastern shore extensive shoals extend far into the Straits of Malacca, and render the navigation tedious and difficult. East of this island, and towards its southern extremity, is the island of Banca, famous for its inexhaustible mine of tin.

Ceylon, divided from the peninsula of the Deccan by the Gulf of Mannar and Palk Strait, is from S. to N. 280 m. long, but its greatest breadth does not exceed 140 m. In the middle of the island, and towards its southern extremity, on both sides of 7° N. lat., is a mountain-mass, which extends over nearly an eighth part of its surface. The mean elevation of this mass may exceed 1,000 ft. above the sea, though some of its more elevated valleys rise to nearly 4,000 ft. This mountain-mass is overtopped by several high summits, among which the Adam's Peak attains 6,150 ft.; but Pedirigallala, the highest pinnacle, is 8,280 ft. above the sea. This mountain-range is surrounded by a hilly country, to a distance of 10 or 12 m. and more. Its mean elevation above the sea varies from 400 to 1,000 ft. This hilly region may in some degree be said to extend to the very shores of the sea in the S. districts; for the country contiguous to the coast between Batticaloa, on the E. coast, and Negumbo, on the W., is not level and undulating, and the coast itself is rather high. The northern half of the island is a level plain

and it is supposed, that even in the interior, it does not rise above 300 ft. Its coast is every where flat and sandy, and remarkable for the great number of lagoons, with which it is skirted. These lagoons increase in size during the rainy season, so as to flow into one another, affording an inland navigation for boats, in some places for 60 or 80 miles. Along the whole of the eastern coast, from Point Pedro to Dondrah Head, and hence to Negumbo, the sea is deep, and may be navigated by vessels of any burden; but the W. coast, N. of Negumbo, as far as Point Pedro, is surrounded by a shallow sea, in which only vessels of 100 tons can be used, and the common vessels employed in this trade vary between 25 and 50 tons. The fertility of the island is very great; sandy tracts indeed occur, but they are not extensive, and produce commonly good crops, when irrigated. Swamps, which in the other islands of the Indian Ocean, cover great tracts of the low country, are rare in Ceylon, and of small extent.

II. BOTANY OF ASIA.—Temperature, soil, humidity, and light are the principal agents in the geographical distribution of plants. These elements exist under greater variety in Asia than in any other region; and hence the amount and diversity of Asiatic vegetation are absolutely without a parallel. It is not alone the extent in lat. of this vast continent, though stretching from the equator to the highest N. parallels; it is not simply the different elevations of its surface, though of these the greatest and least are respectively 27,000 ft. above and 110 ft. below the level of the sea; it is not even the abundance of water in one district, and its almost total absence in another,—which will or can account for this amount and diversity. Powerless as are these causes in influencing the physical conditions of any region, one still more powerful exists in Asia; viz. the very peculiar nature of its conformation. The centre is a high table-land, varying from 6,000 to perhaps 15,000 ft. of elevation, bounded on every side by high mountains, which effectually shut it out from the sea, and on the exterior sides of which the kingdoms of Asia are arranged in every variety of inclination. The difference of aspect thus induced, still more than either lat. or elevation, serves to divide the whole continent into 5 great botanical regions, which, however subject to sub divisions among themselves, are distinguished from each other by peculiarities as striking as though the Atlantic or Pacific rolled between them. N. from the great table-land, the vast country of Siberia slopes to the Arctic Ocean. The intensity and duration of the cold in this dreary region prevent the thriving of any but the most hardy plants, except in the S. districts; where, in addition to the effects of lower lat., vegetation is protected by mountain ranges, which screen it from the freezing N. E. winds. The oak and hazel are found in Daouria, on the border of the country of the Manchoes (*Gmelin, Flor. Sib. i. 50.*); but their size is diminutive, their vegetation languid; nor are they met with in any other district N. of the Altai Mountains. (*Pallas, Flor. Russ. i. 3.*) Yet the well watered lands of S. Siberia abound in thick forests, consisting of birch, willow, juniper, maple, ash, pine, alder, fir, larch, poplar, aspen, and elm trees. (*Gmelin, l. 150–180. iii. 150.; Pallas, Flor. Russ. i. and Voy. en Russ., pass.*) Of fruits there are the Siberian cedar (*Pinus cembra*), the nut of which is an article of commerce; 2 or 3 species of raspberries, blackberries, and other bramble fruit; a species of cherry (*Prunus fruticosus*), from which is distilled a wine; bilberries, whortleberries, and the Siberian apricot. *Gmelin* (lib. 173.) gives a list of 4 species of currants; and *Pallas* (*Flor. Russ. i. 20–23.*) one of 5 species of pears; but the fruit of these is valueless, with the exception of one species of currant, which is confined to the banks of the Argoon, a tributary of the Saghalien, in the S. E. corner of Daouria. During the short but powerful summer, the Siberian soil is covered with flowering and fruiting plants in immense profusion. (*Gmelin and Pallas, passim.* See also *Grew's Phys. Geog.* vol. iii.) But these, as well as the timber, gradually diminish towards the N.; till above the 60th parallel scarcely any thing remains but the hardy beech and a few of the more vigorous lichens and mosses. *Gmelin* remarks (*Præf.* xliii.), that vegetation undergoes a marked change E. of the Yenisei; and, as it is a well-known fact that temperature decreases towards the E., it is not surprising that this should be the case; but the unproductive nature of the soil seems to have been overrated; for, in 1830, an agricultural society was founded at St. Peter and St. Paul, in Kamtschatka, from whose paper (of Nov. 20. 1830) it appears that the return of wheat, raised in that district, was 13 $\frac{1}{2}$ for 1, of rye 21 for 1; and that the cultivation of buckwheat, Himalaya barley, and other grains had proved equally successful. The potatoe, cabbage, onion, beetroot, chicory, and melon had also thriven; and though the cucumber had failed, its failure was owing not to the impracticability of the soil, but to the vines having been destroyed by rot.

The second botanical kingdom of Asia is contained in

the great central table-land itself. This is unquestionably the highest and most extensive plateau in the world, having for its bearers the mountains of Altai and Yablonoi to the N.; the Manchoorian mountains E.; the Himalayas and the mountains of China to the S.; and on the W. the Beloi Tagh, the Elburz, and the Persian mountains. Lying at a great though not equal elevation, bounded and intersected by lofty mountain ranges, and without a single natural outlet to the ocean, the climate, soil, hydrography, and general physical features of this vast region (occupying more than 2-5ths of Asia), are all of a very peculiar kind. The characteristics of the first are dryness and coldness; the second consists of a dry sand, sometimes broken by patches of verdure, at others stretching out into immense deserts, like that of Gobi or Shamo; and the water system consists of lakes without outlets, the final recipients of many rivers, some of them very respectable for length and magnitude. Many of the streams are, however, absorbed in the sandy soil. From these circumstances it may be reasonably imagined that the vegetation is also peculiar; but unfortunately little is known upon this subject, and the investigations of Rubruquis, Marco Polo, and others in the 13th century, and of the Jesuit missionaries in the 17th, were till very lately the only sources from which knowledge could be gained; and though Lord Macartney (*Embassy to China*) and Timkouski (*Voyage à Péking à travers la Mongolie*) afford more recent, they scarcely afford more extensive, information concerning a region which is still, in a great degree, a terra incognita to science. Wood of all kinds is extremely scarce in these high and consequently bleak regions; the nomadic inhabitants use the dung of their cattle for fuel (*Du Halde, iv. 18.*), and similar materials not unfrequently serve for the groundwork of their gilded idols. (*Marco Paulo, lib. l. c. 49.*) On the S. slopes of the table-land are found oaks, aspens, elms, hazels, and walnut trees; but all, even on the immediate confines of China, diminished to mere shrubs; while on the high lands and N. slopes of the same frontier the only wood consists of some wretched thorny brambles. (*Lord Macartney, ii. 200.*) This remarkable absence of timber throughout so great an extent of country is owing, probably (even more than to the nature of the soil), to violent and cold tornadoes, which are extremely frequent, especially during the summer. * (*Carpin, cap. xvi. art. 1.*) In the N. parts of Mongolia the timber approaches in character to that of S. Siberia, but is still very inferior both in kind and quantity. (*Timkouski, l. 44. ii. 290. &c.*) Considering the vast number of beasts that traverse these plains (see *Zoology*), there must be, notwithstanding the extensive deserts, a great variety of grazing herbs and grasses; but except in the E. (*Timkouski, ii. 220.*) agriculture is not practised, and the vegetable food of man unknown. The natives live exclusively on flesh and milk (*Carpin, cap. xxvi. art. 4.; Rubruquis, cap. v.; M. Paulo, liv. l. cap. 57. &c.*); and when questioned as to why they so totally neglect the earth, their reply is, that "God made herbs for beasts, but the flesh of beasts for men." (*Du Halde, iv. 32.*) Timkouski saw in the N. parts of this region red currants, peaches, hemp, and flax, all growing wild. (ii. 290.) There is also here a very remarkable fungus, culled, from its resemblance to the animal, the Tartar lamb; and there can be little doubt but that the flowering and aromatic plants of this region are numerous and peculiar.

The E. slope of the table-land, comprising the basin of the Saghalien (or Amoor) and other great rivers which flow into the Pacific Ocean, forms the third great kingdom of Asiatic botany; and is, in every respect, strongly contrasted with its immediate neighbour. Here are immense forests; so extensive that it required 9 days to traverse one of them, and so thick that it was necessary to kill a bear in order to take an observation of the sun's meridian. (*Du Halde, iv. 7.*) The cold is very severe to as low a lat. as 43°; and consequently the trees are to the kind usually met with in the more N. parallels of Europe. Of fruits, this district possesses apples, pears, nuts, chestnuts, and filberts, all in great abundance; and of grain, wheat, oats, and millet, are produced, together with a peculiar species, unknown in Europe, called *mai-se-mi*, partaking of the nature of both wheat and rice. Rice itself is grown, though in no great quantities; and, in fact, from the little that is known of this great region, it would appear that there is no large district of the earth better adapted for the residence of an agricultural population. Its capabilities are, however, wholly neglected by the Chinese government; while the natives of the soil (the Manchoes), though they do not, like the great majority of the Mongols, utterly neglect the pursuits of husbandry, yet, in general, they may be described as a race of hunters, resembling strongly in habits and manners the aboriginal inhabitants of America. The cotton shrub grows here;

* Timkouski (i. 609.) remarks the frequency of these winds, but denies their violence.

but owing to the low temperature (the lat. being remembered), it does not thrive well. Esculent roots of very many kinds are, however, plentiful; and the medicinal herb ginseng is found nowhere but in this country and N. America. The Chinese believe this plant to be an infallible remedy for every disease, mental and bodily; and it is sought amid incredible fatigues and dangers by parties who are marshalled under officers, almost in the number of an army. Ginseng has no reputation with European physicians, but this may arise from their having used the American species only, which the Chinese declare to be greatly inferior to their own. One attempt was made, by the Jesuit Lourino, to raise the Asiatic plant in Europe; but the result was a complete failure, the seeds, though sown under circumstances of soil and temperature precisely resembling those natural to them, refusing to germinate. Some parts of the soil are swampy and full of wild desert marshes; but sand is almost unknown, and, in general, the ground bears a strong resemblance to the best parts of N. Europe in the thickness and vivid colouring of its grasses, and the variety of its flowering plants. It is a curious fact that the roses, lilies, and other flowers of this part of Asia, excel greatly those of Europe in beauty, but are very deficient in point of odour. The pines and oaks that clothe the mountains are of great size, but diminish rapidly as they approach the sea. (*Du Halde*, iv. 6-7. &c.; *La Perouse*, iii. 16, 17. 21. 75. &c.; *Müller*, *Bot. Diet.* iii. art. *Pamir*.)

The three foregoing districts of Asia, though very extensive, are each remarkably uniform in their productions and general physical appearance. It is true they are comparatively little known, and future discoveries may, it is not unlikely, bring to light many and important deviations from this uniformity; but, at present, wherever surveyed, the variations in different parts of each have been of degree, not of kind; and whatever peculiarity of vegetation marks any one part of the region, appears to mark the whole, and to distinguish it from both its adjoining neighbours. The case is different on the W. slope of the great table-land, the fourth botanical kingdom of Asia. This region is uniform as far W. as the deep depression of the Caspian Sea, but beyond this all becomes changed: the face of the country, the direction of the rivers, the natural productions, every thing constituting the physical geography of a region, puts on a new appearance; and the Caspian seems placed by the hand of nature on the precise spot where it could most decidedly mark the limits of two large districts possessing few things in common. The great plain of Tartary (the only true W. slope from the table-land) is very productive in its K. parts; that is, in the countries of Kokhan, Badakshan, and Bokhara. The description of Ebn Haukel, an Arab geographer, is particularly vivid. "The cultivated plains of Bokhara," he says, "extend above 13 farsang by 12 farsang; and the Soghd (the *Sogdiana* of ancient geography) is for 8 days' journey full of gardens, and orchards; corn fields and running streams, reservoirs and mountains, both on the right hand and the left." (*Quincy's Trans.*, 237.) Corn of all kinds and rice are here very prolific; so much so, that, according to Huedi Khalifa, a field of one or two *dunen* (acres) is amply sufficient to support a family. (*D'Herbelot*, 207.) Of fruit, grapes, melons, pears, apples, figs, &c., grow to such perfection, and in such abundance, that they are exported to Persia, and even to the more fertile region of Hindustan. The pasture grounds are also extremely luxuriant; but it may be gathered that timber is scarce, and the whole country deteriorates as it recedes W. and N. The soil of the Kirghiz country N. of the Sihon is chiefly of a saline character; but the pasture may still be good, since immense numbers of animals, wild and domestic, are fed in the extensive steppes. Trees of the hardier kinds, larch, beech, and fir, appear also on the banks of the rivers. (*Pallas*, i. 618. 630. &c.) In journeying W. the country for a time exhibits the extremes of richness and desolation (*Barnes*, i. 33.), the former, however, gradually diminishing till the whole soil becomes wretched unproductive sand, except in the immediate neighbourhood of rivers. (*Barnes*, i. 10. 16. 46. &c.) There is not, perhaps, in the world a more sterile district than that between the Aral and Caspian Seas. In the countries W. of the latter, a strange contrast is presented: on the N. slopes of the Caucasus, indeed, a constantly deteriorating country terminates at last in the wretched wastes of Attrakhan; but even here corn fields and rich pasture grounds dispute the soil with the tamrisk, the camel's thorn, the alyssanthum, and other desert plants: while on the E. W., and S. declivities of the same mountains, magnificent forests of cedars, cypresses, savins, red junipers, beeches, oaks, &c., flourish in great luxuriance; while of fruit, the soil

boasts the almond, fig, peach, quince, apricot, pear, date, jujube, olive, &c.; and of flowers, the rhododendron, Christ's thorn, ponticum, asolia pontica, laurel, seringa, jessamine, lily, Caucasian rose, and a whole host of others. The bread corn and the most useful roots are also produced in most parts of this mountainous country. (*Guldenstadt*, *Com. Petrop.* xx. 49. 335. 483. &c.; *Pallas*, ditto, 1779, li. 274.) With regard to Asia Minor, Mesopotamia, and Syria, it is impossible to give within any reasonable limits the slightest sketch of their numerous productions; though the two last be partially desert, and their deserts be of the most sterile character, yet their fertile spots are scarcely inferior to any on the earth's surface. Rice and barley yield a return of 100 fold; the cotton shrub flourishes; and indigo, sugar, and tobacco are among the useful productions. Lemons, oranges, tamarinds, apricots, dates, and grapes are a very few among the fruits of these regions; which produce in great abundance also nearly all the esculent roots, pulses, and grains. Wood is extremely scarce in Mesopotamia (the date palm is the only tree known there); but in Syria the majestic cedar of Lebanon maintains the fame which it acquired in the days of Jewish greatness; while majestic oaks, cypresses, planes, acamores, savins, olives, mulberry trees, pistachios, junipers, and fig trees clothe the sides of the Anatolian and Syrian mountains, and spread their arms over plains where flourish almost every species of flowering roots and shrubs. Among the oaks of Asia Minor is the *Quercus infectoria*, the gall of which is an important article in dyeing. The pistachio is rarely found beyond the neighbourhood of Aleppo. (*Vatney*, ii. *passim*; *Nesbiter*, *Voy. en Ar.* ii. 250. &c.; *Oliver*, iv. 26. 124. 197. &c.; *Leake*, *passim*; also in *Walpole*, ii. 202. &c.; *Belon*, 79. 156. 166. &c.)

The fifth kingdom of Asiatic botany remains to be noticed. It comprises the S. slope of the central plateau, and contains the three great peninsulas of Arabia, India, and Malaya, together with the extensive territory of China proper and the S. shore of Persia and Beloochistan.* The W. part of this region is badly watered (see ARABIA, LANISTAN, BELOOCHISTAN); and consequently consists chiefly of deserts, or of pasture grounds depending on rain for their fertility. The vicinities of the few and small rivers are, however, even here, crowded with vegetation; and from the Indus eastward (where the hydrography is on a scale of the most profuse luxuriance) a district is comprised unequalled for the abundance and variety of its productions, by any other part of the world. Nearly every plant of the E. continent is indigenous, or can be raised in some part of S. Asia. The following is an imperfect list of the trees alone; and these are not, in general, confined to particular localities, but, in most cases, spread over the whole region:—

Forest Trees.

Bamboo.	Fir.	Oak.	Pear.
Burch.	Parach.	Pine.	Tenk.
Chestnut.	Mangrove.	Plantain.	Willow.
Cypress.	Myrtle.		

Hard Woods.

Aloe.	Ebony.	Lingon.	Sandal-wood.
Eagle-wood.	Iron-wood.	Rose wood.	

Fruits.

Almond.	Citron.	Junboo.	Peach.
Apple.	Correa.	Lemon.	Pear.
Apricot.	Coffee.	Lime.	Plum.
Banana.	Date.	Mangostin.	Pomegranate.
Banyan.	Dunon.	Mulberry.	Shaddock.
Betel.	Fig.	Olive.	Tamarind.
Bignonia.	Guava.	Orange.	
Bread Fruit.	Guava.	Pandanus.	Walnut.
Cashew.			

Spice Trees.

Camphor.	Cinnamon.	Mace.
Cassia.	Clove.	Nutmeg.

Many of these trees yield gums, resins, odoriferous blossoms, or are otherwise useful beyond the generality of their class. There are also several species which cannot be conveniently classed under either of the four foregoing heads; as the champluka, malor, and the tanjang, flower-bearing trees; the touki, from the bark of which the Alacates manufacture a paper; the fang, which yields a rich red dye; the tallow tree, which exudes an unctuous matter, whence its name; the upas, the most deadly of vegetable poisons; the cotton tree; and, above all, the tea plant.

The other kinds of vegetation are not less abundant. Grain of every kind, including 27 species of rice; and some varieties of dourra and barley, scarcely known in other

* The high lands of Persia and Caubul, though directly S. of Tartary, appear to belong naturally to the second kingdom; that, namely, of the central table land. They have the same physical conformation, the same peculiar hydrography and vegetation, and are connected with the Mongolian plateau by a mountain *isthmus* (the

Hindoo Koob), which divides the low levels of Bokhara and the Pamir, in a manner very similar to that in which the Atlantic and Pacific Oceans are divided by the mountain ridge of Panama. (See *MORICAND, CAUBUL, INDIA*, &c.)

regions, is grown with little labour to the cultivator, the richness of the earth in many places precluding the necessity and even the possibility of using manure, though 2 crops are produced annually. The leguminous plants now common in Europe came, in most instances, originally from S. Asia; but, in addition to the peas, beans, lentils, &c., there are here a whole host which have never found their way W., as the lotus, moon, murhus, tanna, tour, toll, &c. (See INDIA, CHINA, &c.) A root called katchill supplies the place of the American potato; but this last root, as well as the yam, is abundantly cultivated, especially in China and the E. peninsula of India. This is also the native home of the arrow-root, galanga, jalap, sarsaparilla, datura, anise, opium, and other drugs. The fields abound in flax, hemp, tobacco (a native plant, according to Lord Macartney, ii. 174.), together with flowers of every kind and dye; though it is remarkable that those of powerful scent are confined to the N. parts. The fine rice that yields the atar is rarely found S. of 20°; and is chiefly limited to the plains of the Upper Ganges and Penjab. (See LUCKNOW and CANTONMENT.) Dye plants are very numerous; the sugar cane grows luxuriantly; and among the numerous strongly odoriferous gums, attempts have been made to identify the spikenard, bellium, malabathrum, sapa-chra, and other precious ointments of the ancients, but without much success. (*Du Halde*, i. 14. &c., ii. 64. &c.; *Lord Macartney*, ii. 43, 165. &c.; *Crawford*, *Emb. to Siam*, *passim*; *Russell's Int. to Roxburgh's Plants of Coromandel*, 1-66.; *Finlayson's Mission to Siam*, *passim*; *Asiatic Researches*, and *Journal of Asiatic Soc. Beng. passim*.)

With regard to the number of species in each order of plants, it is to be remarked that Humboldt divides the Cryptogams as 1-15th of the whole vegetation for equinoxial plains; as 1-5th for equinoxial mountains; as 4 (on an average) for the regions of the temperate zone; and as the sole vegetation of mountains in polar lands. The same authority gives the Monocotyledons (of the old continent) as 1-5th for the torrid, 1-4th for the temperate, and 1-3d (on an average) for the frigid zone. (*Dict. des Sci. Nat. xviii.* 436.) De Candolle, following Persoon, makes the proportions somewhat different; namely (for the whole world), Crypt. 1-6th, Monoc. 1-6th, Dico. 4-6ths of the whole vegetation. (*Idem*, 398.) From these data, and the various authorities cited throughout this article, the following approximate Table of Asiatic Botany is deduced. But it is necessary to observe, that the absolute number of known species is very uncertain. In 1806, there were but 27,000; Brown's splendid addition of Australian plants increased the amount by nearly 1-6th, and since that time discovery has been rapidly at work. It may, however, be doubted whether the very love of science has not betrayed some of its followers into too nice distinctions. De Candolle thinks that Persoon's 27,000 species should be increased to 56,000, and that the number of plants yet unknown or unclassified would swell the list to 110,000 or 120,000 (*Dict. Sci. Nat. xviii.* 490.). Lindley is more moderate; he makes the gross number of species 86,000 (*Intro. to Botany*, 504.) That assigned in the table (44,000), is from Humboldt's data.

Orders.	Whole No. of known species.	Whole No. of known Asiatic species.	No. of species common to Asia and other regions.	No. of species peculiar to Asia.
Cryptogams	6,000	1,837	900	937
Monocotyledonous	6,909	1,950	875	1,075
Dicotyledonous	81,091	4,050	2,169	1,881
Total	44,000	7,837	3,941	3,894

III. ZOOLOGY OF ASIA. — Asia is the native home of all the more useful species of animals; with the exception, perhaps, of the sheep. From some district or other of this continent came, originally, the ox, horse, camel, goat, ass, together with the whole race of domestic poultry; except the turkey, which is a denizen of the New Continent. Utility may, indeed, be regarded as the leading characteristic of Asiatic Zoology; for though its carnivorous mammalia be numerous as compared with the whole number of species, the majority are not merely harmless to man, but in a considerable degree useful to him, consisting of several kinds of seals, and the fur-bearing quadrupeds of the north. Birds of prey are remarkably scarce, when the great extent of mountain land is taken into consideration; and of those existences which have little but peculiar or anomalous formation to distinguish them Asia is all but destitute. The truth of these remarks will be at once evident from the following tables, constructed, with as much care as possible, from *Cuvier's Règne Animal*; *Shaw's Zoology*; *Pennant's Hist. of Quad.*; *Genera of Birds*, *Arctic Zoology*, and *View of Hindostan*; *Du Halde's China*; *La Perouse's Voy-*

ages; *Georg's Geog., Phys. and Nat.*, vi. and vii.; *Pallas's Spicilegium Zoologicum, Travels*, &c.; *Gmelin's Reise der Sibierin, Reise der Russland*, &c. &c.

Batrachians	35	2?	2?	0?
Total	305	76	27	49

The Reptilia are divided into *genera*, not *species*, according to the text of Cuvier. The list of species is sufficiently long in some other authors; but the French naturalist warns his readers to receive them with extreme caution, as they abound in repetitions of the same species under different names and in transpositions of synonyms (ix. 263.). Similar considerations forbid the attempt to classify the Pisces, Insecta, or Mollusca, a tabular arrangement of which classes would not, indeed, possess much interest.

A glance at these tables will exhibit, at one view, the zoological riches of Asia. Of the class Mammalia, more than a third of the whole number of species are found upon its soil, and nearly a fourth (accurately 7-30ths) are peculiar to it. In the more important species, these proportions are considerably increased. The Asiatic Ruminantia are nearly two fifths of the whole; those peculiar to the soil, nearly two sevenths. The Pachydermata are in a still higher ratio; the Rodentia and Carnivora, which two orders include the more useful fur-bearing animals, in nearly the same. The strong-winged Cheiroptera are indeed almost equally numerous; but the Quadrumania are reduced to little more than a fourth of the whole, and the anomalous orders of Marsupialia and Edentata can scarcely be said to have a place in Asiatic mammalogy. But it is not either the actual or relative amount of animal life that constitutes the chief advantage of Asia in this respect; among its numerous species of the more important orders it reckons the most important of the species themselves. Of these, the first in rank, with reference to its locality, is, perhaps, the camel. Other animals are more generally useful to man; but without this patient and intelligent servant, a large, perhaps the largest, part of Asia would be no home for the human race. Expressly formed for existence in a desert, it has been domesticated for a period long antecedent to all history, and for countless generations has been the means of connecting districts otherwise effectually separated, and has formed the principal wealth of

their inhabitants. The camel has this peculiarity to distinguish it from other domestic animals, that it does not follow its master in his wanderings. The other tribes, with one exception (the rein deer), have become denizens of every corner of the earth, however remote from their native home. It seems, indeed, a law, that the lower animals which herd with man shall follow him, with these two exceptions; but these, though fully as subservient and as useful as any others, have never become naturalized beyond the limits where they were first found. The attempts to establish the camel in Greece, Italy, Jamaica, and Barbadoes, have been signal and decisive failures. Yet the animal can support as great a range of climate as most others, being found in N. Tartary, as far as the shores of Lake Baikal (from 50° to 55° N. lat.), where the average temperature is scarcely, if at all, higher than that of Lapland, and where the winter's cold is frightfully severe, as well as under the scorching sun of intertropical countries. It is true, in these N. lands, its size becomes diminutive; but it preserves its hardy character, multiplies abundantly, and forms the wealth of the Burat and Mongol not less than of the Arab and Syrian. (*Marco Paulo*, ii. 159; *Pallas's Spic. Zool.*, xi. 4; *Du Halde*, iii. 488; *Pennant's Hist. Quad.*, i. 120; *Cuvier*, iv. 8. 8c.)

Of the ox tribe, the most useful species are Asiatic, as the common ox (*Bos Taurus* of Linnaeus), the aurochs, the buffalo, and the yauk. Their varieties are almost numberless; but those enumerated are considered by Cuvier (iv. 28—31.) as the only distinct species, with the exception of those not found in Asia, such as the American bison, the Cape buffalo of Africa, and the musk ox. The most striking distinction between the Asiatic and the American species of this genus, is, that the former only are domesticated, or appear capable of domestication. In all other respects they exhibit a general resemblance, amounting almost to identity; their gregarious habits, their food, their internal formation, all are extremely similar; nay, they breed promiscuously, and the issue of a cross are prolific: but while the Asiatic species have been domesticated as long as society has existed, the others remain to this day as untamed as when they first took possession of their native woods. A natural result of this distinction has been the distribution of the common ox from the Arctic circle to New Guinea, and round the whole world in longitude, while the American and African species appear incapable of multiplying beyond their original limits. The buffaloes, or humped, are less dispersed than the straight-backed species, and appear to be less capable of supporting a low temperature; but wherever the climate is at all adapted to them, they, like the others, are found to be naturalized, and thus they have spread from India (apparently their native home) over N. Africa and S. Europe; nor can there exist any reasonable doubt but that they would equally thrive in Australia, Polynesia, and Temperate America, were the experiment tried.

The aurochs and the yauk (or grunting ox) are only partially reclaimed, if, indeed, the former do not still exist in all its original wildness; but Cuvier seems to be mistaken when he limits its locality to the Carpathians and Caucasus. Tartarian travellers describe the breed as existing in a state of semi-domestication on the Plateau of Mongolia, and breeding with the domestic cow, thereby producing a cross much stronger and more fit for labour than the common ox. (*Marco Paulo*, ch. lxxi. p. 52; *Rubricus*, ch. xviii. p. 57.) This creature is, next to the rhinoceros, the largest of land animals. It has been by some naturalists supposed to be the original specimen of the domestic variety; but Cuvier has pointed out some osteological differences, which plainly refer it to a different species. It has also the grunting voice of the yauk, which might by possibility be regarded as a small variety of the aurochs, were it not for the tail, which in the yauk resembles that of the horse, not the same which composes the standards of the Turkish officers. The number of cattle fed by the wandering Tartar nations seems almost incredible: every fertile plain, and some plains that are almost sterile, are covered by them; and some one or other of the species thrive upon the sides and even upon the summits of the whity mountains of Tibet and Daouria. The domestic ox was unknown in Kamtschatka till introduced there by the Russians; and the musk ox appears to be unknown in Arctic Asia, though remains of the creature have been occasionally found, especially a skull (not fossil), near the mouth of the Obi, in the latter end of the last century. (*Pallas's Nov. Com. P. t.* xvii. p. 61; *Gmelin's N. C. P.* v. 331, &c.; *Du Halde*, iv. passim, &c.; *Zimkowski*, ii. 289, &c.; *Pennant's Hist. Quad.*, i. 15—27; *Cuvier*, iv. 28—31.) Nor are sheep less plentiful in Asia than cattle, though it may perhaps be doubted whether this useful creature be not one of the very few treasures which belong originally to Europe; the derivation of the various woolly species is doubtful between the Mouton of Italy and the Argali of Siberia. (*Cuvier*, iv. 27.) There is no race of animals, except the dog, so subject to vary; and

amid the multitude of breeds now distributed all over the world, it is probably useless to attempt to identify the original. The Argali, found in Siberia and all the mountainous regions of Asia, is, like the European varieties, distinguished by its short tail. Like other Arctic animals, the Argali, also, changes its covering, which is rather fur than wool in the winter. In India the sheep are long-tailed; and in Persia, Tartary, China, and Syria, the tail is not only elongated, but loaded with a mass of fat. The power which this creature possesses to accommodate itself to climate seems almost unlimited: in the hot plains of Asia its covering becomes coarse and scanty; while in the frozen regions of Tibet its thick wool has an under lining of the finest kind, forming an important article in manufactures and commerce. (*Pallas's Spic. Zool.*, xi. 3—31. 58—82; *Gmelin's Reise durch Russland*, iii. 486. *et seq.*; *Reise durch Sibirien*, i. 168. *et seq.*; *Du Halde*, iv. pass.; *Pennant*, 33—46; *Cuvier*, iv. 28—29.) There can be little doubt but that the *Capra Egagrus* of Gmelin, the *Ibez Alpinum Sibiricarum* of Pallas, is the original stock whence all the varieties of the goat tribe are derived. It herds in the mountains of Taurus, Tartary, Persia, China, E. Siberia, and Kamtschatka. It inhabits indifferently all climates, but assumes a very different appearance under the most dissimilar climates. The Lugora goat of Cappadocia, the Tibet goat, the Bouquetin or Ibex, and the domestic species, *Capra Hircus*, are the most noted varieties. The animal is in a very high degree serviceable to man, especially to the nomadic races of its native country; its coat furnishing an important article of manufacture, its skin the leather of which the wanderer makes his water-bottles and packing-cases; its milk is salutary in many complaints; and, when young, it affords a nutritious and agreeable food. (*Pallas's Spic. Zool.*, xi. 31—57; *Pennant's Hist. Quad.*, i. 45—56; *Cuvier*, iv. 23—25.) The rein deer is common to the Arctic regions of Asia, Europe, and America. It runs wild in the snowy wastes of Siberia and Kamtschatka, but is likewise domesticated, and supplies to the tenants of these dreary regions the place of the horse, cow, sheep, goat, and camel. It is not, however, so extensively domesticated in N. Asia as in Lapland. (*Hist. Kamtschatka*, 228; *Bell's Travels*, i. 213; *Cuvier*, iv. 9.) The elk is also common to Asia, Europe, and America; it inhabits the cold regions of Siberia and Mongolia, where, though undomesticated, it is highly useful as an animal of chase, the flesh furnishing a good species of food, the tongue especially being esteemed a great delicacy; and the skin making a buff leather, capable, according to good authority, of turning a musket ball. (*Pennant's Hist. Quad.*, i. 93—98; *Cuvier*, iv. 9.)

Of other ruminants, Asia has the musk, apparently throughout its whole extent from Siberia to Ceylon (*N. C. P.*, iv. 393; *Pallas's Spic. Zool.* xlii. 3—45; *Bell's Travels*, i. 240, ii. 88; *Du Halde*, i. 63. 324; *Humboldt's Voy. E. Ind.* i. 261.); together with a great variety of deers and antelopes; it is, however, among these, with the llamas of America and the giraffe of Africa, unquestionably the least useful of the order, that the only luminantia wanting in Asia will be found. (*Pallas's Spic. Zool.* i. 3—44, xlii. 3—71; *Cuvier*, iv. 5. 8—23.)

In its Pachydermatous tribes, Asia exhibits the same superiority over other regions: the elephant, horse, ass, and hog, have their home in its forests, and plains; while the animals of this order absent from its soil are the useless hippopotamus, and the inferior species Tapir, Peccory, Phaco, Damus, &c. The elephant rarely propagates in a domestic state; but it is an error to suppose that this never takes place: the tame females sometimes escape to the woods in breeding-time, and, after coupling with the wild males, return to the herd, or are brought back, and produce their young at the end of 9 months. The locality of the Asiatic elephant is limited: it does not appear to be found in W. India or N. of the Himalayan mountains; but in India, Malabar, Birwah, China, and the islands of the Eastern Archipelago, it is numerous both in its wild and domesticated state; and, besides its utility as a beast of burden, and the value of its tusks as an article of commerce, it is held in great regard for many occult medicinal properties supposed to exist in its flesh, eyes, bones, &c. (*Du Halde*, iii. 480; *Cuvier's Em. Sc.*, 429. 479; *Pennant's Hist. Quad.*, i. 150—161; *Cuvier*, iii. 326.) The horse and ass are both indigenous to Asia, and originally peculiar to that continent. Species of the same genus are indeed found in Africa, but, as in other similar cases, they seem incapable of domestication; while the Asiatic species, especially the Arabian variety, have supplied the whole world with two of the most useful quadrupeds that wait on man. The *Dalgetai*, a creature intermediate in size between the horse and ass, still runs wild in the Asiatic deserts; like his congeners, he is gregarious, and, like them too, his numbers seem almost unlimited; a similar remark will apply to the Koulan or wild ass. (*Du Halde*, i. 17. 80, iv. 80. *et passim*; *Bell*, i. 225; *Pennant*, i. 1—13; *Cuvier*, iii. 340—343.) The hog is spread over the world that it is difficult to assign its original locality; the fact that the species now peculiar are all

African and undomesticated, seems, however, to imply that the original stock of the domestic swine is Asiatic; the more especially as the creature is dispersed over every part of the continent from its S. extremity to the N. shores of Lake Baikal in 56° N. lat. (*Bell's Travels*, i. 279.; *Pallas's Spic. Zool.*, ii. 3.; *Crawford's Embassy to Siam*, 479.; *Cuvier*, 320—323.) Two species of the rhinoceros are peculiar to Asia and the Indian islands, the latter distinguished by a double horn like the *Rh. Africanus*. (*Du Halde*, i. 239.; *Crawford*, 429, 474.; *Pennant's Hist. Quad.*, i. 138.; *Cuvier*, iii. 336.) Tropical Asia possesses most of the fiercer Carnivora: lions, tigers, leopards, black panthers, ounces, and tiger cats, of the cat genus; wolves, hyenas, and jackals, of the dog tribe. They do not, however, all exist in equal numbers, nor equally in every part. The lion is becoming very rare in Asia; he is now found only in the deserts of Mesopotamia, Persia, and India, and perhaps in some parts of China. He does not appear to be heard of in Siam or Cochin China; to which districts, the wolf, hyena, and jackal, as far as is yet known, are also strangers. (*Crawford's Em. Si.*, 428.) The manul, lynx, and wild cat are most numerous in temperate Asia; the first extending, however, almost to the arctic regions, the second stretching into both the frigid and torrid zones; but the last (scarcely ever met with beyond the Caucasian Mountains) appears originally to have been European. The dog and fox, in all their varieties, are common to all the continent; the former, in some parts (as Kamtschatka), supplying the place of a beast of burden, in others being used as an article of food. The Angora and Persian cat are celebrated for the fineness of their fur, as is also the blue cat of Siberia; though the last, if not the two former, seem to have been derived, as well as the domestic cat, from Europe. Formidabile as are some of these creatures, they constitute a considerable portion of the wealth of the countries which they inhabit; their skins form an important article of commerce; and what is remarkable, the bones of the tiger are supposed, like those of the elephant, to possess medicinal qualities, and are highly valued accordingly. (*Crawford's Em. Si.*, 428.) The smaller Carnivora are also found in great abundance, as the different species of martens, among which the ermine and sable stand pre-eminent for their fur; the Asiatic civets, which possess the odour, though not the glandular excretion of the African species; and the Mangousti or ichneumon, which attacks and destroys the most dangerous serpents: bears, badgers, gluttons, sea otters, mottos, walruses, &c., complete the list of Asiatic Carnivora. (*Bell*, i. 100, ii. 61, *et pass.*; *Du Halde*, *pass.*; *Pallas's Spic. Zool.*, xiv. 20, *et seq.*; *Crawford's Em. Si.*, 428, 478.; *Pennant's View of Hindoostan*, i. 193—197, *et pass.*; *Hist. Quad.*, 219—300.; *Cuvier*, ii. 23—61.) The Insectivora and Rodentia consist, the first, of hedgehogs, shrew-mice, and moles in their various species; the latter, of the more important animals, beavers, hares, rabbits, lemmings, marmots, squirrels, dormice, porcupines, jerboas, rats, mice, &c. Of these, the Asiatic species are very numerous, and they form, with the smaller Carnivora, the principal wealth of Siam, since among them are found many that afford some of the richest furs, especially in the winter, when the covering of the creatures becomes thicker in texture, finer in quality, and generally superior in colour. Animals of this order do not appear to be numerous in S. Asia. *Crawford* remarks, that the hare and rabbit are unknown in the lower parts of Siam. The porcupines, on the other hand, are not found in the N. regions; and the jerboas seem peculiar to the wide open plains. (*Gmelin's Reise durch Sib.*, *passim*; *Crawford's Em. Si.*, 428, 478.; *Cuvier*, iii. 63—95.; *Pennant's Hist. Quad.*, 287—469.; *Pallas's Spic. Zool.*, *pass.*; *Sonch. Pct.*, *pass.*) Of the Quadrumana the principal Asiatic species are the orang outang and the gibbons; the smaller apes and monkeys are numerous in the S., especially in India, China, and the islands. As a general fact, the Asiatic monkeys are inferior in structure and intelligence to the African, but much superior to those of America. (*Cuvier*, i. 207—220.) The Cheloptera are numerous all over the world; they seem, however, to abound more in the Asiatic islands than on the continent: some of them, as the *Rousettus* of the Sunda and Molucca Isles, are accounted delicate food; others, as the Timor bat, rather large and destructive; but the more powerful and mischievous species of this order appear to be American, and strangers to the soil of Asia. (*Pallas's Spic. Zool.*, iii. 3—35.; *Pennant's Hist. Quad.*, 548—563.; *Cuvier*, ii. 4—15.) The Marsupialia of this continent consist of but 2 species of Phalangiers, *Phal. Rufus* and *Phal. Chrysorrhous*. (*Buffon*, xlii. 10.; *Temminck*, 12.) They are peculiar to the Moluccas, Java, and Celebes, exhibiting thus, at the extremity of Asia, the first indication of the anomalous Mammalogy of Australia. The single Edentata is the short-tailed Manis, which, like the last order, is peculiar to the Indian islands, except some few instances found in Bengal. (*Pennant*, 505.) Marsden (*Sumatra*, p. 18.) seems to imply that the African long-tailed Manis

is sometimes found in that island. Lastly, the Cetacea consists of dolphins, manati, porpoises, sea unicorns, and whales, of which some one or other species is found on all the coasts of Asia. (*Pennant*, 536—545.; *Cuvier*, iv. 430—443.)

A single glance at the table will exhibit the fact, that the Ornithology of Asia is less rich than its Mammalogy; the former containing considerably less than a fourth of all the known species, while the latter possesses very much more than one third: the continent maintaining, however, in this respect, as in the former, the peculiar character of utility in its possessions; for of the Gallinae, unquestionably the most useful order to man, the number of its species is between a third and a half of the whole, and fully a third of the whole is peculiar to its soil. Among these species are reckoned the original stocks of all the domestic poultry, except the turkey, which is American; the pheasants, partridges, peacocks, and whole flights of pigeons. The species in which it is most deficient are among the grouse, quails, and pintados; but there is scarcely a genus of this useful order of which Asia is wholly destitute. Of other birds, the order Grallae furnishes the ostrich, crane, heron, stork, bittern, plover, spoonbill, ibis, &c., many of which are highly useful in tropical climates as destroyers of serpents and other dangerous reptiles: the Scansores consist of those climbing birds, parrots, paroquets, woodpeckers, macaws, &c., the beautiful plumage of which add so much to the splendour of equinoctial forests; and the Syndactyles (the smaller order of bright plumages), of bee-eaters, kingfishers, and hornbills; which last, from their greater size and peculiar habits, have far less resemblance to the other genera of the order than they have to each other. In all these orders, it will be observed that Asia is relatively rich, except with regard to the Scansores, which, having little but their beauty to recommend them, are the least useful of any yet enumerated. In the others the proportion becomes still lower; and though among the palmipeds, petrels, albatrosses, pelicans, gulls, geese, ducks, swans, &c., Asia has some which the natives have turned to account, as the great cormorant, taught by the Chinese to fish; yet the great home of this order of birds lies in other quarters; America, Africa, Australia, and even Europe. Of birds of prey (Accipitres) Asia has its eagles, vultures, falcons, owls, and hawks; but here, again, the number of species is comparatively small, though in some cases the individuals of a species are very numerous: and in the 4 remaining orders, consisting of all the tribes of granivorous and insectivorous birds, shrikes, pies, thrushes, crows, swallows, goatsuckers, birds of Paradise, and the various songsters, the Asiatic woods are very poor; their chief trophies, of these orders, being generally such as are distinguished for beauty of plumage. Song birds are very scarce. (*Pallas's Spic. Zool.*, iv. v. vi.; *Gmelin*, i. 48—76, 152, ii. 163—193, iii. 86—106, 249—251, 364, 378, &c.; *Pennant's Gen. Birds*, *pass.*; *Crawford's Em. Si.*, 432—480.; *Du Halde*, *pass.*; *Cuvier*, vi.—viii.)

In Reptiles, as in birds, Asia is less abundant than some other regions. Of the Chelonina it has several fine species of turtle, and others that are chiefly valuable for their shells. Lizards are very numerous in individuals, though not in genera, and probably not in species; among these, 2 or 3 kinds of alligators are very destructive in the rivers of India. Of serpents, the most dangerous is the Indian Python (improperly confounded with the boa constrictor); but there are many others highly venomous, and some which are extremely beautiful and quite harmless. Frogs and toads abound in all marshy places, but it seems doubtful whether they be of many different kinds. (*Pallas's Spic. Zool.*, vii.; *Gmelin*, iii. 58, &c.; *Pennant's View of Hindoostan*, *pass.*; *Du Halde*, *passim*; *Cuvier*, ix.)

The seas and rivers appear to possess every known kind of fish, and some that are peculiar (*Pallas*, vii. viii.); and the insect tribe are numerous throughout the whole continent; the ravages of some, as the locust, in Arabia, Syria, and Persia, being far more dreaded than the attacks of carnivorous animals. (*Pallas*, ix. x.; *Cuvier*, ix. xiv. xv.)

IV. RACES OF PEOPLE AND LANGUAGES.—

Not only the majority of the human race in number, but also the greatest variety in the species, is found within the limits of Asia. The subject, as well from extent, nature, and, in many respects, deficiency of information, is one of great difficulty; but we shall, nevertheless, offer some observations upon it, founded on the physical form, intellectual character, and genius of the language of the races. Some of these families or races consist of many millions, while others embrace but a few thousands; a circumstance which has

naturally arisen from the favourable or unfavourable position in which they have been located on their original distribution, and perhaps also from an intrinsic difference in the capacity of the races themselves,—causes which have multiplied some into numerous, powerful, and civilised nations, and kept others in the condition of petty and rude tribes. We begin our classification from the west.

The first family, which may be called the *Caucasian*, comprises all the aboriginal inhabitants of the mountainous region lying between the Black Sea and the Caspian, from about the 38th to the 42d degree of N. lat. It includes the mountaineers of the valleys of the Caucasus—such as the Abasians, Ossetes or Iron, Lesghians, and Kisti; and, in the more level country, or wider valleys lying to the south of the Caucasus, the Georgians, Mingrelans, and Armenians. In personal form this family may be described as European, but in mind Asiatic. The face is of an oval form; the forehead high, and expanded; the nose elevated, with a slight convexity; the mouth small; the lips moderate in size, and the chin full and round. The complexion is fair, without, however, the clearness of the European; the eyes are generally dark, and the hair of the head rarely of any other colour than black, or brown: and, indeed, it may here be once for all observed, that the great variety in the colour of this tegument, with which we are familiar, is confined to Europe,—black being nearly universal in every other part of the world. The hair on other parts of the body, with the Caucasian family, is abundant; the stature is nearly equal to that of the European, and the form of the whole person is symmetrical and handsome. The personal beauty of this race has induced Blumenbach and some other eminent naturalists, to assume its form as the type of the European, or first of the *five* great varieties into which they have, fancifully enough, divided the whole of mankind. They have even gone the length of fancying that the entire European family sprang from the mountaineers of the Caucasus; an hypothesis for which it is almost unnecessary to say that there is not a tittle of historical, philological, or any other evidence. Notwithstanding undoubted advantages of physical form, no nation of this family has ever made any eminent advance in civilisation. Many of them, with a country not unlike Switzerland, though with a better soil and climate, are, at the present day, not more advanced in civilisation than the Swiss or Germans, as described by Cæsar near 2000 years ago. The Armenians alone of the whole family have made a considerable, though far from a distinguished progress. About five centuries before the Christian æra they constituted an extensive society, and even exercised some influence in the political events of Western Asia: they alone of all the nations and tribes composing the Caucasian family, possess a national literature; but even their invention of alphabetic writing dates only from A. D. 406, for previously to that time they used the characters of the Greeks and Persians: always acting a secondary and subordinate part, they have been successively subdued by Persians, Greeks, Romans, Arabs, Turks, and Russians. Language, it should here be observed, considered as the test of unity of race, must be viewed, as respects its genius and the general character of its formation, and not by the identity or dissimilarity of individual words, which, through the accidents of conquest, settlement, religion, and commerce, often find

their way even into languages of very opposite genius. As happens in rude and early stages of society, in every part of the world without exception, the number of languages spoken by the nations of the *Caucasian* family is very great. The tribes inhabiting the valleys and mountains of the Caucasus are said to speak seven distinct languages, besides many dialects; a number, however, which falls far short of those spoken within a similar extent of territory in many parts of America as well as of the islands of the Indian Ocean. The only language of the Caucasian family, of which Europeans have any critical knowledge, is the Armenian, of which we possess dictionaries and grammars: those who have examined it consider it as quite peculiar and distinct from all other known tongues: it abounds in rough consonants: its structure is exceedingly complex: it has an article at the end of nouns: its nouns and adjectives have each ten inflections in the singular and as many in the plural, and the verb is agreeably varied by corresponding changes. All this, which applies, however, more especially to the ancient language, implies that the Armenian is a primitive and original tongue, which, like the Sanscrit, Arabic, Greek, the Latin generally, and for the most part the German, has suffered little change in structure from the commixture of foreign nations and their languages. The modern Armenian has been simplified in its grammatical structure by the mixture of the people with foreign nations, especially the Persians and Turks; changes similar to, but not so extensive as, the Latin language, has undergone in its conversion into Italian, Spanish, French, &c. &c. From this account of the Armenian language, taken together with differences in the physical form and mental qualities of this people, it is not improbable but that, on a better acquaintance with both, it may be found a family entitled to be classed separately from the inhabitants of the Caucasus.

The second Asiatic family has been called by philologists and naturalists the *Arabian* or *Semitic*, the last name being given to it on the hypothesis that the whole is derived from the eldest son of Noah: it embraces all the aboriginal inhabitants of Palestine, Asia Minor, Syria, and Arabia from the east coast of the Mediterranean and Red Sea, up to the west coast of the Persian Gulph. A brunette complexion; more or less intense black or dark brown eyes; long, lank, and almost always black crinal hair; bushy large beards, generally black, but sometimes of a reddish tinge; an oval face in bold and distinct relief, with a nose always elevated, and not unfrequently aquiline; high forehead, and stature nearly of the European mean;—are among the most prominent characteristics of this family, as we occasionally see it exhibited in one of its handsomest forms, the Jewish: we say occasionally, for the differences existing between the Jews settled in different foreign nations show plainly enough, that they have more or less mixed their blood with the people among whom they have established themselves; for they are fair in Germany, brown in Poland, and nearly black in India. Compared with the European, the whole form of the Arabian is spare, slender, and of small bulk and weight. The wrists are comparatively slender, the hand small, and the fibre throughout soft and flexible. These last characters, however, it is to be observed, belong more or less to the inhabitants of all warm climates. In intellectual power and energy, the Arabian family stands un-

questionably next to the European. The history, institutions, and literature of the Jews; the early civilisation of the Assyrians; the commerce and colonies of the Phœnicians; and the conquests, settlements, and literature of the Arabs; attest the truth of this assertion. The influence of the Hebrew institutions has pervaded the whole civilised world; while the language, literature, and religion of the Arabs may be traced from the western confines of Spain and Africa to the Philippine Islands over 130 deg. of longitude, and from the tropic of Capricorn to Tartary, over 70 deg. of latitude. Among a race, so energetic, civilization made a very early progress, and it is not improbable but that 4000 years ago the Phœnicians, Hebrews, Assyrians, and Arabs had already domesticated many of the useful animals, cultivated many valuable plants, and were acquainted with the useful and even precious metals. Several of the nations of this family had invented alphabetic writing, in times far beyond the memory of history,—as the Jews, Phœnicians, Arabians, and Assyrians. Their literature has always been of a more vigorous and masculine character than that of any other Asiatic people, but still has never evinced the taste, sound judgment, and practical common sense displayed by several European nations in various periods of the history of the latter people. For the fine arts, if we except architecture, they have not exhibited a glimmering of capacity. There is one circumstance, however, in the position of this family, which has always proved a serious obstacle to its advancement in civilisation—the unsuitableness of much of the country which it inhabits for any other than the pastoral state of society, owing to its heat, drought, and sterility. Hence the people are necessarily divided into two opposite and hostile classes, a roving and predatory, and a settled and industrious one; the first incapable of advancing itself, and sure to oppose the advancement of the last. In the genius and structure of the languages of the Arabian family, there is a common affinity. They possess sounds which no other people can articulate: while their neighbours have sounds in their languages, which they, in their turn, cannot imitate. In grammatical structure they resemble each other, and the words of their language are readily interchanged, while they rarely, if ever, admit those of neighbouring tongues. While the dead language of India, for example, has found its way into the ultra-Gangetic languages as far even as New Guinea,—into many of the Mongolic and Turkish languages, and into most of the ancient and modern languages of Europe: it has made no impression whatever on the languages of the Arabian stock of nations; so that in the Arabic, the most copious of them all, Sir William Jones could point out but a single word (one of the many synonyms of the *sun*), as common to it and the Sanscrit.

Between the Caspian Sea and Persian Gulph, to the west,—the ocean to the south, India to the east, and an indefinite line to the north, extending at least to 50° of latitude,—there are several races which have much resemblance, but which differ enough in person, mind, and language, to entitle us to class them as different families. The first of these, beginning in a westerly direction, is the *Persian*. With this family, the complexion is fair without transparency; there is little or no colour in the cheek. The hair is long, straight, and almost always jet black; the beard abundant, bushy, generally black, but now and then with a reddish tinge. The

features, according to European notions, are regular and handsome, though generally minute; and, beard excepted, rather effeminate. The stature is little short of the European standard; and the body gracefully but not strongly formed, being altogether less robust than that of the European. The present inhabitants of Persia are much mixed with the blood of Arabian and Turkish settlers; and probably, therefore, the purest sample of the genuine Persian will be found in the emigrants established in foreign countries, called *Parsees*, who scrupulously abstain from intermixture with the people among whom they are settled. The Persians were among the earliest civilised nations of mankind; but their progress has not been in proportion to their precocity. It is probable that a thousand years before the Christian æra they had tamed the useful animals, cultivated useful plants, were acquainted with the useful metals, and constituted a considerable community. That they had at an early period a written language, and that it was national, is attested by the existence of the undeciphered and peculiar characters, of unquestionable antiquity, still found at Persepolis and other places. When the Arabs conquered and converted the Persians about the middle of the seventh century they found three spoken languages; viz. the *Parsee*, the *Pehlvi*, and *Deri*, besides the *Zend*, or language dedicated to religion. The first of these has superseded the rest, which are known only by name, and become the universal language of the country. The modern Persian is of simple structure, like English, French, or Italian, that is, it possesses few or no inflections, prepositions governing its cases, and auxiliary verbs its times and modes. Many of its roots can be readily traced to the Sanscrit. Since the Arabian conquest, it has received a large accession of Arabic words easily discovered by their exotic sounds, for there are many sounds peculiar to one people which are foreign to the utterance of the other. The entire literature of the Persians dates since the Arabic conquest, and, therefore, the earliest portion is little more than 1000 years old, while the great bulk belongs to the 15th and 16th centuries. It consists of songs of considerable merit; of poetical romances, wild and extravagant; of loose chronicles without date, founded on tradition alone; and of treatises on morals written to little purpose for one of the most sensual, mendacious, and astute, but also one of the cleverest people of Asia. For the history of the Persians, for 1500 years before the Arabian conquest, we possess, from themselves, nothing but incongruous fable; and were it not for the occasional, but always unsatisfactory information respecting them communicated by the Greeks first, and then by the Romans, we should have known as little of their early history as we do of that of the Hindoos or Mexicans. The intellectual capacity of the race may be judged of by such facts as these. For 2500 years they have certainly not been wholly stationary; but, measured by the European standard, they have made surprisingly little progress. It is just, however, to state, that the physical geography of their country is not propitious to civilisation. Much of it, like Arabia, is, from drought and sterility, unfit for agriculture, and fitted only for occasional pasture; and hence, at all times, the roving and predatory habits of a large portion of its population; while the same character belonging also, and even to a greater degree, to the countries which surround it, the progress of industry and civilisation has not only been obstructed by internal, but also by

foreign enemies. The Persian family has never been distinguished for the bold spirit of enterprise, or capacity for social improvement, which has characterised the Arabian.

It made some early but temporary conquests in northern India, and often mastered some of the Turkish tribes; but it never made any settlement in Europe, and a few petty Greek states were sufficient to baffle it in its utmost strength. Very different from the Jews and Arabs, such has always been the mediocrity of talent among the Persians, that they have no name which belongs to history, except that of Zoroaster.

The next family of nations we shall notice is the *Turkish*, or *Scythian*. The extensive country in which this family is found, or rather its parent country, lies between the 35th and 60th degrees of latitude from the Hindoo Koosh, a continuation of the Himalaya, to the Belur Tagh, a spur of the Altai chain, and from the Caspian Sea to the western boundary of the desert of Cobi, where they are mixed with the Mongols. The family consists of the Scythians and Parthians of antiquity, and of the true Tartars and Turcomans, with the eastern and western Turks, of the moderns — the Usbecks, Tadjiks, and Kirgis. To the west it has, probably, been considerably intermixed with Greek and Caucasian blood; to the east and north, with Mongolian; and to the south, with Persian. The complexion of this race is a light brunette. The hair generally black, strong, and long; but when the complexion is remarkable for its fairness, it is brown, and also of a more delicate texture. The colour of the eye is a light brown, but the form somewhat contracted. The skull is remarkably globular, the forehead broad, and the space between the brows very prominent; the proportions of the face are symmetrical; the upper jaw-bone is singularly short, and the basis of the lower jaw is also remarkable for its shortness: the facial line is nearly vertical. The body is stout, but the stature shorter than the European. Abstracting hair, complexion, colour, form of the eye, and stature, with the intellectual powers as they have been hitherto developed, the Turk is in fact a European. The Turkish language is one of simple structure, like the Persian or English; and its sounds, but not its words, resemble those of the former. By the conquests of the various nations who speak it, it has been spread from Greece to Chinese Tartary, and from Persia to the 55th degree of latitude; but, unlike the Arabic or Persian, the more cultivated languages of a more civilised people, it has nowhere superseded or much mixed itself up with the dialects of the conquered people; nor in the government of a conquered people have the Turks ever exhibited the skill or tolerance of the Arabs or Mongols. What has been said of the character of the physical geography of the native country of the Arabian and Persian families, is still more applicable to the Turkish. A great portion of it is mere desert, without trees and water; and the cultivable portions are, in fact, but so many patches along the banks of rivers, thinly scattered over a boundless waste of sand. In these patches industry and civilisation spring up, surrounded in every direction by robbers and freebooters, and liable at every moment to be crushed by them. To use the words of Mr. Erskine, in his excellent introduction to the "Translation of the Memoirs of the Emperor Baber," we find among the Turkish family "tribes who, down to the present day, wander over their extensive regions, as their forefathers did, little, if at all, more refined than they appear to have been at the dawn of history."

Their flocks are still their wealth, — their camp their city; and the same government exists of separate chiefs, who are not much exalted in luxury or information above the commonest of their subjects around them." This cause, however, it must be admitted, will not account for the backward civilisation of the Osmanli Turks, who have now for centuries occupied some of the finest regions of Asia and Europe, and been during the same time in close communication with the civilised nations of the latter.

That some nations of the true Turkish family were early civilised to a certain extent, is not to be doubted. It was among them that Alexander, more than three centuries before the Christian era, found the principal materials for founding his Greek kingdom of Bactria; and from time immemorial the horse, ox, camel and dromedary, ass, hog, and dog, have probably been domesticated among them. The ass and hog are still wild animals of the country; and in early times it is not improbable the others were so also.

The Turkish or Scythian family seems to have invented no written character, and hence, in early times, to have had no literature. The evidence of some Bactrian coins shows, that when the more improved nations among them had advanced to writing, they used the alphabetic characters of ancient Persia. The best and most fertile portion of the country of the Turks was conquered by the Arabs towards the end of the 7th century, and this was followed by the adoption of the Arabian alphabet, and by much of the language and literature both of the Arabs and Persians. It was not, however, until the establishment of a firm government under Jaghtai, the son of Jengis Khan, that the Turkish language — from him called the Jaghtai Turkish — began to assume the character of a polished speech, and to be written; and its most flourishing period is comprised in the short time from the death of Timur, in 1405, to the death of Baber, in 1530. Its literature consists chiefly of popular poetry, in the form of odes or songs: but there are also some prose compositions, religious and chronological; of which last the most remarkable are the memoirs of Timur and Baber. Turkish composition, as described by Mr. Erskine, is less inflated and rhetorical than Persian and Arabian; and, judging by his own translation of the last of the works above mentioned, we should be disposed to consider Turkish literature as making a nearer approach, on the whole, to the good sense, taste, and simplicity of that of Europe, than any other literature of Asia.

In the south-eastern angle of what is commonly considered Persia, and now known by the name of Beloochistan, we have three races of men, distinct in person and language, living in the same country, and dwelling together, yet not often intermixing their blood, — a circumstance which will frequently be found in what remains of our review of the "Races of Asia." These are the Beloochees, Brahoos, and Dehwars. The *Beloochees* have dark-brown complexions, black hair, long visages, elevated features, with tall and active, but not robust persons. Half their language is a corrupted Persian; and, although the nature of the other be not ascertained, we have little doubt of its being primitive and original. The *Brahoos* are described by Pottinger as wholly unlike the Beloochees. They have, according to him, thick short bones, — are, in fact, a squab instead of a tall people. Their faces are round, and their features flat, instead of being raised. Frequently they have brown hair and beard, from which we should

augur a fairer complexion than is ascribed to them. The language of the Brahooos is entirely different from that of the Meloches; it contains no Persian, and but a few words of the neighbouring dialects of the Hindoos. The *Delhwars* have blunt features, high cheek-bones, bluff cheeks, and short persons, being altogether rather an ill-favoured race. What is remarkable of them is, that their language is that of a people to whom they bear no personal resemblance, the Persians. This, it may here be observed, is also the case with the *Tadjuks* of the Turkish family, who claim to be the aboriginal inhabitants of Bokhara; but then the *Tadjuks*, though stout in stature, have elevated features, and a ruddy brown complexion. None of these nations have a national literature, or seem ever to have invented an alphabet. Even in the time of Alexander, although rude barbarians, they were far from being savages; for they had oxen, goats, and camels, and cultivated wheat, barley, and several fruits.

To the N. of the races now described, and in the N. E. angle of Persia in its widest acceptation, we find another race, the *Afghan*. This family is marked by a brown complexion, black hair, sometimes brown, a profusion of beard of the same colour, high noses, high cheek-bones, long faces, a robust person, and a stature short of the European. Their language, called *Pushtoo*, is peculiar; it contains few Sanscrit words, but a good many of those of the popular language of Upper India, or Hindi: the sounds are rough, and some of the consonants are such as have no existence in the Persian. They have no alphabet, and use the Arabic characters; and their national literature, consisting chiefly of lyrics, is said not to be above 150 years old. In the time of Alexander these people were rude barbarians, but not savages, for they had towns, and corn, and cattle, and were probably on a level with the Germans and Britons in the time of Cæsar. It is only in comparatively late times that they have made any figure in history. Conquered by a Turkish nation, in the last years of the 10th century, they continued, by their military enterprises and invasions, to exercise great influence over the affairs of Hindostan, and some even over the affairs of Persia, down to the middle of the 18th century.

Among the high mountains and narrow elevated valleys, which lie E. of the country of the Afghans, exists a people, of whom little is known beyond their names: these are the *Kaffers*, or infidels, so called by their Mohammedan neighbours, the *Dards*, *Tibet-Baltai*, *Chitral*, *Hazaras*, and *Aimaks*. These people are described as remarkable for their fairness; the possession, occasionally, of light hair and blue eyes, and great personal beauty. They speak many languages, which are absolutely unknown to Europeans. According to a most judicious writer, Mr. Erskine, they constitute "a series of nations, who appear never to have attained the arts, the ease, or the civilisation of the southern states; but who, at the same time, unlike those to the north, have, in general, settled on some particular spot, built villages and towns, and cultivated the soil." Letters seem to be unknown to these people: they cultivate small quantities of wheat and millet, but their principal wealth consists in oxen and goats. The mountain barriers which surround them have protected them from invasion; and the narrow valleys which comprise their country, divides them into numerous tribes, and hinders their civilisation. For want of a better name, this may be called the *Dard* family.

Proceeding eastward, we come to a great and numerous family, the *Hindoo*, spread from the 7th to the 35th degree of north latitude, and from the 64th to the 95th of east longitude. Correctly speaking, this is perhaps not one family, but an aggregate of races, bearing such a general resemblance to each other, as the European varieties do among themselves, although wider in degree. The colour is commonly black, or at least a deep brown; and hence the name of *Hindoo*, applied to them by their fairer Turkish and Persian invaders: for that word in the Persian language is equivalent to negro in ours. The hair is always long, coarse, and black; the beard of the same colour, and not deficient; the eye invariably black, or deep brown; the face oval, and the features well raised, symmetrical, and handsome; so far at least as the absence of colour and transparency will allow, but generally with an effeminate cast: with some defect in the lower limbs, the person is well formed. The stature is generally short of the European: the body is spare, and deficient in strength and capacity of enduring toil, if compared with the surrounding families; but the want of force is in some measure compensated by lightness, flexibility, and dexterity. Judging by the form of the skull, modern naturalists have placed the Hindoos, or still more whimsically, "the higher orders" of them, in the same class with the natives of Europe. This is but an ingenious philosophical dream; and Orme, who knew them well, and who never suspected the possibility of placing them in the same category with men of white skins, robust frames, and high enterprise, justly describes them as having been "from the earliest ages of antiquity a people who have no resemblance, either in figure or manners, with any of the nations contiguous to them." Their general appearance to a stranger is truly and graphically described by Mr. Ford, chaplain to the factory at Surat in the commencement of the 17th century. "A people," says he, "presented themselves to mine eyes, clothed in linen garments, somewhat low-descending; of a gesture and garb, as I may say, maidenly, and well-nigh effeminate; of a countenance shy, and somewhat estranged, yet smiling-out a glozed and bashful familiarity." Clearness and subtlety, rather than depth with vigour, characterise the intellectual capacity of the *Hindoo*. In practical good sense they are below the Chinese; in energy, vigour, and enterprise, below the Arabs, Persians and Turks; but they are equally astute with any of these; if, indeed, they do not, in this respect, surpass them all. They have been repeatedly, and for so numerous a people, easily conquered; but, on their side, they have never gone abroad for conquest.

The Hindoos were probably among the earliest civilised of the families of mankind. Nearly 2,200 years ago, the Greeks found them composing communities, whose advance in the arts of life was equal to that of the Persians of the same period; and to have attained such a state, must have been the work of many previous centuries. The country they inhabit has a favourable climate, and fruitful soil, and nature presented to the exercise of their natural ingenuity many valuable products in the animal, vegetable, and mineral kingdoms, such as the useful animals, many of which are still found in a wild state in the country, with several descriptions of corn, esculent roots, cotton, and silk. All the languages of the Hindoos are of simple grammatical structure, except one, the dead Sanscrit, as complex as the Greek or Arabic.

There are at least 10 alphabets, which we hold to have been each separately invented, but afterwards more or less improved by borrowing from that of the Sanscrit, the most comprehensive of them all, particularly in the adoption of its regular and almost philosophical arrangement. We know as little of the people whose language the Sanscrit was, as we should of the Romans, if we had no writings in Latin but what were mythological, dramatic, or poetical, that is, if we had neither Roman history nor Roman monuments. We should in that case point to the modern language which approached the nearest to the Latin, and certainly decide upon Italy as the native country of the Romans. The Hindoo language which contains the greatest amount of Sanscrit, is the modern Hindi; and at the close of the 10th century, on the first Mohammedan invasion, a language was spoken at Delhi and its vicinity as nearly resembling it as Saxons does English. The nation then, of which the Sanscrit was the vernacular language, probably had for its primitive seat the countries on both banks of the Jumna, about the 28th degree of N. latitude; and this is, indeed, pointed out by many intelligent Hindoos, as the locality of the ancient people whose language and institutions have exerted so great an influence over a large portion of mankind. As we diverge from this focus, the proportion of Sanscrit found in the dialects of India, becomes less and less; and in some of the languages of the South, not more of it is to be found, nor in any other shape, than that in which we find Latin in English. Hindoo literature, notwithstanding the unquestionable antiquity of its culture, is extravagant, rhapsodical, puerile, and destitute both of instruction and amusement. In ingenuity and invention it can bear no comparison with that of the Hebrews, Arabs, or Persians; nor in common sense or authenticity, with that of the Chinese, tame and mechanical as is the latter. The authentic records of the Hindoos cannot be carried back by any ingenuity beyond eleven centuries; and even this much is the work of European antiquaries. That period then carries Hindoo chronology only to the middle ages of European history, — corresponds with the Arab conquest of Spain, — and is long posterior to the conquest of England by the Saxons, of France by the Franks, and of Italy by the Lombards. The capacity of the Hindoo family, then, tried by the test of literature, stands lower than that of any of its considerable neighbours. We have already said, that though in colour, form, and feature, a common character belongs to the whole Hindoo family, there exist also striking differences. We shall endeavour to point out a few of these. Beginning from the north-west, we have the *Cashmerians*, with genuine Hindoo features, brunette complexions, and rather stouter and taller persons than the inhabitants of the plains of Hindostan. They have a peculiar language and a national alphabet. South of these, and on the plain, we have the more numerous and powerful nation of the *Sikhs*, or *Singhs*. "The features of the whole nation," says Burnes, the traveller who has most recently described them, "are now as distinct from those of their neighbours as the Indian and Chinese. With an extreme regularity of physiognomy, and elongation of countenance, they may be readily distinguished from the other tribes." We shall add to this, that they are a tall, active, handsome race; of very dark complexions, but of features strongly marked by the genuine Hindoo character. Their language

is a dialect of the Hindi. Between the 25th and 33d degree of N. latitude, and the 72d and 87th degree of E. longitude, exists a numerous people, now, for the most part, speaking also a dialect of the Hindi, which has, in consequence of the Mohammedan conquest, received a large admixture of Persian, just as the Saxon did of French, and almost at the same period. They are generally taller and fairer than the people of the south, and of all the Hindoo family may be considered as having made the greatest advance in civilisation. Their language is written in the same alphabet as that used in writing Sanscrit. Throughout India they are known as *Hindustanecs*. To the east of these, and inhabiting the extreme eastern portion of the country of the Hindoos, we have the Bengallee race, distinguished by dark complexions, low stature, and feeble and slender frames beyond any other Hindoo people. The Bengallees have a peculiar language of simple structure, without inflexions, the parts of speech being formed by the use of particles and auxiliaries. Sanscrit words and roots enter largely into its composition; and it has been alleged of this, and of most of the other vernacular languages of India, that Sanscrit forms their groundwork, as Latin forms that of Italian, French, and Spanish. This, however, is unquestionably not true of all the languages of the south of India; and we think it very doubtful if it be so even of that of the Bengallees. This last has a peculiar alphabet, formed on the principle of the Dewanagari, an alphabet of the Sanscrit, the basis most probably having been a rude character of indigenous invention. There is no Bengallee literature which goes further back than the 15th century, and very little even of this. The Bengallees, like the other Hindoos, have no history; and the first authentic date in their chronology, is the year 1203, when the country was invaded and conquered by the Turko-Persians, from Delhi. Upon the whole, the Bengallee race may be looked upon as the least energetic, physically and mentally, of the Hindoo family. Even within Hindostan, they have never ventured, as conquerors or emigrants, beyond the limits of their own country; while, from the earliest ages, they seem to have been invaded and subdued by all their western neighbours. In flexibility and acuteness, however, they equal any other Hindoos; and in our times, have exhibited a capacity for improvement beyond them all.

To the south of the Bengallees, we find the *Oria* race, or *Orias*, taller and stronger than the former, but still with slight and delicate figures. This race is remarkable, even among Hindoos, for a lack of spirit and intelligence. They have a peculiar language, of simple structure, into the composition of which both Sanscrit and Bengallee enter largely, but its foundation is most probably native. The alphabet is founded on the principle of the Dewanagari, and the literature consists almost wholly of translations and paraphrases from the Sanscrit.

To the south of the Nerbudda river, and of the *Orias*, we have the populous race of the *Telungas*, stouter, taller, and much more energetic. These are the people called by the earlier European settlers *Gentoos*. Their language is inharmonious, harsh, not very simple in its structure; and is written in a peculiar national alphabet; following, however, as all the Indian alphabets do, the convenient classification of the Dewanagari. Sanscrit is found in it, as

French exists in English, Greek in Latin, Arabic in Persian, or Turkish and Persian in the dialects of northern India. Their national literature is considerable in extent, but that is all that can be safely asserted of it. This is the only Hindoo race which has exhibited any thing like a spirit of foreign enterprise; and that enterprise is wholly mercantile. Their commerce and their migrations at present extend, and seem from very remote periods to have extended, to the islands of the Indian Ocean, and the countries between India and China. The spread of the language and institutions of the Hindoos, indeed, to these countries, was most probably in a great measure their work.

To the west of the Telingas, we find the *Mahratta* race, smaller in person; indeed rather of meagre and diminutive form, of ungraceful make, and rapacious aspect. The *Mahratta* language is peculiar; and in reference to the admixture of Sanscrit found in it, the same observations apply as to the Telinga. Among all the considerable races of the Hindoo family, the *Mahratta* had long been the most backward in civilization, and were totally unknown to history as a people, until the beginning of last century, when they suddenly entered on a career of conquest, which threatened, and, but for the presence of a European power, would probably have effected, the subjugation of all India.

The south of India, beyond the Telinga and *Mahratta* races, is occupied by four distinct races, differing in language, and, in some respects, in physical form and intellectual character; but as in both respects it would be difficult to define the differences with precision, we shall content ourselves with their simple enumeration. Of all of them it may be observed, that they are (the inhabitants of Bengal excepted) of shorter stature, but of more compact form, than the Hindoos of the north. They are commonly also of darker complexions. Immediately to the east of the Telinga, is the *Tamil* race, occupying the whole of the level country below and to the east of the great table land of the peninsula as far as Cape Comorin. South of the river Krishna, and occupying the table-land, is the *Kanara* or *Cannarese* race, considerably civilised, and wide spread in this part of India. Below the table-land, and on the western coast, we have two races, the *Malabar*, and the *Tuluva*, to the south, peculiar in their physical organisation, intellectual character, and language. Besides these well ascertained races, there are evidences of the existence of distinct races also in the peninsulas of Gujarat and Kutch, and in the territory of Sind; in all of which there seem to have been peculiar languages, reduced at present to dialects by the admixture of conquerors and settlers from the north. Among the Hindoo races must be included the aboriginal inhabitants of Ceylon, or *Cingalese*, who resemble the Hindoo, and no other family, in their colour, the form of their persons, the character of their features, and the texture of their minds. They have a peculiar language, an indigenous alphabet, following the Sanscrit arrangement, and their speech contains an abundance of Sanscrit words.

But besides these more considerable races of the Hindoo family, there are a good many rude tribes, differing essentially in language, and often in person, from their more civilised neighbours, and from each other. If we reckon these last at not more than half a dozen, we shall find that the whole Hindoo family of nations does not consist of less than 18 different races, differing

more or less from each other, in stature, strength, mein, and intellectual endowment. If we carry our minds back to a period of Hindoo history when society was in as rude a state as in America on its discovery; — before the time when some of the races, by their superior energy, and more favourable position, had destroyed or absorbed those that were more feeble, or less auspiciously situated, we shall probably be led to conclude that the number of races and languages was, in proportion to extent, as great in India, as we have found it to be in the New World, uniform as the Hindoo physical form and mind is commonly considered to be.

From the eastern limit of the country of the Hindoos, to the western limit of China, and from the 7th to the 26th degree of N. latitude, there exists a great family, which has a common character, that is, the different races, or nations, or tribes composing it, agree as much among themselves as Europeans, Hindoos, or Chinese. We shall give this family a name which has been already applied to it, viz. the *Hindoo-Chinese*, though perhaps it would be better to apply to it that of one of its leading varieties. The following is an outline of its physical form. Head generally well proportioned, but of remarkable flatness in the occipital part. Features never bold, prominent, or well defined, as in the nations of central Asia. Nose small, round at the point, but not flattened; and the nostrils, instead of being parallel, diverge greatly. Mouth wide, but the lower part of the face does not project; lips rather thick; eyes small and black. Eyebrows not prominent, nor well marked. The face, instead of being oval, as in the Hindoo, Persian, Turkish, Arabian, and European families, is of a lozenge form; arising from its great breadth across the cheeks, and the prominence of the latter. Complexion a light brown; much fairer than the Hindoo, but darker than the Chinese. It is never black, as in many Hindoos and most negroes. The people described, are themselves aware that they are a fairer race than the Hindoos; and, like the Turks and Persians, call the latter "black men." The hair of the head is always black, lank, coarse, and abundant. On every other part it is scanty; and the beard is throughout thin and defective. The average stature may be taken at five feet three inches; so that they are shorter than the Hindoos and Chinese, but rather taller than the Malayan family. The lower limbs are better formed than in the Hindoo family, and the hands larger and less effeminate. The whole person is robust, but without the lightness, flexibility, and grace of the Hindoo form. It is at the same time more vigorous, strong, and hardy. The languages of this family of nations are for the most part monosyllabic, and as we approach China wholly so. Even the polysyllabic words of foreign languages naturalised among them, are pronounced as if each syllable were a distinct word. It follows, of necessity, that they are extremely simple in their structure, particles supplying the places of inflexions in all parts of speech, and words following each other in the natural order of ideas. There are, besides the Pali, or character of the religious language, six alphabets, employed by as many distinct nations, which, however, on examination, may be reduced to three. The Birinese, Peguans, and Aracanese, write in the same alphabet, with trifling modifications. The Siamese, Cambodjans, and, for the most part, the Laos, write in one alphabet — that usually called the Siamese. But a portion of the people of Lao also write in an

alphabet distinct from these two. The Birinese and Siamese have adopted the classification of the Sanscrit, but not so the peculiar alphabet of Iao. We hold all three to be of native invention, and the introduction of the Sanscrit classification to be only recent and incidental. The fourth alphabet, or Pali, in which religious works are generally written, is common to all the nations now mentioned, and is the same which is now used in Ceylon for a similar purpose, and which was once used in Java and other regions remote from India, the country in which it unquestionably originated. The languages of the Hindoo-Chinese countries now mentioned have not only a common character, as to sound, structure, and genius, but they contain also many words in common, the necessary effect of invasions, conquests, and settlements; the greater number of them, probably, in rude and early periods of society, and of which, with few exceptions, history has preserved no record. A large infusion of Sanscrit, through the medium of the Pali, is also common to them all. But what is the Pali itself? The common belief is, that it is the ancient language of Magadha or Bahar. It differs chiefly from Sanscrit in being more vocalic, more effeminate in its pronunciation, and less complex in its grammatical structure; and, in short, much in the same way that Romaic and Italian differ from Greek and Latin. Most probably it was a language which arose on the ruins of the Sanscrit; and was the result of a conquest of the people who spoke the latter, effected by some other Hindoo nation, the principal seat of whose government was Magadha or Bahar. This theory would confirm the common and rational opinion, that the religion of Buddha is of more recent origin than that of Brahma. The Pali is not an intrinsic portion of the Hindoo-Chinese languages; but it is found to exist in them, as Arabic does in Persian or Turkish. It, in fact, embellishes them, but is not essential. The mind of this family, as exhibited in their literary efforts, ranks them below that of the Hindoos. In enterprise they rank also below the latter. Their wars and enterprises have been wholly confined among themselves; and they have never exercised the slightest influence over the other great families of mankind; nor have they produced a single great name known to history, or one remembered even by themselves a century after his death. Still their civilisation must be of considerable antiquity, for the elements to promote an early advance unquestionably exist in their country, and these have never been presented to any family of mankind without begetting early improvement. The ox, the buffalo, and the elephant, are natives of their countries throughout; and very probably the horse and dog were so in early times. The soil too is generally of remarkable fertility; is well watered; and, in all likelihood, rice and some smaller grains, with some farinaceous roots and useful fruits, are indigenous. Inferior to the Hindoos, and still more to the Persians, Arabs, and Chinese, their superiority over all the negro and American nations is in a still greater proportion. Their progress in agriculture, in the common arts of life, the character of their religious and civil institutions, and their possession of a written character and a literature, to which they have been little indebted to foreigners, attest, in short, an early and considerable progress in society. Birinese temples, with every appearance of authenticity, can be traced back to the 9th century, corresponding to the ages of Charlemagne and Haroun-al-Raschid.

This, to be sure, is no great antiquity: but the people who constructed such buildings were already far removed from being savages.

We shall now offer a brief sketch of the races or varieties of the Hindoo-Chinese family, beginning our examination from the westward. After leaving the country of the Hindoo family, — of the men of black complexion, fine prominent features, slender person, and graceful form, — we approach the men of brown complexion, flat features, and strong-built but squab persons. Still the Hindoo form, whether from admixture of races or original constitutional difference, has not wholly disappeared; and the half-civilised people of Cassay, Cachar, and Assam, with about a dozen small tribes in a wild and half-savage state, may be described as partaking of the physical form of both Hindoo and Hindoo-Chinese. All these speak different languages, and the more civilised write, some with the alphabet of the Bengallees, and some with that of the Birinese. Among a few, language is polysyllabic, but monosyllabic dialects prevail.

To the south and east of the savage semibarbarous or half-civilized tribes and nations now mentioned — extending to the south as far as the 7th degree of north latitude, and to the east as far as the Anam race, we find six considerable nations, in which the physical character we have ascribed to the Hindoo-Chinese family is well marked, the genius of whose languages agrees, and who are nearly in the same state of social advancement. These are, the Aracanese, Birinese, Peguans, Laos or Shans, Siamese and Cambojans. Each of these has its own peculiar language; and there exists even in their physical form, especially as to size, strength, and feature, differences which, though not very obvious to a stranger, are sensible enough to themselves. Living among them in scattered communities, as far as European inquiry has extended, there exist no less than eight tribes, migratory or savage, speaking as many distinct languages.

From the eastern frontier of Camboja, to the western frontier of China, exists the Anam race, comprising the Cochinchinese and Tonquinese. These, though they have the common characters of the Hindoo-Chinese family, differ from the rest in so many particulars, that they might probably have been considered, without impropriety, as a distinct family of the human race. In stature they are shorter than their neighbours, the Laos, Cambojans, and Siamese, and greatly shorter than the Chinese. Their persons are squat, but well proportioned and active; their features are unseemly, their cheek-bones very high, and in that direction the face is very broad. Their language is purely monosyllabic, and in its terms has no admixture of the western languages. It has no alphabet; but, in lieu of it, uses, with little variation, the symbolic writing of the Chinese. Besides the Anam nation there are two considerable tribes inhabiting the same country, the Vampa and Moi, speaking their own distinct and peculiar idioms. Thus, throughout the whole of the Hindoo-Chinese countries, and among a people probably not by one-tenth part so numerous as the Hindoos, we have 32 nations with distinct languages.

We now come to an important family, comprising, indeed, a very large portion of mankind, the Chinese. The outline of its physical character may be described as follows: — Colour a sickly white, or pale yellow; hair of the head lank, black, coarse, and shin-

ing; beard always black, thin, and deficient; there is but little hair on any other part of the body; eyes invariably black, or dark; eyes and eye-brows oblique, turning upwards externally; cheek-bones high, and face round — neither square, nor lozenge-formed, nor angular in its outline. Nose small, depressed at its extremity, and thick at the root; lips thicker than with Europeans, but moderate compared to those of the negro. The whole person is well built and symmetrical; there is not in it the lightness and agility of the Hindoo; but there is sufficient activity, and far greater strength. The hands are small and soft, like those of the other people of warm climates. The lower limbs are particularly well formed, far excelling in this respect those of all other Asiatic people. The languages of this people are purely monosyllabic; none of the nations comprising it having ever known how to put two syllables together. 390 poor monosyllables, beginning with a consonant, and ending in a vowel, a liquid, or a nasal, and each monosyllable admitting commonly of about four intonations, so as to make in all about 1300 words, make up the whole of their meagre colloquial dialects, which are no less than 15 in number, corresponding with the ancient provincial divisions of the country, which in early times composed, probably, at least as many distinct nations. The Chinese monosyllables are neither affected by number, case, nor gender; by mood, tense, or person; but are designated by prefixed or affixed particles, about 30 in number. The language of the Hottentots is scarcely ruder, more uncouth, or inharmonious. The Chinese family never invented an alphabet. From knotted words they came to their present symbolic character, which bears no resemblance to the Egyptian or any other hieroglyphics. It is a language for the eye, and not the ear, — a character which may be read in English, or in Arabic, as well as in any Chinese language, and probably, indeed, with more precision. The Chinese writing, in fact, is a universal character, like the Arabic numerals, and has consequently many conveniences; but it has also its inconveniences. It has prevented the culture of oral language; occasioned the continuance of many distinct languages in the same country; and these, wretchedly meagre in structure, sound, and comprehensiveness. The Chinese mind, as indicated by its literature, is frigid, mechanical, and unimaginative. For the fine arts, in which the Greeks and Etruscans had made such remarkable progress 2500 years ago, the Chinese have never, to the present day, exhibited any capacity. They are laborious, practical, orderly, a vast assemblage, in fact, of shopkeepers and mechanics. They are among those families that made the earliest progress in civilization. Whatever they have is, also, indigent; for of all mankind they owe least to strangers. The Chinese carry their authentic history back to a period of near 3000 years; and their sage, Confucius, lived and wrote in the present character 2300 years ago; — wrote, in short, his moral rhapsodies while Herodotus was writing history; and in the same age in which flourished Pericles, Phidias, Hippocrates, and Plato; so that China was obviously as inferior to Europe then as it is now. At that time, however, China, south of the Yellow river, which at present contains the greatest and most industrious portion of its population, was in a state of entire barbarism; and even the northern frontier was divided into many petty states, — facts that only contribute with many

others to prove the comparatively recent origin of the whole human race. Two hundred and fifteen years before Christ, or above two centuries and a half later, the Chinese built along their frontier a wall of 1500 miles in extent, some 20 feet high, and broad enough for half a dozen horsemen to ride abreast, — the only human monument that makes "a conspicuous figure on the map of the globe." This was in the age of the Hannibals and Scipios, and in point of magnitude, but nothing else, far exceeded the power of the Romans and Carthaginians of the same period. We may infer from it that a people who could erect such a work, and who 2000 years ago had a frontier of 1500 miles to defend, were already numerous, and to a certain degree industrious. We may safely infer, then, that the Chinese, from their early progress in civilization, from their invention of printing, their discovery of silk and porcelain, their progress in useful works, such as domestic architecture, bridges, and canals, and their acquaintance with the art of civil administration, are, if not the most showy and brilliant, at least the most practical and useful, of the Asiatic races. One thing has been always common to this and the Hindoo family, — an absence of the spirit of enterprise. In no age have the Chinese gone abroad in search of foreign conquests or adventures; and even their indirect influence on strangers has been confined to their own immediate neighbourhood, no doubt a wide circuit. Like all Asiatic people, too, they exhibit a disposition to stand still, after making certain advances in civilization, which, in their case, have undoubtedly been respectable. They at all events display none of that illimitable facility of expansion which, in the history of our race, has hitherto alone characterised the European family. The Europeans of the 19th century bear very little resemblance to those of the 15th, except in spirit and enterprise; but we perceive that the Chinese of these two distant ages are in all respects very nearly the same. The European has advanced at the speed of the race-horse, while the utmost that can be said of the Chinese is, that its pace has been that of the tortoise.

Even in the apparently homogeneous population of China, there is to be found considerable diversity, both physical and intellectual, probably as great as in the European family or the Hindoo. It has been already stated that there are fifteen languages, belonging to as many provinces; and, indeed, several provinces have more than one language. The inhabitants of the southern and eastern coast are commonly more athletic than those of the centre and north; and among the latter are found some who have less of the obliquity of eye which is so characteristic of the Chinese, and whose features altogether approach more nearly to the European. There are even races within the empire that are not Chinese, either in person or speech, and who still preserve their independence, as the Meao-tse in the interior, the Lolos on the western frontier, with the mountaineers of Hainan and Formosa. These two islands, indeed, seem only to have been colonised by the Chinese, as the Saxons colonised Britain; while the aborigines, like the Welsh and Highlanders, have been confined to the mountains. The language of Formosa is, in fact, polysyllabic, and contains many words of the Malayan family of languages; and the Chinese colonisation of this island we know to be only of two centuries' date.

Near the Chinese we have another great family, bearing it some resemblance, but still so distinct

in physical and intellectual character, that we are warranted in classing it separately. This is the *Japanese*, which occupies a country of great extent, in the fine and temperate climate from 30° to 45° N., and comprises a population inferior only to the Chinese. Their colour is tawny; stature short, but robust; noses flattish; eyelids thick, and as it were puffed; eyes, as usual, dark, but less sunk than those of the Chinese; lower limbs large and thick, not clean and well made, as with the latter. "In the main," says Kempfer, "they are of a very ugly appearance." The language of the Japanese, instead of being monosyllabic, is polysyllabic. The Chinese can pronounce the aspirate *h*; the Japanese have no such sound in their language. The Chinese have as it were a natural incapacity of pronouncing the consonants *r* and *d*, which they always convert into *l*. The Japanese pronounce them with the same facility as Europeans. The different pronunciation of the two people made a lively impression on Kempfer, who describes it as follows: "As to the pronunciation, that also is very different in both languages, whether we consider it in general, or with regard to particular letters; and this difference is so remarkable, that it seems the very instruments of voice are differently formed in the Japanese from what they are in the Chinese. The pronunciation of the Japanese language in general is pure, articulate, and distinct, there being seldom more than two or three letters, according to our alphabet, combined together in one syllable: that of the Chinese, on the contrary, is nothing but a confused noise of many consonants, pronounced with a sort of singing accent, very disagreeable to the ear." He adds, that, with the exception of a very few commercial terms, the language of Japan does not contain a single word borrowed from the dialects of China; and hence he argues, with justice, that the two nations are wholly of distinct origin. The Japanese, to a certain extent, have adopted the symbolic writing of the Chinese; but they have also an alphabet of their own, which is syllabic, like that of the Manchooks, and like it, too, written from top to bottom. A Hindoo alphabet has also been recently discovered among them, confined to the priesthood, whose ritual is in the Sanscrit or Pali language. The Japanese, from the accounts we possess of them, are a race of considerable physical and intellectual energy; inferior to the Chinese in ingenuity, but superior to them in spirit and courage. Favoured by a country enjoying many advantages of soil, climate, extent, insular position, with most probably the possession, on the spot, of many of the most useful plants and animals, they could hardly fail to make an early progress in civilization. Their authentic history, according to themselves, dates 660 years *a. c.* This is probably greatly over-rating its real authenticity; for it would carry us back almost to the foundation of Rome, and would precede by nearly two centuries the age of Confucius and Pericles. In fact they admit that they are a people of more recent civilization than the Chinese by 12 centuries. They have had, however, a long time for improvement, and for the last three centuries may be considered as having been absolutely stationary; if indeed, as the result of their self-exclusion from strangers within that period, they may not rather be considered to be in a more unfavourable position than before it. While Chinese civilization has been repeatedly interrupted by the invasions of the shepherds of the North, no strangers have ever successfully invaded Japan; and the only attempt at

conquest, made by the Mogul conquerors of China, between five and six centuries ago, the elements, and the courage of the Japanese, repelled, and punished by the destruction of 100,000 of the invaders. An industrious, and in many respects, an ingenious culture of rice, barley, and wheat, — respectable manufactures of silk, cotton, pottery and lacquered ware, — letters, literature, authentic records, the art of printing, and political institutions, — prove the Japanese to be capable of a respectable civilization according to the Asiatic standard; but they prove also, that notwithstanding their more favourable position, both as to climate and political security, their natural genius is inferior to that of the Chinese. That they are a peculiar and original family, we think there can be no question. This is their own opinion; and Kempfer observes, in reference to this subject, that they "fancy themselves highly affronted by the endeavours of some who busy themselves to draw the original of their nation from the Chinese or others of their neighbours."

We have described the individuals of the Japanese family as if there existed among them no differences, physical or intellectual; but if we knew more of them, probably many considerable variations would be found in both respects. The inhabitants of Nipon, the principal island, are distinguished by "big heads, flat noses, and muscular fleshy complexions," as Kempfer expresses it. Those of Saikok are short in stature, of slender make, but well-shaped and handsome. The inhabitants of the Loochoo islands are described by our navigators as being neither Chinese nor Japanese, but partaking of both: they are most probably neither, nor yet a mixture of both, as they fancy, but an original and distinct race. Their stature does not exceed 5 feet 2 inches, so that they are a very diminutive race. Their language is peculiar, partaking equally of the monosyllabic and polysyllabic character. In fact, the Japanese empire is an aggregate of small hereditary principalities, in which a little acquaintance would probably discover much diversity. In language, too, probably much difference would be found to exist; although, in all likelihood, not to so great an extent as in China; owing to the existence of a more perfect oral language, a common alphabet, and, in general, the absence of the artificial medium of communication which is universal among the people of the latter country.

To the N. E. of China we have another family, the *Coreans*, occupying a peninsula equal to Britain in extent. The Coreans are described as superior in strength and stature to the Chinese and Japanese, but they are evidently a race very inferior in mental energy and capacity to either. Their language, or most probably languages, are peculiar, differing from those of their immediate neighbours, the Manchooks, Chinese, and Japanese. It would appear, also, that they have a national alphabetic character, although occasionally having recourse also to the symbolic writing of China. In the useful arts they have made considerable progress; but the standard of their civilization is much below that of the Chinese and Japanese. Their authentic history goes back to 100 years *a. c.*, or corresponds with the classic æra of Rome.

The inhabitants of two-thirds of the superfluous of Asia, from the seats of the families already specified to the Frozen Ocean, remain to be described. These have a common resemblance in some important features; but it is only such a resemblance, colour alone excepted, as exists in all the families already mentioned from the

eastern shore of the Atlantic to the eastern confines of Hindostan. Modern naturalists have described the whole, including in it the nations to the E. of the Hindoos, which we have just classed, as *one* of the five permanent varieties of the human race, under the name of the *Mongolian*. A classification of this description, which arranges under a single head people differing most widely in form of person, stature, strength, language, and mental capacity, appears to us of no value whatever, and we feel ourselves warranted in attempting a different one, though the materials before the public for such a purpose be exceedingly imperfect; and the subject itself, from its extent and variety, as well as the rude and wandering character of nearly the whole of the races concerned, is naturally of much complexity. We shall divide the races into those which inhabit the valleys or southern slopes of the Himalaya chain: those which dwell between the latter, the Chinese and Corean families, and the Altai mountains; and, lastly, those which dwell between the Altai range generally and the Northern Ocean.

The first race, proceeding in the above order, and beginning from the E., is the Bootea, or inhabitants of Bootan. "It is not possible to conceive," says Turner, who was perfectly well acquainted with both, "a greater dissimilarity between the most remote inhabitants of the globe, than that which distinguishes the feeble-bodied and meek-spirited natives of Bengal, and their active and Herculean neighbours the mountaineers of Bootan." They have invariably black hair; the eye is a very remarkable feature of the face—small, black, with long pointed corners, as though stretched and extended by artificial means; their eye-lashes are so thin as to be scarcely perceptible; and the eyebrow is but slightly shaded. Below the eyes is the broadest part of the face, which is rather flat and narrow from the cheek-bones to the chin. The skin, about as fair as that of a southern European, is remarkable for its smoothness; and the beard does not present itself until a very advanced age, and then is scanty. The Bootees are a stout, active race, and their stature occasionally rises to 6 feet. Mr. Turner, indeed, describes them as "models of athletic strength." The Bootees are a long-settled agricultural people, and have made considerable progress in the arts; have a peculiar language; an alphabet which follows the Hindoo arrangement; and in civilization, allowance being made for their remote, insulated, and mountainous country, may be considered on a par with the inhabitants of the countries lying between India and China.

Westward of the Booteas is the country of the Nepal, which, independent of Hindoo colonists and settlers from the S., who are sometimes of pure blood, but have often mixed it with that of the natives, contains 8 aboriginal races; viz. the Gorkhas, Magars, Gurungs, Jariyas, Newars, Murnis, Kirauts, and Lapchas. This, from the predominant race, may be called the *Gorkha* family. These are a short, robust people, of an olive complexion, and of features less Mongolian than those of the Booteas. Their languages are for the most part distinct from each other, and polysyllabic, and the greater number of them have a knowledge of letters. There is, among one of the races at least, the rudiments of a native alphabet; but the Dewanagari, adapted by additions and omissions to their native pronunciation, has been adopted by the greater number. Their state of civilization is

nearly the same as that of the Booteas; but they have, recently at least, exhibited a greater spirit of enterprise.

To the N. of Bootan and Nepal, and on the terrace of the grand chain of the Himalaya, at an elevation of 12,000 or 13,000 ft. above the sea, in a cold and dry climate, and an ungenial soil, are found the Tibetan family; which, as far as our knowledge goes, extends over 26 degrees of longitude, or from the 74th to the 100th. The Tibetians have what is commonly called the Tartar countenance—a face angular and broad across the cheek-bones, and small black eyes, with very little beard. Instead of being tall, like the Booteas, they are short, squat, broad-shouldered; but slow and sluggish in mind as well as body. They are mild in disposition, and have never exhibited the mental energy or enterprise of their neighbours either to the N. or S. The horse and ass, two species of the ox, the goat, and sheep, are domesticated among them. All these are probably natives of the country, and the two first are said still to exist in the wild state. Their language is guttural, nasal, and harsh, and in a great measure polysyllabic. They possess a peculiar alphabet, which bears some resemblance to that of the Hindoos in their neighbourhood, but does not follow its arrangement. For religious purposes they have another alphabet, much resembling the P'ali, and which they no doubt received along with the religion of Buddha or Fo, which they have been the medium of communicating to many of the tribes of Tartary, including the two which have conquered China. They have long possessed the art of printing with immovable wooden blocks, which they use, however, only for the multiplication of religious works.

We come now to far more important races: those inhabiting generally the vast plateau and extensive ascents between the Himalaya and Altai ranges, as far as the 140th deg. of long., and then between the former and the right bank of the Amur, or Amour. This is the *Mongolian* family, and may be described as being generally comprised between the 40th and 50th degrees of lat., and ranging over 80° of long., or from the 60th to the 140th deg. E., although, in some situations, exceeding these limits N. and S. by a few degrees. We shall first give the general description of the whole family. Forehead low and slanting; head altogether of a square form. The cheek-bones stand out widely on either side; the *glabella* and *ossa nasi*, which are flat and very small, are placed nearly in the same plane with the malar bones; there are scarcely any superciliary ridges; entrance of the nose narrow; the malar fossa forms but a slight excavation; the ulvular edge of the jaws is obtusely arched in front; chin rather prominent; body short of the European stature, broad, square, and robust; extremities short, but slender; shoulders high; neck thick and strong. Hair always black, and the eye invariably black or dark brown. Hair of the head long and lank; and there is a paucity of beard, as well as of hair over the rest of the body.

There are two great divisions of this family known to Europeans, under the name of Eastern and Western Tartars. The first comprise chiefly the Manchos, sometimes called also Manshurs and Manjurs. These are the present lords of China, of which their parent country constitutes but a dependency, though a favoured one. Those that are seen in China are not always easily distinguished from the Chinese. They

are described as shorter and squatter than the Chinese, and having a more angular countenance, and harsher features. It must be recollected, however, that a perfect similarity of dress and costume is apt to mislead the observer, and that most of the first conquerors marrying Chinese women, the nominal Manchooks of China are in reality, in a great measure, a mixed race. Inhabiting a more genial climate and a better soil than the Mongols or Western Tartars, the Manchooks are a more civilised people than the latter. They have for the most part habitations, and some agriculture, though flocks and herds constitute their chief wealth. The great river Amur, or Saghalien, and its many branches, which abound in fish, passing through their territory, many exist as fishermen. The Manchoo language is quite national and peculiar; it is polysyllabic, full, and sonorous. It has the sort of copiousness which characterises the Sanscrit and Arabic, and which, in a perfect language, ought rather to be called redundancy. The number of words for the horse, ox, and dog, according to age, sex, size, colour, and other qualities is, for example, overwhelming. The present alphabet of the Manchooks is syllabic, written in columns from the top to the bottom of the page, like the Chinese, but, contrary to the practice of that character, from left to right. It is said to have been invented only during the present dynasty, the Manchooks having, previously, used the same character as the Mongols. The Manchooks, though they have acted a considerable, have by no means acted an equally distinguished, part on the great theatre of the world with their neighbours the Mongols. In the 11th century, however, they established the great empire known in the middle ages by the name of Katay or Cathay, by uniting to their own country the northern half of China. This, after lasting 117 years, was subverted by the arms of Jenghis Khan; but in the year 1624, and at an interval of more than four centuries, the Manchooks again possessed themselves of China, and have now for more than two centuries governed that empire, and probably with a skill and wisdom never equalled by its native masters.

We come now to the true Mongols, — to the race "whose rapid conquests," as Gibbon expresses it, "may be compared with the primitive convulsions of nature, which have agitated and altered the surface of the globe." They extend westward from the longitude of Peking, or about 116°, to the Sea of Aral, a sweep of at least 3000 miles, and with the same physical form, the same language, and no great variety of manners, embrace the communities or tribes known to us under the various denominations of Mongols, or Moghuls, Kalkas, Eluths, Ogurs, Kokonors, Kamil, and Kalnucks. It is peculiarly to this family that the descriptions given by European writers of "the Tartars" is applicable. They are, in fact, the same men as the companions of Attila, Jenghis Khan, and for the most part of those of Timur, who, though priding himself on being a Turk, was in reality a Mongol, whose family had been long settled in a Turkish country, and whose myriads were a mixture of both races. Gibbon, on the authority of Jordanes, describes the person of Attila, and says that it exhibited "the genuine deformity of a modern Calmuck." An ecclesiastic, quoted by Matthew Paris, gives, in 1243, a picture of the Mongols who were the instruments of the conquests of Jengis and his sons, which is evidently drawn by an eye-witness. "The Tartars," says he, "have firm and robust bodies, lean and palid countenances, high and broad shoulders, short and

distorted noses, pointed and prominent chins, a low and deep upper jaw, long teeth distant from each other, eyelids stretched out from the temple to the nose, eyes black and unsteady, an expression oblique and stern, extremities bony and nervous, large and muscular thighs, but short legs, with a stature equal to our own, the deficiency in the length of the lower limbs being made up in the rest of the body." The Catholic missionaries, who in the reign of the Chinese emperor Kang-hi repeatedly travelled over the country of the Mongols, and actually surveyed a portion of it, confirm this description. The Mongols, by their statement, are a stout, squat, swarthy, and ill-favoured people, with the common Tartar countenance expressed in its boldest lineaments. The language of the Mongols is polysyllabic, and differs wholly from that of the Manchooks. What is remarkable, and almost peculiar to this people, is, that the whole race speak the same language, from the longitude of Peking almost to the Caspian, and in some situations even into the heart of Siberia, and westward within the confines of Europe. This arises, no doubt, from their being physically the same race, from their ever wandering and unfixed habits, the frequent mixture arising from these habits, the practice of a universal hospitality, and their having been repeatedly united under the same government, though never very permanently. Something similar to this may be found among the islands of the Indian Ocean, the languages of which have a vast number of words in common, a pacific sea constituting in this case a common medium of intercourse and communication, like the steppes and deserts of the Mongols, the *prao* and the canoe, in fact, taking the place of the horse, the ox, and the camel. The country of the Mongols is cold, elevated, and dry, few parts of it being fit for culture, and a great portion of it consisting of deserts, or "seas of sand," as the Chinese express it, in which there is neither herb nor water. It abounds, however, in game and wild animals. For the chase there is the tiger, leopard, deer, antelopes, hares, and many species of the gallinaceous family. The camel, ass, and even the horse, are still found in it, in their wild state; and no doubt the ox and sheep were so also before they were appropriated. Such a country necessarily made the Mongols early a nation of shepherds and hunters, and chained them down as it were to that condition.

The Mongols, with the exception of a very small number, live exclusively on animal food; and their clothing and dwellings, or tents, are for the most part of animal tegument or fibre. When urged to agricultural employment, their answer is, "Herbs were made for the beasts of the field, and the beasts of the field for man." (*ante*, p. 178.)

Their whole employment consists in the tending of cattle, war, and the chase. Their knowledge of letters is of the humblest order, and applicable only to the purposes of superstition in the hands of their priests. One tribe, the Igurs or Ogurs, invented a meagre alphabet of 14 letters, which, improved and extended from that of Tibet, is still in use. Of their own history and important migrations, which civilised nations have recorded for more than 2000 years, they know as little as rats or marmots do of theirs. Jenghis Khan was wholly illiterate, and Timur and Baber had a knowledge only of Turkish and Persian letters. The immense country of the Mongols may be described as a vast nursery of soldiers, consisting of many camps, equipped, provisioned, and ready to march at a moment's notice, without inconvenient-

ence or expense. The people have strength and hardihood of body, and vigour and intelligence of mind, to avail themselves of these advantages; and whenever a leader of genius capable of uniting the tribes in a common adventure has sprung up among them, they have proved a pest and nuisance to all the civilised races of mankind within their reach. Such a union made it necessary for the Chinese to build their great wall more than two centuries before the Christian era; occasioned about the same period the destruction of the Greek kingdom of Bactria; caused the settlement of the Huns within the confines of Europe, with their acts of destruction and rapine in the finest parts of it, in the 4th and 5th centuries; and the conquest of Turkestan, Persia, India, and China, achieved by Jenghis Khan, Timur, and their descendants in the 13th, 14th, and 15th centuries. The Mongolian family is at this day very nearly what it was 2000 years ago, and in all intermediate times. Are mankind likely, then, to be again harassed by any of their great military expeditions? Such an event is very unlikely with any nation, the Chinese excepted; and as far as the European family is concerned, the invention of gunpowder and fire-arms, with other improvements since the 15th century, have made it all but impossible. Asiatics, indeed, though sometimes obtaining temporary advantages, have never been a match for the Europeans, even when the latter were comparatively weak and semibarbarous. Attila was defeated in the plains of Chalons by an inferior army of the barbarians of northern Europe; and the whole of his adventures were, after all, but so many predatory inroads on a large scale. Jenghis Khan, his successor, effected only the conquest of the weakest and rudest nations of Europe, the Russians, Poles, and Hungarians, and even their subjugation was temporary. Timur did still less, and the Bosphorus was sufficient to stop the progress of a conqueror who had marched in triumph over 5,000 miles of Asiatic territory. The Franks defeated the Arabs in the height of their pride and power. A handful of Normans dispossessed them of Sicily, and the mountaineers of Biscay, after a long struggle, finally expelled them from Spain; so that within the memory of history no Asiatic people has formed any thing better than a temporary establishment in Europe. Civilised Europeans have been conquered by barbarians of their own family; but not, since the historic age, by Orientalists. The researches of modern philologists, however, make us acquainted with the singular and apparently unaccountable fact, that the languages of India, the Manchoes, and Mongols, and of the Turkish, Persian, and European families, contain many words in common; not so much changed by the peculiar pronunciation of each people as not to be clearly identified; while the Arabic and other languages of the same family do not contain any such common words. It appears to us that this may be most rationally accounted for on the supposition of an invasion and settlement of Transoxiana, Persia, and Europe by the Mongols, in times far beyond the reach of history, before the invention of letters, when there were neither Greeks nor Romans to tell the story. How the Mongolian languages came to possess many words in common with the Hindoo, seems obvious enough. All the Mongolian nations at this day receive their religion, and the language in which that religion is explained, from the Tibetians; and the Tibetians, it is admitted, have received both from India. But what, it may be asked, could tempt

the Mongolian nations to the invasion, conquest, and settlement of a country so rude and remote as Europe in the times we are supposing? The answer is, the same cause which produces constant international wars among themselves down to the present moment, — the restless military habits engendered by their position, — the constitutional animal courage of a race energetic and enterprising, — the desire to find new pastures for horses, herds and flocks, which a well watered and (then) thinly peopled country like Europe could well supply; and the victories of one tribe, forcing the conquered to abandon their own lands and seek new establishments. This was, in fact, the cause which drove the Huns of the 2d century a. c. upon the Greek kingdom of Bactria, and eventually brought that people to Europe in the 3d and 4th centuries after Christ, producing even their permanent settlement on its eastern confines. The conquests of Attila, and of Jenghis, it may be added, had similar objects in view, but took a different direction, and ended differently, owing to the resistance in their times of a comparatively numerous, wealthy, and civilised people. Timur, with the strength which Europe had already attained, at the close of the 14th century, only threatened to invade it. Both he and Jenghis invaded and overran all the other countries of the West in the languages of which Indian words are to be found; but, like the remote invaders to whom our theory alludes, they never touched the Arabian peninsula, nor formed any permanent establishment in any country in which the Semitic class of languages is spoken.

The native capacity of the Mongolian family is sufficiently attested; by the production of such men as Attila, Jenghis, Timur, Baber, and Kublay Khan; as well as in the conquest, the retention for more than 200 years, and the skilful government during nearly the same time, of the vast empire of China. It is singular, indeed, that the most useful, if not the greatest public work in that country, the grand canal of 600 miles in length, was the work of the first Mongol emperor, who was the undisputed lord of the whole. Kublay Khan, the grandson of Jenghis, though born a shepherd, added to the enterprise and courage of his own race the learning and skill of the conquered people.

Between the Altai range and river Amur to the S. and the Frozen Ocean to the N., there exist tribes almost as numerous as in any equal extent of the American continent, and far more distinct in physical form. Many of them are obviously distinct families: and others, not so considered, will, we are satisfied, be found to be such on a better acquaintance. The whole are so numerous, obscure, and unimportant, that it is difficult, or rather impossible, to classify them satisfactorily.

There are found near to, and on the banks of the Amur or Saghalien, 4 nations, called Soloni, Kertching, Daguri, and Natkis, all of which have languages wholly different from their immediate neighbours the Manchoes, while they differ also among themselves. They are rude, dull, and wholly without the knowledge of letters; live on fish; and with them we find the dog, from necessity, first substituted for the horse and the ox.

Sherbani, the grandson of Jenghis Khan, led a colony of Mongols into Siberia, amounting to 15,000 families, and his descendants reigned there for 300 years, or until the Russian discovery and conquest; so that the Mongols, although originally foreigners, now form a considerable portion of the population of Siberia, either pure or mixed up with the native tribes of the country. The Tungoos are said to be allied to the Manchoes.

They are of middling stature, with features more distinct and more in relief than the Kal-mucks or Mougols; well-made, active, and courageous. The *Buriats*, it is pretended, also, are of the Mongolian race; but it is evident from their physical form that this cannot be the case, notwithstanding the existence of Mongolian words in their language. According to Pallas, an eye-witness, they are short in stature; and so effeminate, that six of them hardly equal, in point of strength, a single Russian. These cannot be of the same stock with the powerful and intrepid people that, centuries ago, conquered these same Russians. The *Wagauls* constitutes a small family, dwelling between the Ouralian mountains and the Obi, of stature below the European, with black hair, scanty beard, and Tartarian face. The *Ostiaks* are a family small and feeble, with hair of a light colour and reddish tinge. They can count no further than 10, and live almost exclusively on fish. The *Samoyeds* extend along the Frozen Ocean from the 40th to the 115th deg. of E. long. The stature of this very distinct family is commonly from 4 ft. to 5 ft., and consequently at least a foot short of the European standard. Head disproportionately large; face flat; mouth large; ears also large, and the lower portion of the face projecting. The *Tchouktchs*, *Yakagines*, and *Koriaks* occupy the extreme eastern angle of Asia fronting America, and are a coarse-featured, short people; without, however, the flat noses, or peculiarly small eyes of the Kamtchatcaddals. They resemble the Esquimaux of America; and speaking three distinct languages, are probably as many distinct races. The *Kamtchatcaddals* are a very short race, with broad shoulders, a large head and a flat elongated countenance, thin lips, small eyes, and very little hair. The *Aleutians*, or inhabitants of the Aleutian islands, are a different race from these. They are swarthy, short, but stout and well-proportioned. The people occupying the great island of Saghalien at the

mouth of the Amur, and the whole chain of the Kurile islands, from the Cape of Kamtchatka, to Jess in Japan, are a distinct race from any of those above mentioned.

The stoutest and most vigorous of the people of this part of Asia, or those found to the S., dwell in moveable tents, like the Mongols; have horses and oxen; and are not wanting in stature, strength, and the military virtues. On the contrary, the inhabitants of the bleak and inhospitable regions towards and on the shores of the Polar Sea all exchange the horse, ox, and sheep for the rein-deer and dog; live in cabins or caverns instead of moveable tents; are small, weak, and pusillanimous: "a race," as Gibbon expresses it, "of deformed and diminutive savages, who tremble at the sound of arms." Among all the native races to the N. of the Altai mountains, letters are wholly unknown, agriculture is scarcely practised; for war on a large scale the people have neither disposition, capacity, nor means; and, to obtain food and clothing, nearly their whole time is consumed in fishing and the chase.

V. AMOUNT OF POPULATION.—POLITICAL DIVISIONS.—There are no means whatever by which to form any thing like a correct estimate either of the extent or population of the greater number of Asiatic states. The estimates of the population of China only vary from about 150 to about 368 millions; and the differences in the estimates of the population of other countries, though much less in absolute amount, are quite as great in degree. There are also great discrepancies in the estimates that have been formed of the area of the different states, originating partly in the want of correct measurements, and partly in the fluctuating and ill-defined nature of their boundaries. The subjoined estimate is not, therefore, put forth as if it were exempted from error; but we are inclined to think that it will be found to be more nearly accurate than most of those by which it has been preceded.

Estimate of the Area and Population of the different Asiatic States.

States.	Area in Square Miles (Engl.).	Population.
Chinese Empire and dependant States	7,141,000	168,000,000
Russian Empire	5,846,000	3,600,000
Empire of Auram	98,000	5,000,000
Burman Empire	184,000	2,000,000
Siam	80,000	2,800,000
Malay Peninsula	58,000	600,000
Ceboy	7,000	70,000

VI. PROGRESS OF DISCOVERY.—The geographical knowledge of Asia may be considered as commencing with its western countries, and with Greece, the cradle of our present civilisation. Judea and Phenicia are the quarters from which the earliest information comes. The Jews scarcely recognised distinctly any object more easterly than the Euphrates, emphatically termed by them "the river;" beyond which, at a vague and uncertain distance, they placed "the ends of the earth." Tyre traded with several cities on its banks, but does not seem to have pushed her intercourse further; though Dr. Vincent reasonably conjectures, that the chests of rich apparel, carefully bound with cords, brought by this channel, were from countries much more remote. A great traffic is mentioned with Dedan, a city of Arabia, which, from its many isles, and its merchandise of precious cloths, must have been in the vicinity of Ormuz, and have drawn these commodities from India. They were transported, by large caravans, across Arabia to Edom or Idumea, which was greatly enriched by this traffic. From the south of Arabia, Sheba, or Sabæa, sent caravans laden with gold and incense, both probably obtained from the opposite coasts of Africa.

The knowledge of the Greeks, in the nearly cotemporary age of Homer, was far more limited. He seems to have had no distinct knowledge of any country east of Asia Minor. Colchos, on the Euxine, being supposed to contain the chariot of the sun, must have been viewed as the eastern extremity of the earth: the voyage thither by Jason, in the ship *Argo*, was regarded as an almost superhuman achievement. The name Asia was then applied only to a part of the coast of Caria, whence it was extended to the peninsula, and ultimately to the whole continent; after which the other was named the Lesser Asia.*

The triumphant contest of Greece with Persia excited deep interest, and generated plans of conquest, which rendered every information respecting that empire acceptable. The most valuable contributor was Herodotus, who, during a residence at Babylon, collected materials for a description of the satrapies into which it was divided. To the north it extended over a part of the Caucasian provinces, enabling the writer to delineate tolerably the extent and boundaries of the Caspian. Margiana and Bactria probably reached to the Oxus, beyond which wandered the Scythian tribe named Massagetae. India was the most easterly satrapy; but being described as containing no great river except the Indus, and bounded by an immense desert, it evidently contained only the western provinces, while the Gangetic and southern countries were entirely unknown. Herodotus gives a somewhat rude description of the inhabitants, suggested probably by the bordering mountaineer tribes. The fact of its affording a revenue four times that of Egypt, shows clearly that it was already opulent and improved. Darius is said to have employed Scylax, the Caryandrian, to descend the Indus, sail along the southern coast, and come up the Red Sea; a voyage accomplished in two years.†

The next great source of information to the Greeks was the expedition of Alexander. It did not, indeed, extend much beyond the already known limits of the Persian empire; but the countries, before known only by vague report, were then carefully examined and described. Under his direction two engineers, Diognetus and

Bacton, made surveys of each march, which were published by the latter, but are unfortunately lost. To the north, Alexander pushed beyond the Jaxartes, but without being able to bring under subjection the rude tribes who tenanted those regions. On the side of India, he learned the existence of the Ganges and the fine countries on its banks, to which he eagerly sought to penetrate; but the mutiny of his troops compelled him to stop at the Hyphasis. The Greeks had then an opportunity of observing some of the peculiarities of the Indian people; their division into castes; their fantastical religious austerities; and the merit attached to suicide. Alexander descended the Indus to its mouth, and sent thence a fleet under Nearchus, who traced the coast of Asia as far as the Persian Gulph, which he ascended, and joined his master at Babylon. This voyage, now so easy, was then considered a most perilous achievement, and the party arrived in a state of distress and exhaustion. Alexander himself, in returning through the maritime provinces, became aware of their extremely desolate character, through which, indeed, his army was in danger of perishing.

On the partition of Alexander's empire, Seleucus obtained Syria, with as much of the countries to the eastward as his arms could hold in subjection. He is said to have attempted the conquest of India; but there is no distinct account how far he penetrated; probably it was not beyond Alexander's limit. He sent however an embassy, under Megasthenes, to Palibothra (Pataliputra) on the Ganges, capital of one of the most powerful kingdoms ever formed in India; and through this channel a good deal of additional information was obtained. He also employed his admiral, Patroclus, in an attempt to circumnavigate Asia; and rumour even represents him as having accomplished this vast circuit, and entered from the northern ocean into the Caspian; but the manifestly fabulous character of this report makes it impossible to conjecture how far he really penetrated.

All the materials thus collected were at the disposal of Eratosthenes, the learned librarian of Alexandria; and were employed by him in forming, on the astronomical principles of Hipparchus, the first systematic delineation of the globe. It is however, as to Asia, extremely imperfect. The Ganges is made to fall into the eastern ocean, represented as bounding the habitable earth. The Cape of the Coliæci (Comorin) is made at once the most southerly and most easterly point of Asia. About ten degrees north of the Ganges, and a very little east, is placed, in the same ocean, the city of Thinae, often alluded to as the extremity on that side of the habitable world: this appears the first very imperfect rumour, which reached the western nations of the Chinese empire. Not far from Thinae, the coast turned westward, stretching along the great northern ocean, which bounds both Europe and Asia, but at so low a latitude that the Caspian was considered to be a gulph connected with it by a narrow strait. This was a retrograde step even from Herodotus, who had described it justly as an inland sea. Asia, thus wanting Tibet, China, the greater part of Tartary, and all Siberia, possessed little above a third part of its real dimensions.‡

The Romans did not, by their conquests, obtain any accession to the knowledge of Asia. Before they reached Persia, that country had been occupied by the Parthians, a brave

northern people, the attempts to subdue whom were not only fruitless, but most disastrous. But the boundless wealth accumulated in the imperial capital, from the spoils of conquered nations, brought all sorts of commodities, however distant the place of their production, and however high their price, to its markets. The *Serica vestis* (silk), then first introduced, became for some time quite the rage, and was readily paid for at its weight in gold. The fragrant malabathrum (betel, or tea), and the ornamented vessels, named murrhina (probably porcelain), brought also vast prices. The merchants of Alexandria and Byzantium were thus impelled, not only to embark large capitals, but to brave hardship and danger in reaching the remote extremities of the continent, where these commodities were produced.

Of the maritime route, Arrian, a merchant of Alexandria, has given a detailed and correct account, supposed to be written in the first century. He describes it as extending along Persia, Arabia, and India, as far as Nelisurum (Nelkunda), on the coast of Malabar. The Greek navigators had not then proceeded farther east, but found in that port supplies of the important articles of silk and malabathrum. This trade was carried on by ships that steered directly across the Indian Ocean from the Straits of Babel-Mandeb, by the route first discovered by Hippalus. Of the more easterly coasts, Arrian gives only hearsay accounts, becoming gradually fainter and more fabulous. But he distinctly indicates Masulipatam and the mouth of the Ganges, with the exquisitely fine cottons there fabricated. Even beyond this limit, he mentions Chryse or the golden isle (Sumatra or Borneo). Thinae is noticed, but in a manner still more confused than by Eratosthenes. But he gives a curious account of the collection of the leaves of malabathrum by a people, the form of whose visage shows them to be Tartars or Chinese, and of the manner in which they were picked, dried, and curled. Vossius, Vincent, and most other writers, conceive this to be the betel. Mr. Murray, however, has lately endeavoured to show, that this last, being only used for wrapping the areca nut, must for that purpose be used fresh, and would be destroyed by the above processes; that it cannot consequently be, and is not, an object of trade, though the areca is; and that the malabathrum alluded to was, therefore, most probably tea. The ancient accounts, however, give no distinct intimation how the article was used, nor any reason to think, supposing it to be tea, that it was by drinking the infusion, but rather, in some form, as an object of scent.*

About a century after, Ptolemy published his elaborate system of geography, which shows a very remarkable extension of knowledge in regard to Asia. He delineates, though rudely, a very large extent of coast from the mouth of the Ganges to Cattigara, on the coast of the Sinae; chiefly from a pretty detailed route of his predecessor Marinus, partly furnished by Alexander, a mariner, who, from his name, was probably a Greek. His statement that it reached 1,300 miles S. E., and then about as much N. E., could only consist with a voyage from the head of the Bay of Bengal to China. Sada, the point where he turned north, must be at or near Singapore. Thence he described a coasting voyage of 350 miles, when he crossed "the sea," (evidently the broad mouth of the Gulph of Siam,) and reached

what he terms the Golden Chersonese, a name very naturally suggested by the rich mines on the opposite coast of Borneo. Thence he had twenty days' coasting sail (along Cochin China and Tonquin); finally, a course, partly south, but more east, led to Cattigara, which must thus have been on the southern coast of China, and from its name probably Canton. Ptolemy, however, though he professedly made this the basis of his delineation, evidently adopted, and unskillfully combined with it, information from other quarters. In his tables, the Golden Chersonese, from its vast extension southward, and containing the names Malayo colon and coast of the Pirates, very clearly designates Malacca, conjoined probably with Sumatra, which is not separately mentioned. The extreme point of Cattigara, too, is placed on a coast, stretching, not east, as Alexander had described, but due south, with a view probably to harmonise with the strange theory, according to which the coasts of Africa and Asia formed a vast circuit, and met, enclosing the whole Indian Ocean.†

The same geographer describes a caravan route, formed through Asia by the merchants of Byzantium. Proceeding due east, through Asia Minor and Persia, they made some circuits in order to include Hyrcania (Astrabad), Aria (Herat), and Margiana (Khorassan); they then reached Bactra (Balkh), which seems to have been the main centre of the inland trade of the continent. The route, which had hitherto been through immense and level plains, led then over those lofty mountain ranges that lie to the north of India. After a laborious ascent, they reached a station called the Stone Tower, where the merchants, destined for the remotest extremities of Asia united for mutual aid and defence: thence, a route of seven months, chequered by many perils and vicissitudes, brought them to Sera, the capital of Serica. That this country is China is now so generally admitted, that we need scarcely notice the theories which assign to it a less distant position, especially that of Gosselin, who, in profound ignorance of the localities, would make it Sernagur, in the north of India. The produce of silk, the character of the people, industrious, mild, pacific, timid, and shunning the intercourse of foreigners, all combine to exclude any other supposition. It is remarkable that northern China, reached by this route, is called Serica, while its southern coast is named that of the Sinae. It is, in fact, uncertain, whether the two were then under one government; at all events, the names were probably those used by the neighbouring nations, as, at present, the term China, the same with Tsina or Sina, is received by us from the people of the oriental archipelago. Ptolemy's knowledge did not reach to the eastern ocean; and, unlike Eratosthenes, he did not assume its existence, but bounded Asia on that side, as well as on the north, by a vast expanse of "unknown land."‡

This communication, opened by Rome during her highest prosperity, was gradually lost amid the distractions and weakness of the empire, and when all the intermediate countries were occupied by the hostile Saracen power. Stephen of Byzantium, and the Geographer of Ravenna, about the eighth century, show only the most imperfect knowledge of the countries beyond Bactriana, including them under the vague term of India-Serica.

A new people now arose, who, impelled by ambition and religious zeal, explored and civilised a great portion of the world. The Arabs, under the impulse given by Mohammed, rushed from their deserts, and conquered an empire more extensive than that of Rome. They penetrated even into Scythia, which had remained impervious both to the Persians and Greeks; and established flourishing kingdoms on the banks of the Oxus and the Jaxartes. During the enlightened æra of the caliphs, particular attention was paid to geographical knowledge. A number of leading positions were determined by astronomical observation, a process to which the Greeks had been almost strangers: India was well known to them, and ere long became subject to Mohammedan princes. China was never even approached by conquest, but commerce conveyed some pretty accurate ideas respecting that country; indeed, in the 9th century, two Arab merchants, Wahab and Abusaid, visited it, and published an account, in some respects very accurate, and accordant with modern observation. They mention its great fertility and populousness; the production and general use of rice, silk, tea, and porcelain; the rigid watchfulness of the police; the general diffusion of reading, and the preference of written over spoken language. It is remarkable that Abulfeda and Edrisi, the most eminent of the Arabian geographers, appear ignorant of this work, and their account is meagre and defective. On the north, some imperfect notices were received of Siberia and the Arctic Ocean. This region excited intense interest from its being supposed to contain the castle of two enormous giants, Gog and Magog, the search after which impelled the caliphs to expeditions of discovery. After several fruitless efforts, one was dispatched, with strict orders not to return without having discovered this castle. Under this impulse they marched towards the Altai, and returned with a truly formidable description of the fortress, as surrounded by walls of iron, and with a gate fifty cubits high. This report was implicitly received, and the castle appears conspicuous in all the maps of the middle ages.*

Europe mean time was buried in the deepest ignorance as to all that related to the eastern world. Attention, however, was at last powerfully attracted to it by the crusades. Some direct accounts were received, and lights were sought in Ptolemy and other ancients: the result was a very confused mass of notions, which are curiously exhibited by Sanudo, in the map prefixed to his narrative of those expeditions, entitled, *Gesta Dei per Francos*. The world is there represented as a great circular plain, in the centre of which stands Jerusalem. Sera is borrowed from Ptolemy; but India is placed partly beyond it, and, under the titles of Major, Minor, and Interior, is scattered through different and distant parts of Asia. The Indus, in the text, is made the boundary of that continent. To the north, Albania and Georgia stretch almost to the sea of darkness, and in the same quarter appears the castle of Gog and Magog.

Attention was about the same time forcibly drawn to another Asiatic region. The Mongol chief Jengis, and his descendants, established an empire of immense extent, comprising on one side China, and on the other Russia, which was long held under Tartar sway. Thence they marched through Poland into Hungary and

Silesia. The Duke of that country, having ventured to encounter them, was defeated and slain. Circumstances deterred them from proceeding farther; but their numbers, ferocity, and conquests, struck Europe with terror. In hopes of averting future invasion, it was determined to send embassies from the Pope, as the chief of Christendom; and two monks, Carpini and Rubruquis, were successively employed. They travelled by long journeys, of many months, over the vast plains of Tartary to Karrakarum, a rude capital, situated far east in that region. They were tolerably well received, as oriental courts are fond of the attention and homage which missions imply; but the threatened invasion was prevented by quite different causes. Being probably the first who had penetrated into those remote regions, they communicated new ideas respecting their vast extent, and the countries situated both at their eastern and northern extremities.†

About the same time that this intercourse with the east was opened, and partly in consequence of it, the spirit of industry and commerce revived among the maritime cities of Italy. Venice and Genoa had established factories and carried on trade, not only over all the Levant, but on the coast of the Black Sea. From this last quarter, two Venetian nobles of great enterprise, of the name of Polo, undertook to visit the court of a Tartar prince, descended from Jengis, with a view to dispose of some valuable commodities. Various vicissitudes led them on to Bokhara; and they were there induced to accompany a mission to Cambalu, the court of Kublay, named the Great Khan, who inherited the most valuable of Jengis's conquests in China and the neighbouring countries. Having returned to Venice, they again set out for the East, taking with them Marco, one of their sons, to whom we are indebted for a most interesting account of his and their travels. On their outward journey, they passed through Balch, Kashgar, Khotun, Tangut, and other countries in that great table-land of Middle Asia, which we name Little Bucharia, and respecting which we have little better information than Marco communicated.

Cathay, as northern China was then called, with Cambalu, its capital, the modern Peking, completely dazzled the travellers. The walls forming a square, each side of which measured six miles — the lofty ornamented gates — the spacious streets — the immense palace, with its painted halls — the beautifully ornamented gardens — the pomp of the imperial festivals — all these objects, nearly on the same scale as now, far surpassed any magnificence of which Europe could then boast. Being well received, and even officially employed, Marco made an extensive tour through the western provinces, visiting part of Tibet, and obtaining information respecting Mien (Ava). This was followed by a more interesting journey into Mangi, or Southern China, which not long before had formed a separate kingdom, but happened then, as now, to be subject to a power resident in the north. He describes it justly as more fruitful and populous than the region first visited. Its capital, Quinsai, or the Celestial City, is painted quite in magic colours; its edifices, canals, ornamented bridges, spacious lake, and the palaces which embellished its shores. He indulges here in some exaggeration; yet Hangtchoofoo (as the place is now named, though it has long ceased to be a seat of empire,) is described as nearly as large as London, and surrounded by delightful environs.

* Edit. i. Géogr. Nubiens. Paris, 1819: Notices et Extraits des Manuscrits du Roi de France, tom. ii.; Anciennes Relations, &c. traduites par Renaudin. Paris, 1718.

† Macklay, l. 16. 117. Purchas, iii. ch. 1.

Marco heard also of Xipangu, or Japan, as a rich insular empire, which the Great Khan had made a vain attempt to subdue. Returning by sea, the travellers touched at Tsiompa and Sumatra. They spent some time successively in Ceylon, Coromandel, and Malabar, and Marco gives a not unfaithful account of Indian manners and superstitions. Then sailing up the Persian Gulph, they proceeded from Ormuz to Trebisond, whence they returned to Venice, 24 years after their departure. No travellers ever perhaps carried home so great a mass of important information; but the narrative, being tinctured with the marvellous, and resting on Marco's sole authority, became exposed to much of that scepticism with which the first travellers into new regions are often unjustly assailed.*

The great discoveries thus made were not however neglected. In the beginning of the fourteenth century, Juan de Monte Corvino, a Minorite friar, undertook a religious mission into the east. He penetrated to Cambalu, where he was allowed to reside for a number of years, and made many converts; the city was even erected into a see, of which he was named archbishop. About the same time Pegoletti, an Italian merchant, traced the caravan route through Asia as far as Cambalu, and published his itinerary.† Another Minorite friar, Oderic of Portenau, narrated a voyage made to India, the oriental archipelago, and China, returning by way of Tibet. He describes some Chinese peculiarities, which could not seemingly have been copied from former writers; such as the pride taken by the female grandees in long nails and little feet; and the use of birds in fishing. He mentions, indeed, a country of pigmies, with other wonders, which have somewhat shaken his credit. These, however, being related only upon hearsay, indicate credulity rather than bad faith. This cannot be said of our countryman, Sir John Mandeville, whose relations for some time drew a much greater attention: his statements are mostly borrowed, and exaggerated, from Oderic, and by pretending to have visited the pigmies, and seen other marvels, which the other stated only on report, he proves his work to be a complete forgery.‡

In the end of this century, the conquests and widely extended empire of Timur, with his victory over Bajazet the Turkish sultan, resounded throughout Asia, and in some degree through Europe. Henry III. of Castile sent two successive embassies to the court of the Tartar conqueror, the last in 1403, under Clavijo, who spent some weeks at Samarcand, and though he has not added much to geographical knowledge, he gave an interesting account of the court and policy of that monarch.||

By these different means, a light, though somewhat dim, was thrown upon the farthest extremities of Asia; but it did not much avail the Italian republics, who were unable to reach its southern shores by sea, while the land-route was too arduous and perilous to be much frequented. The period, however, was now at hand, when the furthest extremities of Asia were to be the scene of European enterprise and adventure. In 1497, Vasco de Gama doubled the Cape of Good Hope, and reached the shores of India at Calicut. In the short space of twenty years

the Portuguese, by a succession of victorious armaments, established forts and settlements in Hindostan, the Malayan peninsula, and most of the islands of the archipelago and even attempted them in China. Although this career could not be said to be one of discovery, almost all these countries being to a certain degree known, the hitherto doubtful accounts were authenticated, and they were surveyed with much greater precision. In the seventeenth century, a body of French missionaries, eminent for mathematical and astronomical knowledge, obtained permission to reside in Peking, and were even employed in making a survey of China and the adjacent countries. The materials thus collected were transmitted to France, and arranged by D'Anville. Through the like agency, a less perfect knowledge was obtained of Japan.¶

But though the south of Asia, including its finest regions, had thus become completely known, there remained north of the Altai Mountains nearly a third part of the continent to which neither conquerors nor merchants had yet penetrated. Its discovery was reserved for Russia. After groaning for ages beneath the Tartar yoke, she emancipated herself, in the fifteenth century, under Joan Vassilievitch, and has ever since continued an active and increasing power. About the end of that century, having conquered the Cossacs, she had the address to engage that active and hardy race to explore and conquer for her the vast region of Siberia. They proceeded step by step, till, in 1639, fifty years after the commencement of the undertaking, Dimitrei Kopilof arrived at the Gulph of Ochotsk, a branch of the eastern ocean. Another division marched south-east upon the Amour, but there, having encountered the Chinese, were obliged to fall back. This progress, being along the southern part of the territory, did not bring them in contact with the coast forming the frozen boundary of the continent, which the English and Dutch were, in the meantime, exerting themselves to traverse as the nearest route to China. Middleton, Barentz, Hudson, and other navigators, engaged in this attempt; but none of them reached beyond the Gulph of Obi, a little east of Nova Zembla. About 1640, however, the Cossacs sent expeditions down the rivers Lena, Indigirka, Alaska, and Kolima, tracing their mouths, and the coasts between them. In 1646 they reached the extreme north-east peninsula of Asia, inhabited by the Tchutchi; in 1648 Deschnew and another chief undertook to sail round it, and though the accounts are imperfect, seem to have accomplished their object. Towards the end of the century, Behring discovered the most easterly cape of Asia; he and Tchirikoff afterwards made voyages to America. Cook, in his third voyage, sailed through these straits, and appeared to ascertain the disjunction of the two continents. It was still possible, however, that their coasts, by a vast circuit, might join each other; but this idea has been completely removed by the voyages of Wrangel on one coast, and of Beechey, Dease, and Simpson on the other. We may observe also that Cook, Perouse, and Broughton did much to explore the eastern boundary of Asiatic Russia, and its connection with the large island of Jesso, with Japan, and China.**

The entire coast of Asia has thus been explored, and in a great measure possessed, by Europeans. But the interior, never well described, and having ceased to be regarded in a commercial point of view, has continued comparatively unknown. The great range of the

Himalah, better described by Ptolemy than in many modern maps, has, however, been carefully surveyed, and its astonishing height ascertained. The expeditions of Turner and Moorcroft into Tibet, Elphinstone into Caubul, and Burnes into Bokhara, greatly extended our knowledge of these regions.* The embassies from Russia to China crossed Mongolia and the desert of Gobi; while Pallas and Humboldt, from that side, gained much information respecting these central regions. But Ferghanah, Yarcund, Kashgar, and the whole of Chinese Tartary, with its fine plains and lofty mountain ranges, are but little known, and would amply reward the enterprise of a traveller, who should elude the jealous policy by which they are shut against strangers.

ASIA-MINOR. See NATOLIA.

ASIAGO, a town of Austrian Italy, prov. Vicenza, 24 m. N. Vicenza. Pop. 4,700. It is built on the summit of a hill, and is celebrated for its dye-works, and fabrics of straw hats. The annual value of the produce of the latter is supposed to exceed 150,000.

Asiago is the chief town of a district containing seven communes, the inhabitants of which speak a corrupt dialect of the German. They are supposed, by some antiquaries, to be descended from fugitive Cimbræ, escaped from the great battle in which that people were totally overthrown by Marius, 101 years a. c. Marco Pezzo, an ecclesiastic, and a native of the district in question, published a curious dissertation on this subject, a third edition of which appeared at Verona in 1768.

ASOLA, a town of Austrian Italy, on the Chiassa, 20 m. N. by N. Mantua. Pop. 3,000. It is fortified, has an hospital, and a flature of silk. Its foundation dates from the remotest antiquity.

ASOLO, a town of Austrian Italy, 19 m. W.N.W. Treviso. Pop. 3,000. It is finely situated on a hill, and is encircled by walls flanked with towers. It has an old cathedral, a public fountain, and some good houses. It is very ancient.

ASPE, a town of Spain, Valencia, 16 m. W. Alicante, in a mountainous country near the Taroffa. Pop. 5,000. There are quarries of fine marble in its vicinity.

ASPERG, a town of Württemberg, 3 m. N.W. Ludwigsburg. Pop. 1,400. Its church has some remarkable antiquities. At a little distance to the N. is the fort of Hohen-Asperg, on a steep rock, 1,105 feet above the level of the sea. It is at present used as a prison.

ASPERN, a small village of the arch-duchy of Austria, on the left bank of the Danube, opposite the island of Lobau, about 2 m. below Vienna. This and the neighbouring village of Esling were, in 1809, the scene of a tremendous conflict between the grand French army commanded by Napoleon, and the Austrians under the archduke Charles. After two days' (21st and 22d May) continuous fighting, with vast loss on both sides, Napoleon was obliged to withdraw his troops from the field, and take refuge in the island of Lobau.

ASPET, a town of France, dep. Haute Garonne, cap. cant. 8 m. S.E. St. Gaudens. Pop. 2,784. It has manufactures of nails, combs, and boxwood articles.

ASSAM, an inland territory of India beyond the Ganges, a dependency of the British empire, forming part of the E. frontier of our Indian possessions. It is included in the valley of the Brahmaputra, between 25° 40', and 28° 10' N. lat. and 90° to 97° 35' E. long.; having N. the Himalaya Mountains, which separate it from Bhootan and Tibet; E. Tibet; S. the Naga and Garrows Mountains, which divide it from the Birman and Munnepoor territories; and W. Bengal: length, E. to W., about 460 m.; area, 18,300 sq. m.; pop. (*Pemberton*, 1835) 602,500. (*Hamilton's Hindostan*, ii. p. 740.)

It is divided into,—

	Area.	Pop.	Revenue.	Chief Town.
Upper Assam	sq. m. 10,000	209,500	rupees. 120,000	Jorhath.
Central Assam	5,633 1/2		4,000	Hergong.
Lower Assam	2,665 1/2	400,000	216,000	Gowahat.

The general aspect of Assam is that of fine and fertile lowlands, inclosed by ranges of undulating hills, and these again by loftier ones, the surface of which is mostly covered by forests. But their summits, in winter, are often covered with snow. The geology of this region has not been much studied: the mountains which form its S.

boundary, which increase in height as they proceed eastward, consist in part of a hard grey granular slate; and on the inferior heights there are many scattered boulders of granite: shell limestone is found in large quantity near Dhirmpoor. (*Pemberton, Bodas, Report on the E. Frontier of British India*, Calcutta, 1836, p. 78.)

The most remarkable natural feature of Assam is the number of rivers, in which it surpasses every other country of equal extent. Besides the Brahmaputra, which runs through its centre in a S. W. direction, it has 34 rivers flowing from its N., and 24 from its S. mountains, all of which are navigable for trading vessels of some size! (*Hamilton, E. I. Gazetteer*, p. 39.; *Pemberton, Report*.)

In Upper Assam, the Brahmaputra divides into two streams, including the considerable island of Dehing, one of the most fertile tracts in the country, having an area of 1,800 sq. m., and a pop. of 25,000. The inundations which prevail during a part of the year (see BRAHMAPUTRA), and give Assam the appearance of an extensive lake, and the great subsequent heats, render the climate most unwholesome and pestiferous both to Europeans and natives.

The chief mineral products are gold dust, in the sands of many of the rivers, the collection of which employs a great number of people, the produce of the Jhumaree river alone being estimated at 140,000 rup. a year; silver; iron; salt, chiefly from springs in Upper Assam; lead; coal; and petroleum. Throughout the whole length of the Assam valley, a forest 7 or 8 miles wide extends along the N. border, chiefly of a tropical character; but at the foot of the hill ranges, chestnut, alder, &c. are intermixed with the other trees. The timber is of the rom. (see BRAHMAPUTRA), and gives Assam the appearance of an extensive forest, excepting the conchocou (*Picus elastica* Roxburgh), which grows solitary, sometimes to the height of 100 feet, and covering with its branches an area of 600 sq. ft. Tea, of a genuine kind, has been discovered in the region inhabited by the Singpho tribes, where it grows over a large tract of the peculiar yellowish soil so characteristically adapted to it: it has been brought to the London market, both black and green, and has fetched a high price; but it remains to be seen whether it can be produced as cheap and of as good a quality as in China. Our anticipations, we confess, are not very sanguine (January, 1836). This province is very favourable to the production of silk, which is of a very superior quality; but mostly made by wild insects, of which there are 8 different species; the sugar cane grows in China, but no sugar is made; a beautiful deep blue dye is obtained from *room*, a species of *Kuella, Acanthaceæ*; and a powerful poison is procured from some plant by the Assamese, into which they dip their arrows.

The hills along the bed of the Trolieh are very steep, and covered with dense jungle nearly to their summits. There are no tigers, but many bears, monkeys, squirrels, &c. The chief object of culture is rice, and next to this mustard seed; wheat, rye, barley, and millet are rare; many sorts of pulses, the banana, orange, and other fruits, black pepper, ginger, turmeric, capsicum, onions, and garlic, are cultivated; and cotton by the hill tribes. Cattle and poultry are few; the buffalo is most used in agriculture. Villages rare, and the scattered huts mostly built of bamboo. There is some small trade with Bootan and Tibet: several remarkable roads or causeways intersect Assam, the origin of which is not known, but they appear to have been constructed at a distant period; one of these extends from Cooch Bihar in Bengal to the extreme E. limits of this country. The land is tilled by *pykes*, or natives of 4 different classes, who are obliged, for a portion of the year, to give their services for the benefit of the rajah granting them their land. (*Pemberton*, p. 73.; *Hamilton, E. I. Gazetteer*, p. 40, 41.)

The manufactures are those of silk velvet and cotton stuffs, and are carried on by the women: silks are in general use for clothing, and similar to those of China. The trade is mostly with Bengal, the imports from which are broadcloths, muslins, chintzes, &c. salt, opium, liquor, glass, crockery, tobacco, betel, and rice; the exports being gold dust, ivory, silver, amber, musk, daos, Birman cloths, and a few Chinese cloths: in 1833, cotton was added to the exports from Assam. (*Hamilton*, p. 72.) There is a duty of 10 per cent. on the value of all imports. The country is inhabited by a number of different tribes, who in central Assam are united under a rajah tributary to the British Government. Upper and Lower Assam are in the direct occupation of the British, who keep at Suddya two companies of Assam light infantry under a British officer, and two gun-boats. (*Pemberton*, p. 71.) Justice is administered by the heads of tribes, and their punishments are of the most barbarous description, a capital crime involving the death, not only of the criminal, but also of all the members of his family! The religion is that of Brahma, introduced in the 17th century; before that period, the god Chang (probably the same as Boodh) was adored: the priests have great influence, and are intriguing and vicious. The people are active, hardy, and enterprising; but barbarous, revengeful, and deceitful: they consist of

* Asiatic Researches, vols. 6, 10, 11, 12. Frazer's Tour in Himala Mountains, &c.

numerous different tribes, as the Bor-Khamti, Singpho, Mishmees, &c., each under a separate chieftain. Principal food rice, but they also eat serpents, rats, locusts, dogs' flesh, &c.; they use an Hindostanee dialect, the language of Assam being nearly extinct. Some of the tribes go quite naked; others have a covering round their middle, and over the head and shoulders they wear moustaches, but shave the scalp and chin. Their habitations, even in the principal towns, are mere huts, with a clay floor and conical roof of straw or bamboo. In every respect, this country is in a state of abject barbarism. Little is known of their history; in 1688, they invaded Bengal, but were repulsed by some of Shah Jehann's officers, and lost some of their own frontier provinces. A general of Aurangzeb subsequently led an army into Assam, which he lost before Gergong during the rainy season by disease and the resistance of the enemy. Assam is one of the provinces ceded to the British by the Birmees in 1826. (*Hamilton, Description of Hindostan*, pp. 744, 745; *Hamilton, E. J. Gazetteer*, p. 41.)

ASSCHE, a town of Belgium, prov. South Brabant, about half way between Brussels and Dendermonde. Pop. 4,000. It has some trade in hops, flax, and corn.

ASSEERGIUR, a town and fortress of Hindostan, presid. Bombay, prov. Candesh, cap. distr. belonging chiefly to Sindia's dom., on a detached hill of the Saut-poorah Range, 15 m. N. Boorhanpoor, and 215 m. E.N.E. Surat. Lat. $21^{\circ} 28' N.$, long. $76^{\circ} 23' E.$ Pop. (1822) about 2,000. The town, straggling and irregular, with one good bazar, stands at the base of the rocky hill on which the fortress is placed. The summit of this hill is about 1 100 yds. from E. to W., and 100 yds. high; it is inclosed by a wall, and surrounded by a precipice from 80 to 100 ft. in perpendicular height, so well scarped as to leave no means of ascent except at two spots, both of which are strongly fortified. A second line of works of excellent masonry protects it on the S.W. side, on the principal road to the fort; and a third line embraces the hill immediately above the town. It is besides protected by ravines and deep hollows on every side, and possesses the rare advantage of plenty of water. Magazines and a Sally port, easily blocked up by the garrison, are excavated within the rock. The approach from the N. is over a wild tract infested with tigers and wolves. Asseerghur is surrounded on every side except the W. by Sindia's dom., and is the nearest place in the Bombay presid. to Bengal. It was taken in 1803 and 1819 by the British, who have held it since the last-mentioned year. (*Hamilton's E. J. Gaz.* i. 64.)

ASSENDELFT, a village of the Netherlands, prov. Holland, 7 m. N.N.E. Harlem. Pop. 2,200.

ASSENEDÉ, a town of Belgium, prov. East Flanders, 13 m. N. Ghent. Pop. 3,200. It has manufactures of wool and cotton, dye works, breweries, soap works, &c.

ASSENHEIM, a town of the G. duchy Hesse-Darmstadt, at the confluence of the Nidda and the Wetter, 13 m. N.E. Frankfurt on the Mayne. Pop. 4,000. A part of this town belongs to the duke of Isenburg Budingen. A good deal of wine is produced in its territory, and it has considerable coal mines.

ASSENS, a sea-port town of Denmark, W. coast of the island of Funen, on the channel called the Little Belt, 22 m. W. S.W. Odensee, lat. $55^{\circ} 17' N.$, long. $9^{\circ} 54' E.$ Pop. 1,500. It has distilleries, and a considerable trade in corn. It is the usual point of departure for persons leaving Funen for Sleswick.

ASSIS, a town of Italy, States of the Church, 13 m. E.S.E. Perugia. Pop. 4,000. It is situated on a mountain, is the seat of a bishopric, has a cathedral and several other churches, some of which are ornamented with fine pictures. Metastasio belonged to this town.

ASSOUAN. See SYENE.

ASSUMPTION, or ASUNCION, a city of S. America, cap. Paraguay, and residence of the dictator, finely situated on an eminence on the left bank of the great navigable river of that name, lat. $25^{\circ} 16' S.$, long. $57^{\circ} 37' W.$ Pop. circa 10,000. It was founded in 1537, and from its advantageous situation became of sufficient importance to be made a bishopric in 1547. It is miserably built; the streets being undevelped, and most of the houses no better than huts. The only good buildings are the convents. What has been called its "beautiful cathedral" is a paltry, white-washed fabric; and its government house, with the title of palace, though extensive, is mean. The men are said to be well made and athletic, and the women handsome; the country round is comparatively well cultivated and populous. Assumption is the centre of a considerable trade in hides, tobacco, timber, maté, or Paraguay tea, wax, &c. (*Robertson's Paraguay*, i. 288.)

ASSUMPTION, a small island of the Marianæ archipelago, Pacific Ocean, lat. $19^{\circ} 45' N.$ long. $145^{\circ} 54' E.$ It is cone-shaped, and consists almost entirely of lava and other volcanic products. It produces a few cocoa nut trees, and is described by Pêrouse as a most wretched place.

ASSUS, an ancient city of Asia Minor, in Troas, near the sea, whose ruins occupy a site contiguous to the modern and inconsiderable village of Belram, 12 m. E. Cape Baba (an. *Lectum*), 35 m. W.S.W. Mount Ida, and nearly opposite to Mollivo in Mytilene. It is said to have been founded by a colony from Lesbos, and was famous in the history of Grecian philosophy from its having been the birth-place of Cleanthes the stoic, and for a while the residence of Aristotle. Colonel Leake says of its ruins, that "they are extremely curious. There is a theatre in very perfect preservation; and the remains of several temples lying in confused heaps on the ground; an inscription upon an architrave on one of these buildings shows that it was dedicated to Augustus; but some figures in low relief on another architrave appear to be in a much more ancient style of art, and they are sculptured on the hard granite of Mount Ida, which forms the materials of several of the buildings. On the W. side of the city the remains of the walls and towers, with a gate, are in complete preservation; and without the walls is seen the cemetery, with numerous sarcophagi still standing in their places, and an ancient causeway leading through them to the gate. Some of these sarcophagi are of gigantic dimensions. The whole gives, perhaps, the most perfect idea of a Greek city that anywhere exists." (*Leake's Asia Minor*, p. 128.)

ASSYE, a town of Hindostan, prov. Berar, in the Nizam's dom., 28 m. N. Jaulna. It is celebrated as the spot where the Duke of Wellington commenced his career of victory. On the 23d of September, 1803, his Grace, then General Wellesley, with 4,500 men, (of whom only 2,000 were British,) completely defeated the combined forces of Dowlat How Sindia, and the Nagpore rajah, amounting to 30,000 men. The conquerors won the field, leaving about 1,200 slain, 98 pieces of cannon, 7 standards, their whole camp equipage, and much ammunition. The British-Indian army lost 1,566 men, killed and wounded.

ASTAFORT, a town of France, dép. Lot-et-Garonne, cap. cant. on the Gers, 10 m. S. Agen. Pop. 3,527.

ASTERABAD, or ASTRABAD, a city of Persia, cap. of a small prov. of the same name, on the Gourgân, about 12 m. from where it falls into the S.E. angle of the Caspian Sea, denominated the Bay of Asterabad, lat. $36^{\circ} 30' N.$, long. $53^{\circ} 23' E.$ Mr. Fraser says that it contains from 3,000 to 3,500 houses, so that its population is estimated at 12,000 to 18,000. It is surrounded by a low mud wall, about $\frac{3}{4}$ m. in circuit. Formerly it was much more extensive than at present; a great part of it being in ruins, and there being, also, within the wall, extensive gardens and numerous trees. Houses, chiefly of wood, are said to be picturesque and pleasant, and are frequently furnished with verandahs resting on wooden pillars; their roofs project far beyond their walls. The streets are well paved, and clean, and are furnished with drains to carry off the water, which in most other Persian cities is allowed to stagnate in pools. None of the public or private buildings deserve notice. The palace of the prince, or governor, is a miserable fabric. The bazars, or public markets, are tolerably extensive; but they contain little besides the articles required for the consumption of the place. Asterabad, though in fact a port, has but little trade. It is said to be very unhealthy; a consequence, most probably, of thickets and forests being allowed to approach the very walls. (*Fraser's Caspian Sea*, &c. p. 7.)

ASTI (an. *Asia* or *Hasta Pompeia*), a city of the Sardinian prov. Alexandria, on the Bourbo, near its confluence with the Tanaro, 28 m. E.S.E. Turin, lat. $44^{\circ} 57' N.$, long. $8^{\circ} 12' E.$ Pop. 22,000. It is surrounded by old walls in ruinous condition, and was famous for its 100 towers, of which hardly 30 now remain. Streets narrow; but it is in general pretty well built. The cathedral, a modern building, occupies the site of a temple of Diana, and it has, besides, numerous parish churches and palaces. Asti is the seat of a bishopric, of a court of original jurisdiction, and a royal college, and has several silk flatures, with manufactures of silk, stuffs, &c. The vineyards in its vicinity furnish the best wines of Piedmont; and it carries on a considerable trade in them, in raw and manufactured silks, and other articles. One of the greatest poets of modern Italy, and, indeed, of modern Europe, Victor Alfieri, descended from an ancient and noble family of Asti, was born here on the 17th January, 1749.

Asti is a very ancient city. In 1104 it was burned down by the emperor Frederic Barbarossa, but it had been previously evacuated by the inhabitants. (*Stamoni, République Italienne*, iii. p. 57.) It soon recovered its ancient grandeur, and in the 13th century was able to contend with the forces of Charles I. of Naples. In the 14th century it formed part of the territory of the lords of Milan, and was transferred, in 1387, as the dowry of a Milanese princess to the duke of Orleans, brother to Charles VI. of France. It remained under the dominion of the French till 1529, when it

was ceded by the treaty of Cambray to the emperor Charles V. The latter made it over to one of his female relations, who married a prince of the house of Savoy, in whose possession it still continues. (*Conder's Italy*, i. p. 226.)

ASTIER (ST.), a town of France, d^ép. Dordogne, on the Isle, 10 m. W. S. W. Périgueux. Pop. 2,300.

ASTORGA, a town of Spain, prov. Leon, 30 m. W. Leon, in an extensive and fertile plain near the banks of the Tuerito, lat. 42° 27' N., long. 6° 10' W. Pop. 4,000. It is very ancient, and was formerly fortified by a wall and a castle; but both of these have been allowed to go to decay. Some new defences were, however, constructed in 1810, previously to its reduction by the French under Junot, but we are not informed as to their present state. The town is ill built, and the streets narrow and dirty. It is the seat of a bishop, has a Gothic cathedral, celebrated for its high altar, 4 parish churches, and some convents.

ASTRAKHAN, an extensive gov. of Russia in Europe, lying along the N. W. shore of the Caspian Sea, and divided into two nearly equal portions by the Volga. Area supposed to be about 83,000 sq. m. Pop. estimated by various authorities at from 250,000 to 320,000. This is one of the least valuable provs. in the empire. With the exception of the Delta of the Volga, and a narrow strip of land along the banks of that river, it consists almost entirely of two vast steppes, one on each side the river, in part occupied by sand hills, but mostly low and flat; the soil consisting of mud and sand, strongly impregnated with salt, interspersed with saline lakes, and altogether unsuited to cultivation. In consequence, agriculture is all but neglected; but in the Delta of the Volga, gardening is practised with some success, and superior fruits are raised. In summer the heats are frequently excessive, while in winter the frosts are equally severe. Horses are of the beautiful Cuckum breed; and some of the wandering tribes have great numbers of camels. That fertility which nature has denied to the land, she has given to the water. The fishery forms the principal source of the wealth of this government, and is carried on upon a great scale on the Volga, which teems with fish, and along the shores of the Caspian. Sturgeon, carp, and seal, but particularly the first, are the fish most commonly taken. The annual value of the sturgeon fishery is estimated at from 2,000,000 to 3,000,000 roubles; and above 30,000 barrels of caviar, prepared from the roes of the sturgeon, have been exported from Astrakhan in a single year. Though few in number, the inhabitants consist of a great variety of races. They are mostly nomades; and, according to the official statements, there are, in the entire government, only 20,000 individuals subject to the capitation tax. With the exception of some fabrics in Astrakhan, manufacturing industry is unknown.

ASTRAKHAN, a city of Russia, in the cap. of the above government, on a small island in the Volga, on the left bank of the main stream, about 30 m. from its embouchure, lat. 46° 20' 53" N., long. 47° 55' E. Pop. 31,000. This "Alexandria of the Scythian Nile," as it has been sometimes called, stands on ground elevated sufficiently to be above the reach of the inundations. It consists of three parts: — the *Kremlin*, or citadel; the *Belogorod* (white town); and the *Subotki*, or suburbs. In the first, or nucleus of the city, is the cathedral, a large square edifice surmounted by five domes, the convent of the Trinity, and the archiepiscopal palace; in the second are the buildings for the government functionaries, including an admiralty board, having charge of the flotilla kept on the Caspian, the gymnasium, and the bazars, or factories for the use of the merchants. The houses in the suburbs, where the bulk of the population resides, are of wood; whereas in the other two divisions they are of stone. Streets crooked, and mostly without pavement. It is the seat of an Armenian as well as of a Greek archbishop; and it has also Mohammedan, Jewish, and Protestant places of worship. Exclusive of the gymnasium, there is an ecclesiastical academy, a district grammar school, and some inferior schools; but education is, notwithstanding, at a very low ebb here, and throughout the government. There are several manufacturing establishments for the production of cottons, woollens, and silks; with distilleries, tanneries, soap-works, &c. Astrakhan is the centre of the fisheries carried on in the Volga and Caspian. Its burghesses had formerly a monopoly of the fishery in the Volga; but since 1840 they have been free to every one. During the season, the fisheries employ immense numbers of people and boats. The population of the city is then much augmented, and it presents an animated lively scene. It is the grand fishing mart for all the interior of the empire; it is also the great entrepôt of the trade with Persia and the countries to the east of the Caspian, sending to them leather, furs, iron, copper, tallow, &c., and getting back silk and cotton goods, raw silk, cotton twist, drugs, carpets, &c. The exports to the countries in question in 1831 amounted to 1,467,100 roubles, and the imports to 912,416 roubles; but they have sometimes been more than double these

amounts. This trade is principally carried on by Armenian merchants. (*Schmitzer, La Russie*, &c. p. 699; *Official Tables*, &c.)

ASTURIAS, a principality in the N. of Spain, now the prov. of Oviedo, lying along the Bay of Biscay, between 42° 30' and 70° 10' W. long., having E. the Castilian prov. of Santander, S. Leon, and W. Galicia. Its area has been variously estimated, but may be taken at about 3,630 sq. m. Pop. (1834) 434,635. Surface much diversified. Its S. border consists of a chain of high mountains, which gradually diminish in height as they approach the coast, along which there are extensive tracts of pretty level land. It is extremely well watered, being intersected by the Nalon, Navia, and other rivers, and has several sea-ports, as Gijon, Ribadesella, Cudillero, Aviles, &c. The climate along the coast is mild, but in the mountains it is frequently severe, and it is distinguished by its humidity. But little wheat is raised, the inhabitants subsisting chiefly on maize, and a species of corn called *escanda*. Hazel nuts are scarce; but chestnuts are very plentiful, and of excellent quality. The vine is cultivated in some parts; but the produce of wine is not sufficient for the consumption, the deficiency being supplied with cider, which is partly also exported. Oranges and lemons are produced in a few places, and great numbers of cucumbers. Besides lemons, melons, the wood of which, as well as the fruit, is most valuable, the mountains are covered with forests of oak, beech, plane, &c. There is a considerable exportation of cattle and horses from this prov. to the interior. Iron, copper, lead, antimony, jet, amber, marble, mill-stones, &c., are found in different places. Coal is also found, and Mifano says that 90,000 quintals are shipped for other parts of the peninsula. With the exception of hardware, with many articles of which this prov. supplies the rest of Spain, its manufactures are in a very backward state. Mr. Townsend says of the inhabitants, "They eat little flesh; they drink little wine; their usual diet is Indian corn, with beans, pease, chestnuts, apples, pears, melons, and cucumbers; and even their bread, made of Indian corn, has neither barm nor leaven, but is unfermented, and in the state of dough; their drink is water." (ii. 14.) The principal towns are Oviedo, Gijon, Aviles, Navia, &c.

Asturias may be said to be the cradle of Spanish independence. The Saracens, who had overrun the rest of the country, were unable to overcome the Christians, who had taken refuge in the fastnesses of its mountains. Pelayo was proclaimed king in 718; and his successors having gradually extended their conquests, took, about two centuries after, the title of kings of Leon. In 1388 the prov. was erected into a principality, and became the appanage of the heir presumptive to the throne, who has since been styled prince of Asturias. Several peculiar privileges have been conferred on this province on account of the services it has rendered to the monarchy. (*Anstillon, Milano*.)

ASZODI, a market town of Hungary, co. Pesth, on the Galga, 23 m. N. E. Pesth, in a fertile valley. Pop. 2,220, mostly Protestants. Here is a large and handsome country-seat belonging to the barons Podmaniczky, with a fine collection of coins and natural curiosities. It has manufactures of blue and green dyed sheep-skins, for which there is a considerable demand. (*Nat. Encyc.* i. 134.)

ATACAMA, an extensive district of Bolivia, or Upper Peru, lying along the Pacific Ocean, between the river Lao on the N., and the Salado on the S., or between 21½ and 25½ deg. S. lat. Towards its N. extremity there are some fertile valleys; but by far the greater part of its surface is an absolute desert covered with dark brown or black movable sand. The arid soil of this portion is never refreshed with rain, and except where a very few rivers descend from the Andes, it is both uninhabited and unwholesome. Cobija, or Port La Mar, is built at the mouth of one of these rivers.

ATESSA, a town of Naples, prov. Abruzzo Citra, 14 m. W. Vasto d'Aumone. Pop. (canton, 1832) 7,525. It is situated on a hill, has a fine collegiate church, with parish churches, convents, an hospital, and 3 *monte de pietà*. The poet Cardone was a native of Atesa.

ATFIEH, a town of Egypt, cap. prov. same name, near the right bank of the Nile, 42 m. S. S. E. Cairo. Pop. 4,000. It is supposed to be on or near the site of the ancient *Aphroditopolis*.

ATH, a town of Belgium, prov. Hainault, on the Dender, and on the high road from Tournay to Brussels, 15 m. N. by W. Mons. lat. 50° 48' 17" N., long. 3° 46' 22" E. Pop. (in 1835) 8,817. It was fortified by Vauban, and the works have been materially improved and strengthened since 1815. It is well built. Principal public buildings, the arsenal, town-house, and the church of St. Julian: the spire of the latter, 150 feet in height, was destroyed by lightning in 1817, and has not been rebuilt. Ath has a college, founded in 1416; a school of design; an orphan hospital; theatre, &c. It has manufactures of linen, woollen and cotton stuffs, hats and gloves; establishments for bleaching and dyeing; with oil-mills, soap-

works, breweries, distilleries, &c. It is an entrepôt for the trade in coal, and for the produce of the surrounding country.

ATHAPESCOW, or ATHABASCO, an extensive lake of N. America, being about 200 m. in length, and from 14 to 15 in average width. Fort Chipewyan, at its S.W. extremity, is in lat. $58^{\circ} 42'$ N., long. $111^{\circ} 18'$ W. It receives the Athapescow river; and the Slave river flows from it into Great Slave Lake, lying about 170 m. N.E. Its N. shore is high and rocky, whence it is sometimes called the lake of the hills.

ATILBOY, an int. town of Ireland, co. Meath, prov. Leinster, on a small branch of the Boyne, from which it is supposed to have its name, signifying "the yellow ford." 31 m. N.W. by W. Dublin. It is a place of no historical notoriety. Pop. in 1821, 1,569; in 1831, 1,969, forming 2-3rds of that of the par., which in 1834 amounted to 5,191, of whom 333 were of the E. church, and 5,158 R. Cath. The town, situated in a level and fertile district, consists of one long street; has a modern church, with an ancient tower; a large and elegant R. Cath. chapel, in the ancient English style, with a steeple 90 feet high; a dispensary; schools, partly endowed and partly private, in which about 400 pupils are educated; and almshouses, in which 12 poor widows are supported. Fuel is supplied in plenty from an extensive neighbouring bog. The Hill of Ward, near the town, 400 feet high, is a striking object in this flat country. The town, which is a bor. by prescription, received a charter from Hen. IV., confirming and extending its privileges, which were confirmed and further extended by subsequent monarchs, particularly by Elizabeth, who confirmed on it the right of sending 2 ms. to the Irish Parl.; and by James I., by whom the municipal limits were fixed at a mile beyond the town in every direction, to which was added a right to hold a court of record. But these, and some manorial powers, have fallen into desuetude since the Union, when the bor. lost its right to return ms. to Parl. Petty sessions are held here on alternate Thursdays. There is a large flour-mill in the town. The market, held in the market-house on Thursdays, is well supplied with corn and provisions. The fairs are numerous; the principal being those held on the Thursday before 28 Jan., on 4 May, 4 Aug., and 7 Nov.; the others, held on 3 and 10 Mar., 22 and 30 June, and on 22 and 29 Sept., are less important. The post-office revenue in 1830 was 2017; and in 1836, 2457. The town is a constabulary station. A *caravan*, conveying an average number of 8 passengers each trip, plies between it and Dublin seven times a week. (*Municipal and Trade and Reports, &c.*)

ATIERNKY, a decayed town of Ireland, co. Galway, 14 m. E. Galway. Pop. 1,319. It was formerly of some importance, having been enclosed by walls, and possessed of a university. It returned a member to the Irish Parl.

ATHENS*, one of the most famous cities of antiquity, and the capital of the new kingdom of Greece, is situated on the W. side of Attica, about 5 m. from the Gulph of Ægina, lat. $37^{\circ} 58'$ 1" N., long. $23^{\circ} 46'$ 14" E. Its situation bears a considerable resemblance to that of Edinburgh, being built on the W. side of an abrupt and rocky eminence rising out of an extensive plain terminated N. by mounts Pentelicus and Parnes, N.E. by Mount Anchesinus, E. by Mount Ilymettus, S.W. by the Hill Museum, now called Philopappus, and W. by Lycabettus. During the prolonged conflicts of the revolutionary war (1820-27) the town, which previously consisted of 1,200 houses, was laid in ruins; and when the seat of government was transferred to Athens in 1834, it was with the greatest difficulty that buildings could be fitted up for the members of the regency, the diplomatic body and their offices. It is, however, again rising rapidly into importance, but in general is meanly built, consisting in great part of mud houses. Several streets have been opened, levelled, and widened, the principal of which are Ilermes, or Mercury Street, Æolus Street, Minerva Street, and the Bazar or Market Street. The first of these traverses the town, which it divides into two equal parts, parallel with the Acropolis, and is crossed at right angles by that of Æolus, which terminates close under the Acropolis. Minerva Street,

the broadest of all, runs in nearly the same direction as Æolus Street. Bazar or Market Street, so called from its containing the shops for the supply of the various articles required by the population, is about $\frac{1}{2}$ m. in length. The principal commodities are "caviar, onions, tobacco, black olives, figs, rice, pipes with amber mouth-pieces, rich stuffs, silver-chased pistols, dirks, belts, and embroidered waistcoats." (*Wordsworth's Residence in Attica*.) The houses, built in the modern German style, are generally supplied with "jalousies" and balconies, and contain shops and coffee-houses on the lower story. The other streets of Athens are hardly deserving of the name, being mere narrow lanes, displaying marked contempt for regularity. The principal public buildings are, the royal palace, a large edifice recently constructed, with a portico facing the Acropolis, the mint, the royal stables, a military hospital, and a barrack. Many large private houses have been also lately erected, and building is proceeding "with such spirit, that the sum of 300l. is frequently given for $\frac{1}{2}$ an acre of land." (*Wordsworth*.) The population of Athens amounts to about 17,000 (*Zeitung der Corresp.*), and is perhaps more heterogeneous in its composition than that of any city of its size. "Greeks, in their wild costume, are jostled in the streets by Englishmen, Frenchmen, Italians, Dutchmen, Spaniards, Bavarians, Russians, Danes, and Americans." (*Steven's Travels in Greece*.) European shops invite purchasers by the side of Eastern bazars; coffee-houses and billiard rooms, and French and German restaurants, are opened all over the city. The mixture of its population bears a striking analogy to the extraordinary contrasts presented by the city itself. "The same half acre of ground," says a recent traveller, "often contains two or three remaining columns of an ancient portico, a small Christian chapel of the middle ages, a Venetian watch-tower, a Turkish mosque, with its accompanying cypresses and palm-trees, and a modern fashionable looking residence;" thus, as it were, distinctly exhibiting the different phases of the varied existence of this celebrated city. Athens is the seat of a university, and has a gymnasium, in which the government has founded several exhibitions for the maintenance of students, three public seminaries, and two schools supported by private benevolence. Great efforts have been made to secure the health of the city, by cleansing and repairing the ancient sewers, and by draining the marshes formed by the overflowings of the Cephissus, the exhalations of which were extremely noxious. There are 13 churches, 12 belonging to the Eastern, and 1 to the Western Church. Though the manufactures of Athens are very backward, its revenues are considerably improved: according to the official statement of 1838, they amounted to 160,000 drachms. At the Piræus, too, the harbour of Athens, several large houses have been built, and "some good streets, flanked by low but respectable dwellings, have already been completed." A large custom-house, a quay, and a lazaretto, have been erected, and though trade cannot be said to flourish, the town presents rather a bustling appearance, and contains about 1,500 inhabitants. The communications between Athens and the Piræus have been greatly facilitated of late by the construction of a good road: and it is rumoured that a railway will soon be formed between the two places. Athens stands on a spot rich in remains of antiquity; and it is reasonable to suppose that its present tranquillity will prove favourable to the better illustration of monuments and places already identified, and that the excavations every

* Athens, so called from Ἀθήνη, Minerva, the patroness of the city. There were several places of the same name in Greece. Strabo. Byz. (v. c. 7), enumerates 8. The Romans used to designate the city of Minerva, *Athene Minerva*.

where forming for laying the foundations of new buildings will lead to many valuable discoveries.

The ancient city of Athens

— The eye of Greece, mother of arts
And eloquence, native to famous wits,
Or hospitable —

considerably exceeded in extent the modern town; and, unlike the latter, which, as already observed, spreads into the plain chiefly on the W. and S.W., encircled the Acropolis. It was enclosed in a sort of peninsula formed by the confluence of the Cephissus and Illyssus, the former of which flows due S. past the W. side of the city; the latter, which rises a few miles to the N.E. of the city, runs past it in a S.W. direction. At the time when Athens had attained its greatest magnitude, it was encompassed by a wall surmounted at intervals by strongly fortified towers. The plan of this wall, many parts of which still remain, exhibits the form of an irregular oblong, having at its N. extremity the gate of Acharnæ, on the S. the Itonian gate and the fountain Callirhoë, on the W. the gate of Diochares, and on the E. the Peiræic gate. In attempting to describe the leading features in the topography of Athens, we cannot do better than transfer to our columns an extract from an article on Athens in the *Penny Cyclopædia*, which exhibits within small compass a more distinct outline of that city than is any where else to be met with. "Beginning with the gate of Acharnæ on the north, as above stated, the wall ran eastward near the base of Anchesinus, and past the Diomeian gate to the gate of Diochares, which led to the Lyceum; it then continued parallel to the Illyssus on the western side of that stream to the fountain Callirhoë or Enneacrunus; and thence to the hill of the Museum, which it crossed, comprehending the still existing monument of Philopappus within its circuit. Its course from the Museum was north, taking in the chief part of the Pnyx and Mount Lycabettus, to the Dipylum, which led to the outer Ceramicus or great burying ground, and to the Academia or School of Plato, in the depression between the Pnyx and Lycabettus. A line from Dipylum to the gate of Acharnæ completes the circuit." Athens had three great harbours, the Piræus, Munychia, and Phalerum. These ports formed a separate city larger than Athens itself, and were connected with it by means of the long walls (*μακρά τείχη*) the identification of which has involved the learned in interminable disputes. The harbour of the Piræus, was a spacious basin embraced by two arms of rocky land which formed gigantic natural piers. Even now it is considered a safe port, and in former times it constituted at once the harbour, dockyard, and arsenal of Athens.

Athens, at its most flourishing period, contained about 10,000 houses (*Xen. Mem.* iii. 6. 14.), which were for the most part so small and mean in appearance that, according to Dicaearchus, it was to the public edifices alone that it owed its attractions. The inhabitants were comprised under three classes, citizens (*πολιται*), sojourners (*μετοικαι*), and slaves (*δουλοι*); of these the slaves greatly preponderated, though it is difficult to make an accurate computation of their numbers. Indeed, the whole question as to the population of Athens is involved in great obscurity. Hume, Letronne, Boeckh, Leake, Clinton, and others, have in our own times directed their efforts towards its elucidation, and have supported their reasonings with great learning and ingenuity, though with little unanimity or success:

and the difficulties that surround the subject, from the vagueness, inaccuracy, and discrepancy of the *data*, are so great as almost to preclude the possibility of arriving at any thing like a satisfactory conclusion. Boeckh has estimated the population of the city and its ports at 180,000; Clinton at 160,000; and Leake at 116,000. The statement of Athenæus that the number of slaves in Athens (or Attica) was 400,000, is universally admitted to be grossly exaggerated. The commercial operations of Athens embraced every known country and commodity. "All the products of foreign countries," says Boeckh, "came to Athens, and articles which, in other places, could hardly be obtained singly, were collected together at the Piræus. Besides the corn, the costly wines, iron, brass, and other objects of commerce which came from all the regions of the Mediterranean, they imported, from the coasts of the Black Sea, slaves, timber for ship-building, salt-fish, honey, wax, tar, wool, rigging, leather, goat skins, &c.; from Byzantium, Thrace, and Macedonia, timber, slaves and salt-fish; slaves from Thessaly; carpets and fine wool from Phrygia and Miletus." "All the finest products," says Xenophon (*De Rep. Ath.* ii. 7.), "of Sicily, of Italy, Cyprus, Lydia, Pontus and the Peloponnesus, Athens by her empire of the sea is able to collect into one spot." Nor were manufactures neglected. It is true that commerce was regarded as the chief point of national policy, and that every encouragement was given to it which high protecting regulations and other privileges could bestow. But no restriction was imposed upon industry: the meanest manual occupation was attended by no disgrace; hence every branch of industry flourished, and the manufactures of Athens were every where esteemed. The native products of Athens too were of great importance; they consisted chiefly of olives, figs, and honey, and have been celebrated in all ages. The wealth of the city was also augmented by the silver mines of Laurion, and "those sumptuous edifices, which constituted the pride of the Athenians, and the admiration of the present day, owed their origin to the marble quarries of Pentelicus." (*Dodwell's Greece*.) The opulence, prosperity, and power of Athens are fully exhibited by Thucydides (*lib.* ii. 13.). Previously to the Peloponnesian war, the treasury contained 9,700 talents, besides a great quantity of gold and silver deposited in the temples of the gods and in other public edifices. The city was defended by 1,200 cavalry, 1,600 bowmen, and 13,000 heavy armed troops; 16,000 men were stationed in the fortifications, and the coast was guarded by 300 well manned ships. The same historian has distinctly indicated (*lib.* ii. 40.), that the freedom of the Athenian institutions, so pre-eminently adapted to develop the energies of the human mind, was the chief source of their unparalleled greatness; but our limits preclude us from entering into details on the government and public economy of Athens, and we can only refer the reader to Boeckh's invaluable treatise on this difficult and interesting subject.

We now proceed to notice briefly the monuments of antiquity which still exist at Athens, as they have been described by Chandler, Clarke, Gell, Stuart, Dodwell, Leake, and other travellers. The most striking object is the Acropolis*, or old Cecropian fortress, founded by Cecrops, about anno 1556, A. C., rising abruptly out of the Attic plain, and

* The Acropolis alone formed the ancient city, and from its elevated position was termed *ἡ νέα πόλις*, in contradistinction to the lower part, *ἡ παλαιά πόλις*, afterwards built. Athens, including the upper and lower parts, was styled, by way of eminence, *ἡ πόλις*, or *ἡ ἀστυς*, the city.

covered with relics of Athenian grandeur. At its W. end, by which alone it was accessible, stood the Propylæa, the gate, as well as the defence of the Acropolis. Through this gate the periodical processions of the Panathænaic jubilee were wont to move; and the marks of chariot wheels are still visible on the stone floor of its entrance. It was of the Doric order, and its central pediment was supported by 6 fluted marble columns, each 5 ft. in diam., 29 in height, and 7 in their intercolumniation. On the right wing stood the Temple of Victory, and on the left was a building decorated with paintings by the pencil of Polygnotus, of which Pausanias has left us an account. In a part of the wall still remaining there are fragments of excellent designs in basso relievo, representing the combat of the Athenians with the Amazons: besides 6 columns white as snow, and of the finest architecture. Near the Propylæa stood the celebrated colossal statue of Minerva, executed by Phidias after the battle of Marathon, the height of which, including the pedestal, was 60 ft. But the chief glory of the Acropolis was the Parthenon, or Temple of Minerva. It was a peripteral octostyle, of the Doric order, with 17 columns on the sides, each 6 ft. 2 in. in diameter at the base, and 34 ft. in height, elevated on three steps. Its height, from the base of the pediments, was 65 ft., and the dimensions of the area 233 ft. by 102. The eastern pediment was adorned with two groups of statues, one of which represented the birth of Minerva, the other the contest of Minerva with Neptune for the government of Athens. On the metopes was sculptured the battle of the Centaurs with the Lapithæ; and the frieze contained a representation of the Panathænaic festivals. Ictinus, Callicrates, and Carpius, were the architects of this temple; Phidias was the artist; and its entire cost has been estimated at 1½ million sterling. Of this building, 8 columns of the eastern front and several of the lateral colonnades are still standing. Of the frontispiece, which represented the contest of Neptune and Minerva, nothing remains but the head of a sea horse and the figures of two women without heads. The combat of the Centaurs and the Lapithæ is in better preservation; but, of the numerous statues with which this temple was enriched, that of Adrian alone remains. The Parthenon, however, dilapidated as it is, still retains an air of inexpressible grandeur and sublimity; and it forms at once the highest point in Athens, and the centre of the Acropolis. On the N. E. side of the Parthenon stood the Erechtheium, a temple dedicated to the joint worship of Neptune and Minerva. There are considerable remains of this building, particularly those beautiful female figures called Caryatides, which support, instead of columns, three of the porticos: besides three of the columns in the north hexastyle with the roof over these last columns. The rest of the roof of this graceful portico fell during the siege of Athens, in 1827. Such is an outline of the chief buildings of the Acropolis, which in its best days had 4 distinct characters; being at once the fortress, the sacred inclosure, the treasury, and the museum of art of the Athenian nation. It was, so to speak, an entire offering to the deity, unrivalled in richness and splendour; it was the peerless gem of Greece, the glory and the pride of art, the wonder and envy of the world. In the city of Athens itself there are still some monuments of antiquity to be found. Of these, the principal are three exquisite Corinthian columns crowned by architraves: the

Temple of the Winds, built by Cyrrhæstes, of an octagonal figure, with a representation of the different winds on each of its sides; and the monument of Lysicrates, called by the modern Greeks, the lantern of Demosthenes. This building consists of a pedestal surrounded by a colonnade, and is surmounted by a dome of Corinthian architecture; it was supposed to be the spot which Demosthenes used as his study—a supposition which has, however, long been overthrown. Beneath the southern wall of the Acropolis, near its extremity, was situated the Athenian or Dionysiac theatre. Its seats, rising one above another, were cut out of the sloping rock. Of these, only the two highest rows are now visible, the rest being concealed by an accumulation of soil, the removal of which would probably bring to light the whole shell of the theatre. Plato affirms it was capable of containing 30,000 persons. It contained statues of all the great tragic and comic poets, the most conspicuous of which were naturally those of Æschylus, Sophocles, and Euripides among the former, and those of Aristophanes and Menander among the latter. On the south-west side of the Acropolis is the site of the Odeum, or musical theatre of Herodes Atticus, named by him the theatre of Regilla, in honour of his wife. On the north-east side of the Acropolis stood the Prytæneum, where citizens who had rendered services to the state were maintained at the public expense. Extending southwards from the site of the Prytæneum, ran the street to which Pausanias gave the name of Tripods, from its containing a number of small temples or edifices crowned with tripods, to commemorate the triumphs gained by the Choragi in the theatre of Bacchus. Opposite to the west end of the Acropolis is the Areopagus, or Hill of Mars, on the eastern extremity of which was situated the celebrated court of the Areopagus. This point is reached by means of 16 stone steps cut in the rock, immediately above which is a bench of stone, forming three sides of a quadrangle, like a triclinium, generally supposed to have been the tribunal. The ruins of a small chapel consecrated to St. Dionysius the Areopagite, and commemorating his conversion by St. Paul (Acts of the Apostles, xvii. 34.), are here visible. About a quarter of a mile south-west from the centre of the Areopagus stands Pnyx, the place provided for the public assemblies at Athens in its palmy days. The steps by which the speaker mounted the rostrum, and a tier of three seats hewn in the solid rock for the audience, are still visible. This is perhaps the most interesting spot in Athens to the lovers of Grecian genius, being associated with the renown of Demosthenes, and the other famed Athenian orators,

“ Whose resistless eloquence
Wielded at will that fierce democracy,
Shook the arsenal, and felled over Greece
To Macedon, and Artaxerxes’ throne.”

On proceeding without the city, our attention is attracted by the ruins of the temple of Jupiter Olympius. This was one of the first conceived and the last executed of the sacred monuments of Athens. It was begun by Pisistratus, but not finished till the time of the Roman emperor Adrian, 700 years afterwards; but of the 120 columns which supported it, only 16 remain. The last ruin to which we shall allude, is the temple of Theseus, built by Cimon, shortly after the battle of Salamis. This is one of the most noble remains of the ancient magnificence of Athens,

and the most perfect, if not the most beautiful, existing specimen of Grecian architecture. It is built of Pentelic marble, the roof, friezes, and cornices still remain; and so gently has the hand of time pressed upon this venerable edifice, that the first impression of the mind in beholding it is doubt of its antiquity. Such is an outline of the remains of the chief Athenian edifices, which link bygone times with the present, and which, as long as there is taste to appreciate, or genius to imitate, must arrest the attention and challenge the regard of every intelligent mind. We shall devote what remains of our limits to a short notice of the Athenian history, from the earliest ages down to the present time.

Concerning the early inhabitants of Athens, we are almost wholly destitute of information; and even after its history begins to emerge from obscurity, the events which distinguish it are for a long time scanty and doubtful. Though Ogyges is mentioned as the first king of Athens, it is not till three centuries later that Athenian history assumes a definite form, when Cecrops (A.C. 1553) a native of Egypt, by marrying the daughter of Actæon, obtained the sovereignty. He collected the hitherto scattered inhabitants of Attica, divided them into tribes, and founded the Acropolis. Nothing of importance occurs in the history of Athens among the successors of Cecrops, till the time of Theseus (A.C. 1300), who united in himself the attributes of legislator and warrior. The reins of government descended in his family, without any occurrence of historical importance, till Codrus (A.C. 1068) heroically sacrificed his life for his country. At this time an aristocratical was substituted for the monarchical form of government, and the title of "king" was exchanged for that of "archon." On its first institution, the office of archon was hereditary, and for life; but after the lapse of 2 centuries, it was limited to 10 years, and after passing through 6 hands on this footing, was finally changed to an annual office. When the last change took place, a further alteration was made by dividing the duties of archon among 10 persons, selected by the people from the class of the nobles, in whom were vested all legislative and judicial powers. Such a form of government was peculiarly exposed to party spirit and contentions for power, and pressed heavily on the people; and a strong desire for a definite code of laws arising, Draco was chosen as the lawgiver (A.C. 624). The atrocity of his code, however, which awarded the punishment of death at once to the most venial offences and the most flagrant crimes, soon rendered it incapable of execution; and Draco lost the public favour and died in exile. To quell the disturbances which continued to distract the city, the people (A.C. 594) had recourse to Solon, who had already distinguished himself as a general, and invested him with the office of archon. The code of laws which he framed, was admirably suited to the exigency of the times: for though its tendency was decidedly democratic, a counterbalancing check was given to popular encroachment by the establishment of the assembly of 400, and by the prerogatives vested in the court of Areopagus. Indeed, the freedom of spirit which Solon introduced and rendered durable, and the liberal education which the whole system of his laws made indispensably necessary to the noble and wealthy citizens, soon rendered Athens the central point of illumination to all the republics of Greece. Nor were the consequences of Solon's measures at all retarded by the subsequent domination of Pisistratus (A.C. 561). For notwithstanding his assumption

of the regal power, his administration was characterised by an assiduous cultivation of the arts and sciences; and it is to him that posterity is indebted for the collection of the Homeric poems in their present definite form. That the spirit of Athenian freedom was not extinct, was proved by the expulsion (A.C. 510) of Hippias and Hipparchus (the sons of Pisistratus), whose tyranny became oppressive; and from this time the constitution of Solon was gradually melted down into a pure democracy, until Cleisthenes gave the last blow to the aristocracy by the institution of ostracism.

The petty internal contests which had agitated Athens, were now however to be swallowed up in others of far greater magnitude. With rapid strides the Persian monarchy had been encroaching upon Greece, and most of the Grecian states had already sworn fealty to Darius, when Athens and Lacedæmon raised the banner of defiance, and the battle of Marathon (A.C. 490), under the conduct of Miltiades, at once achieved the liberty of Greece, and enshrined Athens in the centre of a glory. We can do no more than allude to the subsequent invasion of Greece by Xerxes, his alternate successes and defeats, the seizure and conflagration of Athens and its citadel, the stratagems of Themistocles, the memorable battles of Salamis, Platæa and Mycale, and, lastly, the defeat of the Persians. Among other consequences that resulted to Athens from the Persian invasion, was the impetus given to its naval affairs. Themistocles, who was eminently imbued with a naval spirit, caused (A.C. 479) a new and more commodious harbour to be built at the Piræus, which in process of time was joined to the city by the celebrated Long Wall. This precaution invested Athens with the command of the sea, and raised her commercial and military marine to an unexampled pitch of prosperity; a prosperity which was maintained in full vigour by the moderation of Aristides, so deservedly named the just, and by the generous and martial spirit of Cimon, son of Miltiades (A.C. 466). Before the Persian invasion, Athens had contributed less than many other cities, her inferiors in magnitude and in political importance, to the intellectual progress of Greece. She had produced no artists to be compared with those of Argos, Corinth, Sicily, Ægina, Laconia, and of many cities, both in the eastern and western colonies. She could boast of no poets so celebrated as those of the Ionian and Æolian schools. Her spirit hitherto had been decidedly martial; but her peaceful glories quickly followed, and outshone those of her victories and political ascendancy. After the termination of the Persian war, literature and the fine arts began to tend towards Athens as their most favoured seat, for here, during the age of Pericles, above all other parts of Greece, genius and talents were fostered by an ample field of exertion, by public sympathy and applause. It was during this age that painting, architecture, and sculpture, reached the highest degree of perfection; and that Greek poetry was enriched with a new kind of composition, the drama, which exhibited all the grace and vigour of the Athenian imagination, together with the full compass and the highest refinements of the language peculiar to Attica. The drama was indeed the branch of literature which peculiarly signalled the age of Pericles; and the intellectual character of the Athenians is vividly portrayed by the sublime and impassioned strokes of Æschylus, the graceful and elegant touches of Sophocles, the elaborate philosophy of Euripides, and the

caustic railery and moral power of Aristophanes. And though time has effaced all traces of the pencil of Parrhasius, Zeuxis, and Apelles, posterity has assigned them a place in the temple of fame beside Phidias and Praxiteles, whose works are, even at the present day, unrivalled for classical purity of design and perfection of execution. But it was not alone to works of art and the embellishment of the city by splendid architectural decorations, that the efforts of Pericles were directed. For at the period in question, the whole of Athens with its three celebrated harbours, Piræus, Munychia, and Phalerum, connected by means of the Long Walls begun by Themistocles, was made to form one great city, enclosed within a vast parabols of massive fortifications, extending to no less than 174 stadia, of which the circuit of the city amounted to 43, the Long Walls taken together to 75, and the circumference of the harbours to 76. But the advantages that flowed to Athens from the administration of Pericles were not without alloy. The splendour which he introduced exhausted the public revenues; and to supply deficiencies, recourse was had to the infliction of rigorous imposts upon the allied states. Hence a spirit of disaffection was engendered; and Sparta, who had long viewed with jealousy the magnificence of her rival, seized the opportunity of fanning the discord into a flame. This issued in the Peloponnesian war, the various fortunes of which have been so ably recorded by the pen of Thucydides. After the lapse of 27 years, during which period the movements of the conflicting parties were characterised by various success, victory at length declared for the Spartans, and the Athenians were forced to submit to the dominion of the Thirty Tyrants; a humiliating period in the history of Athens, over which we would willingly throw a veil. It was reserved, however, for the skill of Thrasybulus (A. C. 403) to restore to Athens its former constitution; a revolution which he was able to effect without much severity, or effusion of blood. Perhaps in the whole history of the Athenians, there is no feature more remarkable than the vigorous elasticity of spirit which they displayed in recovering from disasters; and never was the truth of this remark so strikingly illustrated as at the present period. One generation had scarcely passed away, since she was groaning beneath the Thirty Tyrants and the reign of terror — her native energies prostrate, her external resources swept away — and now we find her on a lofty eminence. Seventy-five cities hail her as the head of their confederacy; the Ægean isles are numbered among her foreign settlements; Lacedæmon recognises her dominion of the sea; she is confessedly, and without a rival, once more the first of the Grecian communities. Nor is this all; hitherto we have seen her producing and fostering legislators, warriors, statesmen, painters, sculptors, poets, historians, and orators; we are now to behold her in another aspect, as the mother of that philosophy at once subtle and sublime, which even at the present hour exerts a powerful influence over the human mind. This important æra in the history of Athens has been beautifully alluded to by Milton: —

See there the olive grove of Academe,
Plato's retirement, where the Attic bird
Trills her thick-warbled notes the summer long;
There flowery hill Hymettus with the sound
Of bees' industrious murmur oft invites
To studious musing; there Ilysus rolls
His whispering stream; within the walls then view
The schools of ancient sages; his who bred
Great Alexander to subdue the world,

Lyceum there and painted Stoa next;

To sage philosophy next lend thine ear.
From heaven descended to the low-roof'd house
Of Socrates; see there his tenement,
Whom well inspired the oracle pronounced
Wise of men; from whose mouth issued forth
Mellifluous streams that water'd all the schools
Of Academics old and new, with those
Surnamed Peripatetics, and the sect
Epicurean, and the Stoic severe."

From this time a new æra begins in the history of Athens. Philip, king of Macedonia, by dint of dissimulation and bribery, contrived first to embroil the different states of Greece, and then to trample on their independence. The Athenians, roused by the thunders of Demosthenes, made a vigorous defence (A. C. 338); but the battle of Chæronea proved adverse to their hopes, and on this field sunk the supremacy of Athens. And if the last sparks of her heroism do not expire with Demosthenes, the fitful gleams they throw out from time to time, serve but to "mark the ruins they adorn." It is true that under the sway of Alexander the Great, and the different generals who succeeded him in the government of Athens, she made various efforts to throw off the yoke; but these efforts resemble more the spiteful ebullitions of a pusillanimous slave, than the glorious aspirations of a noble spirit struggling to be free. In this state she continued, the sport of every tyrant who chanced to draw a prize in the lottery of war, till the Roman eagles soared over the Acropolis, and the victorious Sylla proclaimed Athens a tributary of Rome (A. C. 86). But while Athens thus saw every trace of her political existence vanish, she rose to an empire scarcely less flattering, to which Rome itself was obliged to bow. Her conquerors looked to her as the teacher and arbiter of taste, philosophy, and science; and all the Romans who were ambitious of literary attainments, flocked to Athens in order to acquire them. This tribute of respect to Athenian taste and genius was paid by various Roman emperors in succession. Under Adrian (A. D. 117) she even regained much of her former internal splendour; and his example was followed by several of his successors, though on a less magnificent scale. The description of Athens by Pausanias belongs to this period. In the third century, according to Zosimus, Athens was taken by Gothic invaders, who, however, did not long retain their acquisition, having been expelled by the inhabitants under the command of Cleodemus. In the year 398, it was again taken by Alaric king of the Goths, who is said to have laid in ruins its stately structures, and to have stripped it of its ancient splendour. After this dreadful visitation, Athens sunk into insignificance, and became as obscure as she had once been illustrious. We are told indeed that the walls of Athens were put in a state of defence by Justinian: but from the time of this emperor, a chasm of nearly seven centuries ensued in its history, except that in the year 1180 it furnished Roger, king of Sicily, with a number of artificers, who there introduced the culture of silk. Doomed apparently to become the prey of every spoiler, Athens again emerges from oblivion in the 13th century, under Baldwin and his crusaders, at a time when it was besieged by a general of Theodoros Lascaris, the Greek emperor. In 1427, it was taken by Sultan Murad; but some time afterwards was recovered from the infidels by another body of crusaders, under the Marquis of Montferrat, a powerful baron of the west, who bestowed it on Otto de la Roche, one of his followers. For a considerable time it was

governed by Otto and his descendants, with the title of duke; but this family was afterwards displaced by Walter of Brienne. The next rulers of Athens were the Acciaoli, an opulent family of Florence, in whose possession it remained till 1455, when it was taken by Omar, a general of Mohammed II., who settled a colony in it, and incorporated it completely with the Turkish empire. In the year 1687, it was captured by the Venetians under Morosini, after a short siege, during which the Parthenon, then in an almost perfect state, and the other buildings of the Acropolis, sustained great damage. After a short interval, it again fell into the hands of the Turks, under whose jurisdiction it remained, until the treaty of Adrianople in 1829, following up the provisions and the stipulations of the treaty of London in 1827, established the new kingdom of Greece, of which Athens is now the capital.

Such is a brief and necessarily imperfect sketch of Athens and its inhabitants. To have investigated the causes that led to its rise, progress, and decline; to have analysed the character of its people, and to have traced it through its varied phases in their love of glory, in their refined taste, in their fickleness and injustice on the one hand, and, on the other, in their generosity and gratitude, in their courage and cowardice, haughtiness and humility (*Plin. de Parrhas.*), would have involved us in discussions to which volumes alone would have been adequate, even if the vastness of the subject had not precluded the attempt. Plunged for centuries in barbarism, and subjected to the galling yoke of a foreign despotism, it is not surprising that the modern Athenians should have inherited little but the vices of their forefathers. But now that their nationality is restored, and the light of civilisation has again dawned upon their country, it may, we trust, be inferred that the few seeds of the ancestral character which still linger in their constitution, exhibiting themselves in pride, stubbornness and susceptibility, will ripen into such qualities as may render them worthy denizens of the soil, *unde humanitas, doctrina, religio, fruges, jura, leges ortæ atque in omnes terras distribute putantur.*

ATHENS is the name of several towns in the U. States, but none of them is of any material importance.

ATHERSTONE, a m. town of England, co. Warwick, hund. Hemlingford, contiguous to the Coventry canal, 12½ m. N. Coventry. Pop. 3,870. It has a free school, founded in 1573, and manufactures of hats, ribands, and shalloons. There are here four annual fairs; that which is held on the 19th of September being one of the most considerable in England for the sale of cheese.

ATHERTON. See CHOWBENT.

ATHIS, a town of France, dep. Orne, cap. cant., arrond. Domfront. Pop. 4,537.

ATHLONE, an inland town of Ireland, cos. Westmeath and Roscommon, on the Shannon, 65 m. W. Dublin, lat. 53° 32' N., long. 7° 54' W. Its name is derived from *Ath Luana*, "the ford of the rapids." To command this ford a castle was built here by the English shortly after their arrival in the country, that became a post of great consequence. In 1641 Athlone was besieged by the Irish army; but, after a resistance of upwards of 5 months, was relieved by the Duke of Ormond. In the subsequent war of 1693, it was gallantly defended by Col. Grace against the English, but was taken by storm the next year by Ginkell, afterwards Earl of Athlone. The fortifications, which had suffered much during this siege, were renovated; but in 1697, the castle and the greater part of the town were destroyed by the explosion of a gunpowder magazine, occasioned by lightning. During the late war with France it was made the military depot for the W. of Ireland, and secured by strong works on the Connaught side, covering an extent of 1½ acres, and containing two magazines, an ordnance store, an armoury for 15,000 stand of small arms, and barracks for 900 men. The pop. in 1821 amounted to 7,543, and in 1831 to 11,406, showing an increase of 3,863 in the intervening period, being at the high rate of 51·213

per cent. In 1834 the pop. of the parishes of St. Peter and St. Mary, mostly in the town of Athlone, amounted to 15,040, of whom 1,708 were Protestants of the E. Church, 9 Prot. diss., and 13,323 R. Catholics.

The town is divided into two nearly equal portions by the Shannon, over which is a long and inconveniently narrow bridge, built in the time of Elizabeth. Its public buildings are the two parish churches, 4 Roman Catholic parochial chapels, a Franciscan chapel, a Presbyterian and 2 Methodist meeting-houses. A public school, endowed by one of the Ranelagh family with 470 acres of land, educates, maintains, and apprentices 18 boys; there are also parish schools for boys and girls, and an abbey school for Catholic children. The number of pupils in the different public schools is about 350, and the private seminaries in the town educate about 500.

By its ruling charter, received from James I. in 1606, its limits are fixed at 1½ mile in every direction from the centre of the bridge; but for electoral purposes they are confined nearly to the space covered by the dwellings, houses, which extends over about 485 acres. The governing body consists of a sovereign; 13 burgesses, one of whom is the constable of the castle; a common council of about 20 members, chosen for life; and an unlimited number of freemen nominated by the common council. The borough was represented by 2 ms. in the Irish, and is now represented by one in the Imp. Parl. The right of election exists in the members of the corporation resident within 7 m., and in the 104 householders: the number of electors in 1837 being 235. The sovereign holds a court three times a week, for petty criminal cases. The general sessions for Roscommon are held here twice a year, and those for Westmeath four times. There are petty sessions on alternate Saturdays. On the Roscommon side there is a small prison or bridewell for the temporary detention of culprits.

There are in the town, or in its immediate neighbourhood, two distilleries, and the same number of breweries, tanneries, and soap and candle manufactories, besides several flour-mills. Coarse hats were formerly made here in large numbers, but the demand for them is now trifling. A small trade is carried on with Shannon Harbour and Limerick by steamers on the Shannon, the intercourse being aided by a canal about 1 m. in length, near Athlone, by which the rapids in the river are obstructed.

Markets on Tuesdays and Saturdays. Fairs on the Monday after Epiphany, 10th March, Holy Thursday, and 24th Aug.: each fair continues for three days.

Athlone is principally supported by the expenditure of the garrison; and in proportion as this has been diminished by the continuance of peace, so has its wealth and prosperity declined. There are but few resident families of wealth or independence; and the working classes, being chiefly agricultural labourers, live according to the habits, and are affected by the fluctuations incident to this portion of the pop. of the island.

ATHOS, AGIOS-OROS, or MONTE SANTO, a famous mountain of Turkey in Europe, near the S. extremity of the most easterly of those peninsulas that project in a S. E. direction from the district of Saloniki (part of Macedonia) into the *Ægean Sea*, being that between the Gulphs of Contesa (*Sinus Strymonicus*), and Monte-Santo (*Sinus Singiticus*). This peninsula is joined to the mainland by a low isthmus, not more than 1½ m. across, and not more, where highest, than 15 feet above the level of the sea. But the peninsula itself, which is about 25 m. in length, by about 4 m. in breadth, is mountainous and rugged. Mount Athos has, by a recent survey, been found to be in lat. 40° 10' N., long. 24° 20' 30" E., and to reach the height of 6,349 ft. above the level of the sea. It rises abruptly from the water, its lower parts being covered with forests of pine, oak, chestnut, &c., above which towers the bare conical peak of the mountain.

Mount Athos has been famous both in ancient and modern times. Herodotus relates that the fleet of Marathon, the Persian general, in attempting to double Mount Athos, was reported to have lost above 300 ships, and 20,000 men. (Lib. vi. s. 44.) When Xerxes invaded Greece, he determined to guard against the occurrence of a similar disaster, by cutting a canal across the isthmus, of such dimensions as to admit of two triremes passing abreast (*Herod. lib. vii. s. 24.*); of which great work the traces still remain. In modern times the peninsula of Mount Athos has been occupied from a remote epoch by a number of monks of the Greek church, who live in a sort of fortified monasteries, of which there are about 20, of different degrees of magnitude and importance. These, with the farms or *metochis* attached to them, occupy the whole peninsula, which has thence derived its modern name of Monte Santo. The situation of the different monasteries is very various; but generally the most romantic and strikingly beautiful that can be imagined. Some of them belong to Russians, others to Bulgarians, and others to Servians. Except the produce of their own farms and vineyards, and the sale of crosses, beads, &c., they depend chiefly on the oblations offered by

the numerous pilgrims by which they are occasionally visited, and on the sums collected by their mendicant brethren in other parts. They pay an annual contribution to the Porte. No females are admitted within this peninsula; and a market held weekly within its limits, and resorted to by the country people, presents the singular spectacle of a market without noise, and a crowd without a woman!

Most of the monasteries possess considerable collections of manuscripts, and it was long a prevalent opinion that some of the lost treasures of ancient genius might be recovered, were a diligent search made in the monasteries of Mount Athos. In 1801, however, they were thoroughly explored by Dr. Carlyle, and, with the exception of a copy of the *Iliad* and *Odyssey*, a few of the edited plays of the different tragedians, a copy of Pindar and Hesiod, the Orations of Demosthenes and *Æschines*, parts of Aristotle, and copies of Philo and Josephus, he did not meet with any thing that could be called classical! There were some valuable MSS. of the New Testament, but none so old by centuries as the Codex Alexandrinus or MS. of Beza. Polymathic divinity, and lives of the saints, formed the great bulk of the libraries.

The monasteries suffered severely from the exactions of the Turks during the Greek revolution. The entire population of the peninsula was estimated at about 6,000 in 1801; but at present it is probably rather under 3,000. (*Wapok's Memoirs relating to Turkey*, i. pp. 194-230; *Journal of the Geog. Society*, vii. pp. 61-74.)

ATHY, an hill town of Ireland, co. Kildare, prov. Leinster, on the Barrow, 38 m. S.W. Dublin. Its ancient name was Athleagar, "the western ford." From its position on the border of the English pale, and on a ford of the river, it has been a frequent scene of conflict. In 1308 it was plundered by the Irish, and burnt by Edward Bruce in 1315. A fort, built about 1646, to guard the pass of the river, was occupied in 1648 by Owen Roe O'Neal, on the part of the Irish, but in 1650 it surrendered to the parliamentary forces. Pop. in 1821, 3,698; in 1831, 4,494; in 1834, 4,615 of whom 740 were of the R. church, 50 Prot. diss., and 3,815 R. Cath. The two portions into which the town is divided by the Barrow, are connected by a bridge of five arches, thus forming one continuous main street, whence several lesser avenues diverge. There is a par. church, a plain building; a spacious R. Cath. chapel, with a Presbyterian and a Methodist meeting-house. Adjoining the town is a small chapel, an ancient cemetery, and a small Dominican monastery. Besides the parochial school, which instructs about 300 children, there are two others supported by voluntary subscriptions, in which 400 boys and 100 girls are instructed. There is also a dispensary and a poor fund. It is a chief constabulary station, and has a small cavalry barracks. By a charter of 11 James I., the corporation consists of a sovereign, two bailiffs, and 12 burgesses. Previously to the Union the borough sent two mss. to the Irish parliament. The summer assizes for the county are held here, as are general sessions of the peace in January and June, and petty sessions every Tuesday. The borough courts are now disused, except one called the curl court, in which the sovereign decides pleas of debt under 2*l*. Irish currency, on the first Monday in every month. The county gaol is near the town; it is built on the radiating principle, and is provided with 32 sleeping, and 3 solitary cells. The commitments to it in 1837 were 90. The sentences were,—death, none; transportation for life, 6; for 7 years, 12; imprisonment for one year, 2; for 6 months or under, 29; fine or whipping, 7; liberated by acquittal, or want of prosecution, 34. The total expenditure for the year was 840*l*., being an average of 9*l*. 7*s*. for each prisoner. The markets are held on Tuesdays and Saturdays; the fairs on 17 Mar., 25 Apr., 9 June, 25 July, 10 Oct., and 11 Dec. The modern consequence of the town is mainly derived from its being at the junction of a branch of the Grand Canal with the Barrow, and from the latter being made navigable to its embouchure. It has, in consequence, become a place of considerable commercial importance. The principal trade is in corn, of which large quantities are purchased, partly for mills on the Barrow, but chiefly for the Dublin market, to which city it is conveyed principally by the Grand Canal. Corn, butter, provisions, &c., are also sent down the Barrow to New Ross and Waterford; and timber and other articles, for the use of the adjoining districts, are imported by the same channel. The malted trade is in a flourishing state: duty was paid in 1836 on 11,016 bushels. The post-office revenue in 1830 was 420*l*.. In 1836, 520*l*. Passengers are conveyed to Dublin by the Grand Canal by means of fly-boats. One of the mail-coach roads from Dublin to Cork passes through the town; and a *carravan*, carrying 8 passengers each trip, daily plies to Carlow. (*Municipal and Railroad Reports, &c.*)

ATINA, a town of Naples, prov. Terra di Lavoro, 13 m. S. E. Sora, near the Melfa, among some of the loftiest summits of the Apennines. Pop. 4,000. It has a cathedral, a convent, and an hospital; and was formerly

the seat of a bishopric, suppressed by Pope Eugene 1801. It is principally remarkable for its Cyclopean remains.

This is one of the most ancient of the Italian cities; being, according to Virgil (*Æn. lib. vii. 629.*), a considerable town as early as the Trojan war. It was taken from the Samnites by the Romans, A. U. C. 440. Cicero says it was a prefecture, and one of the most populous and distinguished in Italy. (*Cic. pro Plancio*.) It received a colony from Rome during the reign of Nero. (*Cramer's Ancient Italy*, ii. p. 116.)

ATLANTIC OCEAN. This is one of the great divisions of that watery expanse which covers more than three fourths of the surface of the globe. It lies between the Old and the New World, washing the E. shores of the Americas, and the W. shores of Europe and Africa, extending lengthwise from the Arctic to the Antarctic Seas. Where narrowest, between Greenland and Norway, it is about 530 m. across; but between N. Africa and Florida, where it attains to its maximum breadth, the distance from shore to shore exceeds 4,150 m. Though it comprises little more than a fifth part of the whole ocean, its shores form a more extended line of coast than those of all the other seas taken together. This arises from several extensive mediterranean seas, which enter deeply into the contiguous continents, being connected by straits with the N. Atlantic Ocean, and forming portions of it. Such are the Baltic and Mediterranean Sea in the Old Continent; and Hudson's and Baffin's Bays, and the Columbian Sea (Gulph of Mexico and Caribbean Sea), in the New World. And it is probably in some degree owing to the facilities afforded for commercial intercourse by these arms of the Atlantic, that the countries in their vicinity have made a greater and more early progress in civilisation than those of most other parts of the world.

To the same cause has also been ascribed the circumstance of the nations inhabiting the shores of the Atlantic having applied themselves peculiarly to navigation; they have not limited their activity in this branch of industry to the Atlantic, but navigated every other sea; and there is now no harbour, how remote soever, which is not regularly visited by their ships, with the exception of those to which a free access is denied, or which do not furnish any article of trade. The Atlantic Ocean has thus, as it were, become the most frequented highway of commercial nations, and has been more completely explored and examined than the other seas; and frequently repeated experiments have enabled rules to be laid down for the guidance of vessels traversing its different parts, in different seasons of the year, which give the greatest facility and security to its navigation.

Those groups of islands which impede navigation, and render it comparatively difficult and dangerous, are much less numerous in the Atlantic than in most other seas. If, indeed, we except the chain of islands which separates the Columbian Sea from the Atlantic, and which, therefore, may be considered as forming part of the shores of the ocean, it can hardly be said that there exists any group of islands between 60° N. lat. and 60° S. lat. The Azores, Canaries, and Cape de Verd Islands, as well as those of Guinea and the Bermudas, occupy a comparatively small space, and are easily avoided; and the two last-mentioned groups lie far from the common track of vessels. The Canaries, including Madeira, are frequently visited; being situated where it is usual for vessels to change the direction of their course.

The direction of the winds and currents is of special importance as affecting the performance of voyages; and to the more exact knowledge of their course and influence, as well as to other improvements in the art of navigation, is to be ascribed the fact that voyages are at present performed in nearly half the time they occupied only two centuries ago.

Winds.—As the Atlantic Ocean, including the two Icy Seas at its extremities, extends from the Arctic to the Antarctic Pole, it is in parts subject to the *perpetual* or *trade* winds, in others to the *variable* winds; and along some of its coasts, between the tropics, the winds are subject to a regular change according to the seasons—or, in other words, *monsoons* are there prevalent.

The trade-winds do not extend beyond the 32nd parallel from the equator; sometimes they are not met with at a greater distance than 27° lat. The whole surface of the sea extending from these latitudes to the poles is the province of the *variable* winds. The latter blow in every season from all points of the compass; but, by long experience, it has been found that the W. winds prevail in both hemispheres. If a line be drawn in the direction of a meridian, it is estimated that the proportion between the winds blowing from the W. to those that come from the E. is as 9 to 54. This, at least, is the proportion in the N. hemisphere, where the estimate has been made with the greatest exactness. It is, besides, to be observed, that whilst the winds between the tropics and near them blow nearly always with the same degree of force, the variable winds vary extremely

in this respect,—blowing sometimes almost with the strength of hurricanes, and at other times sinking into dead calms.

The two trade-winds do not blow over the whole surface of the sea lying between the tropics. They are separated from each other by the *region of calms*. This region varies, according to the seasons, in extent; and does not always occupy the same part of the ocean. It is found to extend from a short distance off the shores of the Old Continent to a short distance off those of the New, but its breadth is very various. Sometimes it occupies not more than 2° of lat., and at other seasons up to 10° . The most remarkable fact respecting this region is, that it does not extend equally on both sides the equator, but lies nearly the whole year round in the N. hemisphere. Only when the sun is near the tropic of Capricorn it passes the line, but never extends farther to the S. than 24° . On the N. of the equator it advances, at certain seasons, even to the 14th or 15th deg. of lat. These changes in the extent and in the range in which the region of calms is met with, and in which the trade-winds blow, depend evidently on the position of the sun. When the sun is near the N. tropic, or retiring from it, especially in July, August, and September, the calms advance towards the N. even to the 14th and 15th deg. of lat.; and at the same time the S. trade-winds encroach considerably on the N. hemisphere, being met with as far as the 4th or 5th deg. of N. lat. Then the breadth of the region of calms is 10° ; but when the sun is near the S. tropic, or begins to retire from it, the S. trade-winds also recede farther S.; and in January, February, and March, the calms extend to the S. of the line, but only to a distance of from 1° to 24° . In this season the N. trade-wind advances to 2° N. lat., and the width of the region of calms is then narrowed to from 3° to 4° lat.

The central line of the region of calms may be placed at about 5° or $5\frac{1}{2}^{\circ}$ lat.; and its mean breadth may extend over 5° or $5\frac{1}{2}^{\circ}$, or from 300 to 350 sea m. Continued calms reign in this region; and they would form an insuperable obstacle to the progress of vessels, were not the air daily agitated by a squall which occurs about 2 o'clock in the afternoon. At noon, a black and well-defined cloud appears near the horizon, which increases, and announces a violent thunder-storm; suddenly a wind arises, blows for a short time with great violence, sends down a few drops of rain; and after this tumult of the elements has lasted from $\frac{1}{2}$ to 1 hour, the calm returns. These short violent squalls are called *tornadoes*, and it is only by their means that the region of calms can be passed by vessels using sails; but it always proves a very tedious navigation.

The *northern trade-wind* is subject to change, not only respecting the extent of sea over which, but also respecting the direction in which, it blows. When the sun advances in the N. hemisphere, it withdraws, as already seen, farther from the equator. It also, blows over a wider range of sea, near the coast of America, than at a short distance from the Old Continent. In the seas inclosing the Canary Islands, it is rarely met with at 30° lat., and often not before the 27th parallel is reached; here, therefore, its N. boundary may be fixed at 24° N. lat. as a mean. On the W. borders of the ocean, however, near the coast of America, it extends farther N., even to 32° lat.; here its mean boundary may be fixed at 30° lat. In the neighbourhood of the Old Continent, this trade-wind blows from this N.E., but it declines more to the E. as it proceeds farther W. In the middle of the ocean it is E. $\frac{1}{2}$ N., and where it approaches the New Continent it blows from due E. This wind is somewhat changeable towards its N. boundary; sometimes violent N.E. winds are found to prevail between the 22d and 30th deg. of lat., and in the same parallels it is frequently very weak. But no navigation can be more pleasant than that with this trade-wind. It is rather to be called a breeze than a wind; and is uniform, and never interrupted by squalls. The waves which are raised by it are low, and their swell gentle. Where this wind blows, the passage from the Old Continent to America may safely be effected in an open boat. Hence the Spaniards have called this part of the Atlantic Ocean the "Sea of the Ladies,"—*Golfo de las Damas*.

The *southern trade-wind* differs from the northern in the greater extent of sea over which it blows, extending, as we previously observed, in summer, to 5° or even 6° to the N., and never receding farther to the S. of the equator than 24° . It is, farther, much more regular, not being interrupted towards its S. boundary by other winds. Its direction near the Old Continent is, also, somewhat different; for here it blows parallel to the coast extending from the Cape of Good Hope to the Bight of Benue—that is, from the S. At a distance from the continent it becomes by degrees more easterly, and where it approaches America its direction is nearly due E. The meridian of 20° W. of Greenwich may be considered as the line of separation between the winds which blow more southerly or more easterly. To the E.

of this line, the wind varies between S.S.W. and S.S.E.; but to the W. of it, between S.S.E. and S.S.W.

In some parts the trade-winds extend to the very shores of the continents; in others, a tract of sea lies between the trade-winds and the land in which a different wind is prevalent. Thus it is found, that in the sea between the N. trade-wind and the African coast, from the Canaries to the Cape de Verd Islands, the wind blows constantly from the W. This phenomenon is sufficiently explained by the peculiar nature of the Great African desert, the Sahara. Its surface, destitute of vegetation, and covered with loose sand, is heated by the sun to an excessive degree, and in consequence the superincumbent air is rarefied, and rises. Where this rarefied air comes into contact with the more dense air covering the surface of the sea, the latter expands over the desert; and this gives rise to a continual flow of air from W. to E.

Farther S., between the Cape de Verd Islands and Cape Mesurado (7° N. lat.), a kind of monsoon prevails, which, in certain places, blows to the distance of 200 m., and opposite Sierra Leone about 150 m., off shore. From September to June it proceeds from the N. to the N.E., and in the rest of the year from S.W. Along the coast of Guinea, and in the Bight of Benin, the S. trade-wind prevails nearly the whole year round; but its direction is a little changed, the wind blowing from the S.W. Between the Bight of Benin and 30° S. lat., the trade-wind blows to the very shores of the continent.

On the other side of the Atlantic Ocean, along the coast of Brazil, a regular monsoon prevails. It proceeds, between September and March, from between N. $\frac{1}{2}$ E. and N.E. $\frac{1}{2}$ E.; and from March to September, from between E. $\frac{1}{2}$ N. to E.S.E. These winds blow with considerable force, and extend sometimes to a great distance from the shore, especially in the months of June and July. There are instances on record of its having been met with nearly as far as the middle of the Atlantic.

N. of Cape S. Roque, the trade winds reach the very shores of the American continent and the West Indies. In these parts they seem even to extend over a considerable part of the continent itself; for the continual E. wind which blows over the plain of the river Amazon, to the very foot of the Andes, is with reason considered as a continuation of the trade-winds. The same may be said of the E. winds which blow over the plains watered by the Orinoco, where this wind is felt as far as Angostura, and at certain seasons still farther W.

Currents.—We are less acquainted with the currents than with the winds. This arises partly from the difficulties in which the subject is naturally involved, and partly from the comparatively short time which has elapsed since they have attracted the attention of navigators and naturalists.

Currents are to be distinguished from *drift-water*. By the latter expression, that motion of the water is understood, which is produced on the surface of the sea by perpetual or prevailing winds. By pushing continually the upper strata of the water towards that point to which they blow, they cause a slow motion of the water in that direction. Accordingly, we find that that part of the Atlantic Ocean, which is subject to the trade-wind, is in a continual motion towards the W.; which is most sensible in those regions which are always exposed to the trade-winds, and less so where they blow only in certain seasons. This kind of current is in most parts constant, but its flow very gentle. Its mean velocity is from 9 to 10 m. a day, and it is very favourable to navigation.

Other drift-currents are met with in those parts of the Atlantic, in which the wind changes with the seasons; as along the coast of Sierra Leone, and that of Brazil, S. of Cape S. Augustine. In the former the current runs, from September to June, S., and in the remainder of the year in a N. direction. Along the coasts of Brazil, the current, from September to March, runs in a S. direction, and from March to September, N.

Even in those parts of the Atlantic which are subject to a continual change of the wind, a drift-current is observable. We observed, that N. of 30° N. lat., and S. of 30° S. lat., in the region of the variable winds, the W. winds prevail, and in these parts of the ocean a W. current is perceived; but it is feeble, and manifests itself in the N. Atlantic only on the whole course of a voyage from Europe to America and backward, retarding the former and forwarding the latter. This drift-current seems to attain its greatest velocity S. of 30° S. lat.

Besides the drift-currents, the velocity of which is moderate, there are others of much greater force, called *properly currents*. Their origin is still involved in obscurity; but, from some facts, we may suppose that they are not formed on the surface of the water, but are of great depth, and in many parts, if not in all, extend to the very bottom of the sea. These currents cannot be compared with rivers; for they extend over such a portion of the surface of the sea, that if they were trans-

ferred to the continent they would cover countries of great extent.

In the Atlantic, these currents run across the ocean in three places. The current crossing the Atlantic near the line, is called the *Equatorial current*; it runs from E. to W. The current, which, in a direction from W. to E., traverses the N. Atlantic between 36° and 44° , bears the name of the *Gulf Stream*; and that which runs in the same direction, through the S. Atlantic, between 30° and 40° S. lat., is named the *S. Atlantic current*. Other currents run along the shores of both continents between 40° N. lat. and 30° S. lat. Along the Old Continent they run towards the equator; but, on the shores of America, they flow from the line towards the poles. These latter kind of currents are intimately connected with the equatorial current; but very slightly, if at all, with the gulf stream or the S. current.

The *Equatorial current* may be supposed to have its origin in the Bight of Benin, on the W. shores of Africa, between the islands of Anno Bom and St. Thomas; whence it proceeds, in a W. direction, towards Capes S. Roque and Augustine, on the coast of Brazil. Its breadth is different in different parts. Near its origin it is not quite 30° of lat. across, about 160 m.; but, in its progress to the W., it increases considerably in width. Opposite Cape Palmas, its N. border is found at about $10^{\circ} 45'$ N. lat., but the S. reaches nearly to 5° S. lat.; thus its breadth extends here over more than 60° of lat., or upward of 360 nautical m. It attains its greatest breadth between 20° and 22° W. long., where it extends over 70° or 80° of lat., from 40° or 50° S. of the equator to 25° or 30° N. of it; here, consequently, it is 450 nautical m. across. A little farther W. between 22° and 23° W. long., it sends off a branch to the N.W.; and here it narrows to about 300 m., which breadth it probably preserves up to its division into two currents, opposite Capes S. Roque and S. Augustine; but that part of its course, which lies W. of 23° and 24° W. long., is somewhat declined towards the S. Its velocity varies likewise, not only in the different parts of its course, but also in different seasons; being much greater in summer than in winter. From Anno Bom to 10° W. long. it may run from 25 to 30 m. a day; but between 10° and 16° S. its velocity increases to from 44 to 80 m. at the end of June and the beginning of July; in the other summer month it is somewhat less; and, from October to March, very moderate, and sometimes very weak. Between 16° and 23° W. long., where it is commonly crossed by vessels, the rapidity of the current rises often to 45, 50, and even 60 m. per day; but its mean velocity may be fixed at about 30 m. That part of the current, between 23° and the coast of Brazil, is avoided by vessels, and its rapidity not exactly known; it seems rather to increase, and not to be affected by the seasons. The temperature of the water within the current is every where some degrees lower than that of the seas without the current. The whole length of this current, from St. Thomas to Cape S. Roque, amounts to upward of 2,500 sea m.

The portion of the equatorial current which branches off from the main stream between 22° and 23° W. long., and about 24° N. lat., is called the *N.W. current*. At the point of separation, it may be from 180 to 200 m. in width; farther N. it widens even to 300 m., but narrows again to 240 and less. Its velocity is not so great as that of the main equatorial current. In its S. part, as far as 10° N. lat., it may run 30 m. a day; but it afterwards slackens considerably; yet at all times it may be traced up to 18° N. lat., and commonly even to 26° . In the N. part of its course it declines more to the N., till it is lost in the drift-current. It is not improbable that this current increases the velocity of the drift-current, which navigators have observed between 25° W. lat. and the island of Trinidad; and that the change in the direction of the drift-current, which here declines to the N.W., is also to be ascribed to the same cause.

At a distance of about 300 m. from the coast of Brazil, extending between Capes S. Roque and S. Augustine, the equatorial current divides into two branches. That which continues to run along the N. coast of Brazil, turns at the mouth of the Amazon to the N., and proceeds along the shores of Guyana to the island of Trinidad, where it enters the Caribbean Sea. It is called the *Guyana current*, and the length of its course does not fall short of 1,500 m. Its velocity is greatest in summer and winter; and may, in the former, be about 30 m. a day at a mean. It enters the Caribbean Sea by the different straits which, S. of the island of Martinique, divide the smaller Antilles from one another and from the continent of S. America. In these straits, the currents setting into the Caribbean Sea are strong: that between Trinidad and Grenada runs from 1 to $1\frac{1}{2}$ m. per hour; less rapid is the current in the strait between S. Vincent and S. Lucia; and between the latter island and Martinique it runs not more than 21 m. per day. At the Virgin Islands the flow of the water is only 8 or 10 m.

a day; and that is not more than the common rate at which the drift-current runs. In the Caribbean Sea the Guyana current terminates; for, in that sea, no perpetual current has been traced. It rather seems that the currents which exist there, depend on the winds, and change the direction of their course according to the seasons.

The other current, which branches off from the equatorial current, opposite Cape S. Augustine in Brazil, is called the *Brazil current*, and runs to the S.W. along the shores of S. America, but does not in any part of its course approach near to them. From 80° S. lat., where it separates from the Guyana current, to 16° or 17° S. lat., the current has a considerable width, and runs about 20 m. or somewhat more a day. Its distance from the continent is no where less than 250 m. Farther S. it increases in breadth and velocity, and approaches at the same time nearer the continent. Opposite Cape Frio it runs about 30 m. a day, and is not more than 200 m. distant from the coast. As, however, from the last-mentioned cape the land falls back to the W., the current is soon found at 300 m. and more from the continent. By declining by degrees, its course farther to the W., it approaches nearer; but never is found at a distance less than 250 m. Thus it continues to the mouth of the La Plata river, running all this way from 15 to 20 m. per day. It becomes weaker as it advances farther S.; but may be traced to the Straits of Magalhães and Le Maire. In the space of sea which intervenes between this current and the coast, the changeable currents occur, noticed above among the currents depending on monsoons.

The Guyana and Brazil currents are those, with which the Equatorial current is connected on the shores of America. The currents with which this great sea-stream is united near the coast of the Old Continent, are the S. and the N. African currents. The *S. African current* seems to have its origin some degrees N. of the Cape of Good Hope. It appears, however, not to be connected with the Agulhas current, which is found at a short distance S. from the Cape, and which runs W. from the Indian sea to the Atlantic Ocean. Between 16° and 11° S. lat. exists a current running from S. to N., at a short distance from the coasts of Africa, but we are not acquainted either with its breadth or velocity; neither, however, appears to be considerable. Between 11° and the island of Anno Bom, the current runs in a N.W. by W. direction, at the rate of from 15 to 25 or even 30 m. a day, but seems to be of inconsiderable width. It increases in velocity at the mouth of the river Zaire, and in width at Cape Lopez; but soon afterwards merges into the Equatorial current.

The *North-African current*, which is also called the *Guinea current* from its terminating opposite the coast of Guinea, has its origin opposite the coast of France, between the southern shores of Ireland and Cape Finisterre in Spain. It is impossible to determine more precisely the place where it originates; but it is a fact well established by experience, that the whole body of water between the Peninsula and the Azores is in motion towards the N. and the western parts of Europe, slowly, and the eastern more to the S.E. Between Cape S. Vincent in Portugal, and Cape Cantin in Morocco, the motion is directed towards the Straits of Gibraltar; and this motion extends as far westward as 20° W. long. Between Cape Cantin and Cape Blanco the general direction of the current is along the coast, but it sets in nearly perpendicularly towards the shores. This portion of the current is about 300 m. across between Cape Cantin and Cape Bojador, but only from 150 to 180 between the last-mentioned Cape and Cape Blanco. Between Cape Blanco and Cape de Verd the current runs a little to the W. of S., approaching the general direction of the drift-current of the trade-winds. Near the Cape de Verd Islands the temperature of the water of the current is 8° lower than in those parts of the sea which lie beyond it. After passing Cape de Verd, the current turns S., and by degrees S.E. and S.S.E. Here it does not approach the shores of Africa; at least, between Cape de Verd and Cape Mesurado it is met with only at a distance of about 200 m. from the coast. The intermediate space is occupied by periodical currents, which run, from September to June, S. or S.W.; but in the remainder of the year, N.E. S. of Cape Mesurado it approaches the coast, and increases in velocity, running sometimes at the rate of 2 m. per hour; here its temperature is considerably increased, but still lower than that of the ocean at large. At Cape Palmas it turns entirely to the E.; and skirts the coast of Guinea until it disappears in the sea opposite the mouth of the Quorra, and in the Bay of Biafra, where it partly seems to mingle with the Equatorial current.

With the N. African current another current is connected, which runs across the British Channel at its western extremity. It runs E. from Cape Finisterre along the S. shores of the Bay of Biscay; turns then to the N. and N.W., along the W. coast of France; and passing Ushant, it traverses the British and Irish Channels. At the Scilly Islands, which it touches with its eastern border, it is 60 m. across. It then con-

thence to the southern shores of Ireland, W. of Carnore Point; and hence turns to Cape Clear, where, after entering the ocean, it turns to the S. and S.E., and rejoins the N. African current. By this current vessels are frequently placed in danger near the Scilly Islands. With certain winds this current runs from 24 to 28 m. a day. We owe the exact knowledge of this current to the careful investigations of the late Major Rennel, and hence it has been called *Rennel's current*.

The *Gulph stream* which crosses the Atlantic between 36° and 44° N. lat., originates in the Gulph of Mexico. The water in this sea is set by two currents into a nearly circular motion; which seems to be the principal reason why it acquires such a high degree of temperature,—being 86° Fahr., whilst that of the ocean at large in the same lat. (25° N.) does not exceed 78° Fahr. The two currents, which put in motion perhaps three fourths of the water of the gulph, unite about 70 m. W. of the Havannah; and by this junction the Gulph stream is formed. It runs along the N. coast of the island of Cuba, eastward; but it is neither broad nor rapid at the entrance of the Straits of Florida at the Salt Keys, where it begins to run about $1\frac{1}{2}$ m. an hour. After entering the straits its velocity increases to 23 m. and occasionally 4 m. an hour. In the Narrows, however, between Cape Florida and the Bimini Islands (which belong to the Bahamas), where the strait is only 44 m. across, and the water-way is straitened by reefs and shoals to 35 m., it runs, in the month of August, 5 m. an hour; and at that rate commonly through the remainder of the strait up to Cape Cañaveral. Though the current has traversed, in this space, about 4° of lat., the temperature of its water is not sensibly diminished. From Cape Cañaveral (about 28° N. lat.) the gulph-stream runs east due N., and then nearly N.E. along the shores of the United States, up to Cape Hatteras (33° N. lat.). It increases gradually in width, and decreases in velocity. At Cape Hatteras it is from 72 to 75 m. across, and it runs only 34 m. per hour. The temperature of its water has sunk from 86° to 83° . In this part, the current runs not so close to the shores as in the Strait of Florida. Its N.W. edge is about 24 m. S.E. from Cape Hatteras. After passing this cape, the current increases still more rapidly in width, and diminishes gradually in velocity. Between Cape Hatteras and the banks of Nantucket and St. George (40° N. lat.), the general direction of the current continues to be from S.W. to N.E., though the W. edge runs nearly due N. at the Nantucket and S. George Banks it suddenly declines its course to the E., and brushing the S. extremity of the great bank of Newfoundland, it continues in that direction as far as 43° or 44° W. long., between 37° and 43° N. lat. Farther E. it bends to the S.E. and S.; and having inclosed the islands of Flores and Corvo, belonging to the group of the Azores, it is lost in the ocean. There are some instances on record of the warm water of the gulph stream having advanced to the very shores of Spain and Portugal. It is difficult to determine the width of the current where it runs across the Atlantic, because its warm water expands on both sides to a considerable distance, where no current has been traced. The strongest current is between 39° and 39° N. lat.; and it is probable that the breadth of the whole current does not exceed 120 naut. m., though the warm water is found to be 200, 250, and even 320 m. across. Between 55° and 66° W. long. the strongest current runs from 55 to 56 m. a day; but 900 m. farther E., only from 30 to 33 m. In the neighbourhood of the Azores its mean rate does not exceed 10 m. a day. The temperature of its water decreases less rapidly. At the meridian of 63° W. long., or 600 nautical m. from Cape Hatteras, the thermometer shows in summer 81° , or from 10° to 11° above the water of the sea under the same lat. At 73° long. its temperature is 75° ; and even at Corvo, not lower than 84° , or from 80 to 10° above the ocean. The length of the gulph stream from the Salt Keys to the S. of the Azores is upwards of 3,000 naut. m. It traverses from 19° to 20° of lat. (from 33° to 43° or 43°), and its temperature decreases only 13° (from 86° to 73°). The sea which is traversed by it is subject to nearly continual gales; especially towards the outer edges of the current.

Nearly in the middle of the Atlantic the gulph stream is joined by the *Arctic current*, which originates beneath the immense masses of ice that surround the pole, and thence runs in a S.W. direction along the E. shores of Greenland, carrying with it a great number of icebergs, ice-fields, and ice-floes. Pressing these icy masses against the coast of Greenland, the current renders that coast inaccessible; but it prevents the ice from spreading over the North Sea, and from encumbering the shores of the British Islands. At Cape Farewell the width of the current seems to be from 120 to 160 m., the ice-masses extending to such a distance from it. After passing Cape Farewell, the current bends to the N. and enters Davis's Strait, running along the western coast of Greenland up to the Polar Circle, where it crosses the strait to Cape Wainham (about 66° N. lat.); hence it flows south-

ward along Cumberland's Island to Frobisher's and Hudson's Straits. Opposite these straits it runs from 15 to 16 m. a day. Approaching Newfoundland, the current divides: one branch, running through the strait of Belle Isle, mixes with the waters brought down by the St. Lawrence; whilst the other skirts the E. shores of Newfoundland, where it passes between the great and the outer bank of Newfoundland (between 46° and 46° lat., and 46° and 47° long.), and at last joins the gulph stream between 44° and 47° W. long. The width of this current, probably, no where exceeds 200 m.; the temperature of its water is ways considerably lower than that of the ocean, sometimes as much as 16° or 17° .

The last current we have to notice, is the *South Atlantic current*, which traverses the ocean from E. to W. between 30° and 40° S. lat. It is not known whether this current be connected with the Brazil current, and we are only generally acquainted with the existence of a motion in the sea between the S. coasts of Brazil and the Cape of Good Hope. In the W. part of the Atlantic its velocity seems to be moderate; but it increases as the current advances farther E., and opposite the Cape it is very strong. It is met with at a distance of from 150 to 180 m. from the Cape; hence it flows in a straight line into the Indian Ocean, and traces of it are found 2,000 m. beyond the Cape. That space of sea which intervenes between this current and the Cape, is occupied by another current, which runs in an opposite direction; being formed in the Indian Ocean by two currents which descend on both sides the island of Madagascar, and unite between the first point of Natal and Cape Recife, about 33° S. lat. Passing the Cape of Good Hope, it enters the Atlantic as a current, running at the rate of from 1 or $1\frac{1}{2}$ m. an hour in a N.W. direction, and may be traced as far as 25° S. lat. This current is called the *Agulhas current*, from passing over the bank of that name at the S. extremity of Africa.

Tracks of Vessels.—In proportion as our knowledge of the prevailing winds and of the strength and direction of the currents has increased, the tracks have been fixed with more precision, which vessels should follow in sailing from or to a country lying on the shores of the Atlantic. In a few cases they follow the same route, whether outward or homeward-bound; but in most cases they follow different routes. We shall notice a few of those which are most frequented.

1. Between Europe and the W. coast of N. America vessels keep clear of the gulph stream, sailing along its N. border, between 44° and 50° N. lat. If, in sailing from E. to W., they were to enter the gulph stream and to stem its current, they would be delayed in their course, perhaps, not less than a fortnight. If, in sailing from W. to E., they were to enter it, they, doubtless, would arrive four or five days sooner in Europe; but the vessels would suffer from the continual gales which prevail within the borders of the stream, so much damage in wear and tear, that it hardly could be compensated by the gain of a few days. In sailing to the United States N. of the gulph stream, vessels have the advantage of a counter current, which runs from the Nantucket and St. George Banks to Chesapeake Bay, and perhaps to Cape Hatteras.

2. In sailing from Europe to the West Indies, and the countries S. W. and N. of the Columbian Sea, different tracks are followed, outward and homeward. In sailing from Europe, the trade-winds are taken advantage of. The vessels pass Madeira and the Canary Islands, and sail S. as far as 21° N. lat., where they are certain to find a constant trade-wind. In this course they must avoid approaching too near the coast of Africa between Cape Nun and Cape Blanco, because the N. African current sets in towards the shores of the Sahara, and the winds blow continually from the sea towards the land. Many navigators who hoped to make the island of Teneriffe, according to their dead reckoning, have been carried so far to the E., that they have been cast on these inhospitable shores, where most of them have perished. Between 1790 and 1805, not less than 30 vessels are known to have been thus lost; and it is supposed that many others had the same fate, without its being known. Having got a constant trade-wind at 21° N. lat., the vessels sail W., and enter the Columbian Sea commonly by one of the straits lying between the islands of Martinique and Trinidad.

In sailing homeward ships sometimes go through the Moua (between Puerto Rico and Haiti) and windward (between Haiti and Cuba) passages; but more commonly they pass round the island of Cuba on the W., and sail through the Straits of Florida. As soon as they have got clear of the strait, they sail E. to get clear of the gulph stream. They then direct their course across the Atlantic, S. of the Bermudas, till they come into the longitude of the island of Flores. They then sail N., either passing between Flores and the other Azores, or to the E. of the group.

3. In sailing from Europe to the coast of Guyana (Demarara, Surinam, and Cayenne), and to those pro-

vinces of Brazil which are situated W. of Cape St. Roque, ships go S. till they meet the trade-wind, and then shape their course to the place of destination, but keeping a few degrees farther to the E.; for, on approaching the New Continent, they meet the Guyana current, which carries them W. If, therefore, they make land somewhat too far to the W., they find it very difficult to attain their place of destination,—having to bear up against the current.

In returning to Europe, the vessels sail along the shores of America, where they are favoured by the Guyana current, as far as the island of Trinidad. Then they keep to the windward of the Antilles, till they get into the variable winds, where they follow the track of the vessels returning from the W. Indies.

4. Sailing from Europe to S. America, S. of Cape St. Roque, ships have to pass through the region of calms, and to traverse the Equatorial current. The first retards their progress, and the second carries them forcibly to the W. If they cut the equatorial line W. of 25° W. long., they cannot make Cape St. Roque, and fall in with the Guyana current, which carries them still farther W., and along the N. coast of Brazil. Then they can only get back to Cape St. Roque by a toilsome voyage of many days. To avoid this, the vessels traverse the line between 18° and 23° W. long. Having done this, they are assisted by the Brazil current in making, with ease, any part of the coast they please.

Vessels homeward bound from this coast take different tracks, according to the seasons. From March to September, when the monsoons blow, and the currents run, from S. to N., between the Brazil current and the continent of S. America, they sail along the shores, till, at Cape St. Roque, they meet the Guyana current; and then they follow the track of the vessels returning from Guyana to Europe. But, from September to March, the periodical winds and currents blow and run from E. to S. W., in the direction of the Brazil current. Ships then sail across the currents, and try to get into the middle of the Atlantic, where they follow the track of the vessels returning from the East Indies.

5. In sailing to the East Indies, it is now the general practice to avoid the numerous difficulties met with in navigating along the coasts of Africa, S. of the equator, and to follow the tracks of the vessels bound to Brazil. Afterwards, the vessels proceed along the coast of S. America to 32° or 33° S. lat., where they get out of the range of the S.E. trade-winds, and are certain to meet with the S. Atlantic current, which carries them eastward. They do not touch at the Cape of Good Hope, but follow the current until they enter the Indian Ocean.

In returning from the East Indies to Europe, vessels enter the Agulhas current near Madagascar, and are carried by it to the Cape of Good Hope, where they commonly stop for some time. From the Cape, the same current takes them by its N. W. course to the middle of the Atlantic. They then shape their course N., so as to traverse the line between 22° and 24° W. long., where they meet the N. W. current, which takes them to 20° or 25° N. lat.; whence they proceed to the Azores.

Ice.—Both extremities of the Atlantic Ocean are invaded by great masses of ice. They either have been detached from the enormous masses, which enclose the poles to a great distance, or from those countries, which are situated so near the poles, that their coasts are covered with ice for the greater part of the year. In the N. seas, the ice consists of icebergs, ice-fields, and ice-floes. The icebergs are enormous masses of ice, sometimes several hundred and even thousand yards long and broad; their summits, however, rarely are so extensive that their limits cannot be discovered from the mast-head, and floes, when their extent may be overlooked from it. In the S. Atlantic only, fields and floes are found, icebergs never having been met with. It is further worth remarking, that the ice advances much nearer to the N. than to the S. tropic. The ice-floes at Cape Horn are far from being numerous; and Capt. Weddell says, that at 56° 20' S. lat., there is no fear of falling in with ice.

In the N. hemisphere, we always find great ice-masses at some distance from the E. shores of Newfoundland, from January to May and June; and icebergs are annually seen grounded on the Great Bank. It even sometimes happens that icebergs are met with in the gulph stream, 40° N. lat. and 32° W. long., as was the case in 1817.

Miscellaneous Remarks.—Fish seem to be much more plentiful in the seas near the arctic, than in those surrounding the antarctic, pole. This is probably to be

accounted for by the greater number and greater extent of banks found in the N. seas, and these, besides, wash a far greater extent of shores, which many species of fish resort to in quest of food. Another remarkable fact is, that the seas near the equator, and, in general, those lying in lower latitudes, are much richer in species than the N. parts of the ocean; but that, in the latter, the number of individuals belonging to each species is far greater. Hence we find that the most extensive fisheries are those, which are carried on to the N. of 45° N. lat.; as the cod fisheries on the Great Bank of Newfoundland, and at the Laffden Islands, the whale fishery at Spitzbergen and on both sides of Greenland, the herring fishery along the coasts of Great Britain, and the pilchard fishery in the British Channel. The most important fisheries S. of 45°, if we except the whale fishery near the S. pole, seem to be that in the Caribbean Sea along the coasts of Venezuela, and that which the inhabitants of the Canary Islands carry on in the sea surrounding Cape Blanco in Africa.

The temperature of the water is greater in the N. than in the S. hemisphere. In the seas N. of the Equatorial current, the thermometer indicates 80° or 81°, and S. of it 77° and 78°, at the time when the sun approaches the equator. This difference may, perhaps, be satisfactorily accounted for by the sun's remaining annually seven days longer to the N. than to the S. of the equator.

The specific gravity and saltness of the sea-water is, doubtless, greater near the equator, than in the vicinity of the poles; but the experiments which have been made to determine the exact difference, have given such different results, that we must still consider this question as undecided. According to Capt. Scoresby, the specific gravity of the sea-water near the coasts of Greenland varies between 1.0269 and 1.0270. Between the tropics, some have found it 1.0300, or nearly this much; and near the equator, even 1.0378, but the last statement is, with reason, regarded as doubtful.

In a part of the Atlantic, the gulph-weed, or *fucus natans*, occurs in great quantities. This region extends nearly across the whole ocean, beginning on the E. at the 30th meridian, and terminating on the W. in the sea washing the E. side of the Bahama Bank. In width, it occupies the whole space between 28° and 36° N. lat.; but the whole extent of the surface between these lines is not equally crowded with weed. The most crowded part extends between 30° and 32° W. long.; where, in the neighbourhood of the island of Flores,—one of the Azores,—it forms first only a small stripe; but farther to the S. expands to a great width. In this part of the Atlantic, which is called by the Portuguese, *Mar de Sargasso* (Weedy Sea), the *fucus* covers, like a mantle, far and wide, the surface of the sea, extending from N. to S. more than 1,200 m. Another part of the sea, covered with *fucus* in a very crowded state, occurs between the meridians of 70° and 72°, and the parallels of 22° and 26°, towards the W. end of the region. The sea lying between these two crowded districts, is, in some parts, only lightly strewn with sea-weeds; but, in others, it occurs in dense masses.

Many conjectures have been formed as to the origin of the name given to this great sea. Of these, the most probable seems to be that which derives it from Mount Atlas. Being first navigated by Phœnician and Carthaginian adventurers, they would naturally designate it by the most conspicuous feature in the limited space with which they were acquainted; and would, therefore, call it *Mar Atlanticum*, or Sea of Atlas.

ATLAS (MOUNT), according to Herodotus, was a single isolated mountain of great elevation, on the W. coast of N. Africa. This information was probably obtained from the sailors and navigators of the time, who saw the elevated mountain which forms at Cape Geer (30° 40' N. lat.) the western extremity, and as it were the beginning, of that extensive range, now comprised under the name of Mount Atlas.

The principal and according to our present knowledge the highest range of Mount Atlas, is that which begins at Cape Geer (near 10° W. long.), and extends E., with a slight declination to the N., as far as Cape W. long., where it approaches 32° N. lat. As to cross it requires two days journey, its width may be estimated at from 30 to 40 m. Its height nowhere seems to exceed the snow-line; for its highest summit, the Mitsin, 27 m. S. E. from the town of Morocco, has been measured by Lieut. Washington, and found to have an elevation of 11,400 feet above the sea. It is only once in about 30 years free from snow; during the winter months the N. declivity of this range is frequently covered with snow for several weeks; we do not know whether this be also the case with the S. declivity, but as it is turned towards the great African desert (the Sahara), and towards the hot winds blowing from that quarter, it is likely that snow falls rarely there, even on the highest summits. This range is called by the natives Djibbel Telge.

From the E. extremity of the Djibbel Telge a chain branches off on the S. side, which runs in a W. S. W.

direction, and terminates with low hills on the Atlantic sea at Cape Nun. According to Jackson it contains a snow-capped summit, E. of Élaia, but its mean elevation does not appear very great. Between this range and the Djibbel Telge lies the province of Suse. Along the S. base of this range, according to the newest information, runs the river Dráh, which does not lose itself in the sand of the Sahara, as has been usually believed, but reaches the sea about 22 m. S. of Cape Nun.

At about 50° W. long. and 32° N. lat. the chain forms a mountain-knot, from which issue two ranges, one running a little to the E. of N., and the other first N. E. and then E. Near the mountain-knot, between the sources of the rivers Oom-er-begh (Morbera) and Mulwia or Mahala, it was till lately supposed that the Atlas attained an elevation of 15,000 or even 19,000 feet; but the route of Caillié lay precisely over this part of the range, and from his account we only can infer that the ridges rise from 1,000 to 2,000 ft. above the country at their base; and this country is probably not more than from 2,000 to 4,000 ft. above the level of the sea; he does not mention any summit rising to the line of congelation.

The range which runs a little to the E. of N. continues in that direction from 32° to 34½°, where at a distance of about 30 m. from the Mediterranean, it divides into two ridges, which hence run along the Mediterranean Sea, in opposite directions, the W. terminating on the peninsula forming the Straits of Gibraltar, at Cape Spartel, and the E. continuing through the whole of Algiers, and terminating at Capes Blanco and Zibeeb, on the strait separating Sicily from Africa. The undivided range (bet. 32° and 34½°) is called by the Europeans Greater Atlas, and by the natives Djibbel Tedla or Adila. The chain which extends W. to Cape Spartel, is commonly named the Lesser Atlas; by the natives, Errif. Its highest part is hardly any where more than 15 or 20 m. distant from the sea; but in numerous places its branches occupy the whole space lying between it and the elevated shores; it forms the capes of Tres Forcas, Quillates, Negro, and Ceuta. Its mean elevation seems hardly to exceed 2,000 ft.

The chain which skirts the Mediterranean from 30° W. long. to 10° E. long., or to Cape Blanco, has no general name. The distance of the highest part of the range from the sea varies between 10 and 30 m., but at numerous points the coast itself is formed by mountains of considerable elevation, which are parts of the great masses lying behind them. No level country of any extent occurs along the shores, except the Plain of Metidjah, E. of the town of Algiers. This range is of greater elevation than the W. Shaw states that the higher portions of it are covered with snow a considerable part of the year; and the French naturalist Desfontaines estimated their height at 7,200 ft. But the highest points have lately been measured, and one has been found to rise 5,124 ft., and another 6,729 ft. only above the sea. E. of 50° E. long. the mountains in the interior seem to be much lower than farther W., but some high summits occur on the coast very near the sea. This chain is at several places broken down, and it is by these wide chasms, that the most considerable rivers of northern Africa find their way to the Mediterranean Sea, as the Mulwia, Shellif, Isser, Sardin, Wad el Kebir, Selous, and Meirah.

The mountains in which these rivers have their origin, are very imperfectly known, even as respects their geographical position. It is supposed that they form the continuation of the ridge which branches off from the mountain-knot at 50° W. long. and 32° N. lat. towards the N. E., but afterwards by degrees declines to the E. East of the meridian of Greenwich, its principal masses seem to lie near the parallel of 35° N. lat. and to extend eastward to the meridian of 10°. Between this range and the more southerly one, lie the valleys and plains of moderate extent, which have a temperate and fertile climate, and constitute the best portion of the countries embosomed within the range of Mount Atlas. Edrial thinks that no country can match these elevated valleys for fruitfulness of soil, and amount of population (ed. Hartmann, p. 140.). The height of the range to the S. seems not to be equal to that lying N. of the valleys, though it probably occupies a greater width: perhaps on this last account it is considered as the principal chain of the Atlas. Among the natives a great portion of it is known under the name of Djibbel Amer, or Lowat.

The country extending south of this range is called, according to Shaw, Sahara by the natives; but though it doubtless partakes in some respects of the character of the Great Desert, it differs widely from it in others, and must be considered as belonging to the system of Mount Atlas. This country, as far as we are informed, presents a succession of flat-backed ridges of moderate elevation, but considerable breadth, running commonly E. and W. The lower grounds by which they are separated from each other, are completely closed valleys or plains of moderate extent, each of which has a temporary or permanent lake in its lowest part, the receptacle of the waters that flow down from the adjacent high grounds

during the rains. The surface of this extensive country is composed of a sandy soil, entirely destitute of trees, and, in most parts, even of every kind of vegetation, at least during the dry season. But along the water-courses extensive plantations of date trees exist; hence the country has received the name of Bled-el-Jereed (the country of dates). In most districts the water is salt or brackish; but in parts potable water may be obtained in abundance by digging wells to the depth of 100 and by sometimes 200 fathoms. This country extends S. to the very borders of the Great African Desert, and extends eastward far beyond 10° E. long.; but the country east of that meridian is not considered as forming a portion of the Atlas which terminates between 90° and 100° with the Nefusa Hills, W. of the Bay of Cabes or the Lesser Syrtis.

Our knowledge of the roads traversing this mountain system, is of course very scanty. Jackson states that only two passes, Behawan and Belavin, exist between the province of Suse and the country N. of the Atlas. Farther E. between 60° and 40° W. long. lies the great caravan road, on which the commerce between Fez in Morocco, and Timbuctou in Soudan, is carried on. It traverses the districts of Tafillet and Draha, and does not appear to present great difficulties, according to the statement of Caillié, who returned by it to Europe: this road is connected with the great caravan road leading to Mecca. We are not well acquainted with the precise place where this latter branches off from the former, but it seems to be between 32° and 33° N. lat., not far from the sources of the river Mulwia. The principal stations of the caravans within the Atlas mountains are named Kassabi or Akabi Shurafa, Tiz Fighig, Gardsela, and Wurglah, all of which are situated near the S. borders of the mountain system. From Wurglah the road passes to Gadames, and hence to Murzuk in Fezzan.

We are very imperfectly acquainted with the mineral riches of the Atlas; the precious metals seem only to occur in the province of Suse, and not in abundance, at least no mines are worked. But copper is very plentiful in the principal range S. of the town of Morocco, where it is worked by natives who inhabit the mountains, and are in a great measure independent of the sultan of Morocco. Iron of good quality occurs in many places, and is worked in few, as is likewise lead: antimony in abundance is found and collected in the range of Tedla. Rock-salt is also plentiful, but not worked, because salt may be obtained with less labour by evaporating sea-water. Saltpetre of a superior quality abounds in some districts of Suse, and in the neighbourhood of the town of Morocco; fuller's earth is abundant and of good quality.

Mount Atlas is inhabited by a nation which must be considered as aboriginal, having probably been in possession of N. Africa long before the beginning of our historical records. It is known under the name of Berberes, or Beybers; though it seems that this denomination is entirely unknown to themselves. This nation, which still forms the bulk of the pop. of N. Africa, including nearly the whole of the Sahara, is divided within the limits of Mount Atlas into two great tribes, the Amazirghes, or Mazirghes, and the Shellous. The latter occupy the two high western ranges, including the province of Suse; and the Amazirghes the remainder. It has long been a question, whether these two nations speak only different dialects of one language, or two essentially different languages; but Gralberg de Hemso, who lately published a work on the empire of Morocco, and understands the languages, states that they are substantially the same, the difference between them being not greater than that between the Portuguese and Spanish, or the English and Dutch languages. Both nations, however, differ in their manner of life and occupations, the Shellous living in houses, cultivating the fertile valleys of the mountain ranges, and applying themselves with assiduity and success to several mechanical arts; whilst the Amazirghes dwell in tents or caverns, attending only to their numerous herds of cattle and sheep. Only a few individuals of these nations are subject to the emperor of Morocco and the sovereigns of Algiers. Those inhabiting the mountains have preserved their independence, and are governed by independent chiefs. They are frequently at war with the sovereigns in whose territories their possessions are included. Among both nations a considerable number of Jews are settled.

The most exaggerated notions were early entertained of the height of Mount Atlas. Mela says that, *In arenis mons est Atlas, dense consurgens, verum incitis undique rupibus, præcepis, inivis, et, quo magis surgit, cælitior, qui, quod altius quam conspici potest, usque in nubila erigitur, cælum et sidera non tangere modo vertit, sed sustinere quoque dictus est.* (lib. iii. s. 10.) This supposed extraordinary height of the mountain, and the ignorance that prevailed in the earlier ages of the contiguous countries, afforded full scope for the exercise of the imagination. The poetical history of Atlas may be seen in Ovid, *Metamorph.* lib. iv. line 656. and is referred to by Virgil in one of the finest passages of the *Æneid*, lib. iv. line 346.

ATRIA, or **ATRIA**, a town of Naples, prov. Abruzzo Ultra I., 5 m. from the Adriatic, and 11 m. N. by E. Civita Penne, on a steep mountain. Pop. canton, (1830) 7,249; town, about 4,000. It is the seat of a bishopric, has a cathedral, parish church, several convents, a grammar school, two hospitals, and a mont-de-piété.

This is a very ancient city, and, instead of the Venetian Adria, it has been supposed to have given its name to the Adriatic; but the weight of authority and probability is against this supposition; its origin is, however, undetermined, or lost in obscurity. Some extraordinary excavations exist in a hill near the town, forming a series of chambers, distributed with such regularity as to authorise the notion that they were designed for some particular object, such as prisons or magazines. These peculiarities have suggested the idea that they are of a more remote construction than the *Lathomia* at Syracuse, which they much resemble, or than the celebrated prisons of Servius Tullius at Rome. Some antiquaries have supposed, not without considerable plausibility, that the word *Atrium* must have been derived from these excavations. The town received a Roman colony about the year 465 U. C. It seems to be generally allowed that the Emperor Adrian was descended of a family original of this city. (*Hist. Des Descendans de Dée Scellie*, l. p. 52; *Cramer's Ancient Italy*, l. p. 291.; *Cramer's Adria*, i. p. 300.)

ATRIPALDA, a town of Naples, prov. Principato Ultra, on the Sabato, 2 m. E. Avellino. Pop. 2,400. It has a collegiate and a parochial church, with fabric of cloth, paper, and nails.

ATTERCLIFFE, a township in the par. of Sheffield, which see.

ATTICA, in antiquity, the most celebrated region of Greece, and the seat of its most renowned people, now part of the nomarchy of Attica and Boeotia, and forming the eparchy of Athens. It lies between lat. 37° 39' (Cape Colonna), and 38° 22' N., and long. 23° 20' and 24° 5' (C. Marathon) E., having N. Boeotia, E. the Aegean Sea, S. and S.W. the Gulf of Egina (Saronic G.), and W. the eparchy of Megara: shape triangular, the base to the N. W.: length 44 m.: breadth about 34 m. It owed all its ancient glory to the industry and genius of its inhabitants. Soil mostly rugged, the surface consisting of barren hills, or plains of little extent. The chief mountains are Nisea (Parnes), the loftiest; Elatea (Cithaeron), and Manglia, which form its N. boundary; Mendeli (Pentelikus), famous for its marble; Viole-vuni (Hymettus), and Laurion (Laurion), famous for its silver mines. The most remarkable plains are those of Athens and Marathon: rivers, the Sarandaporu, Cephissus, and Ilissus. The produce of Attica differs remarkably from that of Boeotia; it is deficient of water, and yields little grain except barley; its pastures are but few, and its spontaneous vegetation consists mostly of evergreens, as the pine, primari, olive, myrtle, &c. Parnes is covered by a forest, and supplies Athens and the surrounding country with fuel; Hymettus abounds with lentisks, wild thyme, and other odiferous plants; its honey still enjoys some portion of its ancient fame; and its mutton has a delicious flavour. The oil is equal to that of France: what corn is produced is very good, and the harvest takes place earlier than in any other part of Greece. Game is very abundant, and wolves, wild boars, and a few bears, are met with in the N. Owls, especially the small grey owl (*Nix pascuina*), still inhabit the vicinity of Athens in great numbers; but luckily there are remarkably few venomous reptiles or insects. The chief mineral treasures are unble, white at M. Pentelikus, and grey at M. Hymettus; the anc. silver mines of Laurion are no longer productive. Air pure and healthy; and though the country is in many parts dreary and desolate, the summits of the mountains afford sublime views, embellished by numerous classical remains, associated with imperishable and ennobling recollections. Every hillock of Attica appears to have been dedicated to gods or heroes, and decorated with their altars and statues, the ruins of which are often clearly traceable. It originally contained 174 demoi or boroughs; it now possesses no town of any importance, except Athens: its villages are mostly inhabited by Albanians. (For farther particulars, see GREECE.)

ATTLEBOROUGH, a m. town and par. of England, co. Norfolk, hund. Shropham, 15½ m. S. W. Norwich. The par. contains 5,800 acres, and 1,939 inhab. The town, formerly a place of some importance, is now decayed and inconspicuous.

ATTUCK (*Atac*, a limit), an *Varanas*, a fort and decayed, though formerly a considerable, town of the Punjab, Hindostan, on the E. bank of the Indus, in lat. 33° 56' N., long. 71° 57' E., 42 m. E. S. E. Peshawar, and 236 m. N. W. Lahore. The modern fort stands on a low hillock beside the river; it is of an oblong form; its shortest faces parallel to the river, being 400 yards in length, and the others twice as long. The walls are of polished stone, and the whole structure is handsome; but in a military point of view it is of little importance, being

commanded by a hill, from which it is divided only by a ravine. On the opposite side of the river is a small village, having a fort erected by Nadir Shah, and a fine aqueduct built by some former Khuttuk chief. The Indus is here 300 yards broad, the channel deep, and the current rapid, but so tranquil that a bridge might be thrown over it; and it is easily passed both in boats and on the inflated hides of oxen, a contrivance common here, and as old as the days of Alexander the Great, who is believed to have crossed the Indus at or near this point. For a long period Attock belonged to Caudal; but in 1818 it was taken by the Maharajah Runjeet Sing, who now possesses it. (*Elphinstone's Caubul*, l. 96, 97.)

AUBAGNE, a town of France, dep. Bouches du Rhone, cap. cant., on the Veauine, 10 m. E. Marseilles. Pop. 6,481. It consists of an old and a new town; the former built on the declivity of a hill, and the latter at its foot. In the first, the houses are small, and the streets narrow and dirty; but in the new part the houses are good, and the streets broad and well kept. It has fabrics of earthen ware and paper, and tanneries; and several fairs are held in it, for the sale of horses, mules, and jewellery.

AUBE, an inland dep. of France, S. E. Paris, between 47° 55' and 48° 42' N. lat., and 3° 24' and 4° 48' E. long. having N. dep. of Marne, E. Haute Marne, the Côte d'Or and Yonne, and W. Seine et Marne. Area, 609,000 hectares. Pop. 253,870. It is traversed by the Seine, which is navigable from Troyes, and also by its important affluent the Aube, whence the dep. has its name: the latter is navigable from Arcis-sur-Aube. Surface generally flat; but in the N. W. quarter there are some low hills. The soil of the region to the N. and W. of Troyes consists of chalk thinly covered with mould, and is exceedingly barren and unproductive, great part of it not being worth cultivation. The subsoil of the other portion, or that to the E. and S. of Troyes, also consists of chalk; but being for the most part thickly covered with alluvial deposit, produces luxuriant crops of corn, hemp, turnips, &c. Agriculture has made considerable progress since the revolution, particularly as respects the culture of turnips, and the formation of artificial meadows. Oxen as well as horses are employed in field labour. The annual produce of wool is estimated at 220,000 kilograms. A great number of hogs are fattened. The meadows in the valleys of the Seine, Aube, and Ainan annually supply about 2,000,000 quintals hay, about one-third part of which is sent to Paris. The forests in some parts are pretty extensive; but in the barren chalk region there is a great want of trees. The best wines are those of Rirey, Bar, Bouilly, Javernant, and Laines-aux-Bois. According to the official tables, the principal divisions of the soil are: cultivable land 394,000, meadows 37,500, vineyards 23,000, woods 80,000, heaths, moors, &c. 22,000 hectares. Excepting chalk and marble, the minerals are unimportant. The manufacture of cotton stuffs and yarn, hosiery, and woollen stuffs, is extensively carried on. There were, in 1834, 2,500 looms, and 3,500 workpeople, employed in the weaving of cotton; 5,000 looms, employing 3,500 workpeople, produced annually 80,000 doz. caps, and 370,000 doz. pairs of stockings; the establishments for spinning wool, produced annually about 400,000 kilograms of yarn; and those for the spinning of cotton put in motion 68,000 spindles, employing from 2,700 to 3,000 workpeople, and furnish annually 500,000 kilograms of yarn. There are also tanneries, works for the preparation of beet-root sugar, glass-works, tile-works, &c. The dep. returns 4 m. to the Ch. of Deputies; No. of electors, 1,308. Amount of public revenue in 1831, 8,176,886 fr. With the exception of Troyes, none of the other towns are of much importance. The condition of the inhabitants of Aube has been materially improved during the last 30 years. "Les progrès de la civilisation y sont remarquables. Les paysans et les artisans sont vêtus et se nourrissent d'un pain presque dire avec recherche. Les ouvriers mangent de la viande, et leurs salaires, qui se sont beaucoup accrus depuis la révolution, ont aussi accru leur bien-être. Ce bien-être leur a inspiré des idées d'ordre et d'avenir. Le département est un de ceux où un caissier d'épargne et de prévoyance a eu la plus prompt succès; l'établissement de celle de Troyes date de 1822." (*Hugo, France Littéraire*, art. Aube; and *French Official Tables*.)

AUBEL, a town of Belgium, prov. Liège, 5 m. N. Verrieren. Pop. 3,100. It has a good weekly market, and a considerable trade in butter and cheese.

AUBENAS, a town of France, dep. Ardèche, cap. cant., near the Ardèche, at the foot of the Céronnes, 13 m. S. W. Privas. Pop. 4,855. It is beautifully situated on the slope of a well-wooded hill, and is surrounded by the ruins of an old wall flanked with towers. The interior of the town by no means corresponds with the beauty of the situation, its streets being generally crooked, narrow, and filthy; and the houses *sombres et mal-propres*. It is the seat of a tribunal of commerce, and has manufactures of cloth, filatures and fabrics of silk, establishments for the dressing of leather, &c. It is the great mart for the sale of the wines and chestnuts of the dep., and has also a considerable trade in raw and wrought silk, wool, and cotton.

AUBERVILLIERS, a village of France, dép. Seine, a little to the N. of Paris. Its inhabitants are principally employed in the raising of garden stuffs for the supply of Paris.

AUBIGNY, a town of France, dép. Cher, cap. cant., on the Nère, 28 m. N. Bourges. Pop. 2,206. It is old, dirty, and ill-built. It has manufactures of coarse cloth, linen-woolsey, serges, &c.; but they have greatly declined from their ancient prosperity. It is still, however, the centre of a considerable trade in wool. Aubigny is the name of numerous small towns and villages in different parts of France. This town with its lordship was erected into a duchy in 1684, in favour of the Duchess of Portsmouth and her son, the Duke of Richmond, in whose family it continues to the present day.

AUBIN-DE-CORMIER (ST.), a town of France, dép. Ille et Vilaine, on a steep hill, 16 m. N.E. Rennes. Pop. 1,769.

AUBIN (ST.), a town of France, dép. Aveyron, cap. cant., 18 m. N.E. Villefranche. Pop. 3,017. In the environs of this town are the burning mountains, or rather hills, of Fontagnes and Buegne, in which subterranean fires have been in action for ages. The smoke and other vapours produced by the fires deposit, on the sides of the crevices of the rocks and earth, by which they make their escape, large quantities of imperfect alum and sublimated sulphur. The alum crystals being collected and refined furnish excellent alum, sufficient for the supply of France.

AUBIN (ST.), a finely situated port town of the island of Jersey, opposite to St. Hilairs, on the W. side of the bay on which the latter is built. Pop., inclusive of that of the parish, which is but small, 2,000. It consists principally of a single street of well built houses. There is a harbour formed by a pier, but it is deficient in water; but the largest ships may anchor inside the pier at St. Aubin's Castle, in the vicinity.

AUBONNE, a town of Switzerland, cant. Vaud, on the Aubonne, 14 m. W. by S. Lausanne. Pop. 1,650. Its castle, which commands a very fine view, was built by the counts of Grayère, and repaired by Ternerier, the celebrated traveller to whom it belonged, in the 17th century. The heart of Duquesne, one of the most celebrated naval officers that France ever produced, is interred in the parish church, where a monument has been erected to his memory. (*Biographie Universelle*, art. *Duquesne*.)

AUBURN, a town of the U. States, N. York, co. Cayuga, at the N. end of Owaseo Lake, 169 m. N.W. Albany, and 314 m. N.W. New York. Pop. in 1830, 5,368. Principal streets wide and macadamized, having numerous lofty buildings of brick and dressed limestone. Auburn is principally celebrated for its state prison, founded in 1816. This is a very extensive building, and has been conducted, since 1823, on what has been called the "silent, or Auburn plan," that is, on the plan of confining the prisoners to separate cells during the night, and making them work together during the day, taking care to enforce, when they are together, the strictest silence. The prison was at first conducted on the system of solitary confinement, which not being found to answer, the present system was established in its stead, and is, no doubt, a very great improvement. It is now being introduced into this country. (For a full account of the Auburn prison, see *Stuart's Three Years in America*, i. 46., &c.) Exclusive of the state prison, there are at Auburn a county prison, built in 1833; a Presbyterian theological seminary, incorporated in 1820, with three professors, and a good library; a college, founded in 1836; a court-house, with numerous places for public worship, banks, &c. (*Godwin's Gaz. of New York*.)

AUBUSSON, a town of France, dép. Creuse, cap. arrond., on the river of that name, 20 m. S.E. Gueret. Pop. 5,631. It is picturesquely situated in a sterile country, in a narrow gorge, surrounded by rocks and mountains. It consists of one long street of good houses; has a theatre, an agricultural society, and publishes a journal entitled the *Album de la Creuse*. The carpet manufacture of Aubusson is the most celebrated in France, after that of the Gobelins and Beauvais. It was formerly, however, much more extensive than at present. In the early part of the 17th century the town is said to have contained 12,000 inhabitants, of whom upwards of 2,000 were directly employed in the carpet trade. But being mostly Protestants, the revocation of the edict of Nantes, by making the greater number emigrate to foreign countries, gave a blow to the manufacture, from which it never recovered. In 1780, it employed about 700 workpeople. It languished for a long time after the revolution; but within the last dozen years it has materially improved, and at present it employs a greater number of hands than in 1780. (*Hugo, France Pittoresque*, art. *Creuse*.)

AUCIL, a city of France, dép. Gers, of which it is the cap., on the left bank of the Gers, lat. 43° 38' 39" N., long. 1° 37' 11" E. Pop. 8,470. It stands on the plateau and declivity of a hill, which gives it at a distance a fine appearance. A considerable suburb is built on the

opposite side of the river, the communication with it being kept up by a bridge. It is the seat of a court of assize, of tribunals of commerce and original jurisdiction, and of an archbishopric; and has a royal college, a primary normal school, a theological seminary, a school of design, an agricultural society, a museum, a public library with about 8,000 volumes, a theatre, &c. Notwithstanding modern improvements, Auch is still generally ill-built, and the streets, though clean, are narrow and crooked. The best part of the town is on the summit of the plateau. There is here a magnificent promenade upon an elevated terrace of great extent, finely shaded, and commanding an extensive view over the neighbouring country as far as the Pyrenees. Principal public buildings, the cathedral and the hotel of the prefecture. The former is one of the most magnificent in France; but though taken as a whole it is admirable, its parts are not a little incongruous, the principal part of the building being Gothic, while the front and some other portions are Greek! The different parts of the interior are exceedingly well-proportioned; the woodwork of the choir and the painted glass windows are each admirable. The hotel of the prefecture, formerly the archiepiscopal palace, is a vast and a noble building. There is also (in the suburb) an immense hospital, with a town-house, barracks, &c. Auch has manufactures of thread and cotton stuffs, called *rases plénaires*, coarse cloths, with tanneries, and establishments for the spinning of wool. A considerable trade is carried on, particularly in the brandies of Armagnac.

Auch is a very ancient town. Before the Roman conquest it was called Cimberis, and was the capital of the Auci. Augustus having planted in it a Roman colony, it took the name of *Augusta-Auscorum*, whence its modern name has been derived. The old city stood on the right bank of the Gers, on the site of the present suburb. The modern city is, however, very ancient, having been founded previously to the reign of Clovis. (*Hugo, France Pittoresque*, art. *Gers*; *Inglist's Switzerland*, p. 22.)

AUCHTERADER, a village and par. of Scotland, co. Perth, on the S. bank of the Earn. The village, which is nearly 1 m. in length, consists of a single street on both sides the high road from Glasgow to Perth, being about 14 m. W. by S. from the latter. It is principally occupied by cotton weavers in the employment of the Glasgow manufacturers, there being above 500 looms in the par., and mostly in the town. At one time it returned members to the Scotch parliament, and it is uncertain now or when it lost the privilege. At present it is the seat of a Presbytery. It was burned down by the earl of Mar, in 1718, and has no building worth notice. Pop. of par. in 1836, 3,315, of whom there were in the town 1,981. The agriculture of the parish has been greatly improved within the present century. (*New Statistical Ac. of Scotland*, art. *Auchterader*.)

AUCHTERMUCHTY, a town and par. of Scotland, co. Fife, the town being situated on the high road from Kinross to Cupar, 9 m. W. the latter. Pop. of par., 3,225. The town is intersected by a rapid stream, employed to turn flax and other mills, and to supply a large field. It is very irregularly built, but it contains a fair proportion of good substantial houses. The inhabitants are principally employed in the weaving and spinning of linen and cotton, especially the former. It was created a royal burgh by James IV., but has never enjoyed the privilege of voting in the return of a m. either to the Scotch or British parliaments.

AUDE, a maritime dep. in the S. of France, on the Mediterranean, separated from Spain by the dep. of the Pyrenees Orientales. Area, 6,077 sq. m. Pop. 281,088. The Aude, whence it derives its name, is the only considerable river in the dep.; but it is traversed from E. to W. by the canal of Languedoc. The coast along the Mediterranean is mostly low, and is bordered by several lagoons, or, as they are called in the language of the country, *étangs*. At the mouth of one of them is La Nouvelle, the only port in the dep. Surface generally hilly and mountainous, being encumbered on the N. with the Montagne Noire, a prolongation of the Cévennes, and on the S. with ramifications of the Pyrenees. The highest summit of the latter, the Pic Mosset, rises about 8,000 feet above the level of the sea; the highest point of the Montagne Noire is about 3,500 feet above the sea. Soil of the plains and valleys generally calcareous and very productive. Climate variable, and principally distinguished by the prevalence of hot winds; that from the S.E. called the *Auran*, and that from the N.W. called the *Gers*. Both of these blow with great force; and at Carcassonne and Castelnaudary the *auran* is occasionally so violent as to uproot houses and tear up trees. In summer it sometimes strikingly resembles the *sirocco*. All sorts of corn are raised on the plains, and millet and buckwheat on the mountains. The produce exceeds the consumption of the inhabitants so much, that the export is estimated at about 500,000 hectolites a year. It is singular, that notwithstanding improved processes

and implements have been pretty generally introduced, the primitive mode of threshing corn, by treading it with horses, is still almost universally adopted. Next to corn, wine is the most important agricultural product, the vineyards being supposed to furnish about 690,000 hectolitres a year. The red wines are inferior, but the white wines, particularly the blanquette de Limoux, are much esteemed. A good deal of brandy is manufactured. Sheep numerous: annual product of wool estimated at 1,800,000 kilograms. Irrigation well understood; and there are some fine artificial meadows. The severe winter of 1829 was fatal to most of the olive trees, and the culture of silkworms is not attended to. The honey of Narbonne is the finest in France. According to the official tables, the soil is principally appropriated as follows: viz.—cultivable lands 275,000, meadows 11,000, vineyards 50,000, forests 44,000, and waste lands, heath, &c. 183,000 hectares. The dep. is rich in mineral products. Mines of iron are wrought in different places; and the total produce of the foundries is estimated at about 17,000 metrical quintals a year. Above 30,000 pieces of cloth are annually manufactured at Carcassonne, of which 6,000 are exported to the Levant. There is also a large manufactory of combs and articles of jet, with fabrics of paper, tanneries, distilleries, salt-works, &c. The trade and industry of the dep. have been greatly promoted by the facilities of communication afforded by the canal of Langouet. The dep. returns 5 mem. to the Ch. of Dep. Number of electors, 1,959. Total public revenue in 1831, 9,162,801 fr. Principal towns Carcassonne, Narbonne, and Castelnaudary. (*Hugo, France Pittoresque*, art. *Aude*; *Dict. Géographique*; *French Official Tables*.)

AUDINCOURT, a village of France, dep. Doubs, cap. cant., on the Doubs, 3 m. S.E. Montbéliard. Pop. 1,432. This village is distinguished by its iron-works, which furnish annually above 5,000,000 kilograms of bar and wrought iron, exclusive of considerable quantities of iron and tin plates. (*Hugo, op. cit.*)

AUDRIÛG, a town of France, dep. Pas de Calais, cap. cant., 2,373 m. N.N.W. St. Omer. Pop. 2,373.

AUERBACH, a town of Saxony, on the Goltzsch, 12 m. E. Plauen. Pop. 2,000. It is the property of baron Plamitz; and has manufactures of muslin and black lace, with breweries, paper-works, &c., and an active trade.

AUERBACH, a handsome village of g. d. Hesse Darmstadt, 15 m. S. Darmstadt. It has a castle, the summer residence of the grand duke; and several wells and baths, much resorted to by the inhabitants of Darmstadt. AUELESTADT, a sumptuous village of Prussian Saxony, reg. Merseburg, 6 m. W. Naumburg. Here, on the 16th of October, 1806, the main body of the grand Prussian army, under the Duke of Brunswick and the king in person, was defeated by the division of the grand French army commanded by Marshal Davoust. The same day Napoleon defeated, at Jena, the right wing of the Prussian army, under General Mollendorf. The combined action has been called the battle of Jena. (See JENA.) Davoust, in reward of his skill and gallantry, received from Napoleon the title of Duke of Auerstedt.

AUGGUR, a town of Hindostan, Prov. Malwa; in the dom. of Sindia; on a rocky eminence 1,508 ft. above the level of the sea, between two lakes, 40 m. N.E. Oojn; lat. 23° 43' N., long. 76° 1' E. It is surrounded by a stone wall, and has a well-built native fortress: it is of considerable extent, and in 1820 contained 5,000 houses; but these, excepting one street, were merely mud buildings.

AUGSBURG (an. *Augusta Indictorum*), a city of Bavaria, cap. circ. Upper Danube, finely situated in an extensive and fertile plain, between and near the confluence of the Wertach and Lech, 35 m. N.W. Munich; lat. 48° 21' 46" N., long. 10° 54' 42" E. Pop. 35,000, of whom about 12,000 are Protestants. This was long one of the richest, most commercial, and powerful of the free cities of the empire. Its fortifications were dismantled in 1703; and though it be still surrounded by walls and ditches, they are no longer useful as means of defence. The streets are mostly narrow and inconvenient; but "the Maximilian Strasse is a noble street, more than $\frac{1}{2}$ of a mile in length, wide and airy, with lofty well-built houses, and ornamented with several fine fountains." (*Spencer*.) There are also some other good streets and squares. The houses, which are mostly old, are many of them large, and sculptured and painted fronts are common. The town-hall, near one of the extremities of the Maximilian Strasse, the finest building in the town, was finished in 1620. It has a hall on its second story, denominated the golden hall, from the profusion of gilding, reckoned one of the finest apartments in Germany. The other public buildings are the palace, formerly the residence of the bishop, but now used for government offices; the cathedral, an extensive Gothic fabric, devoted to public worship; a medical school, and a college for Methodists. It has a considerable transit trade, particularly in the conveying of cotton to Savannah and Charleston. It is united by a bridge to Hamburg, on the opposite bank of the river.

church. Among the educational establishments are two gymnasia, one for Protestants and one for Catholics; an academy of arts, founded in 1820; a polytechnic school; a polytechnic society; 2 endowed schools for females; a Lancasterian school, Sunday schools, &c. The public library is said to contain a valuable collection of printed and manuscript Greek works. The collection of paintings, chiefly of the German school, formerly in the town-hall, has been mostly removed to the *ci-devant* convent of St. Catherine; but the best pictures have been carried to Munich. Among the charitable establishments is the *Puggerei*. This consists of 106 (Reichard says 51) small houses, built in 1819 by the Fugger family, and let to indigent citizens at a mere nominal rent. In our own times, Schaezler, a banker of the city, has followed up this example, by endowing a school of industry for 100 orphans and poor children, and founding an asylum for decayed towns-people.

The manufactures of Augsburg are various and important. That of woollen stuffs is the most extensive and thriving; those of cotton and linen, though still considerable, are said to have materially declined; it has also a common foundry, and produces large quantities of paper, with gold and silver lace and jewellery, printing-types, soap, glass, &c. The *Algemeine Zeitung* is published here, and it is the centre of an extensive trade in printing, engraving, and bookbinding; but its principal importance at present, and for a long time past, has been derived from its being, next to Frankfurt, the grand seat of banking and exchange operations in Central Europe. The greater part of the extensive transactions between Vienna and W. Germany, as well as most of those between Germany and Italy, are finally balanced and adjusted in this city.

This was formerly a place of much greater population and importance than at present. It is very ancient, Augustus having settled a colony in it about 12 years B.C. In the middle ages it was early distinguished by its trade; and having purchased its freedom from the dukes of Suabia, it rapidly rose in importance. At the end of the 14th century Augsburg, Nuremberg, and some other cities in Southern Germany, had establishments in Venice, and carried on a very extensive trade with Italy, the Levant, and the rest of Germany. The family of the Fuggers, probably the richest and most extensive merchants of the 15th and 16th centuries, and who afterwards became princes of the empire, were originally simple burghers of this city; and though the empire excoriated them, they were not its only citizens who attained to almost regal opulence and power. Augsburg declined, partly in consequence of the prolonged wars of the 16th and 17th centuries, but more, perhaps, from the change in the channels of commerce, occasioned by the discovery of the route to India by the Cape of Good Hope, and the rise of other emporiums. Latterly it has improved considerably.

Augsburg has been the theatre of many important events. At a diet held within its walls, on the 26th of June 1530, the famous Confession of Faith, drawn up by Melancthon and subscribed by the Protestant princes, was publicly read before, and presented to, the Emperor Charles V. This celebrated document, has thence been called the Augsburg Confession. Here, also, the *interim*, or provisional edict, was published by Charles V. in 1548; and here, in 1555, was concluded the peace which assured the full enjoyment of their rights and liberties to the Protestants. Augsburg continued to be a free city till 1806, when it was ceded by Napoleon to Bavaria. (*Murray's Handbook for Southern Germany*; *Reichard, Guide des Voyageurs* (Berlin, 1835); *Prusy Cyclopædia*; *Schmidt's Histoire d'Allemagne*, v. 513, title Augsburg, 414.)

AUGUSTA, a city of the U. States, E. frontier of Georgia, on the Savannah river, by which it is separated from Hamburg in S. Carolina; 123 m. N.N.W. Savannah, 138 m. W. N.W. Charleston, lat. 33° 33' N., long. 80° 46' W. Pop. (1810) 2,476; (1830) 6,000. It is situated on an elevated plain; streets wide, and intersecting each other at right angles; houses brick, many of them being spacious and elegant. It has a city hall, court-house, theatre, academy, hospital, with numerous places for public worship; a medical college, and a college for Methodists. It has a considerable transit trade, particularly in the conveying of cotton to Savannah and Charleston. It is united by a bridge to Hamburg, on the opposite bank of the river.

AUGUSTA, a town of the U. States, cap. Maine, on the Kennebec, 168 m. N.E. Boston. Pop. in 1810, 1,805; in 1830, 3,980. It is a finely situated town, and has been, since 1832, the seat of the legislature and government of the state. The river, which is thus far navigable for vessels of 100 tons, is here crossed by a bridge of two arches, each 180 feet in span.

AUGUSTINE (ST.), a town and sea-port of the U. States, E. coast of Florida, lat. 29° 52' N., long. 81° 25' W. Previously to the acquisition of Florida by the U. States, this was a place of some importance, contained from 4,000 to 5,000 inhab., and was defended by a fort. But it has

since declined, principally in consequence of the badness of its port. The bar at the mouth of the latter has more than 8 or 9 feet water at high spring tides, and at low water not more than 5 feet, which at times makes it impossible even for boats to pass in or out. A light-house, on the N. end of Anastasia Island, with a fixed light, marks the entrance to the port. (*Blunt's American Coast Pilot*, p. 243.)

AULENDORFF, a market-town of Wirttemberg, circ. Denube, 13 m. S.S.W. Bibberach. It is beautifully situated, and has a castle that belongs to the counts Konegsegg-Aulendorf.

AULETTA, a town of Naples, prov. Principato Citra, on a hill, near the Negro, 36 m. E.S.E. Salerno. Pop. 1,800. This town is very ancient, having been founded by a Greek colony.

AULONA or **VALONA** (an. *Aulon*), a sea-port town of Turkey in Europe, prov. Albania, cap. sanjak, near the mouth of the Adriatic, on the E. side of a gulph of the same name, 54 m. E.N.E. Otranto, in Italy, lat. 40° 27' 15" N., long. 19° 26' 30" E. Pop. 5,000 or 6,000, consisting of Turks, Christians, and Jews banished from Aucona, by Pope Paul IV. Though very ancient, it has few or no remains of antiquity. It was taken by the Turks from the Venetians in 1691; and the only good houses of which it has to boast, were built by the latter. It is defended by a castle. The Gulph of Aulona has at its mouth the small island of Sassino, which serves as a natural breakwater, protecting it from the heavy seas that would otherwise be thrown in from the W. and N.W. There is deep water on each side the island, and within the gulph expands into a fine basin with excellent anchoring ground. The country round Aulona is exceedingly fertile; but it is very unhealthy in summer, when the town is nearly deserted by the inhabitants. This is a consequence of the contiguous marshes not being drained, and night, it is believed, be easily obviated. But no amelioration need be looked for at the hands of its present masters. "*Campis sur une terre qui les dévore, étrangers à toute idée d'amélioration, ils ne s'occupent que du moment, sans penser aux avantages dans l'avenir.*" (*Pougenville, Voyage dans la Grèce*, i. 286.)

AUMALE, a town of France, dép. Seine Inférieure, cap. canton, on the Bresle, 14 m. E.N.E. Neuchâtel. Pop. 2,068. It has manufactures of coarse cloth, &c. Henry IV. was wounded in an action with the Spaniards under the prince of Parma, on the bridge of this town, in 1592.

AURAY, a sea-port town of France, dép. Morbihan, cap. cant. on the Anrty, 11 m. W. Vannes. Pop. 3,495. It is built on the declivity of a hill; the town-house and the parish church are worth notice. Vessels of small burden come up to the town; but its port lower down is accessible to vessels of considerable burden, and it has a good deal of coasting trade. Charles of Blois was killed and Duguesclin made prisoner in a battle fought here in 1364.

AURICII, a town of Hanover, cap. West Friesland, 15 m. N.E. Emden. Pop. 2,600. It is the seat of the provincial government, a chancery, a Protestant consistory, &c.; has 3 churches, a college, and a gymnasium, with fabrics of tobacco, paper, and paper.

AURILLAC, a town of France, cap. cant. Cantal, on the Jordan, 147 m. E. Bordeaux, lat. 46° 54' 41" N. long. 2° 2' 40" E. Pop. 3,857. The town is built on the declivity of a hill, and between it and the river is the agreeable promenade, called *le Gravier*. Though generally well built, it is gloomy and disagreeable: the streets are narrow, crooked, and ill paved, but well watered and clean. It was formerly surrounded by walls, and defended by a castle; but excepting a part of the latter, the rest of its fortifications have been demolished. The college is the largest of the public buildings: the hotel of the prefect, the town-house, and the church of St. Girard, belonging to the ancient monastery to which the town owes its foundation, deserve notice. There is a handsome bridge over the river. Aurillac has tribunals of original jurisdiction and of commerce; a theatre, a public library containing 6,000 volumes, a society of agriculture, arts, &c., a cabinet of natural history, and a *dépôt des chevaux, or haras*, for the supply of the royal stud. It is an industrious town, and has manufactures of paper, lace, tapestry, with copper-smiths and cutlers, curriers, tanners, shoemakers, &c.

Pignoli de la Force, the author of a *Description Géographique et Historique de la France* (best ed. Paris, 1758—63, 15 vols. 12mo.) was born here in 1673. Carrier, infamous for his atrocities during the revolution, was also a native of this place. (*Hugo, France Pitt.*, art. *Cantal*.)

AURIOL, a town of France, dép. Bouches du Rhône, on the Veauine, 15 m. E. N.E. Marseilles. Pop. 5,319. It is said to be rich, with fine streets and good houses; but to be infected by the dunghills, which, according to a custom tolerated in most small towns of Provence, are deposited on the high road 1 (*Hugo*, l. p. 218.) It has manufactures of wool, brick, and tile works, with well-frequented fairs held on the 18th September, 3d October, and the 6th of December, for hogs, mulcs, grain, and cloth.

AURUNGABAD (*the place of the throne*), a large mart. prov. of the Deccan, Hindostan, comprised partly in

the British dominions (presid. Bombay), and partly in those of the Nizam; principally between 18° and 21° N. lat., and 73° and 77° E. long.; having N. the provs. Gujrat, Candeleh, and Berar, E. Beeder, S. Bejapoor, and W. the Indian Ocean. Surface very irregular, and in general mountainous, especially toward the W., where the Ghauts attain a considerable height. That part of the prov. E. of the Western Ghauts is a table-land rarely less than 1,800 ft. above the sea, and often much more; it abounds with natural fortresses and strongholds. There are no rivers of any size; the Neera, Beema, and Godavery rise within this prov., but acquire no magnitude until after they have left it: the two former streams unite in marking the S.W. boundary. The climate is particularly favourable for the production of European fruits, which arrive at greater perfection than in any other part of India, especially the peach, grape, and strawberry; nectarines, figs, and melons are excellent; but the oranges are inferior to those of Sylhet and Tipperah. The gardens and fields around the villages are very generally inclosed by hedges of prickly pear and milk-plant; rice is the grain most cultivated. Great numbers of horses for the Maharratta cavalry were formerly reared on the banks of the Neera and Beema; they are a hardy breed, but neither strong nor handsome. The inhab. are chiefly Maharattas; but the prov. is comparatively thinly peopled, especially towards the N.E.: the Mohammedans are to the Hindoos only as 1 to 20. Aurungabad has 13 subdivisions, and contains the cities of Bombay, Poona, Aurungabad, and Soolapoor. The bazar of its larger towns are cheerful and enlivening enough, but the streets of its smaller ones extremely dull and gloomy, from the absence of windows facing towards them. The religious edifices are distinguished by many peculiarities from those of the prov. both of N. and S. India; the portico is often nearly as large as all the rest of the building, and in some towns the pagodas are either 12-sided pyramids or square buildings surmounted by a large cupola. Many remarkable antiquities exist in this prov.; as the temples and caves at Salsette, Elephanta, Arce, Elora, &c. Under the protection of Maharratta power, in 1818, plundering by land and piracy by sea prevailed much in and round this prov., the greater part of which, for some time previously to that year, was subject to the Peishwa. Aurungabad was also the great source of the predatory bands that devastated Hindostan for more than a century; though, after the overthrow of the Maharattas, it unexpectedly became one of the quietest and most orderly portions of the peninsula; and in 1820 no part of S. India was so undisturbed, crimes of violence being rare, and property safe. The prov. was formerly called *Alifnagar*, but afterward Dowlatabad, from the city so named being in turn its capital, under two dynasties previously to A. n. 1635; at which period Shah Jehan finally conquered and annexed it to the Mogul empire. The seat of government was then transferred from Dowlatabad to Gurka, which town becoming the favourite residence of Aurungzebe, acquired, as well as the prov., its modern appellation.

AURUNGABAD, a city of the Deccan, Hindostan, cap. prov. of same name, within the doab, of the Nizam, and the quarters of a battalion of his army under British officers. It is built in a hollow on the banks of the Kowlah, a tributary of the Godavery, in 19° 54' N. lat., and 75° 33' E. long., 275 m. N.W. Hyderabad, 180 m. E. N.E. Bombay, and 140 m. N.E. Poona. Pop. (1825) estimated at 60,000, but scattered over a space of 7 miles in circ. Aurungabad was once highly flourishing, and the favourite residence of Aurungzebe, but now, in great part, presents an appearance of decay and ruin; though, at a distance, its lofty minarets, large white domes, and terraced houses, give it an imposing character. The walls, which surround it, though capable of affording protection from predatory bodies, is lower than such walls usually are. The streets are broad, especially the principal bazar, which is 2 m. in length, and has at one extremity a spacious quadrangle, with a handsome modern market: some few streets are paved. There are many large and good houses; and the public buildings, mosques, and caravanserais, are superior to those usually met with in native cities, and interspersed with numerous gardens, groves, and fountains. The shops are supplied with the goods of both India and Europe; but the city is neither active, busy, nor any other symptom of industry, occupation, or prosperity. The only structures worthy of notice are the royal palace of Aurungzebe, which covers a large space of ground, but is now fast mouldering away; and a mausoleum erected by that monarch to a favourite wife, an octagonal building with a cupola and four minarets, constructed on the model of the *Taj Mahal* at Agra, but Lord Munster says it is in every respect inferior: the inclosure surrounding it contains perhaps 80 acres of land laid out in gardens. The principal suburb is on the opposite side of the river, and connected with the city by two substantial stone bridges. Toward the N. there is a large marshy tract of ground cultivated with rice, and near the Delhi gate is a con-

siderable tank, now overgrown with weeds; from which circumstances, combined with its low situation and ruinous state, this city is decidedly unhealthy. It is, however, by reason of its position, well supplied with good water, conveyed thither in stone conduits from the neighbouring hills, and distributed by earthen pipes into stone reservoirs in every quarter. The climate is subject to great and sudden alterations: for 1-3d part of the year E. winds prevail, and the thermometer ranges from 50° to 86° Fahr.; for the rest of the year W. S.W. winds are the most common, the thermometer often rising to 100°. Tropical fruits of all kinds are produced in abundance, and the grapes and oranges are scarcely inferior to those of Europe. The military cantonments are in a salubrious spot about a mile S.W. the city. Aurungabad was originally named Gurka, and became the seat of the provincial government after the Mogul conquest in A.D. 1634. (*Hamilton's E. I. Gaz.* i. 82, 83; *Conder. Mod. Trav.* x. 279-282.)

AUSPITZ, a town of the Austrian empire, Moravia, circ. Brauni, belonging to Prince Lichtenstein.

AUSTELITZ, a small seignorial town of Moravia, circ. Brunn, on the Littawa, 13 m. S.E. Brunn. It has a magnificent castle and gardens. In the vicinity of this town, on the 2d of December, 1805, took place the famous battle between the Prussian and French army under Napoleon, and the combined Russian and Austrian armies under their respective emperors. The genius of Napoleon never shone more conspicuously than on this occasion. His superior talent more than compensated for the numerical inferiority of his forces; and secured for the French a complete and decisive victory with comparatively little loss on their part. The battle of Austerlitz was followed by the treaty of Presburg, signed on the 26th of December.

AUSTLE (ST.), a m. town and par. of England, co. Cornwall, land. It is on the declivity of a hill at the bottom of which is a small rivulet, 243 m. W. S.W. London, 14 m. N.N.E. Truro. The par. contains 11,540 acres, and 8,758 inhab., of whom the town may have about two-thirds. It is situated about 2 m. from St Austle's Bay, and is connected by a railway with the port of Pentewan, and also with the port of Charleston. It has a good church, but the streets are narrow and inconvenient, many of them being unpaved. It is the seat of the most considerable of the stannary courts; but it owes its entire consequence to the Polgooth and Crepell tin and copper mines, &c., and the soap-stone quarries and china clay-works in its immediate vicinity. The pillchard fishery is also prosecuted to a considerable extent in St. Austle's Bay. The extension of the mines and clay-works has been such that the population has more than doubled since 1801, it having then amounted to only 3,784. About 5,000 tons of soap-stone and 7,000 tons of china-clay, are annually shipped from Charleston and Pentewan, principally for the potteries. (*Priv. inform.*)

AUSTRALIA, a great division of the globe, lying S. and S.E. of Asia.

It was for a lengthened period supposed that the different points of land that were discovered in the Southern Ocean, to the S. of the islands of Java and Celebes, and of the Cape of Good Hope and Cape Horn, belonged to, or formed parts of a vast southern continent, to which the name of *Terra Australis* was given. The existence of this great continent was inferred, not merely from the discovery of lengthened portions of coast, but also on theoretical grounds, it being supposed to be necessary as a counterpoise to the vast extent of land round the Arctic pole. (*Histoire des Navigations aux Terres Australes*, i. 13.) But as this *Terra Australis* was supposed to extend quite round the globe, the expediency of subdividing it into smaller portions became evident; and the learned President de Brosses, in his excellent work referred to above, suggested that that portion of it to the S. of Asia should be called *Australasia*, that to the S. of America *Magellanica*, and that to the S. of the Pacific Ocean *Polynesia*, from the number of its islands. (*Navigations aux Terres Australes*, i. 80.) The discoveries of Cook and other modern navigators, have shown that there is but little ground for thinking that there is any continent S. of America. But the appropriateness of the names given by De Brosses to the other portions of the *Terra Australis*, have been very generally acknowledged. And with the exception of the conversion of Australasia

into Australia, and the extension of the latter a little further to the E. than De Brosses had probably in view, his definitions are now universally adopted. It is not, however, very easy to assign the precise limits of Australia, mingling as it does with the Polynesian islands towards the N.E. and with those of the Indian archipelago towards the N.W.: physical, rather than purely geographical, considerations must dictate the demarcation; and, guided by these, the following is probably as little objectionable as any:—

S. of the tropic of Capricorn, Australia extends from the 113th to the 180th meridian.

Between the tropic and 11° S. lat., from the 113th to the 170th meridian.

Between 11° and 5° S. lat., from the 135th to the 165th meridian.

Between 5° and 1° S. lat., from the 131st to the 160th meridian.

Between 1° S. lat. and the equator, from the 130th to the 150th meridian.

Within these limits are included the mass of Australian land, generally called New Holland (a term now rapidly and justly falling into disuse), and the islands of New Zealand, New Caledonia, New Hebrides, Queen Charlotte's Islands, Solomon's Archipelago, New Britain, New Ireland, New Hanover, Admiralty Isles, and Papua or New Guinea.

The continent* of Australia lies between 10° 39' and 39° 14' S. lat., and extends from 130° 26' to 180° 10' E. long. In form, it is very compact; its greatest length, from W. to E., between Dirk Hartog's Point and Sandy Cape, being 2,400 m.; its greatest width from N. to S. between Cape York and Cape Wilson 1,971 m. Its average length and width may perhaps be estimated at 1,800 and 1,700 m. respectively; its coast-line at 7,750 m.; and its area is estimated at about 3,000,000 sq. m. (*Flinders' Charts, Voyage*, i. 224. li. 8. *passim*; *King*, li. 178, *et pass.*; *Picture of Australia*, li. 1.)

I. SKETCH OF AUSTRALIA. Coast.—In comparison with the outlines of Europe and Asia, and the E. sea-board of America, Australia may be regarded as almost from bound. It possesses only two large indentations, the Gulf of Carpentaria on the N., and Spencer's Gulf on the S. Shark's Bay on the W. and Hervey's Bay on the E. are the next largest, but they are very inconsiderable, not more than 40 or 50 m. in width and depth; and for the rest, though some of them, as Port Phillip on the S., and Van Diemen's Gulf on the W., are large when regarded as harbours, they are insignificant if considered as breaking the continuity of the coast. The same remark applies still more forcibly to such inlets as King George's Sound, Western Port, Corner Inlet, &c. on the S., or to the Twofold Bay, Jervis Bay, Botany Bay, Port Jackson, &c. on the E. It may be observed, too, that these ports and harbours are numerous only on the E. and N. shores; a very considerable portion of those on the S. and W. being quite unbroken. (*Flinders*, i. 43-223; *King*, li. 159-178; *Australian Directory*, 30, 31, &c.)

But the most remarkable feature in the Australian coast is, the total absence of outlets for any large rivers. So complete is this, that after Flinders' survey (in 1801-3) had established the fact, a belief became pretty general that the whole land was fenced, at no great distance from the coast, by a continuous mountain ridge; on the inner sides of which the principal rivers had their sources, flowing inwardly to a great internal lake or mediterranean sea. Wild as this hypothesis may now appear, it received some countenance from the earlier results of interior discovery, though it was unwarranted by the accounts on which it was founded, and has been completely disproved by more recent and more accurate investigation. The S. coast, through a length of more than 20°, from Cape Louwin to Spencer's Gulf, is generally low and sandy, with only here and there some eminences, and scarcely any where exhibiting a high inland country. (*Flinders' Charts*, 2-A. *Voy.* i. 49-255.) On the E., indeed, a range of mountains rises at no great distance from the coast, extending from the S. extremity of the continent as far, at least, as the 28th parallel, and, most probably, as far as Cape York, on Torres Straits, the most remote point of

* Continents differ from islands in nothing except size, and (as a consequence of that difference) variety in surface, climate, &c. since every mass of land, however large, is finally surrounded by the ocean. Now the area of America is not more than six times that of Australia; while the latter is more than ten times that of either Borneo, or Japan, the next largest portions of continuous land. Hence, from its being more proportionate with continents than with islands, it seems reasonable to class Australia with the former rather than with the latter.

the mainland towards the N. (*Adm. Ch. Flinders*, ii. 1-76; *King*, i. 165-240; *Blegh's Nar.* 46-59.) But on the N. shore, a mountain, not higher than the mast of a sloop, is noticed by Flinders as the highest point of ground seen by him in a run of 175 leagues along the coast. (*Voyage*, ii. 134.) Low levels, with only here and there some elevations of no great character, mark, also, the shore W. of Carpenter, as far as Cape Londonderry, where the land begins to tend toward the S. W. (*King's Survey*, i. 247-249.) The W. coast, as low as 22°, and, again, between 13° and 16° S., appears to resemble that on the E. (*King*, ii. 159-192.), but between the parallels of 22° and 14°, about 500 m. of coast are wholly unknown, and it is uncertain whether many portions of that recently surveyed on the N. W. may not consist of detached islands, separated by greater or lesser intervals from the main shore. (*A. Cunningham's Geog. Journ.*, ii. 132.)

Interior.—From what has been said, it is evident that the roughest road for the investigation of a strange country, that is, extensive creeks, inland seas, and navigable rivers, are wanting in this "land of anomalies." Its interior recesses had to be explored, if at all, by land travelling; and to this there appeared, at first, to exist an unconquerable barrier. The first settlers on the E. coast found their horizon bounded towards the W. by a dark and rugged chain of mountains which rose at no very great distance from the sea, and to cross which the earlier attempts, those of completing the discovery with skill and energy, completely and signally failed. (*A. Cunningham's Geog. Journ.*, ii. 99.) A rugged and abrupt ascent, called "Caley's Repulse," marks the limit of the first adventurer's tour (*Oxley*, 363.), and the efforts of Daws, Tench, Patterson, Hacking, Bass, and Bailleir, though some of them proceeded a few miles farther than Caley, led to no useful result. The aborigines, when questioned, were totally ignorant of any opening in the mountains (*A. Cun., Geog. Journ.*, ii. 98.); but they had a tradition that malignant spirits resided there, and that the country beyond was inhabited by *white* men. In 1813, however, after an interval of 25 years, an extremely dry season having destroyed the minor vegetation, and produced a great mortality in the flocks and herds, Lieut. Lawson, Mr. Blaxland, and Mr. Wentworth attempted to penetrate the hitherto impenetrable mountain barrier, in the hope of finding pasture and water for the exhausted cattle of the colony. They were so far successful that they gained a view of an extensive country W. of the mountains; but want of provisions compelling them to return, the honour of completing the discovery was reserved for Mr. Evans, the deputy surveyor-general. (*Oxley*, *Introd.* 7-9; *Sturt*, *Introd.* 73-75.) The barrier once penetrated, the lands beyond were not left long unexplored. In the 25 years that have since passed, Messrs. Hume, Hovel, Currie, Cunningham, Oxley, Sturt, Mitchell, &c., have pushed their inquiries as far as the 13th deg. of long. and the 26th deg. of lat.; while, on the opposite coast, the short period of 8 years from the establishment of the Swan River settlement has enabled Messrs. Dale, Preston, Erskine, Bannister, &c., to survey a tract reaching as far N. as 31° S., and extending in some cases nearly 3° of long. Thus, between 4° and 4° of the continent has been explored within the period of a quarter of a century; a fact honourable alike to the zeal and the industry of the explorers.

Mountains and Plains.—In the Old World, the mountain ranges, however tortuous, agree in general direction with the greatest length of the continents in which they lie. Thus the axis of America runs N. and S. of the E. continent (Europe, Asia, and Africa) from N. E. to S. W.; but in Australia the principal chains, so far as observation has yet been carried, appear to run transversely to the direction of the land; that is, from N. to S. The recent discoveries of Major Mitchell have made known a mass of mountain land, called by him the Australian Grampians, which commences near the S. coast at Portland Bay, in lat. 36° 58' S., long. 142° 25' E. The direction of these mountains is at first due N., but in lat. 37° 30', long. 143° 47', a range of grassy hills diverges to the E. N. E. to connect them with the highest masses yet seen in Australia, called by the natives Warragong, and by the settlers the Australian Alps. The connecting range revealed from Mitchell the title of Australian Pyrenees. The Warragongs may be described as running N. N. E. from near the S. termination of the continent at Cape Wilson as far as 35° 20' S.; but as high as 36° S. a chain of less elevation, called the Blue Mountains, branches off from them, and following generally the direction of the E. coast divides the E. and the W. waters. In lat. 32°, long. 150°, the range, after tending, for some distance, a little to the W. of N., suddenly turns due E., and under the name of the Liverpool Range, runs in that direction for about 10° of long., when it resumes its northerly course; but though it has been traced as low as 26° S. lat., no name has been bestowed upon any part of it beyond the parallel of 32°. The highest peak in the Grampians is Mount William, 4,400 ft. above the level of the sea (*Mitchell*, ii. 265.), of the Pyrenees, Mount Cole, or Mount

Byng, probably 3,000 ft. * No measurements have been taken of the Warragongs, but as they are covered with eternal snow (*Mitchell*, ii. 297., &c.; *Currie's Geog. Mem.* 373.), their height, in this lat., cannot be estimated at less than 15,000 ft. The Blue Mountains, so long impassable, do not attain a great elevation: Mount York, the highest peak, being no more than 3,292 ft., but the valleys and plains in this extraordinary range occur extremely near the summits. King's table land is 2,727 ft., the Vale of Clwyd 2,496 ft., and Bathurst Plains 1,970 ft. above the level of the sea. (*Oxley's Bar. Mea. P. Cur.* 8vo. i. 152; *Wentworth*, 82.)

The Liverpool Range is almost as difficult of passage as the Blue Mountains (*A. Cunningham's Geog. Mem.* 152-177.); its highest peaks being between 6,000 and 7,000 ft., and the continuation of the dividing chain apparently still more rugged and abrupt. A gap of the kind, called by the Spaniards *quebradas*, in S. America, stopped Oxley in his journey from the interior to the coast, in 1818. This "*tremendous ravine*," he describes as being from 2 to 3 miles wide at top, and 3,000 ft. in perpendicular depth: its width at bottom does not exceed 100 or 200 ft., and is the bed of a river. (*Journal*, 298.) Sea View III., in this part of the range is between 6,000 and 7,000 ft. high; but Oxley did not think it the most elevated ground in the neighbourhood. (*Journal*, 310.) Practicable passes are, however, being continually discovered; one over the Blue Mountains, near the 36th parallel, was effected by Mr. Thorby in 1819, and 2 others by Mitchell since 1830. (*Mitchell*, i. 153; *Wentworth*, 81.) That over the Liverpool Range, traversed by Mitchell in 1831, which is nearly on the meridian of Sidney, seems to be easier than Pandora's Pass, 1° to the E., crossed by A. Cunningham in 1823 (*Mitch.*, i. 25; *A. Cun., Geog. Journ.*, 179.), and breaks are said to have been observed in the more N. mountains, which promise to be free from those difficulties which were well nigh the destruction of Oxley and his party.

The W. mountain viewed from the E. appears to consist of three parallel ranges, extending about 20° E. of the 118th meridian, and running like the E. chains, almost due N. through the continent. The most E., and the highest of these mts. tables, appears to rise a few miles behind King George's "summit"; the second, called the Darling Range, commences at Cape Chatham, in 35° S. 116° 25' E., and the third and lowest is found running close to the shore from Cape Leuwin. (*Journals of Exped. in W. Australia; Surveyor-Gen. Rep.*, May 11. 1830.) Subsequent observation has, however, discovered that the first is not a continuous range, running N. and S., but two detached and parallel chains extending longitudinally, and separated from each other by a plain of considerable magnitude. (*Journal*, *Dale*, p. 163-167.) The W. chain, called Koolkymurru, is considerably the higher, one of its peaks, Toolbrunup, attaining the elevation of 3,000 ft., an altitude much exceeding that of any other mountain yet examined in W. Australia.

The S. chain, called Pongurup, is not only lower, but of much less extent, having a length of only 13 m., while the Koolkymurru is full 30. (*Journal*, *Dale*, & *Collier*, 161-167, 130, 173, &c.) The Darling range is continuous as far as 31° S., to which distance it has been explored, and there is every reason to conclude that it runs in the same direction to the N. coast, in the neighbourhood of Dampier's Archipelago. Capt King (i. 36-53; *Adm. Ch. N. W. & W. Aust.* vi.) lays down this coast as high and rocky, though bounded to the W. and E. by a low sandy shore, that is, as having all the appearance of the termination of a mountain chain. Should this eventually prove to be the fact, this range will be the most direct in the world; the high N. coast, just described, commencing at Cape Preston in 116° 5' E., and Point D'Entrecasteaux, to which these mountains extend on the S. shore, lying in 116° 1' E. (*Flinders' & King's Adm. Ch.*) The Darling Mountains average from 30 to 40 m. in width, and their greatest observed elevation is 1,800 ft.; but as still higher ground was observed at this altitude, they may probably, in some places, attain 2,000 ft. It is not likely that S. of the 31st parallel, they any where exceed the height. (*Journal*, *Preston*, 2. 11; *Dale*, 31. 33; *Surv. Gen. Rep.*, Mar. 22. 1830.) The third range, mentioned in the Surveyor-General's Report is unimportant; it is probably continued in Moresby's flat-topped range, the altitude of which is about 1,000 ft. (*King*, i. 22; ii. 174. *Adm. Ch.*) In about 33° S. lat., a rugged and irregular succession of mountains branches off W. from the Blue Mountain range, and appears like the dividing line of two great river basins. It quickly divides, however, into groupes, almost detached from each other, to which various names, as Canolobus, Crocker Peel, Macquarrie, &c., have been given; and further W. the interior is here and

* Mitchell, in his description of these mountains (ii. 273-279.) speaks of the view from their summits as bounded only by the higher ranges W. and S., and the road over them as the very lowest track in the whole range. This road (*Expedition Peel*) he afterwards (p. 400.) sizes at from 1,055 ft. to 1,392 ft. of altitude.

there studded with smaller knobs; but, as far as has been yet observed, only in a belt of about 2° namely, between the parallels of 31° and 29° S. The Canobolas is 4,461 ft. in height, an altitude much exceeding that of the Blue Mountains; and the Marga, another peak of the same series, attains the elevation of 2,106 ft. (Mitchell, i. 162.; ii. 10. 377.) Isolated mountains, which in other countries are rarely met with, except in the case of volcanoes, are common enough in this new land. (Osley, 4-77. 234. 258. 261. 275, &c.; Sturt, i. 69-82.; Mitchell, i. 39. 45. 48. 62, &c.)

All the usual formations are found in the Australian mountains (*Pittou King's Appen.* 188.; *Sturt*, i. 197-200.; *Mitchell*, ii. 349-359.), but they seem to occur without order, and in defiance of all known geological laws in the Old World. A ferruginous sandstone forms the Blue Mountains, granite being rarely met with, except when it appears to have cracked the thick overlying stratum, in which case it is found in the valleys and the beds of streams. (Mitchell, ii. 349. 351.) Westward this fundamental rock is sometimes found in mountains of limited extent, and no great height, while more important ranges in their neighbourhood present regular horizontal strata. (Dale, 167.) In the interior the isolated hills are uniformly different in composition from the connected ranges, the latter being of granite, the former of sandstone (Osley, 77.); limestone, so common in the formation of the N. hemisphere, was unknown in Australia before 1813. It was first discovered, W. of the Blue Mountains, in a district, named from it, *Limestone Creek* (Osley, 6.); and although it has since been found in other parts of the continent, it is far from abundant, and presents little or no appearance of stratification. (Mitchell, ii. 348.) Trap occurs in many places, but no location can be assigned to it with reference to the position of other rocks, and vesicular lava is abundant in the neighbourhood of the only volcano (an extinct one) hitherto discovered in Australia. (Mitchell, ii. 350.) This volcano, called by Mitchell (ii. 235-246.) Mount Napier, and by the natives *Murcoa*, lies between the Grampians and the S. coast, in lat. 37° 52' 29" S. long. about 142° 20' E. A bituminous burning hill, belonging to a low range called *Wingen* (the native name for fire) a little to the S. of the Liverpool Range, is chiefly remarkable for the great variety of rocks of which it is composed. The neighbouring peaks are chiefly porphyritic; but the burning mount itself contains within a very short distance, clay shale, argillaceous sandstone, felspar, basalt, ironstone, trap, and horn-blende. (Mitchell, i. 23.) *Wingen* has been burning, apparently for a very considerable time, but no marks of any extensive change appear on the surface near the burning fissures. Real heat is found at the depth of about 4 fathoms.

Malte-Brun observes, that the remarkable polarity of the principal mountains here described, extends throughout the whole of what he terms *Oceania*; and if this be a little strained with regard to some of the islands of Polynesia and the Indian Archipelago, it is at least true, with regard to New Zealand and the other islands included in Australia Proper. The same author (xii. 8.) conceives the chain of the Blue Mountains to be continued in the islands of Bass's Straits, and the axis of Van Diemen's Land, to Cape Pillar, the S. termination of the latter. Mitchell also (ii. 337.) thinks that geological appearances lead to the conclusion that the two lands were not always separated; and this is at least highly probable, and is supported by similar appearances in the Old World; but in the words of Osley, (81.) "The whole form character, and position of this country is so singular, that a conjecture is hardly hazarded before it is overturned, every thing seems to run counter to the ordinary course of nature in other countries." In other lands the rocks and reefs that run into the sea determine, in many cases, the direction and continuity or otherwise, of the mountain systems, but the rocks and reefs of Australia afford no such key to the enquirer; they belong not to geology, they are the work of the coral insect, rising perpendicularly from the depths of the ocean till they form ridges and islands above its surface, which have nothing in common with any thing but themselves. (Flinders, ii. 113-116.) Even the fact, that the geology of the continent and its adjacent islands is similar, is not conclusive, for the number of detached ranges and isolated mountains, existing in the former, prepare the mind for a much more startling admission than that the Van Diemen System may be wholly unconnected with that of the Blue Mountains, from which it is separated by a deep sea, 140 m. in average width.

From the parallelism of the principal chains (the Blue Mountains and the Darlings), it might be not unreasonably supposed that the interior was a table land of moderate elevation. It has already been stated that early belief was directly contrary to this; and the course of discovery has shown both ideas to be erroneous. W. of the Blue Mountains, a succession of terraces, com-

mencing at a great elevation, descend rapidly to a very low level. Oxley, at a distance of less than 80 m. from Bathurst, found himself only 600 ft. above the sea; that is, 1,370 ft. below the town. (Journal, 9.) The transverse mountains divide levels, apparently interminable, of the most monotonous character, and with a deficiency of vegetable matter, that, in the opinion of Sturt (i. 108.), argues powerfully for their recent origin. The line of the horizon is, in these vast flats, as unbroken as it is upon the surface of the sea; and there is every reason to believe, not only that they were at a comparatively recent period under water, but also that a very considerable portion of them is flooded by the overflow of the interior rivers, during wet seasons. The surface of these plains is extremely depressed, and so flat that the detached ranges and isolated mountains which rise out of them, appear like islands surrounded by an unbroken ocean. (Osley, 22. et seq., 80. et seq., 107, &c.; Sturt, i. 144, &c., ii. 52. 55, &c.; Mitchell, ii. 57, et seq.)

Rivers and Lakes.—The vicinity of the dividing ranges to the coast prevents the accumulation of large rivers towards the E. or W.; but from the fact of their running more or less through parallel valleys, these streams possess in general a longer course than might have been anticipated. The chief of those that rise in the Blue Mountains, are the Murrumbidgee, Clyde, Shoalhaven, Hawkesbury, Hunter, Hastings, and the Brisbane. There is nothing remarkable in them, except the fact that some of them, as the Shoalhaven and Hawkesbury, notwithstanding their short courses, issue to the ocean in noble bays. They possess few facilities for internal navigation; and, from the tortuous nature of their currents, they are useless in communicating any idea either of the general shape or character of the country. Some of their affluents are, however, sufficiently striking. They flow through ravines in the sandstone rocks, of from 100 to 3,400 ft. in depth, and of such width that Mitchell supposes that a mass equal to 134 cubic m. must have been removed from the single basin of the Cox, one of the tributaries of the Hawkesbury! The Grose, another affluent of the same river, flows through a valley of less extent, but of more precipitous character; so that the amount of stone displaced is probably not less than in the case of the Cox. What adds to the peculiarity of this feature in Australian geography is, that the outlets to these stupendous ravines are generally very narrow: the disposal of the vast masses of earth is therefore a mysterious as their amount is marvellous. (Mitchell, i. 151., ii. 351.) The rivers here mentioned have their outlets between the parallels of 27° and 36° S. Oxley, in 1824, discovered the Boyne, a rapid mountain stream, falling into Port Curtis, in lat. 25° 56' 30" S. (Field's Mem. 7.) Pummier-stone River falls into Morton's Bay, in 26° 54' 30" S. It was discovered by Flinders (*Introd.* xcvi.); but in consequence of only cursorily surveying the W. shore of that bay, he overlooked the more important Brisbane, probably the largest stream upon the E. coast. (Osley, in Field, 12-23.) Endeavour River, in 27° 27' 19" S. is chiefly celebrated as the place where Capt. Cook repaired his ship after it had lain on a coral reef for 28 hours: it has a wide and convenient mouth; but at a very short distance inland, it becomes incapable of floating the smallest boat. (King, i. 221.) On the W. coast the rivers are less numerous, and still less important. Burns or brooks of excellent water are tolerably abundant, and 4 or 5 streams issue to the sea by very large estuaries, which seem like the entrances of noble water-courses; but as they all have their sources in the farther W. mountain range, their length is insignificant, and they are useless for internal navigation. The only striking uple in Newell's Water, near the parallel of 33° "They are by far the most important yet discovered on the W. coast; and it is more than probable that none of greater magnitude exist in that quarter. (Cross's Journals, 110.; Irwin, 7.; Dale, 37. 30. 155.; King, ii. 167. 191.; Adm. Ch. Erskine, 92.)

On the N. the shore is still more destitute of river mouths. The Liverpool in 134° 15' E., the Alligators in 132° 36', 132° 26', 132° 20' E., the Hunter and the Roe, in 128° 27' E., and Prince Regent's River in 124° 53' E., are all that were found by Capt. King in his laborious survey (1818-19). Of these, the largest (Prince Regent), is not navigable for boats more than 50 m. (including windings from its mouth; but they are all full and wide streams; and, like those upon the E. and W. coasts, issue to the sea by immense estuaries, through which the tide rises sometimes as high as 30 ft. The Prince Regent, Hunter, and Roe, flow between steep rocky hills, from 800 to 400 ft. perpendicular altitude. The Liverpool and Alligators through a flat muddy soil, of the tamest and most monotonous description. (King, i. 99-107. 265-361. 292-309. 402. 413. 433-439.) On the S. coast, the Blackwood falls into Flinders' Bay, in 115° 10' E. King; and in 117° 56' E., Oyster Harbour, the N. part of K. George's Sound, forms the large estuary of the Kalga or French river. Neither of these streams are of much importance; and though it would, perhaps, be too much to affirm that

no others fall into the sea between the Kalgan and the 130th meridian, that is for more than 1,200 m. of long., it is certain that none have been discovered, and the nature of the coast renders it next to impossible that any should exist. In long. 139° E., a small mouth (that of the Murray) occurs; and, in 1836, Mitchell traced to its termination the Glenelg, a river which, rising in the Gramplains, falls into the sea in 141° 17' E., about 16 m. E. Cape Northumberland. This is one of the largest coast rivers in Australia: its affluents are numerous, and its course, including windings, upwards of 180 m., though its source be not more than 70 m. from the sea. It is wide and deep, except at its mouth; but, like most Australian streams, it first expands into a considerable basin, which, afterwards contracting, presents a very narrow outlet to the sea, the entrance from which is choked up by sand-banks. No river further E., except a few insignificant brooks, has yet been discovered upon the S. coast. (*Flinders*, i. 49–222; *Adm. Ch.*; *Cross's Journ.*; *Surv.-Gen. Rep.*, 90; *Co. in Do.* 169; *Mitchell*, ii. 109. 201. 203. 215. 225; *Sturt*, ii. 111–117.)

Along a coast-line of nearly 8,000 m., there are thus not more than 30 river mouths; and of the streams to which these give origin, none have a course of more than 900 m. inclusive of windings, and but very few penetrate to a direct distance of 50 m. from the shore. Since it is evident that these cannot drain 1–10th part of the whole land, it is not very surprising that the belief of an internal lake or mediterranean sea should have been entertained by the first inquirers; and though this be now proved to be unfounded, the hydrography of the interior is scarcely less anomalous than such an arrangement would have been. A little pains is necessary, both to describe and to comprehend this internal water system, to which nothing bearing the least resemblance exists in any other part of the known world. Immediately W. of the Blue Mountains, and in the very highest terraces and table-lands, a host of full and powerful mountain streams combine to form 2 large rivers, the Macquarrie, and the Lachlan, which, nearly on the same meridian (the 149th), diverge towards the N.W. and N. N.W. in their progress to the interior. (*Osley*, 9. 366.) Considerably farther S. another large stream, the Morrum-bidgee, rises in the Warragongs (*Currice, Field's Memoirs*, 877.), and after receiving many short but full streams from the W. faces of the Blue Mountains, runs a very tortuous course, settling finally into one varying but little from due W. Still more to the S., the Murray issues from the unexplored recesses of the Warragongs, and, after being joined by several important streams in the mountain country, receives the waters of the Morrum-bidgee, in lat. 34° 49' S., long. 143° 22' E. (*Sturt*, ii. 86; *Mitchell*, ii. 127–129.); the latter river having, according to the surmise of *Sturt* (ii. 65. 73.), fully verified by *Mitchell* (ii. 64. 69. 77.), been joined by the Lachlan in 34° 35' S., 144° 25' E.

N. of the Liverpool Range, to as low a lat. as 28° 10' 45" S., the Gwydir, Dumaresq, and a very considerable number of other streams, have been discovered—some of them, as the Castlereagh, of very considerable volume; but, though flowing at first in various directions, they all gradually unite in the channel of a very singular stream, the Darling. (*A. Cunningham's Geog. Journ.*, ii. 111, 112; *Osley*, 283; *Sturt*, i. 138; *Mitchell*, i. 34–60. 106.) This river was first struck upon by *Sturt* in 1829, near the 30th parallel and 146th meridian. Its bed was here wide and deep; but the water lay low within it, was intensely salt, had scarcely any perceptible current, and there was no satisfactory appearance of a tide (i. 87.). *Mitchell*, 6 years later, found the waters at this point perfectly sweet, though they had the green transparent tinge that usually accompanies saltness, and there was still no indication of a current. About 50 m. lower they were found to be salt, and continued so for 14 m. to a cataract, where they again became sweet. (i. 212. 229.) In 1830 *Sturt*, in his expedition down the Murray, passed an important stream, which, though large, fresh, and running with a powerful current, he concluded to be the Darling. The history of geographical discovery presents few things more creditable to the skill and penetration of the traveller than this identification. *Sturt* had quitted the Darling in despair, the year before, and left it a salt and all but stagnant stream 300 m. distant towards the N. E.; yet the ingenious conjecture he hazarded as to its being this important affluent of the Murray, has been verified in most respects by the more extensive and better appointed expedition of his successor on the same line of exploration. *Mitchell*, in 1835, traced the Darling from the point where *Sturt* had quitted it in 1829 to 32½ S.; and in

1836 he ascended from its mouth to within 50 or 60 m. of his former camp, and sufficiently far to set at rest every possibility of doubt as to its direction and termination. He found, however, a strange difference in the appearance of its junction with the Murray from that observed by *Sturt*; instead of a full and rapid stream, its bed, in 1836, would have been dry had it not been for the dull and stagnant backwater forced into it from the principal river. The course of the Darling is now ascertained to be a curved line, enclosing all the country W. of the Blue Mountains, from an unknown point N. and E. of the 30th parallel and 146th meridian to its junction with the Murray, in 34° 7' S., 142° 3' E. In this course, besides the rivers already alluded to, it receives the Bogan (New Year's Creek of *Sturt*), and such part of the waters of the Macquarrie as are not absorbed in the soil. (*Sturt*, i. 86–96; ii. 106. 116–120; *Mitchell*, i. 213–268., ii. 109–116.) From its junction with the Darling, the Murray pursues a tortuous course, first towards the W., and then towards the S., receiving 3 or 4 tributaries in its way, till in 35° 10' S. 139° 30' E. it is received into the large shallow lake named ALEXANDRINA, communicating by a narrow outlet with Encounter Bay, in lat. 35° 34' long. 139°. (*Sturt*, ii. 111–117.) Every river W. of the Blue Mountain chain and S. of the 28th parallel is conveyed to the S. shore by a single mouth, and is connected, directly or indirectly, with the Murray, the basin of which consequently includes more than 400,000 sq. m. The Murray itself, from the junction of the Morrum-bidgee to the sea, is not less than 1,500 m. in length, inclusive of windings (*Sturt*, ii. 205.); and it is certainly quite within the mark to allow it an equal length of course from its remote source among the Warragongs to that junction. The length of the Morrum-bidgee cannot be estimated at less than 1,000 m. (*Sturt*, ii. 22–84.); that of the Lachlan is more than 1,200 (*Osley*, 104.); of the Macquarrie, 700 or 800 (*Osley*, 215–244.; *Sturt*, i. 7–38.); of the Darling, more than 1,000 (*Mitchell*, i. 294.); and of the others in proportion. Such a water system would, in any other part of the world, be indeed magnificent, and a means of internal communication almost illimitable. Such is not, however, the case here: the month by which these combined waters issue to the ocean is so miserably small that it was only overlooked by both *Flinders* and *Handlin*, who met in Encounter Bay, where it is situated. (*Flinders*, i. 189–196.); and, when discovered in 1829, it was found to be defended by a double line of breakers, the foam of which extended from one end of the bay to the other. (*Sturt*, ii. 175. 239.) Its passage is therefore impracticable, even did its width and depth admit of navigation,—but this they do not; and Lake Alexandrina, into which the Murray first discharges itself, though 50 m. long and 40 m. wide, is so extremely shallow as to be incapable, in many places, of floating even a boat (*Sturt*, ii. 169.) Hence it is that this combination of so many streams has such a poor and insignificant termination. The Macquarrie alone, at less than 100 m. from its source, is sometimes capable of floating a 74-gun ship. (*Osley*, 152.; *Wentworth*, 101.) The Castlereagh is even more considerable (*Osley*, 253.); and the Darling, Morrum-bidgee, and Murray, appear, in some seasons and in some parts of their course, to be capable of supplying a host of such lakes as that which is the common recipient of the waters of them all. But in truth these rivers, notwithstanding their great length of course and width of channel, are of the nature of mountain torrents. Formed in the hills, by the confluence of many powerful streams, they rush from their mountain homes important watercourses; but quickly reaching a very level country, they become sluggish in their motion, except when urged by the influence of flooding rains; and, receiving few or no tributaries, their existence depends on the magnitude of their sources, so that they shoal and narrow as they proceed,—an effect exactly the reverse of any thing observed in older countries. When the mountains are saturated with water, the bed of these streams become fully charged, and then they foam and thunder along their track, till, in the flats of the low country, they meet with some opposition, when (their banks no longer able to contain them) they spread to the right and left in marshes, of which the overflow finds its way by insignificant channels to other streams. In dry seasons, on the contrary, these rivers dwindle to trifling brooks, even in the mountains, while, in the plains, their wide and deep beds become converted into dry and dusty chasms. This is the case with the Macquarrie and the Lachlan, which, issuing from the mountains in large and full streams, are lost in the interior flats in extensive swamps, which in wet seasons are every where inundated, while, after a long-continued drought, the beds of the rivers present nothing more of moisture than a succession of ponds, and their marshes, nearly or wholly dried, exhibit the creeks by which their imperfect communication is kept up during the inundation with the Darling and Morrum-bidgee, which thus receive but little water from them, either during drought or deluge. (*Osley*, 35–37. 102. 136. 142. 252, 268, &c.; *Sturt*, i. 36. 38. 82.

* This is according to Mitchell's Map; but the gentleman places C. Northumberland 22½ farther E. than Mitchell does. (*Ch. and Vol.* i. 302.) The latter, by bearing a little off the land, in consequence of blowing weather, did not see the small mouth of the Glenelg.

† The positions are given from Mitchell's work and map. They differ nearly 1° in long. from those of *Sturt*, but in consequence of the far superior appointments of Mitchell's expedition, they are more likely to be accurate. Among other considerations, *Sturt*'s only chronometer was broken on the Murray.

148.; and *Mitchell*, i. 321., ii. 32, 771, &c.) Yet this last mentioned supply, trifling as it is, is perhaps the greatest that the last mentioned rivers receive, and in consequence the supply they bring to the Murray is very uncertain. (*Sturt*, ii. 108.; *Mitchell*, ii. 113.) The latter, however, never loses the character of a permanent river, which can be affirmed of no other known stream of the interior, except, perhaps, its affluent, the Morumbidgee. The quantity of water, finally conveyed to the sea, is not therefore great; absorption and evaporation perform their work unchecked by any liberal supply from the surrounding country; and were it not that the two chief rivers receive an occasional impetus to their current by the occurrence of rapids (*Sturt*, ii. 83, 98, &c.), it is by no means improbable that the whole might be exhausted before it reached the coast.
